HIV-2 Infection

Updated: December 06, 2023
Reviewed: December 06, 2023

Key Considerations and Recommendations
• The clinical course of HIV-2 infection is generally characterized by a longer asymptomatic stage, lower plasma viral loads, and lower mortality rate than HIV-1 infection. However, without treatment, the majority of individuals with HIV-2 will progress to AIDS and death. • No randomized controlled trials have addressed when a person with HIV-2 should start antiretroviral therapy (ART) or which regimens are most effective for initial or second-line ART when treating HIV-2; thus, the optimal treatment strategy is not well defined. • Existing data on the treatment of HIV-2, and extrapolation from data on the treatment of HIV-1, suggest that ART should be started at or soon after HIV-2 diagnosis to prevent disease progression and transmission of HIV-2 to others **(AIII).** • Quantitative plasma HIV-2 RNA viral load testing for clinical care is available and should be performed before initiating ART **(AIII).** • For ART-naive patients who have HIV-2 mono-infection or HIV-1/HIV-2 coinfection, antiretroviral (ARV) regimens should include an integrase strand transfer inhibitor (INSTI) plus two nucleoside reverse transcriptase inhibitors (NRTIs) **(AII).** A recommended alternative regimen is a boosted protease inhibitor (PI) that is active against HIV-2 (darunavir or lopinavir) plus two NRTIs **(BII).** • HIV-2 is intrinsically resistant to non-nucleoside reverse transcriptase inhibitors (NNRTIs); therefore, NNRTI-based regimens, including long-acting injectable rilpivirine (given with the INSTI cabotegravir), **are not recommended** for treatment of HIV-2 **(AIII).** • Patients with hepatitis B virus (HBV)/HIV-2 coinfection should be prescribed ART that contains drugs with activity against both HIV-2 and HBV **(AIII).** • HIV-2 RNA, CD4 T lymphocyte (CD4) cell counts, and clinical status should be used to assess treatment response **(AII).** Unlike people with HIV-1, people with HIV-2 should continue to undergo periodic CD4 testing even if their viral loads are persistently suppressed, because disease progression can occur despite an undetectable viral load **(AIII).** • Resistance-associated viral mutations to INSTIs, PIs, or NRTIs may develop in people with HIV-2 while they are on ART. However, no validated HIV-2 genotypic or phenotypic antiretroviral resistance assays are approved for clinical use. • In the event of virologic, immunologic, or clinical failure, a new ARV regimen should be constructed in consultation with an expert in HIV-2 management. • *In vitro* studies demonstrate that HIV-2 is intrinsically resistant to the fusion inhibitor enfuvirtide, and limited data also show that HIV-2 is intrinsically resistant to fostemsavir); therefore, these drugs **are not recommended** for treatment of people with HIV-2 **(AIII).** • For patients with multidrug-resistant virus, ibalizumab and lenacapavir demonstrate *in vitro* potency against HIV-2 and may be considered **(BIII).**
Rating of Recommendations: *A = Strong; B = Moderate; C = Weak* ***Rating of Evidence:*** *I = Data from randomized controlled trials; II = Data from well-designed nonrandomized trials or observational cohort studies with long-term clinical outcomes; III = Expert opinion*

Overview

HIV-2 infection is endemic in West Africa, with certain countries experiencing a population prevalence of >1%. The possibility of HIV-2 infection should be considered when treating people of West African origin, people who have had sexual contact with or shared needles with people of West African origin, and people who reside in countries with strong socioeconomic ties to West Africa (e.g., France, Spain, Portugal, and former Portuguese colonies, such as Brazil, Angola, Mozambique, and parts of India). Globally, it has been estimated that 1 million to 2 million people have HIV-2—a number that includes people with HIV-1/HIV-2 dual infection. However, current and accurate prevalence data are scarce, and neither the Joint United Nations Programme on HIV and AIDS nor the World Health Organization has formal surveillance systems for HIV-2.[1]

Clinical Course of HIV-2 Infection

The clinical course of HIV-2 infection is generally characterized by a longer asymptomatic stage, lower plasma viral loads, and a lower mortality rate than HIV-1 infection.[2,3] However, without effective antiretroviral therapy (ART), HIV-2 infection will progress to AIDS and death in the majority of individuals.[4] Concomitant infection with HIV-1 and HIV-2 may occur, and the possibility of this coinfection should be considered when treating people from areas with a high prevalence of HIV-2.

Diagnostic and Monitoring Assays for HIV-2 Infection

In the appropriate epidemiologic setting, HIV-2 infection should be suspected in people who have clinical conditions that suggest HIV infection but who have atypical serologic results (e.g., a positive screening assay with an indeterminate HIV-1 Western blot).[5] The possibility of HIV-2 infection should also be considered in the appropriate epidemiologic setting in people who have serologically confirmed HIV infection but low or undetectable HIV-1 RNA levels, or in those who have declining CD4 T lymphocyte (CD4) cell counts despite apparent virologic suppression on ART.

The 2014 Centers for Disease Control and Prevention guidelines for HIV diagnostic testing[6] recommend using an HIV-1/HIV-2 antigen/antibody combination immunoassay for initial testing and using an HIV-1/HIV-2 antibody differentiation immunoassay for subsequent testing. The Geenius HIV 1/2 Supplemental Assay (Bio-Rad Laboratories) is approved by the U.S. Food and Drug Administration (FDA) to differentiate HIV-1 infection from HIV-2 infection. The Multispot HIV-1/HIV-2 Rapid Test is no longer available. Commercially available HIV-1 RNA assays do not reliably detect or quantify HIV-2 RNA.[7] Quantitative HIV-2 RNA testing is available at the University of Washington (UW)[8] and the New York State Department of Health (NYSDOH).[9] HIV-2 nucleic acid amplification test–based (total DNA/RNA) diagnostic testing is now commercially available for clinical care.[10,11] However, it is important to note that up to one-third of people with untreated HIV-2 will have HIV-2 RNA levels below the limits of detection (10 copies/mL for UW testing and 7 IU/mL for NYSDOH testing); some of these people will have clinical progression and CD4 count decline. No validated HIV-2 genotypic or phenotypic antiretroviral (ARV) resistance assays are approved by the FDA for clinical use. HIV-2 genotypic ARV resistance assays are available at UW for research use only.

Treatment of HIV-2 Infection

To date, no randomized controlled trials that address when to start ART or the choice of initial or subsequent ART for HIV-2 have been reported[12]; thus, the optimal treatment strategy has not been defined. Existing data on the treatment of HIV-2 and extrapolation from data on the treatment of HIV-1 suggest that ART should be started at or soon after HIV-2 diagnosis to prevent disease

progression and transmission of HIV-2 to others **(AIII).** However, CD4 cell recovery in people with HIV-2 who are on ART is generally poorer than that observed in people with HIV-1.[13,14]

Data from *in vitro* studies suggest that HIV-2 is sensitive to the currently available nucleoside reverse transcriptase inhibitors (NRTIs); however, HIV-2 is more likely to develop resistance to NRTIs than HIV-1.[15] HIV-2 is intrinsically resistant to non-nucleoside reverse transcriptase inhibitors (NNRTIs)[16]; thus, NNRTI-based regimens, including the long-acting injectable rilpivirine (RPV) (given with the integrase strand transfer inhibitor [INSTI] cabotegravir [CAB]), **are not recommended** for treatment of HIV-2 **(AIII).** Several small studies in individuals with HIV-2 have reported poor responses to dual-NRTI regimens[17,18] or regimens that contain an NNRTI plus two NRTIs.[19,20] Clinical data on the effectiveness of triple-NRTI regimens are conflicting.[21,22]

INSTI-based regimens or protease inhibitor (PI)–based regimens are treatment options for people with HIV-2. As discussed below, three single-arm clinical trials showed favorable outcomes in patients who received INSTI-based regimens. Data regarding the efficacy of PI-based regimens primarily come from observational reports. A randomized controlled trial comparing raltegravir (RAL) plus tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) to lopinavir/ritonavir (LPV/r) plus TDF/FTC is completed, but the results have not been reported (FIT-2; NCT02150993).

Integrase Strand Transfer Inhibitor–Based Regimens

All FDA-approved INSTIs—RAL, elvitegravir (EVG), dolutegravir (DTG), bictegravir, and CAB—have potent activity against HIV-2 *in vitro*.[23-28] INSTI-based regimens have shown favorable treatment responses in observational studies.[29-31] Three small, single-arm, open-label clinical trials have assessed the effectiveness of INSTI-based regimens in ART-naive individuals with HIV-2. These studies evaluated RAL plus TDF/FTC, EVG/cobicistat/TDF/FTC, and DTG plus either abacavir/lamivudine or TDF/FTC. All the studies demonstrated favorable clinical and immuno-virologic results at 48 weeks, providing the best evidence to date for HIV-2 treatment recommendations.[32-34]

Protease Inhibitor–Based Regimens

In general, regimens that contain boosted PIs that are active against HIV-2 (and that also include two NRTIs) have resulted in more favorable virologic and immunologic responses than regimens that consist of only two or three NRTIs.[13,14,22,35] Darunavir (DRV), lopinavir (LPV), and saquinavir are more active against HIV-2 than other approved PIs.[36-38] While LPV/r is more active against HIV-2 than DRV *in vitro*, it is less well tolerated. Some clinicians may use boosted DRV (where available) to enhance adherence. Older unboosted PI-based regimens, including nelfinavir or indinavir plus zidovudine and lamivudine, and atazanavir-based regimens have shown poor clinical success rates.[12,17,18,39,40]

Other Antiretroviral Drugs

Among the entry inhibitors, HIV-2 is intrinsically resistant to enfuvirtide.[41] The CCR5 antagonist maraviroc appears to be active against some HIV-2 isolates[42]; however, there are no FDA-approved assays that can determine HIV-2 co-receptor tropism, and HIV-2 is known to use many other minor co-receptors in addition to CCR5 and CXCR4.[43] The post-attachment inhibitor ibalizumab (IBA) has potent *in vitro* activity against HIV-2 isolates.[44] Limited data suggest HIV-2 is intrinsically resistant to the attachment inhibitor fostemsavir (FTR).[45,46]

The capsid inhibitor lenacapavir (LEN) demonstrates nanomolar potency against HIV-2 *in vitro* but is 11- to 25-fold less active against HIV-2 than HIV-1.[47,48]

Some national and international guidelines have recommended specific preferred and alternative drug regimens for initial and second-line ART for HIV-2 infection[49-52]; however, there are currently no comparative randomized controlled clinical trial data that support the effectiveness of a specific recommended regimen.

The Panel's Recommendations

Until more definitive data on outcomes are available, the Panel on Antiretroviral Guidelines for Adults and Adolescents provides the following recommendations for the management of individuals with HIV-2 mono-infection or HIV-1/HIV-2 dual infection:

- A regimen that contains one INSTI plus two NRTIs is the recommended initial ART for most individuals with HIV-2 **(AII).**
- An alternative regimen is a boosted PI (DRV or LPV) that is active against HIV-2 plus two NRTIs **(BII).**
- HIV-2 is intrinsically resistant to NNRTIs; therefore, NNRTI-based regimens, including long-acting injectable RPV (given with the INSTI CAB), **are not recommended** for treatment of HIV-2 **(AIII).**
- HIV-2 demonstrates intrinsic resistance to the fusion inhibitor enfuvirtide *in vitro*, and limited data show intrinsic resistance to FTR; therefore, these drugs **are not recommended** for treatment of people with HIV-2 **(AIII).**
- For people with multidrug-resistant HIV-2, IBA and LEN may be considered based on *in vitro* data **(BIII).**
- Patients with hepatitis B virus (HBV)/HIV-2 coinfection require ART that contains drugs with activity against both HIV-2 and HBV **(AIII).** See Hepatitis B Virus/HIV Coinfection for more information.
- HIV-2 plasma RNA levels, CD4 counts, and clinical status should be monitored to assess treatment response, as is recommended for HIV-1 **(AII).**
- People who have HIV-2 RNA levels that are below the limits of detection before they initiate ART should still undergo routine HIV-2 plasma RNA monitoring in addition to CD4 count and clinical monitoring. Unlike HIV-1, people with HIV-2 require continued CD4 count monitoring, as disease progression can occur in the setting of undetectable HIV-2 viral load **(AIII).**

Women with HIV-2 who are of childbearing potential require similar considerations when choosing a regimen as women of childbearing potential with HIV-1 (see What to Start). There are no data on HIV-2 treatment as prevention; however, both data from studies of people with HIV-1 and data on the natural history of HIV-2 transmission suggest that effective ART likely provides a reduced risk of transmission to sexual partners.[53-55]

Viral mutations that are associated with resistance to NRTIs, PIs, and/or INSTIs may develop in people with HIV-2 while they are on ART.[38,56,57] Currently, transmitted drug resistance appears to be rare among people with HIV-2.[58,59] In several small studies, twice-daily dosing of DTG was found to have some residual activity as a second-line INSTI in some people with HIV-2 who had extensive ART experience and RAL resistance.[60-63] Genotypic algorithms that are used to predict drug resistance in HIV-1 may not be applicable to HIV-2 because the pathways and mutational patterns that lead to resistance may differ between the HIV types (see the HIV2EU Algorithm and the Stanford University HIV Drug Resistance Database).[64] In the event of virologic, immunologic, or clinical failure, a new ART regimen should be constructed in consultation with an expert in HIV-2 management.

HIV and the Older Person

Updated: September 12, 2024
Reviewed: September 12, 2024

Key Considerations and Recommendations When Caring for Older People With HIV
• Diagnosis of HIV at a later stage of disease is more common among older people. Early diagnosis and treatment of HIV and counseling to prevent secondary HIV transmission remain important in the clinical care of older people with HIV. • Antiretroviral therapy (ART) is recommended for all people with HIV **(AI).** ART is especially important for older individuals because they have a greater risk of serious non-AIDS complications and potentially a blunted immunologic response to ART. • Compared to people without HIV, people with HIV have a twofold higher risk of developing atherosclerotic cardiovascular disease (ASCVD), and their age at incident ASCVD diagnosis is about a decade younger. In addition to current American Heart Association (AHA)/American College of Cardiology (ACC)/ Multisociety Guidelines, the Panel on Antiretroviral Guidelines for Adults and Adolescents (the Panel) recommends initiating at least a moderate-intensity statin in people with HIV aged 40 to 75 years who have 10-year ASCVD risk estimates of 5% to <20% **(AI).** See Statin Therapy in People With HIV for the Panel's additional recommendations on the use of statin therapy as primary prevention for people with HIV. • Polypharmacy is common in older people with HIV, and all drugs, supplements, and herbal treatments should be assessed regularly for appropriateness, potential for adverse effects, proper dosing, and drug interactions **(AIII).** • Potential for drug–drug interactions between antiretroviral drugs and concomitant medications (including statins, supplements, and herbal medicines) should be assessed regularly, especially before a new ART regimen or concomitant medication is started. In this context, it is also important to inquire and counsel about the use of non-daily medications, including long-acting injectables and as-needed medications. • Adverse drug events from ART and concomitant drugs may occur more frequently in older people with HIV than in younger individuals with HIV. Therefore, the bone, kidney, metabolic, cardiovascular, cognitive, and liver health of older individuals with HIV should be monitored closely. • HIV infection is associated with immunologic aging and systemic inflammation, which may contribute to the development of comorbidities across multiple organ systems as well as aging phenotypes like frailty. HIV experts, primary care providers, and other specialists should work together to optimize the medical care of older people with HIV, including adhering to treatment and prevention guidelines for different medical comorbidities. • Age-related decline in neurocognitive function is faster in people with HIV compared to those without. Cognitive impairment in people with HIV—with manifestations including problems with memory, attention, and executive function—is associated with reduced adherence to therapy and poorer health outcomes, including increased risk of death. For people with progressive cognitive impairment, referral to a specialist (e.g., neurologist, neuropsychologist, geriatrician) for evaluation, testing, and management may be warranted **(BIII).** • Mental health disorders, including an increased risk of anxiety and depression, are a concern among aging people with HIV. Screening for depression and management of mental health issues are important when caring for older people with HIV. • Given that the burden of aging-related diseases is significantly higher among people with HIV than in the general population, additional medical and social services may be required to effectively manage both HIV and comorbid conditions.
Rating of Recommendations: *A = Strong; B = Moderate; C = Weak* ***Rating of Evidence:*** *I = Data from randomized controlled trials; II = Data from well-designed nonrandomized trials or observational cohort studies with long-term clinical outcomes; III = Expert opinion*

Introduction

Effective antiretroviral therapy (ART) has increased survival in people with HIV[1-4], resulting in an increasing number of older people with HIV. In the United States in 2022, the proportion of people newly diagnosed with HIV aged ≥55 years was 9%, according to the Centers for Disease Control and Prevention (CDC). Among people with HIV in 2022, 38% were aged ≥55 years, 13.2% were aged ≥65 years, and these proportions are expected to increase steadily.[5] The difference in life expectancy between people with HIV and the general population has significantly narrowed since the use of effective ART and is now estimated to be 5 years or fewer for those with CD4 T lymphocyte (CD4) cell count >500/μL after initiating ART.[3] However, the difference in mortality rates increases significantly with advancing age. While there has been a large reduction in AIDS-related mortality with effective ART, noninfectious comorbidities and complications, including atherosclerotic cardiovascular diseases (ASCVD) and non-AIDS malignancies, now account for a growing proportion of the causes of death among people with HIV.[2,3,6,7]

The discussion in this section of the guidelines refers to individuals aged ≥50 years as older people with HIV. Many older people with HIV have had HIV for years or decades; therefore, accumulating disease risk associated with longstanding HIV disease itself and/or exposure to antiretroviral (ARV) medications (including prior use of older ART regimens with greater toxicity in some cases) should be considered. Specifically, HIV may affect the biology of aging, possibly resulting in earlier manifestations of morbidities generally associated with more advanced age. As a result, older people with HIV may suffer from aging-related illnesses earlier and at higher rates than those without HIV, and will require more non-ART medications than younger people, which may complicate HIV clinical care.[8,9,10]

It is also important to consider distinct issues for people who are diagnosed with and/or acquire HIV at older ages. For example, older adults may have an increased risk of acquisition and transmission of HIV, in part as a consequence of reduced mucosal and immunologic defenses and changes in risk related-behaviors (e.g., decrease in condom use because of less concern about pregnancy or more high-risk sexual activity with increased use of erectile dysfunction drugs).[11,12] In addition, HIV screening among older adults remains low because they are generally perceived to be at low risk of acquiring HIV. The sections below review important considerations for the diagnosis and treatment of HIV among older people, as well as the potential clinical implications for people now living to older ages with longstanding HIV disease.

HIV Screening and Diagnosis in the Older Person

Older people with HIV (aged ≥55 years) are significantly more likely to meet the case definition of AIDS at HIV diagnosis than people aged <55 years (threshold defined by CDC surveillance data).[13] Also, older adults appear to have lower CD4 counts at seroconversion and steeper CD4 count decline over time[14] and tend to present to care with significantly lower CD4 counts.[15,16] Therefore, education, preventive measures (including pre-exposure prophylaxis or PrEP), and routine screening of asymptomatic older adults for HIV should be emphasized,[17] as well as considering HIV infection in the medical evaluation of older adults.

Antiretroviral Therapy in the Older Person With HIV

Importance of Prompt Initiation of Antiretroviral Therapy After HIV Diagnosis

ART is recommended for all individuals with HIV (**AI;** see Initiation of Antiretroviral Therapy). Early treatment may be particularly important in older adults because of blunted immune recovery and

increased risk of serious non-AIDS events in this population.[18,19] However, ART-associated CD4 cell recovery in older adults is generally slower and lower in magnitude than in younger people,[20-23] suggesting that early diagnosis and treatment may result in better immunologic response and possibly improved clinical outcomes. In a modeling study based on data from an observational cohort, the beneficial effects of early ART were projected to be greatest in the oldest age group (people aged 45 to 65 years).[24] The benefits of early ART initiation were further demonstrated in an analysis of HIV cohorts from Europe and the Americas showing a lower all-cause and non-AIDS mortality with immediate ART initiation in people aged 50 to 70 years.[25] More definitive information was provided by the START study, which randomized ARV treatment–naive participants with CD4 counts >500 cells/mm^3 to either immediate ART or deferred ART until CD4 count dropped below 350 cells/mm^3. The highest absolute risk reduction of serious AIDS and non-AIDS events associated with immediate ART was found in participants aged 50 years or older.[26] All older people with HIV should be informed that maintaining a plasma HIV RNA (viral load) at <200 copies/mL with ART improves overall health and prevents sexual transmission of HIV (see the Treatment as Prevention section).

Choice of Antiretroviral Regimens in the Older Person With HIV

The choice of ARV regimen for an older person with HIV should be informed by a comprehensive review of the person's other medical conditions and medications (including non-prescription drugs, supplements, and herbal treatments), and results from cumulative genotypic resistance testing. The What to Start section (Table 7) of these guidelines provides guidance on selecting an ARV regimen based on a person's characteristics and specific clinical conditions (e.g., kidney disease, elevated risk for cardiovascular disease [CVD], osteoporosis). In older people with HIV and reduced renal function, dosage adjustment of nucleoside reverse transcriptase inhibitors (NRTIs) may be necessary (see Appendix B). In addition, ARV regimen selection may be influenced by potential interactions between ARV medications and drugs used concomitantly to manage comorbidities (see Tables 24a through 25b). Adults aged >50 years should be monitored for ART effectiveness and safety as similarly recommended for other populations with HIV (see Table 3); however, in older people, special attention should be paid to the greater potential for adverse effects of ART on renal, liver, cardiovascular, central nervous system, metabolic, and bone health (see Table 21). A meta-analysis confirmed that people with HIV have a 1.5-fold higher risk of fragility-related fracture and a fourfold higher risk of hip fracture. The increased risk is not completely explained by differences in bone mineral density (BMD) alone, indicating there may be differences due to bone microarchitecture or other HIV-related factors contributing to the marked fracture risk. ART regimens that contain tenofovir disoproxil fumarate (TDF),[27] boosted protease inhibitors (PIs), or both are associated with a significantly greater loss of BMD, with or without osteoporosis, compared to regimens containing other NRTIs and integrase strand transfer inhibitors (INSTIs).[28-31] Abacavir (ABC), NRTI-sparing regimens, and tenofovir alafenamide (TAF) may be considered as alternatives to the use of TDF in older individuals who may be at risk of nephrotoxicity, osteopenia, or osteoporosis; however, with ABC, the benefit should be balanced with its potential for increasing the risk of CVD (see What to Start). The long-acting (LA) injectable combination of cabotegravir (CAB) and rilpivirine (RPV) is also an option for ART among older people with HIV, with the same considerations as for all people with HIV (see Optimizing Antiretroviral Therapy in the Setting of Viral Suppression).

Antiretroviral Efficacy and Safety Considerations in the Older Person With HIV

The efficacy, pharmacokinetics (PK), adverse effects, and drug interaction potentials of ART in older adults have not been studied systematically. Data from clinical trials of second-generation INSTIs (dolutegravir [DTG] and bictegravir),[32] two-drug regimens (DTG/lamivudine),[33] and LA CAB/RPV

have shown similar virologic efficacy, safety, and tolerability between participants >50 years of age and those aged 50 and younger.[34]

Hepatic metabolism and renal elimination are the major routes of drug clearance, including the clearance of ARV drugs. Both liver and kidney functions decrease with age and may result in impaired drug elimination and increased drug exposure.[35] Most clinical trials have included only a small proportion of participants aged >50 years, and current ARV dosing recommendations are based on PK and pharmacodynamic data derived from participants with normal organ function. Because it is not known whether drug accumulation in older people may lead to greater incidence and severity of adverse effects than in younger people, therapy in older people requires close monitoring and heightened awareness of drug-related adverse effects, especially in those with hepatic or renal impairment.

Adherence Concerns

Suboptimal adherence to ART is the most common cause of treatment failure. Although most older people with HIV are able to achieve viral suppression with a single-tablet regimen, some people who have a long history of ART may have acquired drug resistance, thus requiring more complex multiple-pill regimens. Complex dosing requirements, high pill burden, polypharmacy, inability to access medications because of cost or availability, limited health literacy (including misunderstanding of instructions), depression, substance use, frailty, and neurocognitive impairment are among the key reasons for nonadherence and should be regularly assessed and managed (see Adherence to the Continuum of Care).[36-38] Although some of the factors associated with nonadherence may be more prevalent in older people with HIV, older people have demonstrated better adherence to ART than younger people in some studies.[39-41] Severe menopausal symptoms are also associated with reduced adherence to ART, which increases the risk of drug resistance and adverse HIV-related health outcomes in menopausal women, highlighting the importance of managing these symptoms among women with HIV.[42,43] To facilitate ART adherence, it may be useful to discontinue unnecessary non-HIV medications, simplify ART regimens, and apply evidence-based behavioral approaches including the use of adherence aids such as pillboxes or daily calendars, and support from family members and friends (see Adherence to the Continuum of Care). LA dosing options, such as LA CAB/RPV, may ease pill burden and adherence concerns for some older adults (see Optimizing Antiretroviral Therapy).

Optimizing Antiretroviral Therapy in Older People With HIV

Given the greater incidence of comorbidities, non-AIDS complications, and frailty among older people with HIV, switching one or more ARVs in an HIV regimen may be necessary to minimize toxicities, drug–drug interactions, or to reduce pill burden.[38] Expert guidance now recommends bone density monitoring in men aged ≥50 years and postmenopausal women and suggests switching from TDF or boosted PIs to other ARVs (such as TAF or INSTIs, respectively) in older people at high risk for fragility fractures.[44] Given the high prevalence and faster progression of chronic kidney disease (CKD) in aging people with HIV—likely from a combination of HIV, ART, and non-HIV risk factors—development of CKD must be closely monitored in an older person on ART.[45,46] Table 7 provides guidance for ARV drugs to use based on selected clinical scenarios, including comorbidities.

Polypharmacy in Older People With HIV

People with HIV and aging-associated comorbidities may require additional pharmacologic interventions that can complicate therapeutic management.[8] In addition to taking medications to manage HIV and comorbid conditions, many older people with HIV are also taking medications to relieve discomfort (e.g., pain medications, sedatives) or to manage adverse effects of medications

(e.g., anti-emetics). Older individuals may also self-medicate with over-the-counter medicines or supplements.

Polypharmacy is more common in older people with HIV than similarly aged people in the general population.[8,47,48] Among people with HIV aged ≥65 years, it is predicted that the prevalence of comorbidities and polypharmacy rose with increasing age and duration of HIV infection.[49,50] In the Swiss HIV Cohort Study, the prevalence of polypharmacy and inappropriate prescribing in people aged ≥75 was 66% and 67%, respectively.[51]

In people aging with HIV, the effects of polypharmacy, including the use of drugs that affect neurocognitive function, can contribute to serious adverse outcomes, such as serious falls and fractures, delirium, hospitalization (including intensive care unit admissions), and death.[52-57] Polypharmacy may also increase the likelihood of adverse consequences such as medication errors (by prescribers or prescription recipients), medication nonadherence, additive drug toxicities, and drug–drug interactions. Older people with HIV are probably at an even greater risk of polypharmacy-related adverse consequences than younger or similarly aged people without HIV. When evaluating any new clinical concern or laboratory abnormality in people with HIV, especially in older people, clinicians should always consider the possible role of adverse drug reactions from both ARV drugs and other concomitantly administered medications.

Drug–Drug Interaction Concerns

Interactions between ARV drugs and concomitant medications, supplements, and herbal treatments can occur and can be easily overlooked by prescribers.[58] Potential drug–drug interactions can occur between ARV and non-ARV medications, as well as between non-ARV medications.[48,59] The available drug interaction information on ARV agents is derived primarily from PK studies performed in small numbers of relatively young participants with normal organ function who do not have HIV (see Tables 24a–25b). Data from these studies provide clinicians with a basis to assess whether a significant interaction may exist. However, the magnitude of an interaction may be greater in older than in younger people with HIV; therefore, it is important for clinicians to remain vigilant to assess for potential drug–drug interactions given the high prevalence of polypharmacy in older people with HIV. The risk of significant drug–drug interactions appears to be higher with PI-based or non-nucleoside reverse transcriptase inhibitors-based ART than with INSTI-based ART, although there are some important interactions with INSTIs that should be recognized and managed (including with polyvalent cations that are frequently taken as supplements).[60-62]

Hormonal therapies may be taken to alleviate symptoms of menopause or for other medical indications. Although data on drug–drug interactions between hormonal therapies and ART are limited, existing data suggest little to no impact of hormonal therapies on the efficacy of some ART.[63-65]

HIV and Immunologic Aging

Chronic HIV infection is associated with elevated soluble markers of immune activation and inflammation, as well as cellular phenotypes indicative of T cell and myeloid cell activation, even after HIV RNA levels are suppressed with ART.[66] The levels of inflammation and immune activation also increase with age and age-associated diseases.[67] In this context, the combined effects of HIV and advancing age on chronic inflammation have implications for risk from a broad spectrum of diseases.[68,69]

A contributing factor to the early development of aging-related diseases among people with HIV has been posited to be the effect of HIV on immunologic aging. In addition to higher levels of immune activation, aging is associated with a higher frequency of cellular senescence as well as impaired

immune responses and surveillance.[70] HIV infection is associated with higher frequencies of T cell phenotypes characteristic of immunosenescence, as well as phenotypes reflective of highly differentiated or activated states.[71-74] Higher frequencies of senescent T cells are then associated with a greater risk for such comorbidities as CVD. In addition, the degree of CD4 T cell recovery after ART initiation is diminished among people ≥50 years old versus younger people with HIV.[75,76] This impaired T cell recovery with advancing age may then have functional consequences, as people with HIV demonstrate reduced immune responses to vaccination, as well as impaired control of copathogens such as cytomegalovirus (CMV).[77-79] The persistence of impaired or ineffective immune response toward copathogens then contributes to ongoing chronic immune activation (e.g., CMV-specific responses),[78] as well as the increased risk of both AIDS and non-AIDS–defining cancers that are driven by pro-oncogenic viruses (e.g., human papillomavirus [HPV]-and Epstein-Barr virus [EBV]-related cancers).[80]

Immunologic aging in the context of HIV also entails chromosomal and genetic changes. Whether a consequence of untreated HIV viremia, direct toxicity from ARV drugs, or both, people with HIV have been shown to have shorter leukocyte chromosome telomere length, itself a marker of poor health and mortality.[81-83] DNA methylation is an epigenetic alteration that occurs at a predictable rate with advancing age, predicts lifespan, and increases in the setting of chronic HIV disease.[84-87] Finally, a genetic mechanism that may more directly link immunologic aging to comorbid disease risk is clonal hematopoiesis, which entails an age-related expansion of somatic gene mutations among leukocytes (also referred to as age-related clonal hematopoiesis or ARCH). Clonal hematopoiesis is more common among people with HIV, and the degree of difference with people without HIV may be more pronounced with advancing age[88,89] and in people with low nadir CD4 counts.[90,91] Several of the leukocyte gene mutations characteristic of clonal hematopoiesis lead to dysregulation of inflammatory pathways, which is then associated with higher levels of inflammatory markers and ASCVD.[92-94] In summary, clonal hematopoiesis is an example of HIV disease influencing age-related genetic somatic mutations that may contribute to ongoing systemic inflammation and associated disease risk among older people with HIV.

Disease-modifying pharmacologic interventions targeting immunologic aging are an area of active study within geroscience, but none are currently recommended specifically for older people with HIV with the exception of statin therapy as primary prevention of ASCVD risk (see Atherosclerotic Cardiovascular Disease in the Older Person With HIV below and Statin Therapy in People With HIV).

Morbidity, Mortality, and Non-AIDS Complications Among Older People With HIV

The clinical implications of greater immunologic aging and persistent inflammation can manifest in any organ system, diminishing the health span of older people with HIV. The frailty phenotype—defined clinically as a decrease in muscle mass, weight, physical strength, energy, and physical activity—represents an important example of an age-related syndrome that occurs with greater frequency and at earlier ages among people with HIV and is associated with a broad spectrum of adverse effects and disease risk. Specifically, frailty among people with HIV has been associated with incident CVD, diabetes mellitus, recurrent falls and fractures, lower quality of life, cognitive impairment, hospitalization, and mortality.[95-104] The frailty phenotype remains incompletely characterized among older people with HIV and identifying effective treatment strategies is an important priority for clinical management. However, pharmacologic and non-pharmacologic interventions addressing frailty among people with HIV have been proposed and have the potential to significantly impact their quality of life and survival.[105,106]

Although the life expectancy of people with HIV is approaching that of people without HIV, the incidence and prevalence of age-associated comorbidities in people with HIV are increasing.[107,108]

The age-related comorbidity burden is significantly higher in people with HIV compared to the age-matched general population.[8] These predictions differ by comorbidity and by demographic factors—including race, ethnicity, age, sex, and HIV transmission mode—displaying substantial disparities for some populations.

Data from insured adults suggest that people with HIV spend approximately 15 years more of their lifespan with one or more major comorbidities when compared to people without HIV; this difference is reduced but persists (at approximately 10 years) for people who initiate ART at a CD4 count of >500 cells/mm^3.[109] A simulation modeling study projected that by 2030, 45% of people with HIV on ART would be living with two or more physical comorbidities and 64% with at least one mental health comorbidity.[110]

Non-AIDS–Defining Complications and Comorbidities in the Older Person With HIV

Non-AIDS comorbid conditions constitute an increasing proportion of morbidity and mortality among people with HIV.[3,111] Heart disease and cancer are the leading causes of death in older people with HIV in the United States. Similarly, other non-AIDS events, such as cognitive impairment and liver disease, have also emerged as major causes of morbidity and mortality in people with HIV receiving effective ART. The prevalence of multimorbidity among people with HIV has increased in the past decade,[112] with hypertension and hypercholesterolemia being the most common comorbidities.[113]

Three groups of factors likely contribute to this burden of noncommunicable diseases among people with HIV: (1) an over-representation of traditional risk factors in this population, especially higher rates of smoking, diabetes, and dyslipidemia; (2) HIV-associated chronic inflammation and immune activation, which are not completely abated by suppressive ART; and (3) possible cardiometabolic complications of some ARV drugs.[114-122]

As the life expectancy of people with HIV increases with ART, more women with HIV are experiencing menopause. Although menopause may occur earlier in women with HIV than in women in the general population,[123] early menopause may also be a consequence of smoking, depression, substance use disorder, and other psychosocial factors that are disproportionately present in women with HIV.[124] Also, HIV might compound menopause-related metabolic changes. For instance, HIV infection and menopausal stage were independent predictors of lower BMD and had an additive effect on lumbar spine and total hip BMD.[125]

HIV-specific primary care guidelines have been developed and are available for clinicians caring for people with HIV, especially for older people with HIV.[126,127] Additional specific guidelines have also been developed for the evaluation and management of the following specific comorbidities in people with HIV: bone health,[44] kidney disease,[128] and secondary prevention for ASCVD.[129] In addition, the following guidelines recently developed for the general population can be applied to older people with HIV: management of hypertension[130], hyperglycemia[131], and hyperlipidemia.[132] However, it is important to note that the recommendations in many of these guidelines have not all been validated in the context of HIV disease. For instance, cardiovascular risk prediction functions developed for the general population likely underestimate the risk in people with HIV.[129,133] Findings of the Randomized Trial to Prevent Vascular Events in HIV (REPRIEVE) study have provided significant insight into the potential role of statins in the prevention of major adverse cardiovascular events in people with HIV. See Statin Therapy in People With HIV for recommendations from the Panel on Antiretroviral Guidelines for Adults and Adolescents (the Panel) on statin therapy as primary prevention of ASCVD among people with HIV. Further analyses of the REPRIEVE data will likely yield additional insights into their benefits (and potential risks) in people with HIV, as well as differences in the predictive value of risk equation scores in demographic subsets of study participants.

Atherosclerotic Cardiovascular Disease in the Older Person With HIV

When compared to people without HIV, data from several studies have shown that people with HIV have about a twofold higher risk of developing ASCVD, and their age at incident ASCVD diagnosis is about a decade younger.[108,109,134,135] ASCVD risk prediction tools used for the general population tend to underestimate risk among people with HIV.[133,136] Data also suggest that the relative increase in ASCVD risk is greater among women with HIV than among age-matched men with HIV when compared to people without HIV.[137,138] Factors influencing ASCVD risk among people with HIV include both higher prevalence of traditional cardiometabolic risk factors and ongoing systemic inflammation associated with HIV,[114,137] even in individuals with viral suppression while on ART. In addition, structural barriers and health disparities in screening and treatment of ASCVD risk factors likely also contribute to excess ASCVD risk among people with HIV in the United States.[139,140]

The 2018 American Heart Association (AHA)/American College of Cardiology (ACC)/Multisociety Guidelines provide recommendations on the use of statins as primary prevention based on risk stratification using estimates of 10-year ASCVD risk from the pooled cohort equations.[141,142] In the general population, statin therapy is recommended for all people at high 10-year ASCVD risk (defined as ≥20%). Recent findings from the REPRIEVE trial have provided evidence for the use of statin therapy as primary prevention for people with HIV at low-to-intermediate ASCVD risk (i.e., <20%). REPRIEVE, a large randomized controlled trial among people with HIV aged 40 to 75 years who were receiving ART, showed that when compared to placebo, pitavastatin 4 mg daily was associated with a 35% reduction in major adverse cardiovascular events over a median follow-up duration of 5 years.[143] Results from REPRIEVE informed the Panel's recommendation on the use of at least moderate-intensity statin therapy as primary prevention among people with HIV of age 40 to 75 years, with a stronger recommendation for those with ASCVD risk score ≥5% who will have a higher absolute benefit from statin therapy. See Statin Therapy in People With HIV for the Panel's full recommendations on statin therapy.

Neurocognitive Impairment in the Older Person With HIV

Cognitive impairment in people with HIV can manifest as difficulty with memory, attention, speed of information processing, and executive and motor functions. Studies that use neuropsychological testing to define categories of impaired cognition—termed HIV-associated neurocognitive disorder (HAND)—find that up to 30% of people with HIV on virally suppressive ART meet these research-based criteria[144], although these categories have not been validated for use in clinical practice. Research studies also demonstrate a steeper decline in performance on neuropsychological tests with advancing age in individuals with HIV compared to those without HIV over the same age range.[145] Although viral persistence and chronic brain inflammation can contribute, cognitive impairment is multifactorial in people with HIV. It is not solely HIV-associated, but also influenced by factors related to comorbidities, including polypharmacy, mood disorders, vascular disease, social isolation, stress, and independent neurodegenerative conditions.[146-151] Hormonal shifts that occur with aging may contribute to neurocognitive impairment, and these changes may manifest as unique differences in clinical manifestations by sex.[152] Finally, the risk of neurodegenerative disease rises with increasing age independent of HIV, and diagnosis of Alzheimer's disease or other forms of progressive dementia in older people with HIV is now an important clinical concern.[153]

Cognitive impairment carries potentially detrimental clinical consequences for aging people with HIV. In a prospective observational study, cognitive impairment was predictive of a lower likelihood of retention in care among older people.[154] Cognitive impairment is also associated with reduced adherence to therapy[155] and poorer health outcomes including increased mortality.[156] Given the importance of cognitive health, screening for neurocognitive impairment is important, though optimal primary care-based screening methods remain unclear. Initial screening with questions about

symptoms of memory loss, slowness, and poor attention can help to guide the need for referral to a specialist (e.g., neurologist, neuropsychologist, or geriatrician).[157,158] Though such questions can be useful in identifying cognitive impairment, a positive response to these questions is not necessarily specific to impairment related to HIV.[159] Of note, people with substantial impairment may not have enough insight into their condition to answer the questions, and input from a partner or family member corroborating the impaired person's cognitive history may enhance the validity of the assessment. No brief cognitive screening test has been clearly shown to be sensitive or specific for cognitive impairment in HIV; the frequently used Mini-Mental State Exam does not typically capture executive function impairment, which is the main manifestation of subtle cognitive impairment in people with HIV.[160] The Montreal Cognitive Assessment may be more sensitive but is not specific. A lower threshold than the original cut-off score of 26 on the Montreal Cognitive Assessment is likely more optimal for HAND screening, as it lowers false positive rates and improves diagnostic accuracy.[161] If a person has persistent concerns over time, has symptoms corroborated by an acquaintance, or has progressively worsening symptoms, referral to a neurologist for evaluation and management or to a neuropsychologist for formal neuropsychological testing may be warranted **(BIII).**[160]

Beyond screening and referral to specialists in neurology, neuropsychology, or geriatrics, an approach to cognitive impairment in aging people with HIV should involve assessing and correcting reversible and treatable factors that contribute to cognitive symptoms, as well as directly addressing modifiable risk factors. Reversible and treatable factors that may contribute to cognitive symptoms include hypothyroidism, low vitamin B12 levels, syphilis, sleep apnea, and cerebrovascular disease.[162] Hearing impairment, diabetes, obesity, hypertension, depression, smoking, alcohol or substance use, and limited physical and social activity have been identified as significant modifiable risk factors for dementia in people without HIV.[163] Given the prevalence of many of these risk factors in older people with HIV, careful attention to their prevention or amelioration is an important component of primary care and cognitive care in aging people with HIV. Finally, the U.S. Preventive Service Task Force now recommends screening older adults (>65 years) for depression.[164]

Mental Health Concerns in the Older Person With HIV

Mental health-related problems are a growing concern in aging people with HIV, though little is known about their prevalence and consequences in this population specifically. In a study that compared a cohort of individuals aged >60 years with HIV to a historical control group of healthy older people, a heightened risk of mood disorders including anxiety and depression was noted among people with HIV.[165] Social isolation combined with depression is particularly common among older adults with HIV and, in addition to its direct effects on morbidity and mortality, it may contribute to poor medication adherence and retention in care.[166,167] The risk of suicide remains greater in people with HIV than in the general population, though increasing age might not further heighten the risk.[168] In one analysis of a multicenter observational study in France, suicide emerged as the second-highest cause of death among virologically suppressed people with HIV on ART.[169] Screening for depression and management of mental health issues are critical aspects of HIV primary care; guidelines for people with HIV, as well as for aging individuals without HIV, recommend behavioral approaches including individual psychotherapy, cognitive behavioral therapy, group therapy, and often pharmacological treatment.[169] When resources are available, integrated care models with routine screening by health care support staff, review by primary providers, and referral to on-site mental health specialists are likely to be the most effective approaches in vulnerable aging populations.

Health Care Utilization and Cost Sharing

The substantially increased burden of age-related comorbidities among people aging with HIV, including CVD, CKD, neurocognitive disease, and fractures, can lead to increased healthcare

utilization and higher costs.[170] Out-of-pocket health care expenses (e.g., copayments, deductibles), loss of employment, and other financial-related factors can cause temporary interruptions in treatment, including ART, which should be avoided whenever possible (see Cost Considerations and Antiretroviral Therapy for more information). The increased life expectancy and higher prevalence of chronic complications in aging populations with HIV can place greater demands upon HIV services[171] and require a focused approach to prioritize modifiable health-related problems. Facilitating continued access to health care, including access to insurance-covered care and medications, is essential to minimize treatment interruptions; clinical outcomes can improve with additional multidisciplinary services to manage concomitant chronic disorders and assist with overcoming structural barriers to care. See the Ryan White HIV/AIDS Program's Available Care & Services page for additional information.

End-of-Life Issues, Including Palliative Care and Interruption of ART

As with all aging people, it is important to discuss living wills, advance directives, and long-term care planning. Palliative care and hospice should be discussed with a person-centered approach that incorporates the person's family situation and cultural, religious, and personal values, among other factors.[172,173]

Few data exist on the use of ART in people with debilitating chronic, severe, or non-AIDS terminal conditions.[174,175] Discontinuation of ART usually results in rebound viremia and a decline in CD4 count; an acute retroviral syndrome has also been reported after abrupt ART discontinuation. For these reasons, most clinicians would continue ART if there are no significant adverse reactions to the ARV drugs. In cases where ART negatively affects quality of life, the decision to continue therapy should be made together with the affected person and/or family members after a discussion of the risks and benefits of continuing or stopping ART.

Substance Use Disorders and HIV

Updated: September 12, 2024
Reviewed: September 12, 2024

Key Considerations and Recommendations
• Substance use disorders (SUDs) are prevalent among people with HIV and contribute to poor health outcomes; therefore, screening for SUDs should be a routine part of clinical care **(AII).** • The most commonly used substances among people with HIV include the following (listed in alphabetical order): alcohol, benzodiazepines, cannabinoids, club drugs, opioids, stimulants (cocaine and methamphetamines), and tobacco. • Health care providers should be nonjudgmental when addressing substance use with people with HIV **(AIII).** • People with HIV and SUDs should be screened for additional mental health disorders **(AII).** • People with HIV and SUDs should be offered evidence-based pharmacotherapy (e.g., opioid agonist therapy, tobacco cessation treatment, alcohol use disorder treatment; see Table 16 below) as part of comprehensive HIV care in clinical settings **(AI).** • Ongoing substance use is not a contraindication to antiretroviral therapy (ART). People who use substances can achieve and maintain viral suppression with ART. • Substance use may increase the likelihood of HIV transmission risk behaviors, the potential for drug–drug interactions, and the risk or severity of substance-associated adverse events (e.g., increased hepatotoxicity or an increased risk of overdose). • Selection of antiretroviral (ARV) regimens for individuals who practice unhealthy substance and alcohol use should take into account potential adherence barriers, comorbidities that could impact care (e.g., advanced liver disease from alcohol or hepatitis viruses), potential drug–drug interactions, and possible adverse events associated with the medications **(AII).** • For people with SUDs, ARV regimens with once-daily formulations (ideally as a single-tablet regimen), high barriers to resistance, low hepatotoxicity, and low potential for drug–drug interactions are preferred **(AIII).**
Rating of Recommendations: *A = Strong; B = Moderate; C = Weak* ***Rating of Evidence:*** *I = Data from randomized controlled trials; II = Data from well-designed nonrandomized trials or observational cohort studies with long-term clinical outcomes; III = Expert opinion*

Background on Substance Use Disorders Among People With HIV

Ending the HIV epidemic requires addressing substance use among people with HIV, which poses a barrier to optimal engagement in the HIV care continuum. Ongoing substance use may prevent an individual from being tested for HIV, initiating antiretroviral therapy (ART), or adhering to ART. Substance use may also increase the likelihood of risk-taking behaviors (e.g., sexual transmission risk behaviors, needle sharing, injection of substances), the potential for drug–drug interactions, and the risk or severity of substance-related adverse events (e.g., increased hepatotoxicity and increased risk of overdose). In the United States, the death toll for drug overdose (102,123 deaths as of February 2024)[1] far exceeds the death toll for HIV (4,941 deaths in 2022).[2] As the drug overdose epidemic continues to expand, health care providers need a basic understanding of how to screen for and treat substance use disorders (SUDs) in people with HIV in clinical settings.[3]

Substance use exists on a continuum, from episodic use to an SUD with its concomitant negative consequences. Research on alcohol consumption has defined a threshold at which consumption does not reach a diagnosis of SUD, but where the level of consumption is nonetheless hazardous to the person. This level of consumption has been defined as at-risk or hazardous use. A comparable category does not exist for other substances. The prevalence of substance use and SUDs is higher among people with HIV than among the general public,[4] and polysubstance use is common. This section will focus on the most commonly used substances among people with HIV (listed in alphabetical order): alcohol, benzodiazepines, cannabinoids, club drugs,[5] opioids, stimulants (cocaine and methamphetamines), and tobacco. Additionally, xylazine, a non-opioid veterinary analgesic that is a common substance adulterant—a substance added to another substance that may lead to negative health consequences—is also discussed.

People with HIV may use more than one substance and may not be ready to consider reducing the use of substances or seeking treatment for SUDs. Polysubstance use occurs for multiple reasons, including to improve the euphoria associated with use (e.g., use of cocaine and heroin mixtures called “speedballs”) and to reduce the adverse effects of a particular substance (e.g., the use of alcohol or benzodiazepines to reduce the anxiety caused by cocaine use).

Substance Use and Sexual Risk-Taking

A growing body of literature describes the intersection of substance use and sexual risk-taking, in which drugs are intentionally used to enhance sexual activity (“chemsex”). This research highlights the impact of substance use on sexual transmission risk behaviors; although no precise definition of “chemsex” exists, studies have investigated various substances used to enhance sexual pleasure, decrease inhibitions related to particular sexual acts, and combat low self-esteem. In a retrospective study in a London sexual health clinic, individuals who disclosed substance use (463 of 1,734 participants) had higher odds of acquiring new HIV infection, bacterial sexually transmitted infections (STIs), and/or hepatitis C virus (HCV).[6] A much larger analysis using the European Men Who Have Sex With Men (MSM) Internet Survey, which collected data from 16,065 United Kingdom-based respondents, found that MSM who reported using methamphetamines or gamma-hydroxybutyrate (GHB) during the previous year were more likely to have gonorrhea infection than MSM who did not use these drugs, with odds ratios of 1.92 and 2.23, respectively.[7] Between 2017 and 2020, the American Men’s Internet Survey collected data on chemsex drug use among MSM in the United States over the preceding 12 months. Of 30,294 MSM respondents, 3,113 (10.3%) self-reported chemsex in the past 12 months, with 3,4-methylenedioxymethamphetamine (MDMA or “ecstasy”) (65.1%), methamphetamine (42.5%), and GHB (21.7%) being the top drugs reported for use.[8] A recent study in Spain using an online, self-administered questionnaire found that 81.4% of 2,919 MSM attending four HIV/STI testing sites in Madrid and Barcelona had ever used any drug, and 50% had engaged in chemsex in the past 12 months. Of those engaging in chemsex, half engaged in condomless anal sex.[9] These data emphasize the need to screen people with HIV for substance use and STIs in clinical settings and to discuss strategies with these individuals to reduce potential harm.[10]

Substance Use and Unstable Housing

People with HIV who inject drugs are more likely to be unhoused.[11] Houselessness among people who inject drugs is associated with an increased risk of HIV acquisition.[12]

Among people with HIV and SUD, houselessness confers an increased risk for disruptions in the HIV care continuum independent of ongoing substance use. In a longitudinal study of people with HIV who used drugs, lack of housing was associated with a 44% decrease in the odds of progression through the HIV care continuum.[13] After adjusting for multiple intersecting risks, including unhealthy alcohol use, other substance use, incarceration, unemployment, education, age,

sex, and race/ethnicity, unhoused people with HIV and SUD had significantly decreased odds of ART initiation and, adherence, and of viral suppression.

Interventions supporting housing among people with HIV and SUD can result in improved HIV treatment outcomes. A randomized controlled trial of a rapid rehousing intervention for people with HIV who were houseless (n = 236, 81% with substance use) found that clients in the Enhanced Housing Placement Assistance arm were more likely to be placed and, placed faster, and were twice as likely as the control group to reach or maintain viral suppression (95% confidence interval [CI], 1.1–4.0).[14,15] An observational study of applicants to a supportive housing program for low-income people with HIV and a mental health condition or SUD (n = 958; 86% with SUD) found that people who achieved stable housing were more likely to engage in HIV care and to achieve viral suppression.[16] These data reflect the importance of not only addressing SUD among people with HIV, but also understanding the co-occurring structural determinants that contribute to poorer outcomes among people with HIV and SUD.

Screening for Substance Use Disorders

Screening for SUDs should be incorporated into the routine clinical care of all people with HIV. The following questions can be used to screen for drug or alcohol use: “How many times in the past year have you used an illegal drug or used a prescription medication for nonmedical reasons?” and “How many times in the past year have you had X or more drinks in a day?” (X is five for men and four for women).[17] Individuals with liver disease, including active HCV infection, should not consume alcohol.

A positive response to either of the two questions above should prompt additional screening with other short screening tools (see the Screening and Assessment Tools Chart from the National Institute on Drug Abuse). These tools can identify substance use and guide decisions on appropriate treatment interventions. Currently, there are not enough data to determine how often people with HIV should be screened for SUDs; however, given the potential negative impact that SUDs may have on people with HIV, it is advisable to ask these questions during every clinical visit.

Health care providers should be nonjudgmental when discussing substance use with people who have HIV **(AIII).** People with HIV who experience stigma or judgment may lose trust in their health care provider’s advice, avoid future visits, and consequently experience poorer health outcomes.[18] Language is one way in which stigma is communicated, and words such as “addict” and “dirty urine” convey a negative connotation. The Office of National Drug Control Policy (ONDCP), American Medical Association, American Society of Addiction Medicine, International Society of Addiction Journal Editors, and others have recommended the adoption of clinical, nonstigmatizing language for substance use, as described in the *Changing the Language of Addiction* report from ONDCP.

Co-occurring Mental Illness

Many people who use substances have co-occurring mental health disorders, including a history of trauma that may drive or exacerbate their substance use. Conversely, ongoing use of substances can place individuals at risk for trauma, such as sexual assault and sexual exploitation, which may further exacerbate their substance use.[6,19] People with SUDs should undergo evaluation and treatment for concurrent mental health disorders using standardized screening instruments (e.g., the Patient Health Questionnaire-2, or PHQ-2, for depression). Where applicable, clinicians should use available behavioral and pharmacological interventions to address mental health concerns, because recommending that people stop their substance use without providing treatment for underlying mental health conditions has very limited efficacy.[20]

Selecting, Initiating, and Maintaining Antiretroviral Therapy

Ongoing substance use is **not** a contraindication for prescribing ART. ART is recommended for all people with HIV to improve their health and to prevent transmission of HIV to others **(AI),** including sexual partners and individuals who share drug paraphernalia. These clinical, community, and individual benefits should encourage health care providers to initiate ART in all people with HIV who use substances. Although effective ART prevents sexual transmission of HIV, its effectiveness in preventing transmission through shared needles and shared use of other drug paraphernalia remains unknown.

For people actively injecting drugs, engagement in a syringe service program (SSP) can facilitate access and adherence to ART. SSPs primarily provide clean drug preparation and injection supplies to reduce transmission of HIV, HCV, and other bloodborne, skin, and soft tissue pathogens. As a regular point of contact for people with complex health and social challenges, SSPs also provide opportunities to offer other integrated health-related and social support services,[21] including those for treating SUDs.[22] For people with HIV, SSPs can be adapted to provide or link to rapid initiation[23,24] and maintenance of effective ART.[24]

When selecting ART regimens for individuals who use substances, clinicians should consider potential barriers to adherence (see Adherence to the Continuum of Care), comorbidities that could impact care (e.g., advanced liver disease from alcohol or HCV), potential drug–drug interactions, and possible adverse events that are associated with the medications. Providers and people with HIV should discuss adherence during multiple, nonjudgmental evaluations. In general, the use of simplified ART regimens should be considered to aid adherence. Regimens for people with SUDs should be easy to take, such as once-daily formulations, ideally as a single-tablet regimen,[25] and should have a high barrier to resistance and a low risk of hepatotoxicity **(AIII).** Adherence counseling should highlight the benefits of ART use, irrespective of concurrent substance use. While a reduction in substance use may improve adherence to ART,[26,27] ongoing use is not a contraindication to ART.

Long-Acting Antiretroviral Therapy

The development of long-acting (LA) injectable ART provides additional options for treatment. The combination of injectable cabotegravir (CAB) and rilpivirine (RPV) is an optimization option for people with HIV who demonstrate retention in HIV care and who are virologically suppressed on oral therapy (see Optimizing Antiretroviral Therapy in the Setting of Virologic Suppression). Current U.S. Food and Drug Administration (FDA) approval for LA CAB/RPV is limited to individuals with expected good adherence and an ability to achieve virologic suppression on oral therapy prior to starting LA ART. Limited data from a small, ongoing observational study found that LA CAB/RPV leads to high levels of viral suppression in people with HIV who have struggled with adherence to oral ART and those who are viremic at treatment initiation, including people who use stimulants.[28] Of note, the clinic in this study provided a significant amount of social support to ensure adherence to the LA CAB/RPV regimen (see Virologic Failure for additional details). It is not known if similar responses can be seen in clinics without the resources to provide a similar level of adherence support. Missing LA CAB/RPV doses or a delay in receiving scheduled injections may result in emergence of HIV drug resistance.[28]

The following factors should be considered when contemplating the use of LA CAB/RPV in people with HIV and SUDs:

- As with all treatment conversations, providers should discuss adherence with their patients during multiple, nonjudgmental evaluations.

- Providers and people with HIV should consider the impact of using LA CAB/RPV in the context of current or past substance use behaviors. Although some people may welcome or even prefer LA CAB/RPV,[29] one qualitative study highlighted that using a needle for administering LA CAB/RPV could be a trigger for people with a history of injecting illicit substances.[30]
- Studies utilizing LA CAB/RPV have included individuals with good adherence before starting the LA ART, but this should not exclude people with SUDs who are struggling with adherence from being considered for LA CAB/RPV. Rather, the clinical team should consider what additional support may be needed to help people with SUDs be successful with LA CAB/RPV and whether using LA ART without established viral suppression is warranted based on preliminary data (see Virologic Failure and Adherence to the Continuum of Care for additional details). Case management, patient navigators, and/or peer navigators should be considered to help people with HIV return for follow-up injections.
- Given the often unpredictable lifestyles of people with SUDs, clinical care teams should be flexible in scheduling injections or accommodating walk-ins for injections. However, it should be stressed that the doses should be given within the mandatory 7 days before or after the scheduled LA CAB/RPV injection date.
- As for all people with HIV, hepatitis B virus (HBV) status should be evaluated before the initiation of LA CAB/RPV (see HBV/HIV Coinfection and Optimizing Antiretroviral Therapy in the Setting of Virologic Suppression for additional details). If not already immune or infected, HBV vaccination should be initiated while considering LA CAB/RPV, including in those with isolated hepatitis B core antibody (HBcAb).
- LA CAB/RPV is not recommended for people with HBV/HIV coinfection unless HBV-active drugs (i.e., tenofovir, entecavir) are included in the regimen.
- As depressive disorders have been associated with LA CAB/RPV in all populations, people with SUD also should be screened for depressive disorders and treated for depression if indicated.[31] If depressive disorders worsen while on LA CAB/RPV, reevaluation should occur to determine whether continued therapy with this regimen is advisable.

Importantly, despite emerging observational data, multiple knowledge gaps exist regarding the use of LA ARVs among people with HIV and SUDs. The results from the ongoing Long-Acting Therapy to Improve Treatment Success in Daily LifE (LATITUDE) Study (NCT 03635788) will provide clinical trial results to help inform the use of LA CAB/RPV among people with HIV and SUDs who have struggled with ART adherence.[32] Additional research is also needed to determine optimal methods for supporting ART adherence (including to LA ARVs) among people with HIV and SUDs. These research studies will need to take into consideration the combination of various interventions (e.g., peer support, case management, pharmacotherapy for SUDs, housing) and the appropriate individual interventions needed to support overall ART adherence.

Commonly Used Substances and Their Impact on HIV and Antiretroviral Therapy

Health care providers should have a basic understanding of evidence-based pharmacologic and behavioral (e.g., cognitive behavioral therapy, motivational interviewing, motivational enhancement therapy, contingency management) treatments for different substances, including alcohol, benzodiazepines, cannabinoids, club drugs, opioids, stimulants (cocaine and methamphetamines), and tobacco. The sections below discuss the impact of these substances on people with HIV and how these substances affect ART use.

Alcohol

Epidemiology

Alcohol consumption is common among people with HIV. Recent estimates indicate that >50% of people with HIV in the United States consume any amount of alcohol (range, 54% to 67%).[33,34] Among a sample of people with HIV across seven university-based HIV clinics in the United States, 27% of people screened positive for unhealthy alcohol use as determined by the AUDIT-C.[34] Unhealthy alcohol use includes a spectrum of consumption, including at-risk or hazardous use, heavy episodic use (binge drinking), and alcohol use disorder (AUD).[35]

Risk-Taking Behaviors, the HIV Care Continuum, and Comorbidities

Unhealthy alcohol use has been linked to HIV acquisition because it can increase the frequency of behaviors that put a person at risk for sexual transmission of HIV.[36-38] In a meta-analysis of 27 studies, any alcohol use, unhealthy alcohol use, and alcohol use in sexual contexts all were associated with condomless sex among people with HIV.[37]

In addition, unhealthy alcohol use has been associated with interruptions in all steps of the HIV care continuum, including lower adherence to ART.[39,40] Studies have demonstrated both temporal and dose-related relationships between alcohol use and adherence, where ART is more likely to be missed on a given drinking day and the day after drinking, with a stronger association on heavy (binge) drinking days.[41-43] The negative impact of unhealthy alcohol use on ART adherence is likely multifactorial and driven by the effects of intoxication, ARV regimen complexity, and patient perceptions of adverse interactions between alcohol and ARV drugs.[44-46] Studies also have demonstrated an association between unhealthy alcohol use and the loss of durable viral suppression,[47-49] greater time spent with a viral load >1,500 copies/mL after ART initiation,[50] increased risk of viral rebound, lower retention in care,[51,52] and increased mortality.[53-55] Unhealthy alcohol use alone (hazardous or AUD) and in combination with other common comorbidities, including viral hepatitis coinfection, can hasten liver fibrosis progression in people with HIV.[56,57] Finally, in general medical populations, unhealthy alcohol use complicates the management of diabetes mellitus, hypertension, mental health disorders, other substance use, and other chronic diseases, and it increases the risk for pneumonia, osteoporosis, a number of cancers (e.g., liver, head and neck, and breast cancers), and tuberculosis.

Management of Unhealthy Alcohol Use

Ongoing alcohol use is not a contraindication for a person to receive ART. However, treatment for unhealthy alcohol use may improve HIV treatment outcomes. Behavioral treatments for unhealthy alcohol use among people with HIV demonstrate a small but significant reduction in alcohol use[58,59] (see additional resources for alcohol management from the National Institute on Alcohol Abuse and Alcoholism and the Substance Abuse and Mental Health Services Administration [SAMHSA]). Pharmacotherapy also can reduce alcohol use among people with HIV. The FDA has approved three pharmacotherapies for AUD: naltrexone, disulfiram, and acamprosate (see Table 16 below).

Clinical trials have demonstrated the efficacy of naltrexone in reducing the number of heavy drinking days among those with HIV and among the general population. Naltrexone appears to be safe to use in people with HIV,[60,61] and it is not associated with significant drug–drug interactions or irreversible hepatotoxicity. However, it is not recommended for individuals with decompensated liver disease and should be used with caution in individuals with elevated transaminase levels. Use of naltrexone in people with HIV and AUD can improve HIV treatment outcomes.[62] In a randomized placebo-controlled trial of 100 prisoners with HIV who met the criteria for AUD, individuals who were

provided depot naltrexone upon release from prison were more likely to achieve viral suppression at 6 months than the placebo group (56.7% vs. 30.3%).[61]

Data on the use of disulfiram and acamprosate among people with HIV are lacking. Notably, integrating treatment for AUD with treatment for HIV has been shown to increase the number of people who receive alcohol treatment medication, counseling, and formal outpatient alcohol treatment services. Integrating these treatments also may improve the likelihood that a person with HIV will achieve viral suppression on ART. A randomized controlled trial of 128 individuals with HIV and AUD compared an integrated stepped-care model of alcohol treatment in Veterans Administration HIV clinics to treatment as usual. At the end of treatment (24 weeks), integrated stepped-care resulted in more participants receiving pharmacotherapy for AUD and participating in counseling. Although differences in alcohol use and viral suppression were not seen at 24 weeks, at 52 weeks, integrated stepped-care was associated significantly with an increased number of alcohol-abstinent days, a decrease in the number of drinks per drinking day, and a decreased number of heavy drinking episodes. In addition, the participants in the stepped-care group had increased odds of achieving viral suppression (odds ratio [OR] 5.58; 95% CI, 1.11–27.99).[63]

Liver cirrhosis—whether related to chronic heavy alcohol use, viral hepatitis, or metabolic dysfunction–associated steatotic liver disease—can result in altered metabolism of ARV drugs. For those who have hepatic impairment due to alcohol-related liver disease, ART dosing should follow the recommendations in Appendix B, which are based on Child-Pugh classifications.

Benzodiazepines

Epidemiology

While the specific epidemiologic data on the prevalence of benzodiazepine use among people with HIV are limited, benzodiazepine misuse is a growing public health concern due to its impact on both morbidity and mortality.[64] Benzodiazepines cause anterograde amnesia, defined as difficulty recalling events after taking the medication. Individuals do not develop tolerance to this neurocognitive effect, and long-term use of benzodiazepines may result in impairment of neurocognitive functioning.[65]

Risk-Taking Behaviors and the HIV Care Continuum

People who inject drugs and who also use benzodiazepines engage in riskier behaviors than people who inject drugs but do not use benzodiazepines; these behaviors may include paying for sex, sharing injection equipment with more people, and performing more frequent injections.[66] A cohort of 2,802 people who injected drugs was followed from 1996 to 2013. During that time, benzodiazepines were the substances with the greatest association with mortality.[67] In a study of opioid and benzodiazepine use and all-cause mortality among 64,602 veterans (16,989 with HIV and 47,613 without) from the Veterans Aging Cohort Study (VACS) cohort (October 2008 to September 2009), long-term benzodiazepine receipt was associated with increased mortality regardless of long-term opioid receipt.[68] The long-term neurocognitive impact of benzodiazepines on ART adherence among people with HIV is unclear, but prescribing a memory-impairing medication to people with HIV who are prone to neurocognitive impairments from other causes may increase the risk of poor ART adherence.[69] Benzodiazepines also are used illicitly to counteract the negative side effects of stimulants, such as cocaine and methamphetamine.[70]

Management of Benzodiazepine Use

Repeated use of benzodiazepines can result in physiologic dependence and life-threatening withdrawal in some people. When feasible, individuals who chronically use benzodiazepines should

be slowly tapered off the benzodiazepines under the supervision of an experienced clinician. Different benzodiazepines have different potencies (e.g., alprazolam is more potent than diazepam) and, therefore, require different tapers in terms of length and graduated decrease in dosage.

Benzodiazepine and Antiretroviral Drug Interactions

Several pharmacological interactions between benzodiazepines and ARV drugs have also been described. For example, some benzodiazepines are cytochrome P450 (CYP) 3A4 substrates; thus, when these benzodiazepines are used with a ritonavir (RTV)-boosted or cobicistat (COBI)-boosted ARV drug, their half-lives and concentrations can increase significantly, leading to enhanced and prolonged sedating effects. See Drug–Drug Interactions for available data on benzodiazepine-related interactions.[71]

Cannabis and Cannabinoids

Epidemiology

Both medical and recreational cannabis (marijuana) use are prevalent among people with HIV.[72] Cannabis belongs to a class of compounds that activate cannabinoid receptors. This class, known as cannabinoids, also includes synthetic compounds, such as K2. In recent years, cannabinoids have become more popular. In 2009, two cannabinoids were reported to the National Forensic Laboratory Information System. By 2015, 84 compounds had been reported.[73] These compounds most commonly cause tachycardia, agitation, and nausea, but they have a wide range of psychiatric effects, including psychosis and paranoia.[74]

Risk-Taking Behaviors and the HIV Care Continuum

Cannabis has not been shown to negatively impact adherence to ART or a person's ability to achieve viral suppression. In one study, among 874 people with HIV, daily cannabis use did not predict lower odds of ART use or achieving an undetectable HIV RNA level, except when combined with binge drinking.[75] Data from the Multicenter AIDS Cohort Study have supported the idea that marijuana use does not predict problems with adherence to ART or achieving viral suppression.[76] In some cases, however, cannabinoids have been listed as the cause of death in overdoses. While data are lacking among adults with HIV, the nationally representative 2015 Youth Risk Behavior Survey (which includes data from 15,624 adolescent students in Grades 9 to 12) found that students who had ever used synthetic cannabinoids engaged in riskier activities, including sex, than students who only used marijuana.[77] While the available data suggest that the use of marijuana is not associated with decreased adherence to ART,[78] data are lacking on the impact of synthetic cannabinoids on ART adherence. Finally, with the growing use of synthetic cannabinoids, there is concern that fentanyl could be added to these products, which may increase the risk of opioid overdose.

Management of Cannabis and Cannabinoid Use

Because of the aforementioned concerns regarding cannabinoid use, particularly the variety of compounds and neuropsychiatric effects, people with HIV should be discouraged from using cannabinoids until more data are available. No pharmacological treatment exists for cannabinoid use disorder; however, behavioral health treatment may be effective for some people.[79-81]

Club Drugs

Epidemiology

Club drugs are recreational substances that have euphoric or hallucinogenic effects or that are used to enhance sexual experiences.[5] The use of multiple club drugs or other drugs simultaneously is common. Although these substances are used by many different people with HIV, the majority of data come from MSM with HIV. The use of club drugs in this population has been shown to negatively impact HIV treatment.[82] Club drugs include MDMA, GHB, ketamine, benzodiazepines (see the benzodiazepine section above), and other drugs that are used to enhance sexual experiences (e.g., mephedrone, inhaled nitrates [poppers], and phosphodiesterase-5 inhibitors [PDE5] for erectile dysfunction). Survey data from users of club drugs also have revealed that efavirenz is purchased by people without HIV for its intoxicating effects.[83]

Risk-Taking Behaviors and the HIV Care Continuum

Club drugs have disinhibitory effects. Using club drugs increases the likelihood that a person will engage in high-risk sexual practices, which can increase the risk of HIV transmission. In addition, these disinhibitory effects can lead to poor ART adherence.[71,82,84]

Management of Club Drug Use

Treatment strategies for club drug use have not been well studied in controlled trials.[85] No recommended pharmacotherapies exist at this time, and the most common strategy for treating people who use club drugs is to employ the behavioral interventions that are used for other drug use disorders.

Club Drug and Antiretroviral Drug Interactions

MDMA, GHB, ketamine, and methamphetamine all have the potential to interact with ARV drugs because they are metabolized, at least in part, by the CYP450 system.[71,84] Overdoses secondary to interactions between club drugs (i.e., MDMA or GHB) and protease inhibitor–based ART have been reported.[71,86] For instance, using PDE5 or ketamine concurrently with potent CYP3A4 inhibitors, such as RTV or COBI, can potentiate the effects of these substances.[82]

Cocaine

See the discussion in the section on stimulants below.

Opioids

Epidemiology

Opioids remain a significant concern for people with HIV, both for the acquisition of HIV and as major contributors to morbidity and mortality. Overdose involving opioids is the leading cause of accidental death in the United States.[87] The appropriate use of opioids while caring for people with HIV and chronic pain is an important component of combating the opioid epidemic, but this subject is beyond the scope of this section. Please refer to additional resources, such as those from the Centers for Disease Control and Prevention (CDC) and the Infectious Diseases Society of America.[88] To combat the opioid overdose epidemic, health care providers should prescribe naloxone for opioid overdose prevention for all people who are using opioids beyond the short-term treatment of acute pain.[3]

Risk-Taking Behaviors and the HIV Care Continuum

Many people who use opioids start by using opioid tablets (e.g., oxycodone) that are ingested orally or crushed and sniffed. Once tolerance develops, some individuals move from sniffing the crushed tablets to injecting heroin purchased on the streets. This transition from sniffing to injecting dramatically increases the risk of HIV and HCV infection.

Low-cost heroin is often a mix of heroin and higher-potency synthetic opioids, such as fentanyl.[87] Methamphetamines and cocaine also have been combined with fentanyl but at a lower rate than heroin.[89,90] With the growing use of synthetic cannabinoids, there is concern that fentanyl could be added to these as well. In all instances where fentanyl or other high-potency opioids are added to other drugs, the risk of overdose increases.

Although treatment for an opioid use disorder (OUD) can improve HIV treatment outcomes, it is not a prerequisite for treating HIV, as some people with HIV are able to adhere successfully to ART despite ongoing opioid use. Although ART coverage among people with HIV who injected drugs increased from 58% to 71% between 2009 and 2015, additional work is needed to improve ART coverage in this population.[91] Data from the Johns Hopkins HIV Clinical Cohort (2001–2012) demonstrated that in the early years of the cohort, people who injected drugs were less likely to be retained in care; however, this gap in retention had closed by 2012, and people who injected drugs and noninjectors had similar probabilities of being on ART and having a suppressed viral load during the later years of the cohort.[92]

Management of Opioid Use

FDA has approved three medications for the treatment of OUD that can help decrease or eliminate opioid use, reduce the risks of morbidity and mortality that are associated with opioid use, and improve HIV treatment success. These medications—collectively termed medications for opioid use disorder (MOUD)—include buprenorphine, methadone, and naltrexone (see Table 16 below). Buprenorphine and methadone are opioid agonists (the use of these drugs is termed opioid agonist therapy), whereas naltrexone is an opioid antagonist or "blocker." Both buprenorphine and naltrexone can be prescribed in the setting of routine HIV clinical care.[93] Prescribing buprenorphine requires specific training but no longer requires an X waiver (see the SAMHSA website for more information). Methadone must be prescribed through a licensed opioid treatment program (OTP). An OTP directory also can be found on the SAMHSA website.[94]

Use of buprenorphine or methadone can lead to reductions in risky behaviors associated with HIV transmission, psychosocial and medical morbidity related to OUD, and criminal behaviors. People who are receiving treatment for opioid use are already engaging with the health care system; therefore, they are more likely to initiate treatment for HIV and to be adherent to their ARV regimens. Both buprenorphine and methadone are cost-effective interventions at the societal level.[95] Methadone has better retention in SUD treatment than either buprenorphine or naltrexone, and it should be considered for individuals who do not achieve successful outcomes with buprenorphine or naltrexone.[96] Buprenorphine has a lower risk of overdose than methadone. In addition, it can be prescribed in primary care offices. People who are taking buprenorphine have significantly better retention in treatment than those who are taking daily oral naltrexone.[97] Although several randomized, controlled clinical trials have demonstrated efficacy for naltrexone when treating OUD, subsequent study results have been disappointing; one meta-analysis revealed that oral naltrexone was equivalent to placebo.[98] To address the adherence challenges with naltrexone, a depot formulation was created for monthly administration. This preparation has the potential to improve adherence; however, studies that compare opioid agonists (i.e., buprenorphine and methadone) to depot naltrexone as treatments for OUD have not been conducted. In a randomized, placebo-controlled trial in people with both HIV and OUD, participants who received at least three doses of

depot naltrexone before discharge from prison achieved longer periods of continuous abstinence after transitioning from prison to the community than those who received either placebo or two or less doses of depot naltrexone.[61] On the basis of these data, methadone or buprenorphine generally are used as first-line agents for the treatment of OUD. Depot naltrexone is used as an alternative treatment for people who have been released recently from correctional facilities when other options are not available.

Important pharmacokinetic interactions between these medications (particularly methadone) and certain ARV drugs are listed in Drug–Drug Interactions.

Although medications remain the backbone of treatment for OUD, there is growing recognition of the critical importance of the social drivers of health and how they impact the willingness of people to engage in treatment with the medications discussed above. A recent randomized study of 114 people with HIV compared the effectiveness of different medications for the treatment of OUD to achieve viral suppression, finding that stable housing, high school–level education or greater, and income stability were associated with a greater reduction in opioid use.[94]

Xylazine and Opioids

Xylazine—a non-opioid analgesic utilized in veterinary medicine that is a commonly used adulterant in opioids and other substances—has become an emerging drug threat associated with the opioid epidemic.[99] The CDC has documented a 276% increase in the monthly percentage of illicitly manufactured fentanyl (IMF)–involved deaths where xylazine was detected.[100] Between 2020 and 2021, the Drug Enforcement Agency reported that xylazine-associated deaths increased by over 100% in all regions of the United States and over 1,000% in the South.[101] This growing body of data led the ONDCP to formally designate fentanyl adulterated with xylazine as an emerging drug threat.[102]

Xylazine is a substrate of CYP3A4 and, as such, when used with an ARV regimen including a CYP3A4 inhibitor, such as RTV or COBI, may lead to elevated levels and prolonged half-lives of xylazine.[103] For people with HIV who continuously use opioids in areas with high rates of xylazine-adulterated IMF, providers should weigh the risks and benefits of using ARV drugs with CYP3A4 inhibitors, given potential interactions and the increase in xylazine-associated adverse effects.

Opioid adulterants, such as xylazine, increase the risk of overdose. Although naloxone only reverses opioid effects, that alone may be sufficient to reverse the overdose. This highlights the need for universal access to naloxone and the active prescribing of naloxone by health care providers. The CDC maintains information about xylazine and how to reduce its harm on its website.[104]

Stimulants

Epidemiology

Cocaine and methamphetamine are powerful stimulants that have been associated with multiple detrimental effects among people with HIV, including accelerated disease progression, poor ART adherence, and lack of viral suppression. Cocaine powder is snorted or injected, whereas the free-base form (crack) is smoked. Methamphetamines can be taken orally or rectally, injected, or smoked. Cocaine and methamphetamine are commonly used with other substances, including alcohol, and can be combined with fentanyl, which increases the risk of overdose.[89,90] Individuals who use stimulants experience a sense of euphoria and may have heightened sexual desire and arousal. This can lead to disinhibited sexual behaviors, increasing the risk of HIV transmission.

The prevalence of stimulant use among people with HIV has been estimated to be 5% to 15% across multiple studies.[105-107] Methamphetamine use is more common among MSM,[108] and increased rates of cocaine use have been observed among ethnic and racial minorities and persons with a history of incarceration.[109]

Risk-Taking Behaviors and the HIV Care Continuum

People with HIV who use stimulants may experience multiple negative health consequences, including rapid development of dependence and adverse effects on multiple organ systems, particularly the central nervous and cardiovascular systems. Stimulant use is associated with neurocognitive impairment,[110] delirium, seizures, hemorrhagic strokes, and mental health disturbances, including anxiety, psychosis, and paranoia.

Stimulant use may independently lead to HIV disease progression even among people who are taking ART and have achieved viral suppression. Research to identify the cellular mechanisms responsible for this is ongoing, but increased viral replication, direct effects on the immune system that lead to declines in CD4 T lymphocyte cell count, enhanced immune activation, and disruption of the blood-brain barrier, facilitating HIV entry into the brain, have been implicated.[111-115] Stimulant use has been associated with poor HIV continuum of care outcomes, including suboptimal rates of ART adherence,[116] retention in care, and viral suppression.[117-119] Lack of viral suppression, combined with the increased likelihood of risky sexual behaviors that occur under the influence of stimulants, poses a threat to the HIV treatment-as-prevention paradigm.[120]

Management of Stimulant Use

Several pharmacologic and behavioral interventions for stimulant dependence have been investigated, and some trials have included people with HIV. The results of pharmacologic interventions generally have been disappointing. No FDA-approved pharmacotherapy for cocaine use disorder currently exists, despite research on multiple drug classes, including antidepressants, antipsychotics, anticonvulsants, and dopaminergic medications (e.g., disulfiram).[121,122] Among people with HIV who use crack and opioids, medication-assisted treatment for OUD may improve ART adherence and viral suppression.[123,124] Limited evidence indicates that some pharmacologic interventions (e.g., methylphenidate, modafinil, bupropion, naltrexone)[125] can reduce methamphetamine use or cravings. A double-blind, placebo-controlled trial of extended-release injectable naltrexone plus oral extended-release bupropion in adults with moderate or severe methamphetamine use disorder demonstrated a higher response of methamphetamine-free urine samples compared to placebo; however, the overall response rate was low.[126] A double-blind randomized clinical trial on people with methamphetamine use disorder evaluated daily mirtazapine versus placebo in individuals who have sex with men. Over 36 weeks of follow-up, daily mirtazapine use led to reduced methamphetamine-positive urine drug tests and concurrent reductions in sexual risk behaviors.[127] No specific recommended pharmacotherapy exists to treat stimulant use disorder in people with HIV.

Several behavioral interventions have shown promise in randomized trials. People with HIV who received motivational interviewing sessions, cognitive behavioral therapy, or a combination of the two experienced decreased stimulant use, improved ART adherence, and were less likely to engage in sexual transmission risk behaviors.[128] Contingency management has been shown to be effective in decreasing stimulant use among people with HIV, but the sustained effects on the reduction of stimulant use and improvements in ART adherence are less clear.[106,129,130] The addition of a positive affect intervention to contingency management, compared with an attention control condition, decreased HIV viral load among gay, bisexual, and other MSM with HIV.[131] Technology-based interventions, such as text messaging, may have a role in supporting ART adherence and decreasing methamphetamine use among people with HIV, but further research is needed.[132]

People with HIV who use stimulants benefit most from multidimensional interventions that target substance use, ART adherence, and risky sexual behaviors.[128]

Despite the challenges discussed above, people with HIV who use stimulants can achieve viral suppression with ART[119] and should be prescribed ART even if stimulant use is ongoing.

Tobacco

Epidemiology

The prevalence of tobacco smoking among people with HIV in the United States is approximately twice that of the general population (33.6% vs. 16.8%).[133] Prevalence is even higher among specific subgroups, including those who use alcohol and/or other drugs, those who have concurrent mental health disorders, and those of a lower socioeconomic status. Although smoking rates are declining overall in the United States, people with HIV are less likely to quit smoking than people in the general population.[133]

Associated Risks of Tobacco Use and HIV Infection

With respect to substance use and HIV, tobacco smoking is the biggest threat to health-related gains achieved through ART. Among individuals with viral suppression on ART, more years of life may be lost from continued smoking than from HIV infection itself.[134,135] Tobacco smoking among people with HIV is associated with an increased risk of numerous health conditions, including lung cancer and other smoking-related cancers, cardiovascular disease, and pulmonary disease. In a sample of 17,995 people with HIV on ART in Europe and North America, individuals who smoked had nearly twice the mortality of those who did not (mortality rate ratio 1.94; 95% CI, 1.56–2.41) with significant mortality attributed to cardiovascular disease and non-AIDS-related malignancy.[134] Importantly, tobacco cessation reduces the incidence of cardiovascular disease and smoking-related cancers (although definitive data on lung cancer are not available) and improves quality of life.[136-138]

Managing Tobacco Use

To maximize the survival benefits of ART, clinicians should consider using evidence-based behavioral and pharmacological[139-141] cessation strategies when treating people with HIV who smoke tobacco (see the tools and recommendations provided by the CDC and the U.S. Preventive Services Task Force and recent review).[142] These include (but are not limited to) advising the individual to quit smoking, using the five A's, employing motivational interviewing, and referring them to a tobacco quitline. Pharmacotherapies for smoking cessation (nicotine replacement therapy, bupropion, and varenicline) have few clinically significant interactions with ARV drugs and can lead to enormous reductions in morbidity and mortality if the person is able to stop smoking. Nicotine replacement is efficacious[143]; however, bupropion doubles rates of smoking cessation compared with nicotine replacement therapy.[144] Varenicline is a partial nicotine receptor agonist. In comparative studies, varenicline was more effective than bupropion in smoking cessation.[144,145] Clinical trials among people with HIV have found varenicline to be both effective and safe.[139,141] In a randomized controlled trial among 179 individuals with HIV who were assigned to receive 12 weeks of behavioral counseling and either varenicline or placebo, varenicline use led to an increase in the percentage of participants who achieved a 7-day abstinence period at 12 weeks (28.1% vs. 12.1%, OR 4.5; 95% CI, 1.83–11.2) and produced higher continuous abstinence between Weeks 9 and 12 (23.6% vs. 10%, OR 4.65; 95% CI, 1.71–12.67) compared to placebo.[141] Although significant between-group differences were not observed after 24 weeks, these data support the use of varenicline among people with HIV. Varenicline should be used in combination with relapse prevention strategies and other measures for long-term tobacco cessation.

Table 16. Medications for Treatment of Substance Use Disorders

Medication	Dose and Recommendations	Potential Interaction With ARV Drugs	Comments
Alcohol Use Disorder			
Acamprosate	666 mg PO three times a day *or* 333 mg PO three times a day for people with CrCl 30–50 mL/min	No significant interaction with ARV drugs expected.	**Contraindicated** in people with CrCl <30 mL/min
Disulfiram	250 mg PO once daily	Use with caution when prescribing an ARV oral solution that contains ethanol and/or propylene glycol (e.g., FPV, LPV/r, RTV).	Counsel people regarding disulfiram reaction when taken with alcohol; symptoms for the reaction may include flushing, tachycardia, nausea, vomiting, or hypotension.
Naltrexone	50–100 mg PO once daily Depot formulation is a fixed-dose monthly injection.	No significant interaction with ARV drugs expected.	Has the greatest efficacy of all FDA-approved medications for AUD.
Opioid Use Disorder			
Buprenorphine	Individualize buprenorphine dosing based on the person's opioid use. The dose range is 4–24 mg sublingually. Dosing is once daily or twice daily.	Potential interaction with ARV drugs that are CYP inhibitors or inducers. See Drug–Drug Interactions for further recommendations.	Buprenorphine has 90% first-pass hepatic metabolism. Verify that the person is using the appropriate technique for sublingual administration before adjusting the dose, because improper administration will result in poor absorption and low drug levels.
Methadone	Individualize the dose. People who receive higher doses (>100 mg) are more likely to remain in treatment.	Potential interaction with ARV drugs that are CYP inhibitors or inducers. See Drug–Drug Interactions for further recommendations.	QTc prolongation is a concern at higher doses. Methadone can be prescribed for OUD only by a licensed OTP.
Naltrexone	50–100 mg PO once daily Depot formulation is a fixed-dose monthly injection.	No significant interaction with ARV drugs expected.	Longer time of continuous abstinence in those who received depot formulation naltrexone compared with placebo after transition from prison to community.

Table 16. Medications for Treatment of Substance Use Disorders

Medication	Dose and Recommendations	Potential Interaction With ARV Drugs	Comments
Nicotine Use Disorder			
Nicotine Replacement Therapy	The FDA has approved a wide variety of nicotine replacement products. All formulations are effective.	No significant interaction with ARV drugs expected.	Work with the person to identify the route of delivery that they will use and find most helpful.
Bupropion	Start at 150 mg PO daily for 3 days, then increase to either 150 mg twice daily or 300 mg once daily (use only formulations that are approved for once-daily dosing).	Concentration may be reduced when used with ARV drugs that are CYP2D6 inducers. See Drug–Drug Interactions for further recommendations.	For optimal results, tobacco quit date should occur 1 week after starting therapy.
Varenicline	Titrate the dose based on tolerability until the desired effect is achieved. The goal is to reach a dose of 1 mg PO twice daily. Requires dose adjustment in people with CrCl <30 mL/min.	No significant interaction with ARV drugs expected.	For optimal results, tobacco quit date should occur 1 week after starting therapy.

Key: ARV = antiretroviral; AUD = alcohol use disorder; CrCl = creatinine clearance; CYP = cytochrome P450; FDA = U.S. Food and Drug Administration; FPV = fosamprenavir; LPV/r = lopinavir/ritonavir; OTP = opioid treatment program; OUD = opioid use disorder; PO = orally; QTc = QT corrected for heart rate; RTV = ritonavir

Transplantation in People With HIV

Updated: September 12, 2024
Reviewed: September 12, 2024

Panel's Recommendations and Key Considerations
• People with HIV who are eligible for solid organ transplant (SOT) or hematopoietic cell transplant (HCT) should have equitable access to transplant **(AII).** • People with HIV should be managed by a multidisciplinary team before, during, and after transplant **(AIII).** • Transplant candidates with HIV should be up-to-date on their vaccination schedule **(AIII).**
Antiretroviral Drug Considerations Before Transplant

• In preparation for transplant, HIV providers should review the transplant candidate's antiretroviral (ARV) history, efficacy of the current ARV regimen, prior HIV drug resistance results, ARV adherence, and the potential for drug–drug interactions **(AIII).**
• All ARV regimen changes should be guided by ARV history, along with current and prior HIV drug resistance testing results **(AIII).**
• If switching to an alternative ARV regimen is necessary, changes should be completed several weeks before the transplant whenever possible to minimize drug–drug interactions in the post-transplant period and to assure tolerability and efficacy of the new regimen before transplant **(BIII).**
• Tenofovir alafenamide (TAF) is preferred over tenofovir disoproxil fumarate (TDF) in transplant candidates and recipients due to the lower risk of affecting renal function and bone mineral density **(AII).**
• To avoid significant drug–drug interactions between ARV drugs and anticipated immunosuppressive therapies, chemotherapies (for HCT), and prophylactic regimens for opportunistic infections, the following should be considered:
  ○ Unboosted second-generation oral integrase strand transfer inhibitor (INSTI)–based regimens (i.e., with bictegravir or dolutegravir) are preferred in most people with HIV needing transplant **(AII).**
  ○ In general, potent cytochrome P450 (CYP) 3A4 inhibitors—including pharmacokinetic boosters, such as ritonavir (RTV) or cobicistat (COBI), and protease inhibitor (PI)-containing regimens—should be avoided **(AII).**
  ○ In general, non-nucleoside reverse transcriptase inhibitors (NNRTIs) such as nevirapine (NVP), efavirenz (EFV), and etravirine (ETR), which are CYP3A4 inducers, should be avoided **(AII).**

Maintenance of Viral Suppression
• HIV viral suppression should be maintained before and after transplant **(AIII).*** • HIV providers with appropriate expertise should design alternative ARV regimen(s) that are likely to achieve viral suppression if post-transplant regimen changes are necessary **(AIII).**
Immediately Post-Transplant
• Immediately post-transplant, renal or hepatic function may fluctuate; close monitoring of these organ functions is recommended to ensure appropriate dosing of ARV drugs and other concomitant medications to avoid potential drug toxicities **(AIII).** • Interruption of antiretroviral therapy (ART) post-transplant should be avoided **(AIII).** • If interruption is necessary, all components of an oral ART regimen should be stopped simultaneously to avoid exposure to an incomplete regimen. The period of interruption should be kept to a minimal duration **(AIII).** • If a person cannot swallow pills, providers should consider using oral liquid formulation if available; alternatively, some pills can be crushed or dissolved for administration orally or via an enteral tube **(AIII).**

Post-Transplant
• Therapeutic drug monitoring for immunosuppressive drugs should be performed to guide dosing adjustments, especially before, during, and after the start or switch of ARV drugs that may interact with immunosuppressive drugs **(AII).** • The burden of medication increases significantly post-transplant. Providers should continue to evaluate for potential drug–drug interactions and overlapping toxicities with the addition of new medications **(AIII).**   ○ When feasible, providers should consider consolidating ART using fixed-dose combination tablets and/or single-tablet regimens to minimize pill burden and bolster adherence **(AIII).**
Hepatitis B Virus or Hepatitis C Virus Coinfection
• All donors and recipients should be screened for hepatitis B virus (HBV) and hepatitis C virus (HCV) with a serological and/or nucleic acid amplification test, according to transplant guidelines **(AIII).** • Transplant candidates and recipients who are nonimmune to HBV (as measured by HBV surface antibody [HBsAb]) should be vaccinated, ideally before transplant **(AIII).** • HBV serology should be monitored after transplant for loss of HBsAb in order to guide the need for revaccination per professional society and transplant center guidelines **(AIII).** • Transplant recipients with active HBV infection should be treated with ARV regimens with anti-HBV activity before transplant and indefinitely after transplant **(AIII).** Use of nucleos(t)ide reverse transcriptase inhibitors (NRTIs) with activities against both HIV and HBV is strongly recommended unless contraindicated or not tolerated **(AIII).** • For management of recipients with HIV without HBV who receive an organ from a donor with markers of HBV infection, see guidance in the HBV-Positive and HCV-Positive Donors section below and follow appropriate institutional protocols. • All transplant candidates and/or recipients with HCV infection should be treated with direct-acting antivirals against HCV **(AII).**
Rating of Recommendations: *A = Strong; B = Moderate; C = Weak* ***Rating of Evidence:*** *I = Data from randomized controlled trials; II = Data from well-designed nonrandomized trials or observational cohort studies with long-term clinical outcomes; III = Expert opinion*
* In some cases, it may be necessary to interrupt ART due to intolerance of or inability to administer ARV drugs pre-transplant, such as in end-stage liver disease or when enteral access is limited. In these situations, the HIV provider should design a regimen that will result in viral suppression after transplant and resume therapy as soon as feasible.

General Principles When Managing People With HIV Before and After Transplant

Below are some key principles to follow when caring for people with HIV before and after transplant.

- Ensure that people with HIV have equitable access to transplant.
- Utilize a multidisciplinary approach.
- Maintain HIV viral suppression.
- Select or maintain an antiretroviral (ARV) regimen to minimize drug–drug interactions.
- Be aware of changes in renal or liver function.
- Perform therapeutic drug monitoring (TDM) of immunosuppressants for all transplant recipients.
- Consider pill burden.

- Consider and address hepatitis B virus (HBV) and hepatitis C virus (HCV) coinfection.
- Prevent infectious complications post-transplant with updated vaccination and antimicrobial prophylaxis.

Outcomes of Transplant in People With HIV and the Importance of Equitable Access to Transplant

Before the introduction of potent antiretroviral therapy (ART), people with HIV were systematically denied solid organ transplantation (SOT).[1] When performed, SOT was linked to unfavorable outcomes,[2] partly attributed to the use of older antiretroviral (ARV) regimens that included protease inhibitors (PI), which interact with immunosuppressive medications, such as calcineurin inhibitors or mTOR inhibitors.[3] SOT also had unfavorable outcomes in people with HIV and HCV coinfection before the era of direct-acting antivirals (DAAs) for HCV treatment.[4] The use of PIs also affects the choice of DAAs for HCV treatment. In the era of integrase strand transfer inhibitors (INSTIs) with fewer drug–drug interactions and the widespread availability of DAAs for HCV, recent cohorts have shown a reduction in the disparity of transplant outcomes between people with and without HIV.[5-7]

In people with end-stage renal disease (ESRD), those with HIV are less likely to be referred for kidney transplant than those without HIV. With the use of potent ART, kidney transplant in people with HIV is associated with a survival benefit over chronic hemodialysis, with high rates of recipient and graft survival at both 1 and 3 years post-transplant.[8] Lower but acceptable rates of recipient and graft survival have been reported with long-term (between 5 and 15 years) follow-up when comparing kidney and liver transplantation outcomes in people with HIV compared with recipients without HIV. This difference was primarily driven by lower rates of survival in people with HIV/HCV coinfection before the use of DAAs for HCV treatment.[6,9] In retrospective studies conducted in the post-DAA era, rates of recipient and graft survival in liver transplant recipients with HIV/HCV appear to be similar to people with HIV without HCV.[5,6] Acute rejection rates for kidney transplant recipients are higher in people with HIV than in recipients without HIV.[10]

Hematopoietic cell transplants (HCTs) in people with HIV are now the standard of care in people with hematologic malignancies for which HCT is indicated.[11] In most reported prospective and retrospective studies in the combination ART era, HIV status does not appear to impact the outcome of autologous or allogeneic HCT with respect to nonrelapse mortality. Allogeneic HCT is particularly intriguing due to its potential to significantly reduce HIV reservoirs or even achieve a cure, particularly when complete chimerism is achieved and the donor is CCR5delta32 homozygous. It is important to note that acute and even life-threatening viral rebound can occur if ART is discontinued after HCT. Planned ARV interruptions should only be attempted in the setting of a clinical trial.[11-16]

Given the improved outcomes and benefits to quality of life and other measures associated with transplantation, transplant eligibility should be equitable between people with and people without HIV **(AII).** Infectious complications and malignancy risk remain a concern post-transplant. For discussion of transplantation from donors with HIV to recipients with HIV, see Solid Organ Transplant Considerations From Donors With HIV below.

Multidisciplinary Approach

With the complexity of care required before, during, and after transplant in people with HIV, a multidisciplinary team approach is recommended, including transplant-specific specialists such as nephrologists, hepatologists, hematologists, infectious disease and HIV specialists, transplant surgeons, pharmacists, nurses, and social workers **(AIII).** This approach is to ensure favorable outcomes and to effectively prevent and manage adverse events.

Antiretroviral Therapy Before, During, and After Transplant

This section of the guidelines will focus on special considerations for ART use before, during, and after SOT or HCT in people with HIV.

Maintain HIV Viral Suppression

Before and after a transplant, it is crucial to ensure that HIV suppression is maintained **(AIII).** This involves continuing ART as prescribed and closely monitoring viral load. Consistent adherence to ART is essential to prevent HIV viral rebound and maintain overall immune health. However, interruption of ART may be necessary in certain situations, such as intolerance of or inability to take oral ARV drugs pre-transplant, which may occur in some people with end-stage liver disease or when enteral access is limited post-transplant. In these situations, an ART regimen that will result in viral suppression after transplant should be resumed as soon as feasible**.**

Antiretroviral History and Review of Drug Resistance Testing Results

Before transplant and before starting, stopping, or changing any ARV drug, it is essential to review the person's ART history and any current and previous drug resistance testing results. This review guides the selection of an appropriate ARV regimen that will maintain or result in viral suppression.

If a person with wild-type HIV achieves and maintains viral suppression after starting ART, it is generally safe to assume that no drug resistance mutations have developed during that time. However, for people who have experienced virologic failure in the past, it is important to thoroughly review their resistance test results and their clinical and virologic responses to previous regimens when designing a new treatment plan.

Cumulative resistance test results encompass all previous and current test results, including genotypic, proviral DNA genotypic (if available), phenotypic, and tropism assays. Proviral DNA genotypic resistance testing can be considered in people with HIV who have suppressed viral loads and no prior drug resistance or unknown ART history information. In individuals with multiple treatment failures, proviral DNA genotypic testing may be useful but should be interpreted with caution. For additional information on proviral DNA assays, refer to the Drug Resistance Testing section.

Using the ART history and resistance results, one should be able to design at least one future suppressive regimen if changes are necessary.

Minimize Drug–Drug Interactions

Transplant recipients require multiple medications to prevent organ rejection, graft versus host disease (GVHD), and opportunistic infections, and to manage post-transplant complications. Polypharmacy can result in a complex array of drug–drug interactions. Consultation with a pharmacist with expertise in transplant, oncology, and/or HIV is recommended to aid with assessing and managing these challenging drug interactions.

Transplant-related drug interactions are commonly mediated by the cytochrome P450 (CYP) enzyme system. Below are some key principles for managing these drug–drug interactions.

- Use an ARV regimen with the lowest potential for drug interactions with medications used post-transplant, such as immunosuppressants, certain chemotherapeutic agents (for HCT recipients), azoles, corticosteroids, and acid-reducing drugs.

- Unboosted, oral, second-generation INSTI-based regimens (i.e., bictegravir or dolutegravir [DTG]) are preferred for most people with HIV needing transplantation **(AII).**
- In general, potent CYP3A4 inhibitors, including pharmacokinetic (PK) boosters such as ritonavir or cobicistat and PI-containing regimens, should be avoided **(AII).**
- In general, non-nucleoside reverse transcriptase inhibitors (NNRTIs) (e.g., efavirenz, etravirine, nevirapine), which are CYP3A inducers, should be avoided **(AII).** Among NNRTIs, doravirine (DOR) has fewer drug–drug interactions; however, experience with DOR in the transplant setting is limited.
- To minimize interactions in the post-transplant period and to assure tolerability and efficacy of the new regimen before transplant, whenever possible, any necessary ARV switches should be completed several weeks before the transplant **(BIII).**
- Therapeutic drug monitoring (TDM) of immunosuppressants is recommended for all transplant recipients; this is particularly important when drug–drug interactions with ARVs are expected **(AII).** Consultation with a pharmacist is recommended.

Drug Interactions Between Antiretroviral Drugs and Immunosuppressants

Immunosuppressants such as cyclosporine, sirolimus, and tacrolimus are mainstays of therapy post-transplant to prevent organ rejection or GVHD and are metabolized by CYP3A4.[17] These immunosuppressants have a narrow therapeutic window for efficacy and toxicity, and their drug concentrations may be impacted by ARV drugs that are CYP3A4 inhibitors or inducers because significant changes in their exposure may occur. There are limited data and experience evaluating interactions between newer ARV drugs and immunosuppressants, including a lack of published studies or case reports.[18-20] Immunosuppressant dose and target drug levels depend on the type of transplant, time since transplant, transplant center-specific protocols, transplant recipients' medical conditions, and other factors. Table 17 provides information regarding expected interactions based on available data and theoretical estimates. Safe and effective use of immunosuppressants should be guided by TDM.

Table 17. Drug Interactions Between Antiretroviral Drugs and Immunosuppressants Used Post-Transplant

	Overview of Interaction Potential	Tacrolimus	Sirolimus	Cyclosporine
NRTI	↔ NRTI ↔ Immunosuppressant	Initiate standard doses. Monitor renal function if used with TDF.	Initiate standard doses. Monitor renal function if used with TDF.	Initiate standard doses. Monitor renal function if used with TDF.
NNRTI	↔ NNRTI **With EFV, ETR, and NVP** • ↓ Immunosuppressant expected	Initiate standard doses and adjust based on TDM. **With EFV, ETR, and NVP** • May need higher doses	Initiate standard doses and adjust based on TDM. **With EFV, ETR, and NVP** • May need higher doses	Initiate standard doses and adjust based on TDM. **With EFV, ETR, and NVP** • May need higher doses.

Table 17. Drug Interactions Between Antiretroviral Drugs and Immunosuppressants Used Post-Transplant

	Overview of Interaction Potential	Tacrolimus	Sirolimus	Cyclosporine
	With DOR (A Weak Inducer) • ↓ Immunosuppressant possible **With RPV** • ↔ Immunosuppressant	**With RPV** • Monitor QTc with RPV.	**With RPV** • Monitor QTc with RPV.	**With RPV** • Monitor QTc with RPV.
PI (With COBI or RTV as PK Booster)	↔ PI ↑ Immunosuppressant requiring dose reduction and/or extending dosing interval	↑ ↑ Tacrolimus Switch to a non-PI/c or PI/r-based regimen. If not possible, consider initiating tacrolimus 0.5 mg PO every 5–7 days. Adjust based on TDM.	↑ ↑ Sirolimus Switch to a non-PI/c or PI/r-based regimen. If not possible, consider initiating sirolimus 1–1.5 mg PO once weekly. Adjust based on TDM.	↑ CsA Consider initiating reduced dose of CsA at 5% to 20% of standard daily dose. Adjust based on TDM.
INSTI	↔ INSTI **For BIC, CAB, DTG, or RAL** • ↔ Immunosuppressant **With EVG/c** • ↑ Immunosuppressant with EVG/c	**For BIC, CAB, DTG, or RAL** • Initiate standard doses and adjust based on TDM. **With EVG/c** • ↑ ↑ Tacrolimus expected • Switch to a non–EVG/c-based regimen. If not possible, consider initiating tacrolimus 0.5 mg PO every 5–7 days. Adjust based on TDM.	**For BIC, CAB, DTG, or RAL** • Initiate standard doses and adjust based on TDM. **With EVG/c** • ↑ ↑ Sirolimus expected • Switch to a non–EVG/c-based regimen. If not possible, consider initiating sirolimus 1–1.5 mg PO once weekly. Adjust based on TDM.	**For BIC, CAB, DTG, or RAL** • Initiate standard doses and adjust based on TDM. **With EVG/c** • ↑ CsA expected • Consider initiating reduced CsA at 10% to 20% of total standard daily dose. Adjust based on TDM.

Table 17. Drug Interactions Between Antiretroviral Drugs and Immunosuppressants Used Post-Transplant

	Overview of Interaction Potential	Tacrolimus	Sirolimus	Cyclosporine
Capsid Inhibitors	↔ LEN expected ↑ Immunosuppressant expected	No data to guide dosing Adjust based on TDM.	No data to guide dosing Adjust based on TDM.	No data to guide dosing Adjust based on TDM.
CCR5 Antagonist, Fusion, Attachment, and Post-Attachment Inhibitors	↔ ARV drugs expected ↔ Immunosuppressant expected	Initiate standard doses. Adjust based on TDM.	Initiate standard doses. Adjust based on TDM.	Initiate standard doses. Adjust based on TDM.

Key: ↔ = No clinically significant change; ↓ = decreased; ↑ = increased; ↑ ↑ = greatly increased; ARV = antiretroviral; BIC = bictegravir; CAB = cabotegravir; CCR5 = chemokine co-receptor 5; COBI = cobicistat; CsA = cyclosporine; DOR = doravirine; DTG = dolutegravir; EFV= efavirenz; ETR = etravirine; EVG/c = elvitegravir/cobicistat; INSTI = integrase strand transfer inhibitor; LEN = lenacapavir; NRTI = nucleos(t)ide reverse transcriptase inhibitor; NNRTI = non-nucleoside reverse transcriptase inhibitor; NVP = nevirapine; PI = protease inhibitor; PI/c = cobicistat-boosted protease inhibitor; PI/r = ritonavir-boosted protease inhibitor; PO = orally; QTc = QT corrected for heart rate; RAL = raltegravir; RPV = rilpivirine; RTV = ritonavir; TDF = tenofovir disoproxil fumarate; TDM = therapeutic drug monitoring

Drug Interactions Between Antiretroviral Drugs and Other Transplant-Related Medications

Transplant recipients often require other medications that may interact with ARV drugs via the CYP450 system or through decreased oral absorption due to altered gastric pH. These include azole antifungals, chemotherapy drugs, corticosteroids, and acid-reducing agents. A summary of these commonly encountered interactions can be found in Tables 24a to 24g. The table below is not comprehensive and is meant to highlight commonly used drug classes in transplant recipients with HIV.

Table 18. Drug Interactions Between Antiretroviral Drugs and Medications Commonly Used in Transplant Recipients

Drug Class	Examples	Effects of Interactions
Azole Antifungals	Isavuconazole Itraconazole Posaconazole Voriconazole	**CYP Inhibition (e.g., With RTV or COBI as PK Booster, Azoles)[a]** • ↑ Azole concentration, ↑ toxicities • ↑ ARV concentration possible, ↑ toxicities **CYP or Glucuronidation Induction (e.g., EFV, NVP)** • ↓ Azole concentration, ↓ efficacy

Table 18. Drug Interactions Between Antiretroviral Drugs and Medications Commonly Used in Transplant Recipients

Drug Class	Examples	Effects of Interactions
Chemotherapy	Busulfan Cyclophosphamide Etoposide[b]	**CYP Inhibition or Induction (e.g., With RTV or COBI as PK Booster)** • ↑ or ↓ Chemotherapy concentration with RTV, ↑ toxicities, or ↓ efficacy • ↑ Chemotherapy concentration with COBI, ↑ toxicities **CYP Induction (e.g., EFV, ETR, NVP)** • ↓ Chemotherapy concentration, ↓ efficacy
Corticosteroids	Dexamethasone	**Dose-Dependent CYP3A4 Induction** • ↓ ARVs that are metabolized by CYP3A4
	High-dose Prolonged Use Prednisone/Prednisolone	**CYP3A4 Inhibition (e.g., With RTV or COBI as PK booster)** • ↑ Steroid concentration, ↑ toxicities
Acid-Reducing Medications	PPI, H2 Antagonists	**Increase in Gastric pH** • ↓ Absorption of certain ARVs, including ATV or RPV. See Table 24a and 24b for recommended timing of administration if concomitant therapy is needed.

Key: ARV = antiretroviral, ATV = atazanavir; COBI = cobicistat; CYP = cytochrome P450; CYP3A4 = cytochrome P3A4; EFV = efavirenz; ETR = etravirine; H2 = histamine 2; NVP = nevirapine; PK = pharmacokinetic; PPI = proton pump inhibitor; RPV = rilpivirine; RTV = ritonavir

[a] CYP inhibition by azoles can ↑ concentrations of immunosuppressants and certain cancer chemotherapy drugs.

[b] The listed are frequently used conditioning therapy pre-hematopoietic transplants that have potential interactions with ART. For other chemotherapeutic agents, consult a clinical pharmacist with expertise in transplant-related drug–drug interactions.

Considerations When Switching Antiretroviral Drugs Due to Drug–Drug Interactions

To minimize immediate interactions in the post-transplant period, whenever possible, any necessary ARV drug switches should be completed several weeks before the transplant **(BIII).** Waiting at least five half-lives would allow for adequate elimination of any interacting ARV drugs and/or PK booster prior to transplant. Switching ART by at least several weeks before transplant also allows clinicians to assess the tolerability and efficacy of the new regimen. Clinicians should be aware that

discontinuation of certain ARV drugs may reverse previously stable drug interactions, therefore other comedications may need to be adjusted. For example, a person's immunosuppressant dose may need to be increased if the clinician is discontinuing a PI-based ARV regimen or the dose may need to be decreased if the clinician is discontinuing certain NNRTI-based regimens.

Changes in Renal or Hepatic Function

Following a kidney or liver transplant or after HCT, there may be abrupt changes in renal or hepatic function that may require dose adjustments of one or more drugs, including certain ARV drugs. All NRTIs except for abacavir (ABC) primarily undergo renal elimination and should be adjusted for dynamic changes in renal function. During the post-transplant period, it may be necessary to use individual components of ARV drugs instead of single-tablet regimens or fixed-dose combinations to allow for appropriate dose adjustments. Tenofovir alafenamide (TAF) is preferred over tenofovir disoproxil fumarate (TDF) because it has a lower risk of affecting renal function **(AII).** Because the rate of renal or hepatic function recovery can differ among recipients and immediate fluctuations may occur post-transplant, regular monitoring of organ function is important to ensure appropriate dosing of ARV drugs and minimize adverse effects or reduced efficacy (refer to Appendix B for ARV dosing in renal and hepatic insufficiency).

Alternative Methods for Antiretroviral Drug Delivery Post-Transplant

Interruption of ART post-transplant should be avoided **(AIII).** If interruption is necessary, all components in an oral ART regimen should be stopped simultaneously to avoid exposure to an incomplete regimen. The period of interruption should be kept to a minimal duration **(AIII).** If an ARV regimen includes both oral and long-acting injectable drugs (e.g., lenacapavir [LEN] or ibalizumab [IBA]) and interruption of the oral drugs is necessary, the oral ARV drugs should be resumed as soon as feasible to avoid monotherapy with the injectable agent.

If a transplant recipient cannot swallow pills immediately post-transplant, providers should consider using oral liquid formulation if available, or crushing and administering ARV drugs (if possible) to administer orally or via an enteral tube **(AIII).** Only a few ARV drugs are available in liquid formulations (Appendix A, Tables 1–10). Although PK data are limited, some ARVs can be temporarily crushed or dissolved and immediately administered orally or via an enteral tube until the recipients are able to swallow whole tablets (see more on Crushing and Liquid Antiretroviral Formulations). For people who require administration of crushed ARVs over an extended period of time, more frequent HIV viral load monitoring is recommended. If adequate oral absorption is a concern, TDM of certain ARV drugs may be considered.

Pill Burden and Post-Transplant Medication Management

Medications required for preventing graft rejection or opportunistic infections following SOT or HCT add significant pill burden and potential cost through medication copays. The complex medication schedule may also lead to medication errors and increased risk for suboptimal adherence. When renal and liver function are more stable, switching to single-tablet regimens or a fixed-dose combination ARV regimen (e.g., TAF or TDF with lamivudine [3TC] or emtricitabine [FTC]), dosed separately pre-transplant, can help reduce pill burden. Assisting transplant recipients with medication coordination, such as using a single pharmacy for dispensing all medications; attempting to synchronize refills to minimize trips to the pharmacy; and utilizing services such as adherence packaging, medication delivery, and refill reminders can also facilitate adherence. Medication and adherence counseling for transplant recipients and caregivers at each medical encounter is essential to ensure safe and effective therapy.

Impact of Medications on Adverse Effects and Comorbid Conditions

Close monitoring and prompt management of drug-associated adverse events is critical for all transplant recipients. Transplant medications, ARV drugs, and other medications may have some overlapping effects that can increase the risk or severity of toxicity. This overlap may have both short-term and long-term effects. Electrolyte disturbances may occur with sirolimus, tacrolimus, and cyclosporine. Of note, TDF may cause Fanconi syndrome, which could exacerbate the electrolyte disturbances. Similarly, nephrotoxicity associated with tacrolimus may also increase with concomitant TDF use.[21] All immunosuppressants are associated with side effects, such as nausea, vomiting, and diarrhea. These gastrointestinal side effects may be worsened when combined with ARV drugs, particularly PIs. While some of these adverse effects may be mitigated with symptomatic treatment, risk can be lowered pre-emptively by avoiding PIs and using TAF over TDF whenever possible.

In the long-term, people undergoing transplant are at high risk of developing new cardiovascular disease, diabetes, or osteoporosis.[22-24] If those conditions were present before transplant, they may worsen post-transplant. ARVs and/or transplant medications may play a role in the worsening of these conditions. Dyslipidemias associated with sirolimus or tacrolimus may be compounded by lipid disturbances associated with PIs or NNRTIs, such as efavirenz.[25,26] Cardiovascular events have been associated with ABC in some studies.[27] Fracture risk may be increased if corticosteroids are used in combination with TDF.[28] Since TDF may negatively impact bone mineral density,[28] TAF is preferred over TDF **(AII).** Management of comorbid conditions in transplant recipients is highly individualized. Clinicians must consider the risks and benefits of adjusting stable ARV regimens versus using other medications to manage complications. If ARV regimens are adjusted post-transplant, selecting agents that have minimal impact on transplant-related comorbidities is helpful in optimizing therapy.

Considerations for Long-Acting Antiretroviral Drugs

Several important factors should be considered when making decisions to initiate or continue transplant candidates on long-acting (LA) injectable ARV drugs, including cabotegravir (CAB) and rilpivirine (RPV) (typically used together as a complete ART regimen), IBA, and LEN. Experience with these LA ARV drugs in transplant candidates is limited, and these agents have not been studied in the setting of severe hepatic disease, ESRD, or post-transplant. The impact of fluctuations in renal function, hepatic function, and fluid shifts that may occur around the time of transplant on the PK of these LA ARVs is largely unknown. Additionally, it should be noted that because LA ARVs may be difficult to obtain in the hospital, administration must be carefully timed to avoid any medication access issues and treatment interruptions.

The benefits of initiating LA CAB/RPV pre-transplant should be weighed against potential risks. People who are stable on LA CAB/RPV prior to transplant may be maintained on their regimen and monitored closely. For individuals with very low platelet counts or who require anticoagulation, intramuscular (IM) injections of LA CAB/RPV may need to be postponed. In these cases, initiation of a bridging regimen with oral CAB and oral RPV until IM injections can be resumed may need to be considered. If oral CAB is not available, DTG may be used in its place.

Although there are occasions when a transplant recipient may not be able to take oral medications immediately post-transplant, in general, this should be resolved within a few days. There are no data on temporarily switching to LA CAB/RPV as a bridging strategy in this instance and, therefore, this strategy is not advised.

IBA and LEN are two LA ARV drugs approved for use in people with multiple drug-resistant HIV. IBA is given as an intravenous infusion every 2 weeks, whereas LEN is given as a

subcutaneous injection every 6 months. These drugs should not be started post-transplant just to reduce pill burden without other indications for their use. Transplant candidates on ARV regimens containing LEN or IBA likely have very limited alternative treatment options and should continue these LA ARV drugs as scheduled, in combination with any oral ARVs that are part of their complete regimen.

Because LA ARV drugs have very long half-lives, abruptly stopping any oral ARVs can lead to functional monotherapy with the LA ARV drugs, which may result in viral rebound and resistance. Therefore, the oral background regimen should be continued. People undergoing transplant who are maintained on these medications should be monitored closely for adverse events, drug interactions, and HIV viral load suppression. Drug interactions are an especially important consideration with LEN, which is a moderate CYP3A4 inhibitor (see Table 17). There is a prolonged period of drug interaction risk due to the extended presence of LEN in the body. Clinicians may inadvertently miss these interactions if they are unaware that LEN is part of the ARV regimen, as clinic-administered injectable LA ARV drugs are often listed separately from other ambulatory prescription medications in electronic health records.

Prevention of Infectious Complications Post-Transplant

Vaccination

Vaccination is a critical tool for preventing infections in all transplant recipients; however, the timing and some aspects of the approach to vaccination differ between SOT and allogeneic bone marrow transplant (BMT) candidates.

Timing of Vaccination

After registering as a transplant candidate and before SOT, there is typically a waiting period that provides an opportunity to assess vaccination status and update the vaccination record. It is important to consult the Centers for Disease Control and Prevention for up-to-date and specific vaccination recommendations, which include those for individuals with end-stage organ disease or immunocompromising conditions. Following an allogeneic BMT, vaccination plays a crucial role in restoring immune function and protecting against infectious diseases. Notably, the goal of vaccination in allogeneic BMT is to induce immune responses by the new engrafted donor immune system, not the pre-existing (recipient) one. However, vaccination strategies can vary based on the recipient's specific condition, transplant protocols, and recommendations from the transplant center. After allogeneic BMT, vaccination schedules are typically planned in phases, starting after the initial recovery period. Following that, vaccines are usually administered sequentially based on the transplant recipient's immune reconstitution status.

General principles for both SOT and allogenic BMT include the following:

- Vaccine recommendations for both SOT and BMT candidates and recipients should follow the same guidance as those recommended for those without HIV.
- In addition to reviewing standard pre- and post-transplant vaccine strategies described by the American Society of Transplantation Infectious Diseases Community of Practice, the need for additional vaccines based on HIV status (e.g., meningococcus) and/or exposure-related risk factors (e.g., mpox) should be assessed (see Immunization section of the *Guidelines for the Prevention and Treatment of Opportunistic Infections in Adults and Adolescents With HIV*).
- For people without HBV infection, HBV vaccination is important to maximize options for ARV simplification strategies that may involve tenofovir-sparing regimens.

- Inactivated vaccines, which do not contain live pathogens, are generally considered safe after BMT. These include vaccines such as influenza, COVID-19, pneumococcal, HBV, tetanus, and diphtheria, as well as the new recombinant zoster vaccine.
- Live vaccines—including the varicella-zoster virus (VZV) and measles, mumps, and rubella (MMR) vaccines—should be avoided in SOT recipients while on immunosuppressants and may not be recommended immediately after BMT due to the recipient's weakened immune system. The decision to administer live vaccines is based on the individual's clinical condition and time since transplantation.

Pre-transplant Screening for Infection Risk and Antimicrobial Prophylaxis

Prior to transplant, transplant candidates should undergo a detailed assessment for infection risk, including history of prior infections, travel history, and environmental exposures. Due to the increased risk of reactivation of latent infections (e.g., tuberculosis, Strongyloides), transplant candidates with HIV who are at risk for these latent infections should undergo screening to guide pre-transplant treatment to prevent reactivation and disease post-transplant. Active opportunistic infections are a contraindication for transplantation. Additionally, both HIV and the immunosuppression associated with transplant are risk factors for anogenital or cervical human papillomavirus-related malignancies.[29] Prophylaxis against bacterial, fungal, and viral diseases is a standard of care at transplant centers and is tailored to factors such as serostatus (e.g., cytomegalovirus) or geographic risk (e.g., coccidioidomycosis). Clinicians should also be aware of the risk for donor-derived infections, especially in the early transplant period.

For more information regarding the prevention and treatment of opportunistic infections and donor-derived infections, refer to the *Guidelines for the Prevention and Treatment of Opportunistic Infections in Adults and Adolescents With HIV* and center-specific protocols.

Recipient Considerations

HBV and HCV Coinfection

Due to overlapping risk factors, HBV and HCV coinfection is common in people with HIV. Both HBV and HCV are causes of cirrhosis that may lead to the need for liver transplant, and are also associated with extrahepatic manifestations such as diabetes mellitus, polyarteritis nodosa, membranoproliferative glomerulonephritis, and cryoglobulinemic vasculitis, which may contribute to ESRD.[30,31] Immunosuppression and chemotherapy (in cases of HCT) associated with transplant may result in loss of control of either HBV or HCV. Flares of active HBV or HCV following liver transplant begin with rises in HBV or HCV viral load, often followed by elevations in liver transaminases,[32,33] and can result in shortened graft survival. In those with only markers of prior HBV infection (core antibody [HBcAb] positive) and without evidence of active replication, HBV may reactivate from a latent state. Rarely, fibrosing cholestatic hepatitis results in rapidly progressive liver disease in transplant recipients.[34-38]

Assessment for HBV and HCV coinfection should occur at entry into HIV care and periodically for those at risk; status should be updated during the pre-transplant period. Transplant candidates or recipients who lack immunity to HBV (as indicated by negative HBV surface antibody [HBsAb]), including those with HBsAb loss, should receive vaccination regardless of HBcAb status and ideally before SOT.[39] Despite repeated attempts at vaccination, some people with end-stage organ disease or immunosuppression do not respond serologically and thus may be at risk for flares. Those undergoing allogeneic HCT generally undergo vaccination after the procedure.[40] For additional

information regarding ARV drugs for people with HIV/HBV coinfection, refer to the Hepatitis B Virus/HIV Coinfection section.

Candidate/Recipient Considerations

Candidate/recipient is HBsAg positive. In people with active HBV (HBV surface antigen [HBsAg]–positive) coinfection, it is important to include either TAF or TDF as part of the ARV regimen, with the goal of suppressing both viruses. Both TAF and TDF are active against HBV, and either can serve as the only active agent for HBV, although they are often used in combination with 3TC or FTC in people with both HIV and HBV. If TAF or TDF cannot be included, another potent anti-HBV drug—entecavir—should be initiated. Entecavir has weak anti-HIV activity and is not considered part of the ARV regimen but can induce nucleoside resistance mutation (M184V) and thus should never be used without a fully active ARV regimen.[41] Due to the low barrier to resistance and high likelihood for viral rebound, the use of 3TC or FTC as the only anti-HBV drug in individuals with HBV/HIV coinfection **is not recommended.**

Maintaining regimens with anti-HBV activity before transplant and indefinitely after transplant is recommended for transplant recipients with HIV and active HBV infection due to the risk of HBV reactivation and the potential for severe liver damage, including fulminant liver failure.

Candidate/recipient is HBcAb positive, HBsAg negative, and HBsAb negative or positive. The risk of HBV reactivation in the transplant recipient depends on the type of transplant, the depth of immunosuppression, and the presence of HBsAb. For liver transplant recipients who are HBcAb positive without evidence of active HBV (negative serum HBsAg and HBV DNA), reactivation risks are considered negligible due to removal of the potential liver reservoir. By contrast, in non-hepatic transplant recipients with markers of past infection, reactivation may occur in up to approximately 5%, usually during the first year, when immunosuppression is most intense and in the absence of protective levels of HBsAb.[42] This risk can be further abrogated if anti-HBV agents are already part of the ART regimen and by boosting HBsAb levels with vaccination. For non-hepatic transplant recipients not already on agents with anti-HBV activity, periodic prophylaxis or monitoring (regular measurements of transaminases and if newly elevated, rapid HBV DNA) strategies may be deployed to the highest-risk recipients per institutional protocol.[43,44]

Candidate/recipient is HCV RNA positive. All transplant candidates and/or recipients with HCV infection should be treated with DAAs against HCV **(AII),** preferably prior to transplant. Exceptions to this principle might include select candidates awaiting liver transplant, with a short waiting time for transplant (e.g., high Model for End-Stage Liver Disease, or MELD, score),[45] or select candidates for non-liver transplants who elect to defer treatment to remain eligible for donor organs from HCV viremic donors,[46-48] per discretion of the transplant providers. For those deferring treatment for HCV before transplant, treatment should be initiated early in the post-transplant period.[49-51] Additional considerations for the care of people with HIV and HCV, including fibrosis assessment, are found in the Hepatitis C Virus/HIV Coinfection section.

Donor-Related Considerations

HBV-Positive and HCV-Positive Donors

Organs from donors with serologic or virologic markers of HBV or HCV infection may be considered when recipients have given informed consent and providers have determined that benefits outweigh potential risks.[52,53] Antiviral treatment for recipients prior to transplantation can help prevent or manage post-transplant infection. Additionally, monitoring for donor-derived transmission and close follow-up of the recipient post-transplantation are necessary to detect and manage any potential infection.

Donor is HBcAb and/or HBsAg positive. To expand the size of the donor pool, use of HBcAb positive/HBsAg negative organs has become common practice.[54] More rarely, donors who are HBsAg positive are also utilized.[55] Without prophylaxis or recipient immunity (presence of surface antibody), the risk of HBV transmission from such donors is present for non-hepatic organs and is extraordinarily high for liver transplants. Strategies to mitigate the risk of donor-derived HBV include pre-transplant vaccination, nucleos(t)ide therapy, and—particularly for liver transplant recipients who receive HBsAg-positive organs—hepatitis B immunoglobulin.[56] Anti-HBV agent prophylaxis may be deployed for moderate to high-risk recipients, with the highest risk (liver transplant recipients) receiving lifelong nucleos(t)ide analogues. Organ recipients with HIV may continue on regimens that already include tenofovir; those on tenofovir-sparing regimens pre-transplant may require the addition of anti-HBV agents such as tenofovir or entecavir. 3TC or FTC alone is not preferred for this indication.

Donor is HCV antibody or HCV RNA positive. The safety of using organs from HCV antibody-positive donors in both HCV viremic and aviremic recipients has been established, especially with early initiation of antivirals in the post-transplant setting.[45-48,51,57-62] Although untreated chronic HCV infection may have an accelerated course in people with HIV and SOT, early and effective treatment abrogates this risk substantially. Transplant candidates with HIV without current HCV infection should consider accepting HCV viremic organs if prompt DAA therapy is available at their center (see the Hepatitis C Virus section for more information).

Solid Organ Transplant Considerations From Donors With HIV

Kidney transplantation demonstrates survival benefit compared to dialysis for people with HIV and ESRD.[63] Previously, the use of organs from donors with HIV was banned. After a successful study of transplanting kidneys from donors with HIV into recipients with HIV in South Africa, the U.S. HIV Organ Policy Equity (HOPE) Act was approved in 2013, amending the law to allow transplantation of organs from donors with HIV into recipients with HIV (HIV D+/R+) under research protocols.[64]

For transplant candidates, eligibility criteria for HIV D+/R+ transplantation are the same as standard transplant criteria. For donors, federally mandated research criteria require that donors do not have active opportunistic infections.[65] Organs from donors with any CD4 lymphocyte cell count or viral load are allowed; however, transplant teams need to consider the likelihood of any ART resistance in the donors and justify whether an ART regimen in the recipient will be effective and tolerated.[65] To date, INSTI resistance has been rare in deceased donors with HIV.[66]

Early studies have shown excellent outcomes of HIV D+/R+ kidney and liver transplantation.[64,67] Based on this, the federal Advisory Committee on Blood and Tissue Safety and Availability has recommended to the U.S. Department of Health and Human Services that HIV D+/R+ kidney and liver transplantation be moved outside of research and into clinical care.[68] Due to the paucity of outcome data, HIV D+/R+ heart or lung transplantation remains under research protocols for now.[68] HIV D+/R+ kidney transplantation has been shown to decrease wait times for transplant.[69] SOT candidates with HIV may therefore consider being listed at a center currently offering organs from donors with HIV, if feasible.

As organ allocation in the United States occurs at a national level, all people with HIV may register as organ donors regardless of their distance from these centers, as their organs would only be directed to transplant candidates with HIV.[70] In addition, people with HIV may be living organ donors under HOPE Act research protocols.[68,71]

Women With HIV

Updated: September 12, 2024
Reviewed: September 12, 2024

Panel's Recommendations
• Antiretroviral therapy (ART) is recommended for all people with HIV to improve their health and to reduce the risk of HIV transmission to sexual partners without HIV **(AI).** • When prescribing antiretroviral (ARV) drugs for women with HIV, clinicians should consider that some ARV drugs have significant pharmacokinetic (PK) interactions with hormonal contraceptives **(AII)** and hormone replacement therapy **(BIII).** Consult Tables 24a, 24b, 24d, 24e, 24f, and 24g for detailed recommendations and a summary of available data when selecting ARV and hormone combination therapy **(AIII).** • Clinicians should discuss with women the possibility of weight gain after initiating or changing ART. Some women in general, and Black women in particular, experience greater weight gain with ART over time than men. Concerns for weight gain should not be a reason for deferring ART. • A pregnancy test should be performed for women of childbearing potential before initiation of ART **(AIII).** • When selecting or evaluating an ARV regimen for women with HIV of childbearing potential, clinicians should consider the regimen's effectiveness, the woman's hepatitis B status, the teratogenic potential of the drugs in the ARV regimen, and the possible adverse outcomes for the mother and the fetus if the woman becomes pregnant while receiving the regimen **(AII).** • During pregnancy, an additional goal of ART is to maintain a viral load below the limit of detection throughout pregnancy in order to reduce the risk of HIV transmission to the fetus and newborn **(AI).** • When selecting an ARV regimen for a pregnant woman, clinicians should consider the available safety, efficacy, and PK data on the use of each agent during pregnancy. The risks and benefits of ARV use during pregnancy should be discussed with all pregnant women **(AIII),** and clinicians should consult the Perinatal Guidelines when designing a regimen **(AIII).** • Achieving and maintaining viral suppression with ART while breastfeeding does not completely eliminate HIV transmission risk but does reduce it to less than 1% **(AI).**
Rating of Recommendations: *A = Strong; B = Moderate; C = Weak* ***Rating of Evidence:*** *I = Data from randomized controlled trials; II = Data from well-designed nonrandomized trials or observational cohort studies with long-term clinical outcomes; III = Expert opinion*

This section focuses on some unique clinical and therapeutic issues to consider and basic principles to follow when caring for women with HIV. Clinicians who care for pregnant women with HIV should consult the Perinatal Guidelines for a more in-depth discussion.

Sex Difference Considerations in Antiretroviral Therapy

In general, studies to date have not shown sex differences in virologic responses to antiretroviral therapy (ART).[1-6] However, limited data show that pharmacokinetics (PK) for some ARV drugs may differ between men and women, possibly because of variations in factors such as body weight, plasma volume, gastric emptying time, plasma protein levels, cytochrome P450 activity, drug transporter function, and excretion activity.[6-10]

Adverse Effects

Several studies with older ARV drugs have suggested that sex may influence the frequency, presentation, and severity of some ARV-related adverse events.[11-13] In the ICONA cohort, people

with HIV treated with dolutegravir (DTG)-based regimens were followed for up to 4 years. There was a higher risk of DTG discontinuation due to toxicity in both ART-naive and ART-experienced women compared with men.[14]

Some studies have investigated how metabolic complications that are associated with the use of ARV drugs differ between women and men. Women have an increased risk of osteopenia, osteoporosis, and fractures, particularly after menopause, and this risk is exacerbated by HIV and some ARV drugs.[15-18] ARV regimens that contain tenofovir disoproxil fumarate (TDF), ritonavir-boosted protease inhibitors (PI/r), or both are associated with a significantly greater loss of bone mineral density (BMD) than regimens that contain other nucleoside reverse transcriptase inhibitors (NRTIs) and raltegravir (RAL).[19-22] Abacavir (ABC), NRTI-sparing regimens, and tenofovir alafenamide (TAF) may be considered as alternatives to TDF for patients who are at risk of osteopenia or osteoporosis. Recommendations for the management of bone disease in people with HIV have been published.[23]

Weight Gain and Antiretroviral Therapy

Weight gain after initiation of ART, especially in people with advanced HIV, can be a sign of a return to better health. However, data from clinical trials and longitudinal cohort studies suggest sex differences in ARV-associated weight gain across all classes of ART among treatment-naive individuals, particularly with the use of certain integrase strand transfer inhibitor (INSTI)–based regimens (DTG and bictegravir [BIC]). In a pooled analysis of eight randomized controlled trials with ARV-naive people initiating HIV treatment, female sex was associated with 1.5 times the odds of a ≥10% weight gain compared with male sex (17.4% vs. 12.2%), with Black females significantly more likely to experience a ≥10% weight gain than non-Black females (19.7% vs. 12.4%).[24] At 144 weeks of follow-up in the ADVANCE study, a 12.3-kg weight gain was recorded among women receiving TAF/emtricitabine (FTC)/DTG compared with 7.4 kg and 5.5 kg among women receiving TDF/FTC/DTG and TDF/FTC/efavirenz (EFV), respectively.[25] In addition to women being more likely to experience weight gain with ARV initiation, the pattern of weight gain differs between men and women. In the ADVANCE study, at 96 weeks of follow-up, women gained more fat than lean body mass than men, with weight gain concentrated in the limbs and trunk. ARV-associated weight gain similarly has been observed among virologically suppressed women switching to an INSTI-based regimen.[26-28] In the Women's Interagency HIV Study, virologically suppressed women who switched to INSTI-based ART or had an INSTI added to their regimen (n = 234) gained an average of 4.2 kg in body weight at the 2-year follow-up compared with 0.2 kg in women remaining on non-INSTI ART (n = 884).[27] Mean change in percent body fat (1.7% vs. 0.3%) and body circumference measures were also greater in the INSTI group than in the non-INSTI group. Investigators did not detect a difference in weight gain by individual INSTI.

It should be noted that, although randomized controlled trials and observational studies suggest that individuals receiving INSTI-based regimens experience greater weight gain than those receiving comparator regimens, significant uncertainty continues as to whether INSTIs are causing weight gain or whether the comparator drugs are suppressing weight gain. For example, an analysis in the ADVANCE trial demonstrated that the greater weight gain observed in DTG- versus EFV-treated participants was dependent primarily on CYP2B6 polymorphisms, which are associated with slow EFV metabolism (and presumably higher EFV levels). Among those with rapid EFV metabolism genotypes, no evidence was found for a weight difference between DTG- and EFV-treated participants.[29] The underlying mechanisms for weight gain in people receiving an INSTI-based regimen, and their impact on cardiovascular diseases, diabetes, pregnancy-related outcomes, and age-related comorbidities among women with HIV are currently unknown.

Switching from TDF to TAF, regardless of whether participants took INSTI, non-nucleoside reverse transcriptase inhibitor (NNRTI), or PI combinations, was found to be associated with weight gain,

particularly in women and people of African descent.[30] The extent of TAF-associated weight gain may be affected by baseline body mass index (BMI). Among participants of the Women's Interagency HIV Study (WIHS) cohort, weight and BMI rose among women with baseline BMI below 30kg/m^3 when transitioning to INSTI, TAF, or INSTI and TAF together.[31]

All these data indicate that ARV-associated weight gain should be a factor to consider when initiating or changing ART, particularly in Black women. Because some ART regimens are more likely to cause weight gain in women, clinicians should weigh the benefits and risks of a particular regimen when initiating or changing ART. However, concerns about weight gain should not be a reason for deferring ART.

Adherence to Antiretroviral Therapy

Some observational studies have found that women are more likely than men to have suboptimal adherence to ART. Defining adherence as missing no dose of ART in the prior 3 days, the Centers for Disease Control and Prevention analyzed data from the nationally representative Medical Monitoring Project (n = 12,394) by race and sex.[32] Race comparisons by sex indicated that women had consistently lower ART adherence than men of the same race. Adherence rates were 94% for White men compared with 88% for White women, 93% for Latino men compared with 88% for Latina women, and 89% for Black men compared with 87% for Black women. A Canadian study followed 4,534 individuals (including 904 women) for a median of 65.9 months and found that a significantly lower proportion of women relative to men were optimally adherent (57.0% vs. 77.1%).[33] In the analysis adjusted for ethnicity and injection drug use, female sex remained associated independently with suboptimal adherence. Women with HIV face multifactorial barriers to adherence. Increasing access to social services—such as food, housing, and transportation—has been associated with improved ART adherence, as have social support and good patient–provider relationships.[34,35] Another analysis of 6,186 women from the Medical Monitoring Project found that women aged 50 and older were more likely to be adherent to ART than women younger than 50.[36] However, menopausal symptoms have been associated significantly with suboptimal ART adherence in cross-sectional[37] and longitudinal studies[38] of older women with HIV. It also was noted that 68.8% of older women with HIV experienced symptoms of menopause, but only 17% received treatment for these symptoms. It is plausible that treating menopausal symptoms may improve ART adherence among older women with HIV.[38,39]

Antiretroviral Therapy Considerations in Women With HIV Who Are of Childbearing Potential

All women with HIV who are of childbearing potential should be offered comprehensive reproductive and sexual health counseling and care as part of routine primary medical care. Topics for discussion should include safe sex practices, reproductive desires and options for conception, the HIV status of sexual partner(s), the use of effective contraception to prevent unplanned pregnancy, and maintaining viral suppression to optimize health in preparation for pregnancy. Counseling also should include discussion of special considerations pertaining to ARV use when using hormonal contraceptives, when trying to conceive, and during pregnancy (see the Perinatal Guidelines). Clinicians should discuss intentions regarding pregnancy with all women of childbearing potential, and a pregnancy test should be performed before initiating ART **(AIII).**

Antiretroviral Regimen Considerations for Individuals Who Are Trying to Conceive

ART should be initiated and viral suppression achieved prior to pregnancy whenever possible. People should be given information about the benefits and risks of initiating specific ARV regimens

when trying to conceive so they can make informed decisions about their care (see Appendix C: Antiretroviral Counseling Guide for Health Care Providers).

Earlier data from the birth outcomes surveillance study in Botswana raised concern about an increased risk of neural tube defects (NTDs) (0.9%) in infants born to women who were receiving DTG at the time of conception.[40,41] At the time of the study, folate fortification of grains in Botswana was uncommon. Folate prescribed before conception was low (0.1% to 0.2%) among the study participants.[42] Updated results from the same study showed that the prevalence of NTDs in infants born to women on DTG at the time of conception was not significantly different from those on non-DTG regimens at the time of conception.[43] Because folic acid is known to prevent NTDs in the general population, all pregnant women and women who might conceive should take at least 400 mcg of folic acid daily **(AI).** In a small cohort of 69 U.S. women who had periconceptional or early-pregnancy DTG exposure and access to folic acid fortification of food and/or received folate supplementation, there was no increased risk of NTDs in exposed infants.[44]

EFV is teratogenic in nonhuman primates.[45] However, in humans, no increase in teratogenicity has been reported with the use of EFV. Based on drug-specific risk assessments by the Antiretroviral Pregnancy Registry, sufficient numbers of first-trimester exposures to EFV have been monitored with no detected increase in the risk of overall birth defects, including in cardiovascular and genitourinary systems. Women who become pregnant while on EFV-containing regimens should continue their current regimens **(BIII).**

Before initiating ART in a woman of childbearing potential, clinicians should review the What to Start: Initial Combination Regimens for People With HIV section and the Perinatal Guidelines for information to consider when choosing an ARV regimen. The key recommendations are listed below:

For individuals who are trying to conceive, the Panel on Antiretroviral Guidelines for Adults and Adolescents recommends initiating one of the following regimens, which are designated as *Preferred* regimens during pregnancy in the Perinatal Guidelines: DTG plus a dual NRTI combination (TAF/FTC, TDF/FTC, or TDF/3TC) or BIC/TAF/FTC. DTG-based regimens are associated with rapid, durable viral load suppression, which is important for maternal health and the prevention of perinatal HIV transmission. Data on the use of long-acting (LA) injectable cabotegravir (CAB) with rilpivirine (RPV) in pregnancy are limited.

For individuals who are not planning to conceive but who are at risk for pregnancy, consider a regimen's effectiveness and tolerability the available data on potential teratogenicity, and the person's preferences (e.g., pill burden) when choosing between regimens that are recommended for initial therapy (see Tables 6a and 6b in the Initial Combination Antiretroviral Regimens for People With HIV section). Clinicians should refer to the Perinatal Guidelines for recommendations.

Reproductive Options for Couples With Differing HIV Status

Couples with differing HIV status should be informed of options to prevent sexual transmission of HIV while attempting conception. If the partner with HIV is on ART and has achieved sustained viral suppression, sexual intercourse without a condom allows conception with effectively no risk of sexual HIV transmission to the partner without HIV (see Antiretroviral Therapy to Prevent Sexual Transmission of HIV).[46-48] People with HIV who intend to prevent transmission by using ART need to maintain high levels of ART adherence and should be informed that transmission is possible during periods of poor adherence, treatment interruption, and viremia. Both partners should be screened for sexually transmitted infections (STIs) and receive appropriate treatment if STIs are diagnosed.

Hormonal Contraception

Safe and effective reproductive health and family planning services to prevent unplanned pregnancies and perinatal transmission of HIV are essential components of care for women with HIV of childbearing potential. These women should receive ongoing counseling on reproductive issues. Individuals who do not desire pregnancy currently but are sexually active or considering initiating sexual activity should be offered effective and appropriate contraceptive methods to reduce the likelihood of unintended pregnancy. Women with HIV can use all available contraceptive methods (e.g., pill, patch, ring, injection, implant) and intrauterine devices (IUDs),[49] after consideration of potential drug–drug interactions as discussed in the next section (also see the Perinatal Guidelines).

Drug–Drug Interactions Between Hormonal Contraceptives and ARV Drugs

Interactions between some ARV drugs and hormonal contraceptives may reduce contraceptive efficacy. However, most data are generated from healthy-volunteer, short-duration PK studies, and clinical data regarding interactions between ARV drugs and hormonal contraceptives in women with HIV are limited. The magnitude of change in drug concentrations that may reduce contraceptive efficacy or increase the risk of adverse effects is not known for all forms of contraceptives, making the clinical implications of some ARV-hormone drug interactions challenging to predict.

Concerns about PK interactions between hormonal contraceptives and ARV drugs should not prevent clinicians from prescribing hormonal contraceptives for individuals on ART. However, an alternative or additional effective contraceptive method is recommended if significant interactions may occur between hormonal contraceptives and ARV drugs (see Tables 24a, 24b, 24d, 24e, 24f, and 24g). A summary of ARVs with known interactions with hormonal contraceptives is described below:

Combination contraceptives containing ethinyl estradiol and progestins, including combined oral contraceptives (COCs), transdermal patches, and intravaginal rings:[50,51]

- EFV significantly decreases progestin concentrations from both COCs and intravaginal rings, which may increase the risk of contraceptive failure. EFV did not reduce oral ethinyl estradiol exposure in one small study, but it reduced exposure when combined with an intravaginal ring, which may increase the risk of intermenstrual bleeding (spotting), particularly with ultra-low and low-dose estrogen-containing contraceptives.
- Elvitegravir boosted with cobicistat (EVG/c), and cobicistat-boosted PIs or PI/r decrease ethinyl estradiol levels, which may increase the risk of spotting, particularly with ultra-low and low-dose estrogen-containing contraceptives. However, these ARV regimens also increase progestin exposure, which preserves contraceptive effectiveness.
- Cobicistat- and ritonavir-containing regimens should be avoided with drosperinone-containing products because of an increased risk of hyperkalemia.
- Fostemsavir (FTR) increases ethinyl estradiol exposure, which may increase risk of thromboembolic events. Product labeling recommends a maximum dose of ethinyl estradiol of 30 mcg per day when combined with FTR.[52]

Progestin-only pills:[50,51]

- EFV significantly decreases concentrations of oral progestin pills, including emergency contraception, which may increase the risk of contraceptive failure.

- Cobicistat- or ritonavir-boosted ARV regimens may increase progestin exposure. The combination may be used without dose adjustment; monitor for progestin-related adverse effects.

Injectable contraceptives (depot-medroxyprogesterone):

- One study of EFV-based ART plus depo-medroxyprogesterone acetate (DMPA) did not find a significant reduction in medroxyprogesterone acetate (MPA) exposure. No change in DMPA dose or frequency is necessary.[53]
- For women receiving both rifampin and EFV for the treatment of tuberculosis and HIV, some experts suggest administering DMPA every 8 to 10 weeks instead of every 12 weeks.[54]

Progestin-releasing contraceptive implants:[50,51]

- EFV significantly decreases progestin concentrations released from a contraceptive implant. Cohort studies have found that women receiving EFV-based ART and contraceptive implants have a higher rate of unintended pregnancies than women receiving other ART combinations.[55,56]
- Cobicistat- or ritonavir-boosted ARV regimens may increase progestin exposure, but the combination may be used without dose adjustment.

Pregnancy

All women with HIV should receive ART early in pregnancy, regardless of their viral load or CD4 T lymphocyte (CD4) cell count, for their own health and for the prevention of perinatal HIV transmission and transmission of HIV to sexual partners **(AI).** ARV drugs reduce the risk of perinatal HIV transmission by decreasing maternal viral load in blood and genital secretions.[57-59] Clinicians who are caring for pregnant adults and adolescents with HIV should review the Perinatal Guidelines.

Antiretroviral Regimen Considerations

In general, the recommendations for the use of ART in pregnant women are the same as those for women who are not pregnant. As in nonpregnant individuals, genotypic drug-resistance testing is recommended for all pregnant women before initiating ARV drugs **(AIII)** and for those with detectable HIV viral load while on ART **(AI).** However, if not yet on ART, ART initiation should not be delayed pending genotypic drug-resistance test results. The ARV regimen can be modified, if necessary, once the resistance test results are available **(BIII).** Unique considerations that influence recommendations on the ARV drugs to use during pregnancy include the following:

- Potential ARV-associated adverse effects for pregnant women, fetuses, and infants
- Need for strict adherence to the prescribed ARV regimen to avoid viremia and drug resistance, optimize health outcomes, and minimize the risk of perinatal transmission
- Limited long-term outcome data for infants who were exposed to ARV drugs *in utero*, especially for newer ARV drugs

Clinicians should review the Perinatal Guidelines for ARV drug recommendations for individuals who recently have received an HIV diagnosis or those who become pregnant while on ART. Selection of ARV drugs for pregnant women should be individualized according to specific ARV history, the results of drug-resistance assays, and the presence of comorbidities, as well as the individual's preferences for balancing known and unknown risks and benefits of an ARV regimen.

Because of data suggesting decreased drug levels during pregnancy and associated loss of virologic suppression, cobicistat-containing regimens, including EVG/c, ATV/c, or DRV/c, are not recommended for initiation during pregnancy.[60] A pregnant woman who has a suppressed plasma viral load on one of these regimens could continue the regimen with frequent (e.g., monthly) viral load monitoring. Alternatively, another regimen that is predicted to maintain viral suppression can be used for the duration of the pregnancy.

The use of LA CAB with RPV has not been studied in pregnancy. In clinical trials, participants who became pregnant were switched from LA CAB and RPV to an alternative oral ARV regimen throughout the remainder of their pregnancies. Based on the pharmaceutical company's clinical trials and compassionate program through March 2021, 25 pregnancies were reported (20 LA CAB/RPV and 5 during oral lead-in phase); in 4 cases, conception occurred during the washout period after treatment discontinuation. There were 8 elective abortions, 6 miscarriages, and 1 ectopic pregnancy. Among the 10 livebirths (9 LA CAB/RPV and 1 oral), 1 infant had congenital ptosis.[61] Women who become pregnant while on ART will need close monitoring, and their pregnancy outcomes should be reported to the Antiretroviral Pregnancy Registry.

If maternal HIV viral load is ≥1,000 copies/mL (or unknown) near delivery, intravenous infusion of zidovudine during labor is recommended, regardless of the mother's antepartum regimen and resistance profile and the mode of infant delivery **(AI).** Administration of combination ART should continue during labor and before a cesarean delivery (oral medications can be administered with sips of water during this time).

Clinicians who are treating pregnant women with HIV are strongly encouraged to report cases of prenatal exposure to ARV drugs (either administered alone or in combination) to the Antiretroviral Pregnancy Registry.

Postpartum Management

Following delivery, clinical, immunologic, and virologic follow-up should continue as recommended for nonpregnant adults and adolescents. Maternal ART should be continued after delivery. For more information regarding postpartum management of HIV, refer to the Perinatal Guidelines.

Some studies have demonstrated that adherence to ART may decline during the postpartum period.[62-64] Clinicians should address ART adherence at each postpartum clinic visit, including an evaluation of specific factors that facilitate adherence or present as a barrier to adherence. Clinicians may recommend an intervention to improve adherence (see Adherence to the Continuum of Care).

Clinicians should discuss future reproductive plans and timing, the risks and benefits of conceiving on specific ARV medications, and the use of appropriate contraceptive options to prevent unintended pregnancy. If an LA reversible contraceptive—such as an implant or IUD—is desired by the person, it should be inserted before hospital discharge or during the postpartum visit if possible.

Infant Feeding

Clinicians should refer to the Perinatal Guidelines for detailed recommendations regarding initiation or modification of infant feeding. Women with HIV should receive evidence-based, patient-centered counseling to support shared decision-making about their desire for infant feeding. Replacement feeding with properly prepared formula or pasteurized donor human milk eliminates the risk of postnatal HIV transmission to the infant.

Breastfeeding is **not recommended** for women who are not virally suppressed or for those who develop a detectable viral load while breastfeeding because of concern for increased risk of HIV

transmission through breast milk.[65] If viremia occurs during breastfeeding, the woman should be advised to replace breastfeeding with another mode of feeding. Viral load testing should be repeated and plasma genotypic resistance testing should be performed if the level of viremia allows for a test to be done.

HIV and Menopause

The population of people with HIV is aging; thus, the number of women with HIV who are experiencing menopause is increasing. The median age of menopause in the general U.S. population is 52.5 years.[66] Evidence suggests that women with HIV are reaching menopause at earlier ages than those who do not have HIV.[67,68] The WIHS, which included 3,059 participants, demonstrated that approximately 1% (n = 35) experienced premature menopause before age 41, 3% (n = 101) between ages 41 and 45, and 21% (n = 442) between ages 46 and 50. These participants self-reported low ranges of hormone replacement therapy (14%, 16%, and 7%, respectively).[39] However, other confounding factors may affect age of menopause in women with HIV, such as sociodemographic factors, illicit drug use, hepatitis C coinfection, smoking, and possibly ART.

A Canadian study of 229 women with HIV reported that the average age of menopause was 48 years, which was 3 years younger than the general Canadian population. Lower level of education and hepatitis C coinfection were associated independently with menopause at <45 years of age.[69] In another study of 667 women with HIV in Rio de Janeiro, Brazil, 24% reached menopause during the observational period and 27% had early menopause (<45 years of age). The median age of menopause was 48 years of age. Age at menarche <11 years, cigarette smoking, chronic hepatitis C, and CD4 count <50 cell/mm^3 were associated significantly with an earlier age of natural menopause.[70]

Menopause is a high-risk period for osteoporosis, which may be exacerbated by HIV and/or ART. A small, randomized international multicenter study demonstrated a trend of increased BMD at the lumbar spine after a switch from TDF to TAF in peri- and early postmenopausal women with HIV.[71]

Defining the relationship between HIV and menopausal symptoms, mental health, and depression is complicated because of overlapping symptoms from HIV itself, effects of ART, other comorbidities, and substance use. Some studies suggest that women with HIV experience a greater burden of menopausal symptoms, including vasomotor symptoms, sexual dysfunction, and mood changes.[67,68,72] Other studies did not find differences between women with HIV and those without HIV.[73,74] Menopausal symptoms also have been associated with reduced adherence to ART and poor cognitive performance.[37,38,75,76]

No studies have shown evidence of estrogen deficiency (i.e., menopause) affecting CD4 count, plasma HIV viral loads, or response to ART.[77,78] Two small studies showed no difference in plasma levels of tenofovir and RAL between pre- and postmenopausal women.[79,80]

The use of hormone replacement therapy (HRT) is low among women with HIV.[38] Data are limited on drug–drug interactions between ART and estradiol as part of HRT, and drug interaction data with ethinyl estradiol cannot be extrapolated to the estrogens used for HRT because of differences in metabolism. Drug interactions between HRT and ART are possible, particularly regimens containing cobicistat, ritonavir, PIs, or some NNRTIs. See the drug–drug interaction Tables 24a, 24b, 24c, 24d, 24e, 24f, and 24g for predicted interactions and clinical recommendations.

CONSIDERATIONS FOR ANTIRETROVIRAL USE IN PEOPLE WITH COINFECTIONS

Hepatitis B Virus/HIV Coinfection

Updated: September 12, 2024
Reviewed: September 12, 2024

Panel's Recommendations
• Hepatitis A, B, and C virus serologies should be performed for all people with HIV **(AIII).** • Before initiating or switching antiretroviral therapy (ART), all people who test positive for hepatitis B surface antigen (HBsAg) should be tested for hepatitis B virus (HBV) DNA using a quantitative assay to determine the level of HBV replication **(AIII).** • Because tenofovir alafenamide (TAF), tenofovir disoproxil fumarate (TDF), emtricitabine (FTC), and lamivudine (3TC) are active against both HIV and HBV, an antiretroviral (ARV) regimen for people with both HIV and HBV should include (TAF or TDF) plus (3TC or FTC) as the nucleoside reverse transcriptase inhibitor (NRTI) backbone of a fully suppressive ARV regimen **(AI).** • In people with HBV/HIV coinfection, using 3TC or FTC as the only drug in a regimen with HBV activity **is not recommended (AII),** because HBV resistance to these drugs can emerge. • If TAF or TDF cannot be safely used, or if there is a desire to use a tenofovir-sparing ART regimen, entecavir should be used as the alternative HBV therapy **(BI).** Entecavir has weak activity against HIV. Using entecavir for HBV treatment without ART may result in selection of the M184V mutation that confers HIV resistance to 3TC and FTC. Therefore, entecavir must be used in addition to a fully suppressive ARV regimen when given to people with HBV/HIV coinfection **(AII).** • Adefovir **(AI)** or pegylated interferon alfa **(AIII) are not recommended** for people with HBV/HIV coinfection. • In people with HBV/HIV coinfection, the discontinuation of agents with anti-HBV activity may cause serious hepatocellular injury resulting from HBV reactivation hepatitis; people with HBV/HIV coinfection should be advised against stopping these medications and should be carefully monitored during interruptions of HBV-active treatment **(AII).** • When switching or modifying an ARV regimen in a person with HBV/HIV coinfection, including switching to long-acting injectables, ARV drugs that are active against HBV should be continued **(AII)** or specific anti-HBV drugs, such as entecavir, should be initiated **(AII).** • HBV reactivation has been reported in people with HIV and prior exposure to HBV (positive hepatitis B core antibody, negative HBsAg) when HBV-active agents are withdrawn as part of an ART regimen. Regardless of hepatitis B surface antibody level, people with HIV and prior HBV exposure are at low risk for reactivation and the associated hepatitis, which can result in serious hepatocellular injury. A monitoring strategy is considered a safe and effective way to assess HBV reactivation in low-risk people **(BIII).** • HBV reactivation has been observed in people with HBV/hepatitis C virus (HCV) coinfection while receiving interferon-free HCV treatment. For this reason, all people initiating HCV therapy should be tested for HBV. People with HCV/HIV coinfection and active HBV infection (determined by a positive HBsAg test) should receive ART that includes two agents with anti-HBV activity before initiating HCV therapy **(AIII).**
Rating of Recommendations: *A = Strong; B = Moderate; C = Weak* ***Rating of Evidence:*** *I = Data from randomized controlled trials; II = Data from well-designed nonrandomized trials or observational cohort studies with long-term clinical outcomes; III = Expert opinion*

Approximately 5% to 15% of people with HIV in the United States also have chronic hepatitis B virus (HBV) infection, defined as positive HBV surface antigen (HBsAg).[1-3] The progression of chronic HBV to cirrhosis, end-stage liver disease, or hepatocellular carcinoma is more rapid in people with HBV/HIV coinfection than in people with chronic HBV mono-infection.[4] Conversely, chronic HBV does not substantially alter the progression of HIV infection and does not influence HIV suppression or CD4 T lymphocyte cell responses following the initiation of antiretroviral therapy (ART).[5,6] Liver-associated complications may occur due to immune reconstitution after initiation,[7,8] or HBV reactivation after discontinuation of antiretroviral (ARV) drugs that are active against both HIV and HBV.[9-14]

Recommendations for People With HBV/HIV

- All people with HIV should be tested for viral hepatitis, including hepatitis A virus (HAV), HBV, and hepatitis C virus (HCV). People without immunity to HAV or HBV should receive a full vaccination series **(AIII).**
- A survey of people with HIV/HBV coinfection in the United States revealed that 4.0% had a positive hepatitis D virus (HDV) serologic test, of which 41.7% had detectable HDV RNA.[15] Because HBV/HDV coinfection has been associated with serious liver complications, many experts recommend that people with HIV and chronic HBV be tested for HDV infection.[16,17] The recommended initial serologic test is an HDV antibody test, which, if positive, should be followed by HDV RNA testing. People with HIV and HBV/HDV coinfection should be referred to an expert in the management of viral hepatitis.
- All people with chronic HBV should be evaluated to assess the severity of HBV infection (see Hepatitis B Virus in the Adult and Adolescent Opportunistic Infections Guidelines). In addition, people with chronic HBV should be advised to abstain from alcohol, be screened for alcohol use disorder,[18] and be counseled on prevention methods that protect against both HBV and HIV transmission.[19]
- Before ART is initiated, all persons who test positive for HBsAg should be tested for HBV DNA by using a quantitative assay to determine the level of HBV DNA **(AIII),** and the test should be repeated every 3 to 6 months to ensure effective HBV suppression. The goal of HBV therapy with nucleos(t)ide reverse transcriptase inhibitors (NRTIs) is to prevent liver disease complications by sustaining the suppression of HBV replication. A large cohort study found that persistent HBV viremia while taking ART and high HBV DNA levels were associated with a higher risk of hepatocellular carcinoma (HCC), even if HIV was suppressed; whereas sustained HBV DNA suppression for ≥1 year was associated with a 58% reduction in HCC risk.[20] The most common reason for persistent HBV viremia in people with HBV/HIV coinfection on tenofovir alafenamide (TAF)– or tenofovir disoproxil fumarate (TDF)–containing ART is suboptimal adherence; thus, the primary focus in this setting should be on improving adherence.[21]
- Because HBV reactivation has been observed in people with HBV infection during interferon-free HCV treatment,[22,23] people with HCV/HIV coinfection and chronic HBV infection should receive ART that includes two agents with anti-HBV activity (such as TAF or TDF plus emtricitabine [FTC] or lamivudine [3TC]) prior to initiating HCV therapy **(AIII).** The diagnosis of HBV reactivation should be considered in people with current HBV infection who experience elevated liver transaminases during or immediately after HCV therapy.

Antiretroviral Drugs With Dual Activities Against HBV and HIV

The NRTIs TAF, TDF, FTC, and 3TC are active against HBV. Entecavir is an HBV nucleoside analog that has weak HIV activity. TAF is a tenofovir prodrug with HBV activity and potentially less

renal and bone toxicity than TDF,[24,25] although weight gain has been observed more frequently with TAF than TDF.[26,27]

The efficacy of TAF versus TDF in hepatitis B e antigen (HBeAg)–negative patients with HBV mono-infection was evaluated through a randomized controlled trial, involving both treatment-naive and treatment-experienced participants. In this study, TAF was non-inferior to TDF, based on the percentage of participants with HBV DNA levels <29 IU/mL at 48 weeks of therapy (94% for TAF vs. 93% for TDF; *P* = 0.47).[28] In another study, TAF was also non-inferior to TDF in HBeAg-positive people with chronic HBV mono-infection, with a similar percentage of participants achieving HBV DNA levels <29 IU/mL at 48 weeks of therapy (64% for TAF vs. 67% for TDF; *P* = 0.25).[29] In both studies, people on TAF experienced significantly smaller mean percentage decreases from baseline in hip and spine bone mineral density at 48 weeks than participants receiving TDF. The median change in estimated glomerular filtration rate (eGFR) from baseline to 48 weeks also favored TAF.[28,29]

In people with HBV/HIV coinfection, (TAF or TDF) plus (3TC or FTC) can be considered part of the ARV regimen; entecavir has weak anti-HIV activity and must not be considered part of an ARV regimen. In addition, TDF is fully active for the treatment of people with known or suspected 3TC-resistant HBV infection, whereas 3TC resistance compromises the activity of entecavir against HBV.

Recommended Therapy

The combination of (TAF or TDF) plus (3TC or FTC) should be used as the NRTI backbone of an ARV regimen and for the treatment of both HIV and HBV infection **(AI).**[30-32] The decision whether to use a TAF- or TDF-containing regimen should be based on an assessment of risk for nephrotoxicity and the acceleration of bone loss. In a switch study in people with HBV/HIV coinfection, study participants who switched from a primarily TDF-based ARV regimen to the fixed-dose combination elvitegravir/cobicistat (EVG/c)/TAF/FTC maintained or achieved HBV suppression with improved eGFR and bone turnover markers.[33] See Appendix B for guidance on renal dosing of NRTIs. Although data on switching from a TDF-based to a TAF-based ARV regimen are limited, the data from the EVG/c/TAF/FTC switch study suggest that people with HBV/HIV coinfection can switch to TAF/FTC-containing regimens with a potential reduction in renal and bone toxicity while maintaining HBV suppression.

Alternative Therapy

If TDF or TAF cannot be safely used or if there is a desire to use a TAF- or TDF-sparing ART regimen**,** entecavir can be used as an alternative HBV therapy in addition to a fully suppressive ARV regimen **(BI).** Entecavir has weak activity against HIV; its use for HBV treatment without ART may result in the selection of the M184V mutation that confers HIV resistance to 3TC and FTC.[34,35] Therefore, entecavir must be used in addition to a fully suppressive ARV regimen when given to people with HBV/HIV coinfection **(AII).** Because entecavir and 3TC share a partially overlapping pathway to HBV resistance, it is unknown whether the combination of entecavir plus 3TC or FTC will provide greater virologic or clinical benefit than entecavir alone. In people with known or suspected 3TC-resistant HBV infection, the entecavir dose should be increased from 0.5 mg/day to 1 mg/day.[36] However, entecavir resistance may emerge rapidly in people with 3TC-resistant HBV infection. Therefore, entecavir should be used with caution in such people, with frequent monitoring (approximately every 3 months) of the HBV DNA level to detect viral breakthroughs.[35]

Important Considerations

- Discontinuation of HBV-active NRTI drugs may potentially cause serious hepatocellular injury resulting from the reactivation of HBV.[37]

- Entecavir has activity against HIV. However, when entecavir is used to treat HBV in people with HBV/HIV coinfection who are not on ART, the drug may select for the M184V mutation that confers HIV resistance to 3TC and FTC. Therefore, when used in people with HBV/HIV coinfection, entecavir must be used in addition to a fully suppressive ARV regimen **(AII).**[38]
- When 3TC is the only active drug used to treat chronic HBV in people with HBV/HIV coinfection, 3TC-resistant HBV emerges in approximately 40% and 90% of people after 2 years and 4 years on 3TC, respectively. Given the similarities between FTC and 3TC, these drugs should only be used in combination with other anti-HBV drugs **(AII).**[39]
- In people with HBV/HIV coinfection, immune reconstitution following the initiation of treatment for HIV and HBV can be associated with elevated liver transaminase levels, possibly because HBV-induced liver injury is primarily an immune-mediated disease.[40]
- Some ARV agents (especially older drugs, such as nevirapine, tipranavir, and high-dose ritonavir) can increase liver transaminase levels. The incidence and magnitude of these increases were higher with HBV/HIV coinfection than with HIV mono-infection.[41-43] The etiology and consequences of these changes in transaminases are unclear because the changes may resolve with continued ART. Nevertheless, some experts suspend the suspected agent(s) when the serum alanine transferase (ALT) level increases to 5 to 10 times the upper limit of normal, or at a lower threshold if the person has symptoms of hepatitis and/or new elevations in bilirubin. However, increased transaminase levels in people with HBV/HIV coinfection may indicate HBeAg seroconversion due to immune reconstitution; thus, the cause of the elevations should be investigated before medications are discontinued. In people with increases in transaminase, HBeAg seroconversion should be evaluated by testing for HBeAg and anti-HBe, as well as HBV DNA levels, which should decrease in the setting of immune reconstitution. Other causes of ALT elevation—such as HCV or HDV infection, alcohol use, metabolic dysfunction-associated steatotic liver disease, and hepatotoxicity from non-ARV agents—should also be considered.

HBV Drugs Not Recommended

Adefovir in combination with 3TC or FTC with a fully suppressive ARV regimen was studied in people with HIV/HBV coinfection.[30,44,45] Adefovir was associated with high rates of HBV treatment failure and a high incidence of renal toxicity. Therefore, the Panel **does not recommend** adefovir for people with HBV/HIV coinfection **(AI).** Pegylated interferon alfa monotherapy is a potential therapy for the treatment of HBV mono-infection; however, data on its use in people with HBV/HIV coinfection are limited, and tolerance of the therapy in people with HIV is a significant limitation to its use. As a result, the Panel **does not recommend** pegylated interferon alfa for people with HBV/HIV coinfection **(AIII).** Pegylated interferon alfa can remain a treatment option in rare cases and with the consultation of an expert.

Changing Antiretroviral Therapy

- **When switching or modifying an ARV regimen in a person with HBV/HIV coinfection:** ARV drugs that are active against HBV (TDF or TAF in combination with 3TC or FTC) should be continued **(AII)** or a specific anti-HBV drug such as entecavir should be initiated **(AII).**
- **When ARV medications that are active against HBV in people with HBV/HIV coinfection must be discontinued:** Withdrawal of HBV-active treatment in a person with chronic HBV infection **is not recommended (AII).** If TAF or TDF cannot be continued due to concern for safety or if there is a desire to use a TAF- or TDF-sparing regimen and entecavir cannot be used or if there is concern for entecavir resistance, the person's clinical course should be monitored with monthly testing of liver transaminases. The risk of HBV flare in this setting is highest in people with positive HBeAg and those with active HBV. If no anti-HBV ARV drug can be used,

entecavir should be added to a fully suppressive ARV regimen to prevent HBV flare **(AII)**, especially in people with marginal hepatic reserve, such as those with compensated or decompensated cirrhosis.[37]

Screening for HBV Before Initiating NRTI-Sparing or NRTI-Limited Antiretroviral Regimens

HBV status should be evaluated in all people with HIV who are not known to have chronic HBV before the initiation of an NRTI-sparing or NRTI-limited ARV regimen (such as long-acting cabotegravir plus rilpivirine [LA CAB/RPV], dolutegravir [DTG]/rilpivirine [RPV], or DTG/3TC). Considerations for screening include the following:

- People with HIV should be screened for HBV infection, and if not already immune or infected (including those with isolated hepatitis B core antibody [HBcAb]), vaccination should be initiated while considering these new ARV regimens (see Hepatitis B Virus Infection in the Adult and Adolescent Opportunistic Infections Guidelines).
- People with HBV/HIV coinfection were not included in clinical trials that evaluated NRTI-sparing or NRTI-limited regimens. If LA CAB/RPV, DTG/RPV, or DTG/3TC are used in people with HBV coinfection, TAF, TDF, or entecavir should also be prescribed **(AII).** In people with prior exposure to 3TC monotherapy, TAF or TDF is preferred due to the risk of HBV resistance to 3TC; thus, there is a lower barrier of resistance for entecavir.
- People with HIV and prior exposure to HBV infection (negative HBsAg, positive HBcAb, and either positive or negative hepatitis B surface antibody [HBsAb]) are likely at low risk (<1%) of HBV reactivation and even lower risk of HBV reactivation hepatitis,[14] although there are insufficient studies to confidently estimate the risk in this population. Of people with HIV and prior exposure to HBV infection, those with positive HBsAb are at the lowest risk for HBV reactivation, although HBV reactivation has been described when HBV-active therapy is withdrawn as part of an ART regimen.[14]
- For individuals with prior HBV exposure, it is reasonable and feasible to incorporate ALT monitoring into the frequent laboratory testing already recommended after switching from ART with HBV NRTI therapy (TDF, TAF, or entecavir) to LA CAB/RPV, DTG/RPV, or DTG/3TC. An increase in ALT would warrant HBV DNA testing to assess for HBV reactivation hepatitis and immediate initiation of HBV therapy once reactivation is confirmed. A monitoring strategy is considered a safe and effective way to assess for HBV reactivation in low-risk people **(BIII).**[46,47] The timeline for reactivation is not clear in this population. Monitoring every 1 to 3 months for 6 months after switching from HBV-active ART is consistent with current recommendations for low-risk people without HIV.

Hepatitis C Virus/HIV Coinfection

Updated: March 23, 2023
Reviewed: March 23, 2023

Panel's Recommendations
• All people with HIV should be screened for hepatitis C virus (HCV) infection **(AIII).** Patients at high risk of HCV infection should be screened annually and whenever incident HCV infection is suspected **(AIII).** • Antiretroviral therapy (ART) may slow the progression of liver disease by preserving or restoring immune function and reducing HIV-related immune activation and inflammation. For most patients with HCV/HIV coinfection, including those with cirrhosis, the benefits of ART outweigh concerns regarding drug-induced liver injury. Therefore, ART should be initiated in all patients with HCV/HIV coinfection, regardless of CD4 T lymphocyte cell count **(AI).** • Initial antiretroviral (ARV) regimens that are recommended for most patients with HCV/HIV coinfection are the same as those recommended for people with HIV who do not have HCV infection. However, when treatment for both HIV and HCV is indicated, the ARV and HCV treatment regimens should be selected with special consideration for potential drug–drug interactions and overlapping toxicities **(AIII)** (see discussion in the text below and in Table 19). • All patients with HCV/HIV coinfection should be evaluated for HCV therapy, which includes assessing their liver fibrosis stage to guide the duration of therapy and to predict subsequent risk of hepatocellular carcinoma and liver disease complications **(AIII).** • Patients with chronic HCV/HIV coinfection should be screened for active and prior hepatitis B virus (HBV) infection by testing for the presence of hepatitis B surface antigen (HBsAg) and antibodies to hepatitis B surface (HBsAb) and hepatitis B core (HBcAb; total or Immunoglobulin G). Persons who are not immune to HBV infection (HBsAb negative) should receive anti-HBV vaccination **(AIII).** • HBV reactivation has been observed in people with HBV infection during HCV treatment with direct-acting antivirals. Accordingly, before initiating HCV therapy, patients with HCV/HIV coinfection and active HBV infection (HBsAg positive) should receive ART that includes two agents with anti-HBV activity **(AIII).**
Rating of Recommendations: *A = Strong; B = Moderate; C = Weak* ***Rating of Evidence:*** *I = Data from randomized controlled trials; II = Data from well-designed, nonrandomized trials or observational cohort studies with long-term clinical outcomes; III = Expert opinion*

The treatment of hepatitis C virus (HCV) infection is rapidly evolving. Patients with HCV/HIV coinfection treated with all-oral, direct-acting antiviral (DAA) HCV regimens can achieve sustained virologic response (HCV cure) at rates comparable to those in patients with HCV mono-infection.[1-3] This section of the guidelines focuses on hepatic safety and drug–drug interaction issues related to HCV/HIV coinfection and the concomitant use of antiretroviral (ARV) agents and HCV drugs. For specific guidance on HCV treatment, clinicians should refer to the HCV Guidance from the American Association for the Study of Liver Diseases and the Infectious Diseases Society of America.

Approximately one-third of patients with chronic HCV infection progress to cirrhosis at a median time of <20 years.[4,5] The rate of progression increases with older age, alcoholism, male sex, and HIV infection.[6-9] A meta-analysis found that patients with HCV/HIV coinfection had a threefold greater risk of progression to cirrhosis or decompensated liver disease than patients with HCV mono-infection.[8] The risk of progression is even greater in patients with HCV/HIV coinfection who have low CD4 T lymphocyte cell counts. Although antiretroviral therapy (ART) appears to slow the rate of HCV disease progression in patients with HCV/HIV coinfection, several studies have demonstrated that the rate of disease progression continues to exceed that observed in patients without HIV.[10,11] Whether HCV infection accelerates HIV progression, as measured by the occurrence of AIDS-

related opportunistic infections or death,[12] is unclear. With older ARV drugs, people with HIV and HCV coinfection experienced higher rates of hepatotoxicity than those seen in people with HIV but not HCV.[13,14] These higher rates have not been observed with the newer ARV agents that are currently in use.

Assessment of HCV/HIV Coinfection

All people with HIV should be screened for HCV infection using sensitive immunoassays licensed for the detection of antibodies to HCV in blood.[15] Patients who are HCV-seronegative but at risk for HCV infection should undergo repeat testing annually or as clinically indicated. Patients who are HCV-seropositive should be tested for HCV RNA using a sensitive quantitative assay to confirm the presence of active infection. Patients who test HCV RNA positive should undergo HCV genotyping and liver disease staging as recommended by the HCV Guidance.

- Patients with HCV/HIV coinfection should be counseled to avoid consuming alcohol.
- Patients with HCV/HIV coinfection also should be counseled about appropriate precautions to prevent transmission of HIV and/or HCV to others.
- Patients with chronic HCV/HIV coinfection should be screened for active and prior hepatitis B virus (HBV) infection by testing for the presence of hepatitis B surface antigen (HBsAg) and antibodies to hepatitis B surface (HBsAb) and hepatitis B core (HBcAb; total or Immunoglobulin G).
    - Patients with evidence of active HBV infection (HBsAg positive) should be further evaluated and treated with ART that includes agents with anti-HIV and anti-HBV activities **(AIII).**
    - Those who are not immune to HBV infection (HBsAb negative) should receive anti-HBV vaccination.
- Patients with HCV/HIV coinfection who are susceptible to hepatitis A virus (HAV) should be vaccinated against HAV.
- All patients with HCV/HIV coinfection are candidates for curative HCV treatment.

Antiretroviral Therapy in HCV/HIV Coinfection

When to Start Antiretroviral Therapy

Initiation of ART for patients with HCV/HIV coinfection should follow the recommendations for all persons with HIV infection, considering the need for concurrent HCV treatment with oral DAA regimens, the potential for drug–drug interactions, and the individual's HBV status.

Considerations When Starting Antiretroviral Therapy

The same regimens that are recommended for initial treatment of HIV in most ART-naive persons also are recommended for patients with HCV/HIV coinfection. Special considerations for ARV selection in patients with HCV/HIV coinfection include the following:

- When both HIV and HCV treatments are indicated, the ARV regimen should be selected with careful consideration of potential drug–drug interactions with the HCV treatment regimen (see Table 19 below).
- In patients with HCV/HBV coinfection, HBV reactivation has been observed during HCV treatment with DAAs.[16,17] Therefore, before initiating HCV therapy, patients with HCV/HIV coinfection and active HBV infection (HBsAg positive) should receive ART that includes agents

with anti-HBV activity (such as tenofovir disoproxil fumarate [TDF] or tenofovir alafenamide plus emtricitabine or lamivudine) **(AIII).**

- Patients with cirrhosis should be evaluated for signs of liver decompensation according to the Child-Turcotte-Pugh classification system. All patients with Child-Pugh class B or C disease should be evaluated by an expert in advanced liver disease and considered for liver transplantation. Furthermore, hepatically metabolized ARV and HCV DAA drugs may be contraindicated or require dose modification in patients with Child-Pugh class B and C disease (see Appendix B).

Hepatotoxicity

Drug-induced liver injury (DILI) following the initiation of ART is more common in patients with HCV/HIV coinfection than in those with HIV mono-infection. Individuals with HCV/HIV coinfection who have advanced liver disease (e.g., cirrhosis, end-stage liver disease) are at greatest risk for DILI.[18] Eradicating HCV infection with treatment may decrease the likelihood of ARV-associated DILI.[19] Alanine aminotransferase (ALT) and aspartate aminotransferase (AST) levels should be monitored 4 to 8 weeks after initiation of ART and at least every 6 to 12 months thereafter, and more often if clinically indicated. Mild to moderate fluctuations in ALT and/or AST levels (<5 times upper limit of normal [ULN]) are typical in individuals with chronic HCV infection. In the absence of signs or symptoms of liver disease or increases in bilirubin, these fluctuations do not warrant interruption of ART, but they do warrant monitoring to ensure a return to baseline. Patients with significant elevations in ALT or AST levels (>5 times ULN), concomitant increase in total bilirubin, or concomitant symptoms (weakness, nausea, vomiting) should be evaluated carefully for signs and symptoms of liver insufficiency and for alternative causes of liver injury (e.g., acute HAV or HBV infection, hepatobiliary disease, alcoholic hepatitis). If these signs and symptoms do not resolve, ART should be discontinued.

Concurrent Treatment of HIV and HCV Infections

Guidance on the treatment and management of HCV in adults with and without HIV can be found in the HCV Guidance. Several ARV drugs and HCV DAAs have the potential for clinically significant pharmacokinetic drug–drug interactions when used in combination. Before starting HCV therapy, the ART regimen may need to be modified to reduce the drug–drug interaction potential. Table 19 below provides recommendations on the concomitant use of selected drugs for the treatment of HCV and HIV infection. In patients receiving ART that has been modified to accommodate HCV treatment, HIV RNA should be measured within 2 to 8 weeks after changing HIV therapy to confirm the effectiveness of the new regimen. After ART modification, initiation of an HCV DAA regimen should be delayed for ≥2 weeks. Resumption of the original ARV regimen also should be delayed until ≥2 weeks after the HCV DAA regimen is completed. The prolonged half-life of some HIV and HCV drugs poses a potential risk of drug–drug interactions if a regimen is resumed soon after ART modification or HCV treatment completion.

Table 19. Concomitant Use of Selected Antiretroviral Drugs and Hepatitis C Virus Direct-Acting Antiviral Drugs for Treatment of Hepatitis C Virus in Adults With HIV

The recommendations in this table for concomitant use of select HIV drugs with U.S. Food and Drug Administration (FDA)–approved HCV DAA drugs are based on available pharmacokinetic (PK) interaction data or are predictions based on the known metabolic pathways of the agents. (Instances where PK interaction data are limited or not available are indicated in the table.) Whenever HIV and HCV drugs are used concomitantly, patients should be closely monitored for HIV and HCV virologic efficacy and potential toxicities. Because the field of HCV therapy is rapidly evolving, readers also should refer to the latest drug product labels and the HCV Guidance for updated information.

Note: Interactions with fosamprenavir (FPV) and nelfinavir (NFV) are **not** included in this table. Please refer to the FDA product labels for information regarding drug interactions with these HIV protease inhibitors (PIs).

[a] Consider using an alternative HCV treatment or ARV regimen to avoid increases in TDF exposure. If coadministration is necessary, monitor patient for TDF-associated adverse events.

[b] Voxilaprevir exposures can increase when it is coadministered with pharmacologically boosted DRV or EVG. Until more safety data in clinical settings become available, patients who are receiving voxilaprevir and pharmacologically boosted DRV or EVG should be monitored for hepatotoxicity.

Table 19. Concomitant Use of Selected Antiretroviral Drugs and Hepatitis C Virus Direct-Acting Antiviral Drugs for Treatment of Hepatitis C Virus in Adults With HIV

[c] Glecaprevir exposures can increase when it is coadministered with EVG/c. Until more safety data in clinical settings become available, patients who are receiving glecaprevir and EVG/c should be monitored for hepatotoxicity.

Key to Symbols:

✓ = ARV agents that can be used concomitantly
✖ = ARV agents not recommended
? = Data on PK interactions with ARV drug are limited or not available
↑ = Increase
↓ = Decrease

Key: 3TC = lamivudine; ABC = abacavir; ARV = antiretroviral; ATV = atazanavir; ATV/c = atazanavir/cobicistat; ATV/r = atazanavir/ritonavir; BIC = bictegravir; CAB = cabotegravir; DAA = direct-acting antiviral; DOR = doravirine; DRV = darunavir; DRV/c = darunavir/cobicistat; DRV/r = darunavir/ritonavir; DTG = dolutegravir; EFV = efavirenz; ETR = etravirine; EVG = elvitegravir; EVG/c = elvitegravir/cobicistat; FTC = emtricitabine; FTR = fostemsavir; HCV = hepatitis C virus; IM = intramuscular; LEN = lenacapavir; LPV/r = lopinavir/ritonavir; MVC = maraviroc; NVP = nevirapine; PI = protease inhibitor; PI/c = protease inhibitor/cobicistat; PI/r = protease inhibitor/ritonavir; PK = pharmacokinetic; PO = oral; RAL = raltegravir; RPV = rilpivirine; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate; TPV/r = tipranavir/ritonavir

Tuberculosis/HIV Coinfection

Updated: September 12, 2024
Reviewed: September 12, 2024

Key Considerations and Recommendations

- Treatment for latent tuberculosis infection (LTBI) in people with HIV should take into consideration the individual's antiretroviral (ARV) regimen as noted below.
  - General recommendations for **once-weekly** isoniazid plus rifapentine for 3 months (3HP) and **once-daily** isoniazid plus rifapentine for 1 month (1HP):
    - These regimens **are not recommended** for people who require twice-daily dolutegravir (DTG) therapy (e.g., those with certain integrase strand transfer inhibitor [INSTI]–associated resistance substitutions or clinically suspected INSTI resistance) **(AIII).**
    - Tenofovir disoproxil fumarate (TDF)/emtricitabine (FTC) **(AIII),** tenofovir alafenamide (TAF)/FTC **(BIII),** or abacavir (ABC)/lamivudine (3TC) **(BIII)** can be used as the nucleoside reverse transcriptase inhibitor (NRTI) backbone. Rifapentine may lower concentrations of TAF. If used, monitor for virologic response.
  - For 3HP
    - Efavirenz (EFV) 600 mg once daily or raltegravir 400 mg twice daily can be used **(AII).**
    - DTG 50 mg once daily may be used for those in whom once-daily DTG is appropriate **(BII).**
  - For 1HP
    - EFV 600 mg once daily can be used without dose adjustment **(AI).**
    - For a person with virologic suppression while on a DTG 50 mg once-daily regimen, the DTG dose should be increased to 50 mg twice daily throughout the course of 1HP, continuing DTG 50 mg twice daily for 14 days after 1HP completion before switching back to once-daily DTG dosing **(AII).**
  - With daily isoniazid alone for 6 or 9 months, any ARV regimen can be used **(AIII).**
  - If rifampin is used to treat LTBI, clinicians should review Tables 24a through 24g to assess the potential for drug–drug interactions between rifampin and different ARV drugs **(AII).**
- All people with HIV and active tuberculosis (TB) who are not on antiretroviral therapy (ART) should be started on ART **(AI)** as described below.
  - **CD4 T lymphocyte (CD4) cell counts <50 cells/mm^3:** Initiate ART as soon as possible, but within 2 weeks of starting TB treatment **(AI).**
  - **CD4 counts ≥50 cells/mm^3:** Initiate ART within 2 to 8 weeks of starting TB treatment **(AI).**
  - **During pregnancy, regardless of CD4 count:** Initiate ART as early as feasible for treatment of the person with HIV and prevention of HIV transmission to the infant **(AIII).**
  - **With TB meningitis:** Initiate ART after TB meningitis is under control and after at least 2 weeks of anti-TB treatment to reduce the risk of life-threatening inflammation in a closed space as a result of immune reconstitution **(AIII).**
- For people with active TB who are receiving ART, the ARV regimen should be assessed with particular attention to potential drug–drug interactions between ARVs and TB drugs. Rifamycin antibiotics (rifabutin, rifampin, and rifapentine), in particular, have considerable potential for drug–drug interactions. The ARV regimen may need to be modified to permit use of the optimal TB treatment regimen (see Tables 24a through 24g for drug interaction data and dosing recommendations) **(AII).**

Rating of Recommendations: *A = Strong; B = Moderate; C = Weak*

Rating of Evidence: *I = Data from randomized controlled trials; II = Data from well-designed nonrandomized trials or observational cohort studies with long-term clinical outcomes; III = Expert opinion*

Managing Latent Tuberculosis Infection in People With HIV

Approximately one-quarter of the world's population has tuberculosis (TB) infection, with a 5% to 10% lifetime risk of progressing to active disease.[1] Among individuals with latent TB infection (LTBI), the risk of developing active TB is much higher among those who also have HIV, and this risk increases as immune deficiency worsens.[2]

Tuberculosis Preventive Treatment

After active TB has been excluded, the Centers for Disease Control and Prevention preferentially recommends one of the following short-course regimens for LTBI treatment (see Treatment Regimens for Latent TB Infection):

- 3 months of once-weekly isoniazid plus rifapentine (3HP)
- 4 months of daily rifampin (4R)
- 3 months of daily isoniazid plus rifampin (3HR)

The World Health Organization (WHO)[3] and the Panel on Guidelines for the Prevention and Treatment of Opportunistic Infections in Adults and Adolescents With HIV also recommend 1 month of daily isoniazid with rifapentine (1HP) as an alternative short-course regimen.

For more than 30 years, isoniazid had been the cornerstone of treatment for LTBI to prevent active TB. Randomized controlled clinical trials have demonstrated that treatment with isoniazid for 6 or 9 months for LTBI in people with HIV reduces the risk of active TB, especially in those with a positive tuberculin skin test.[4] Isoniazid given daily or twice weekly for 6 or 9 months can be coadministered with any antiretroviral (ARV) regimen and remains an alternative option, especially for people in whom rifamycin antibiotics cannot be used **(AIII).**

In the PREVENT TB study, the combination of isoniazid and rifapentine administered once a week for 3 months (3HP), as directly observed therapy, was as safe and effective as 9 months of isoniazid in preventing TB in people with HIV who were not on antiretroviral therapy (ART).[5] Another study randomized 1,148 South African adults with HIV who were not on ART to one of four treatment groups: 3 months of isoniazid and rifapentine, 3 months of isoniazid and rifampin, 6 months of isoniazid, or isoniazid continued for the duration of the trial. TB incidence did not differ among the groups.[6] The Panel for the Use of Antiretroviral Agents in Adults and Adolescents With HIV (the Panel) recommends dolutegravir (DTG) 50 mg once daily with 3 months of once-weekly isoniazid and rifapentine in people with virologic suppression and for whom once-daily DTG is appropriate **(BII).** More importantly, this 3-month regimen **is not recommended** for people who require twice-daily DTG therapy (e.g., those with certain integrase strand transfer inhibitors [INSTI]–associated resistance substitutions or clinically suspected INSTI resistance) **(AIII).** Isoniazid given daily for 6 or 9 months should be used in this setting.

A study of 6,000 people that compared completion rates, safety, and effectiveness of 4 months of daily rifampin (4R) versus 9 months of isoniazid found that 4R was non-inferior to isoniazid for 9 months for the prevention of TB disease, and that safety and completion rates were superior for 4R.[7] However, this trial included only 242 (4%) participants with HIV. While 4R may also be considered for TB-preventive treatment, clinicians should pay careful attention to potential drug–drug interactions with specific ARV drugs (see Tables 24a through 24g).

In 3,000 people with HIV infection in the BRIEF TB study, no difference was observed in TB incidence between those who received 1HP and those who received 9 months of isoniazid.[8] Approximately half of the participants were on ART (either efavirenz [EFV] or nevirapine-based

regimens) while receiving the 1-month regimen. Fewer adverse events and a higher treatment completion rate occurred with the 1HP regimen than with 9 months of isoniazid.

Although rifapentine induces cytochrome P450 (CYP) isoenzymes and can potentially cause significant drug–drug interactions with ARVs, pharmacokinetic (PK) data support its use daily **(AI)** or once weekly **(AII)** with EFV 600 mg daily,[9,10] and once weekly with raltegravir (RAL) 400 mg twice daily **(AII).**[11] In a Phase 1/2 study of 60 adults with HIV and virologic suppression on once-daily dolutegravir (DTG)-based ART and weekly rifapentine with isoniazid,[12] DTG trough concentrations were reduced by 50% to 60%; all but one participant's trough concentration remained above the DTG protein-adjusted 90% inhibitory concentration (IC_{90}), and all HIV viral loads remained suppressed. In a multicenter PK study (A5372), 32 adults with HIV and virologic suppression on DTG-containing ART received DTG 50 mg twice daily throughout the course of 1HP and for 14 days after.[13] DTG trough concentrations were comparable with standard-dose DTG once daily without 1HP, and 31 (96.9%) of 32 participants maintained virologic suppression. One participant had an HIV RNA of 160 copies/mL at Day 28, with HIV RNA <50 copies/mL upon repeat testing on Day 42. Based on these data, the Panel recommends DTG 50 mg twice daily when given with 1HP in people with virologic suppression, continuing DTG 50 mg twice daily for 14 days after 1HP completion before switching back to once-daily DTG dosing **(AII).**

When prescribing either 1HP or 3HP, tenofovir disoproxil fumarate (TDF)/emtricitabine (FTC) **(AIII),** tenofovir alafenamide (TAF)/FTC **(BIII),** or abacavir (ABC)/lamivudine (3TC) **(BIII)** can be used as the nucleoside reverse transcriptase inhibitor (NRTI) backbone. The drug concentrations for ABC, TDF, 3TC, and FTC are not expected to be affected by rifapentine. Rifapentine may lower concentrations of TAF; if TAF is used, monitor for virologic response.

If a person with HIV has been in close contact with a person with drug-resistant TB, the options for LTBI treatment should be modified, taking into consideration drug-susceptibility test results from the source patient. In this setting, consultation with a TB expert is advised.

Isoniazid Preventive Therapy Plus Antiretroviral Therapy in Pregnant Women With HIV

A randomized trial of isoniazid preventive therapy (IPT) compared isoniazid initiated during pregnancy (immediate IPT) to isoniazid delayed until 12 weeks postpartum (deferred IPT) in 956 women with HIV on ART. A greater number of adverse pregnancy outcomes were seen in women on immediate IPT, suggesting that IPT should be delayed until after delivery.[14] Treatment-related maternal adverse events were higher than expected in both arms. In the BRIEF TB study, first-trimester IPT exposure was associated with a nearly twofold increased risk of fetal demise—mostly spontaneous abortion—though the association was attenuated when adjusted for covariates proximal to pregnancy outcome, including ART use.[15] However, two observational studies from South Africa showed better pregnancy outcomes and no increase in hepatotoxicity in pregnant women on ART receiving antenatal IPT.[16,17] The WHO continues to recommend IPT for individuals with HIV.[3]

Impact of Antiretroviral Therapy in Preventing Active Tuberculosis

Effective ART can prevent active TB in areas with high TB prevalence. The TEMPRANO study conducted in Côte d'Ivoire randomized 2,056 participants with HIV to one of four study arms: deferred ART, deferred ART plus IPT, early ART, or early ART plus IPT. The initial results demonstrated that IPT and early ART each independently reduced the risk of a serious HIV-related event, many of which were TB, and that IPT with early ART provided the best protection from serious HIV events and death.[18] Data from longer follow-up (median 4.9 years) showed that 6 months of IPT given early in the course of HIV infection provided a durable survival benefit, with a 37% reduction in the risk of death that was independent of ART.[19] In the START study,

4,685 participants with CD4 T lymphocyte (CD4) cell counts >500 cells/mm^3 were randomized to receive immediate ART or deferred ART. For participants in the deferred ART arm, ART was started when their CD4 count dropped to 350 cells/mm^3 or if they developed a clinical condition that required ART. TB was one of the three most common clinical events, occurring in 14% of participants in the immediate ART group and 20% of participants in the deferred ART group.[20] Collectively, these two large randomized studies showed that early initiation of ART (with or without IPT) reduced active TB, particularly in countries with a high prevalence of TB/HIV coinfection.

Antiretroviral Therapy for People With HIV and Active Tuberculosis

All people with HIV/TB disease should be treated with ART **(AI)**, although the timing of ART initiation may vary as discussed below. Important considerations related to the use of ART in people with active TB disease include the following:

- When to start ART in the setting of drug-resistant TB and in people with TB meningitis,
- Significant PK drug–drug interactions between anti-TB and ARV drugs, *and*
- The development of TB-associated immune reconstitution inflammatory syndrome (IRIS) after ART initiation.

Active pulmonary or extrapulmonary TB disease requires prompt initiation of TB treatment. The treatment of active TB disease in people with HIV should follow the general principles guiding treatment for people without HIV. The Adult and Adolescent Opportunistic Infection Guidelines include a more complete discussion of the diagnosis and treatment of TB disease in people with HIV.

The TB Trials Consortium Study 31/ AIDS Clinical Trials Group (ACTG) A5349 demonstrated success with a shorter, 4-month regimen.[21] This randomized, open-label, controlled Phase 3 trial compared two 4-month rifapentine-containing regimens to the standard 6-month control regimen of isoniazid plus rifampin. In 2,516 participants, including 193 (8%) with HIV, the rifapentine-moxifloxacin regimen was non-inferior to the control regimen, with 11.6% versus 9.6% unfavorable outcomes, respectively (difference 2.0%; 95% confidence interval, −1.1% to +5.1%), and it was safe and well tolerated. Participants with HIV were either already on an EFV-based ART or initiating an EFV-based ART.[22] In both groups, EFV concentrations were decreased slightly, but most maintained EFV concentrations of >1 mg/L and undetectable viremia.[23] This 4-month TB regimen with DTG-based ART is currently under investigation in the ACTG A5406 trial (NCT05630872).

Tuberculosis Diagnosed While a Person Is Receiving Antiretroviral Therapy

ART should be continued when TB is diagnosed in a person receiving ART, but the ARV regimen should be assessed with particular attention to potential drug interactions between ARVs and TB drugs (discussed below). The person's ARV regimen may need to be modified to permit use of the optimal TB treatment regimen **(AII)** (see Tables 24a through 24g for dosing recommendations).

Tuberculosis Diagnosed in a Person With HIV Not Yet Receiving Antiretroviral Therapy

ART should not be delayed until TB treatment is completed, because this strategy was associated with higher mortality rates in the SAPiT-1 study.[24] The timing of ART in specific populations is discussed below.

People with HIV and CD4 counts <50 cells/mm^3: Three large randomized clinical trials in people with HIV/TB disease, conducted in Africa and Asia, all convincingly showed that early ART in those with CD4 counts <50 cell/mm^3 significantly reduced AIDS events or deaths.[25-27] In these studies, early ART was defined as either ≤2 weeks[26] or ≤4 weeks[25] after initiation of TB therapy.

Collectively these three trials support the initiation of ART within the first 2 weeks of TB treatment in people with CD4 counts <50 cells/mm^3 **(AI).**

People with HIV and CD4 counts ≥50 cells/mm^3: In two of the three studies mentioned above,[26,27] no survival benefit was seen for people with CD4 counts ≥50 cells/mm^3 who initiated ART at <2 weeks versus later (8–12 weeks), after beginning TB treatment. Importantly, none of the studies demonstrated harm from earlier ART initiation, and many benefits of ART in people with HIV are well documented, regardless of TB coinfection. It is unlikely that more trials will be conducted to specifically inform the decision on when to start ART in people with TB and CD4 counts ≥50 cells/mm^3.

However, given the growing body of evidence supporting early ART in general and the lack of data showing any harm in people with TB coinfection, the Panel recommends ART initiation within 2 to 8 weeks after starting TB treatment for people with CD4 counts ≥50 cells/mm^3 **(AI).**

People with HIV and drug-resistant TB: People may have single-drug-resistant TB, multidrug-resistant TB (MDR-TB) (defined as strains with resistance to both isoniazid and rifampin); pre-extensively drug-resistant (pre-XDR) TB (defined as MDR-TB plus resistance to any fluoroquinolone), or extensively drug-resistant TB (XDR-TB) (defined as MDR-TB plus resistance to any fluoroquinolone and at least one additional Group A drug listed in the WHO guidelines).[28] Historically, mortality rates in people with MDR-TB or XDR-TB and HIV have been high,[29] but more recent data suggest that treatment outcomes are similar for people with MDR-TB with and without HIV infection. In the Nix-TB study of an all-oral, 6-month regimen of bedaquiline, pretomanid, and linezolid for MDR-TB and XDR-TB, 51% of the 109 participants also had HIV. Rates of cure, serious adverse events, and mortality were similar among those with and without HIV.[30]

Although randomized clinical trial data to guide the optimal timing for ART initiation are lacking, the WHO guidelines recommend ART for all people with HIV and drug-resistant TB, irrespective of CD4 count, as early as possible (within the first 8 weeks), following the initiation of TB treatment.

Management of people with HIV and drug-resistant TB is complex, and expert consultation is advised **(AIII).**

People with TB meningitis: TB meningitis is often associated with severe complications and a high mortality rate. In a study conducted in Vietnam, people with HIV-associated TB meningitis were randomized to immediate ART or to ART deferred until 2 months after initiation of TB treatment. A significantly higher rate of severe (Grade 4) adverse events was seen in people who received immediate ART than in those who received deferred ART (80.3% vs. 69.1% for immediate and deferred ART, respectively; $P = 0.04$).[31]

Despite these study results, in the setting of TB meningitis, many experts would recommend initiating ART early in settings where close monitoring of drug-related toxicities and central nervous system adverse events is feasible (see Adult and Adolescent Opportunistic Infection Guidelines) **(BIII).** ART should be started after TB meningitis is under control and after at least 2 weeks of anti-TB treatment to reduce the risk of life-threatening inflammation in a closed space as a result of immune reconstitution **(AIII).**

Managing people with HIV and TB meningitis is complex, and expert consultation is advised **(AIII).**

Pregnant women: All women with HIV and active TB who are pregnant should be started on ART as early as feasible, both for the treatment of the person with HIV and prevention of HIV transmission to the infant **(AIII).** The choice of ART should be based on efficacy and safety in pregnancy and should take into account potential drug–drug interactions between ARVs and rifamycins (see Perinatal Guidelines for more detailed discussions).

Drug Interaction Considerations

Rifamycin antibiotics (rifabutin, rifampin, and rifapentine) are an important component of TB treatment regimens because of their sterilizing ability. However, they are associated with a considerable potential for drug interactions due to their ability to affect various drug-metabolizing enzymes and transporters. Rifampin is a potent inducer of the CYP (mostly 3A and 2C subfamilies) enzyme system, P-glycoprotein (P-gp), and uridine diphosphate glucuronosyltransferase 1A1 (UGT1A1). Rifabutin and rifapentine are both substrates and inducers of CYP3A4. As potent inducers of metabolic enzymes and drug transporters, rifamycin-related drug interactions may result in significant reduction in ARV drug exposure. The ARV drugs most affected include all protease inhibitors (PIs), non-nucleoside reverse transcriptase inhibitors (NNRTIs), INSTIs, the CCR5 antagonist maraviroc (MVC), the gp120 attachment inhibitor fostemsavir, and the capsid inhibitor lenacapavir. Coadministration of rifamycins with long-acting injectable cabotegravir with rilpivirine or lenacapavir is contraindicated.[32] Most NRTIs, the fusion inhibitor enfuvirtide, and the CD4 post-attachment inhibitor ibalizumab are not expected to have significant drug interactions with the rifamycins. Tables 24a through 24g outline the magnitude of these interactions and provide dosing recommendations when rifamycin antibiotics and selected ARV drugs are used concomitantly.

Because TAF is a P-gp substrate, its plasma concentrations may be reduced by rifamycin antibiotics. Current labeling does not recommend concomitant administration of TAF and any rifamycin antibiotic.[33] However, in a healthy volunteer study, following administration of TAF/FTC with rifampin, intracellular tenofovir-diphosphate concentrations were still 4.2-fold higher than those achieved by TDF.[34] TAF can be used with rifampin with caution and close monitoring of virologic response.

Several ARV drugs are not recommended for use with rifampin; clinicians should refer to Tables 24a through 24g before prescribing these drugs in combination. When DTG, RAL, or MVC are used with rifampin for TB treatment, the ARV doses must be increased. In contrast to its effect on other ARV drugs, rifampin leads to only a modest reduction in EFV concentrations.[35,36] Even though the current EFV label recommends increasing the EFV dose from 600 mg once daily to 800 mg once daily in people weighing >50 kg,[37] this dosage increase is generally not necessary. The Panel recommends EFV 600 mg for individuals receiving rifampin therapy. High-dose (up to 35 mg/kg/day) rifampin is currently being evaluated for treatment of TB meningitis. The data on the magnitude and extent of interactions between high-dose rifampin and ARV drugs are limited.[38-40]

Rifabutin, a weaker CYP3A4 enzyme inducer, is an alternative to rifampin for TB treatment, especially in people taking PI- or INSTI-based ARV regimens. Because rifabutin is a substrate of the CYP450 enzyme system, its metabolism may be affected by NNRTIs or PIs. Therefore, rifabutin dosage adjustment is generally recommended (see Tables 24a through 24g for dosing recommendations).

Rifapentine is a long-acting rifamycin that may be given once weekly or once daily. When given daily, it is a more potent inducer than rifampin.[41] Once-daily rifapentine did not affect the oral clearance of EFV 600 mg in individuals with HIV in the BRIEF TB study,[42] and once-weekly rifapentine has demonstrated minimal impact on EFV 600 mg exposure.[9] Once-weekly rifapentine led to an increase, rather than a decrease, in RAL drug exposure in healthy volunteers.[11] A PK study conducted in South Africa found that once-weekly isoniazid-rifapentine plus once-daily DTG was well tolerated in participants with HIV, with only 3 of 60 participants experiencing a Grade 3 adverse effect (two with

elevated creatinine and one with hypertension). The extent of the interaction varied by day, with a 23% reduction on Day 1, 64% reduction on Day 2, and 56% reduction on Days 5 and 6 after isoniazid-rifapentine dose.[12] In a multicenter PK study (A5372), 32 adults with HIV and virologic suppression on DTG-containing ART received DTG 50 mg twice daily during 1HP and for 14 days after.[13] DTG trough concentrations were comparable with standard-dose DTG once daily without 1HP.

Tuberculosis-Associated Immune Reconstitution Inflammatory Syndrome

Immune reconstitution inflammatory syndrome (IRIS) is a clinical condition caused by ART-induced restoration of pathogen-specific immune responses to opportunistic infections, such as TB, resulting in either the deterioration of a treated infection (paradoxical IRIS) or a new presentation of a previously subclinical infection (unmasking IRIS). Manifestations of unmasking TB-associated IRIS (TB-IRIS) are characterized by their marked inflammatory nature, such as high fever, respiratory distress, lymphadenitis, abscesses, and sepsis syndrome. Manifestations of paradoxical TB-IRIS include fevers, new or worsening lymphadenopathy, new or worsening pulmonary infiltrates, enlarging pleural effusions, and new or enlarging tuberculomas.

TB-IRIS has been reported in 8% to more than 40% of people who start ART after being diagnosed with TB, although the incidence depends on the definition of IRIS and the intensity of monitoring.[43,44] IRIS is infrequently associated with mortality.

Predictors of IRIS include a baseline CD4 count <50 cells/mm^3; higher on-ART CD4 counts; high pre-ART and lower on-ART HIV viral loads; severity of TB disease, especially high pathogen burden; and <30-day interval between initiation of TB and HIV treatments.[45] Most IRIS in HIV/TB disease occurs ≤3 months from the start of ART.

In general, the Panel recommends continuing ART without interruption during IRIS **(AIII).**

LIMITATIONS TO TREATMENT SAFETY AND EFFICACY

Adherence to the Continuum of Care

Updated: September 12, 2024
Reviewed: September 12, 2024

Key Considerations and Recommendations

• Linkage to HIV care and adherence to both antiretroviral therapy (ART) and clinic appointments should be regularly assessed.
• An individual's barriers to ART and clinic appointment adherence should be assessed before or shortly after the initiation of ART and regularly thereafter.
• Rapid access to ART is one of the pillars of the United States' plan to end the HIV epidemic; therefore, delays in access to ART should be addressed and treatment initiated as soon as possible.
• People with HIV having ART adherence problems should be placed on regimens with high genetic barriers to resistance, such as dolutegravir, bictegravir, or boosted darunavir. Side effects, out-of-pocket costs, convenience, and individual preferences should also be considered.
• People with HIV having difficulties with adherence to appointments or ART should be provided additional adherence support using a constructive, collaborative, nonjudgmental, and problem-solving approach.
• The approach taken to improve adherence should be tailored to each person's needs and barriers to care. Approaches could include, but are not limited to—
  ○ Changing ART to simplify dosing or to reduce side effects
  ○ Allowing flexible appointment scheduling
  ○ Finding resources to assist with treatment costs to maintain uninterrupted access to both ART and appointments
  ○ Linkage to resources to assist with unmet social and economic needs, such as transportation, food, housing, and other support services
  ○ Linkage to services to overcome stigma, substance use, or mental illness
• A multidisciplinary approach—including collaborations with nursing, pharmacy, social work, and case management (to the extent available—is often necessary to identify solutions to ART and appointment adherence. The clinician's role is to help people with HIV understand the importance of adherence to the continuum of care, identify the barriers to adherence and address those that are within their purview, and link them to resources to overcome other barriers.
• Single-tablet ART regimens are generally recommended when clinically appropriate, but high-quality evidence to definitively recommend them is lacking and shared decision-making between clinicians and people with HIV is essential **(BIII).**
• At this time, evidence does not support the use of financial incentives to engage people with HIV in ongoing routine care.
• Methods to estimate adherence based on drug levels measured in plasma, dried blood spots, urine, and hair samples are available. Measuring adherence with these methods has not been shown in randomized studies to improve outcomes. However, these methods should be used in a collaborative manner to avoid an adversarial relationship between the provider and people with HIV.

- Because delayed administration of long-acting cabotegravir plus rilpivirine (LA CAB/RPV) may lead to the emergence of drug resistance, LA CAB/RPV is not generally recommended as a complete regimen in people with viremia due to suboptimal adherence to ART, or in people who have ongoing challenges with retention in HIV care. However, based on very limited data, the Panel for the Use of Antiretroviral Agents in Adults and Adolescents With HIV recommends the use of LA CAB/RPV on a case-by-case basis in select individuals with persistent virologic failure despite intensive adherence support on oral ART, and who have no evidence of resistance to rilpivirine RPV or CAB and, with shared decision-making between providers and people with HIV **(CIII).** See Virologic Failure for a more detailed discussion.
- A summary of best practice interventions to improve linkage, retention, and adherence can be found in the Centers for Disease Control and Prevention's Compendium of Evidence-Based Interventions and Best Practices for HIV Prevention.

Rating of Recommendations: *A = Strong; B = Moderate; C = Weak*

Rating of Evidence: *I = Data from randomized controlled trials; II = Data from well-designed nonrandomized trials or observational cohort studies with long-term clinical outcomes; III = Expert opinion*

Introduction

HIV treatment adherence includes initiating care with an HIV provider (linkage to care), regularly engaging in appointments (retention in care), and adhering to antiretroviral therapy (ART). The concept of a "continuum of care" has been used to describe the process of HIV testing, linkage to HIV care, initiation of ART, adherence to ART, retention in care, and virologic suppression.[1-3] The Centers for Disease Control and Prevention (CDC) estimates that about 13% of people with HIV are undiagnosed in the United States.[4] Based on 2022 data, about 82% of individuals were linked to care within 30 days of receiving an HIV diagnosis.[5,6] However, only 54% of people with diagnosed HIV were retained in HIV care. It is estimated that only approximately 69% of people with complete data were virologically suppressed within 6 months of diagnosis. This low rate of viral suppression is primarily due to poor adherence to clinic appointments and ART.[5,7] Outcomes along the continuum of care also vary by geographic region and other population characteristics, such as sex, race and ethnicity, and HIV risk factors.[7] To achieve optimal clinical outcomes and to realize the potential public health benefit of treatment as prevention, adherence to each step in the continuum of care is critical.[8] It is important to note that retention and adherence may fluctuate as a result of life events, changes in insurance status, comorbid conditions, and health system changes, causing people with HIV to shift back and forth on the continuum. Knowledgeable providers and high-quality system processes are vital in promoting rapid linkage and sustained retention in care and adherence to ART. Finally, clinicians should recognize that adherence is a complex behavior requiring knowledge, motivation, memory, behavior change, external resources, and successful and persistent interaction with complex and, sometimes, challenging health care systems.[9-11] The patient–provider relationship is central to improving HIV care engagement and adherence to treatment. Providers must recognize that adherence is a collaborative effort between clinicians and people with HIV.

Addressing social determinants of health (SDOH) is critical to adherence along the HIV continuum of care. The CDC defines SDOH as "the conditions in which people are born, grow, work, live, and age" and "that influence health outcomes."[12] SDOH include access to education, income, nutritious food, transportation, stable housing, and health insurance coverage, as well as policies that may lead to structural racism, HIV criminalization, stigmatization, or immigration status. There are several commonly used screening tools for health-related social needs, including the Protocol for Responding to and Assessing Patients' Assets, Risks, and Experiences (PRAPARE),[13] the American Academy of Family Physicians Social Needs Screening Tool (long and short forms),[14,15] and the Centers for Medicare & Medicaid Services (CMS) Accountable Health Communities Health-Related Social Needs (AHC-HRSN) Screening Tool.[16] The CMS Accountable Health Communities Model conducted a randomized trial connecting beneficiaries to community resources for five core health-related social needs compared with a referral-only group. Individuals in the community resources

group received an in-depth assessment of social needs, planning, referral to community services, and follow-up until the needs were resolved or determined unresolvable. The beneficiaries who received community service navigation experienced reduced emergency department visits and a trend toward lower expenditures and improved hospital-based utilization outcomes compared with the referral-only group.[17] Any unmet social and economic needs identified via screening should be addressed, either through direct service provision or by community referrals.

This section provides guidance on linking people with HIV to care, assessing and improving retention in care, and assessing and improving adherence to ART. The CDC maintains a Compendium of Evidence-Based Interventions and Best Practices for HIV Prevention to improve linkage, retention, and adherence, and the Health Resources and Services Administration (HRSA) has multiple tools to assist clinics housed in the Ryan White HIV/AIDS Program (RWHAP) Best Practices Compilation. In addition, a number of other groups and organizations have provided guidance for improving adherence to the steps in the care continuum.[8,18]

Linkage to Care

Receiving an HIV diagnosis can be traumatic, and linkage to care efforts must be delivered with compassion and persistence. The time from diagnosis to linkage to care can be affected by many factors, including insufficient socioeconomic resources, active substance use, mental health problems, stigma, and disease severity (symptomatic HIV is associated with more successful linkage).[19-23] In the United States, youth, people who use injection drugs, and Black/African American people have lower rates of linkage to care.[7] Some health system factors have also been associated with linkage success or failure. Co-location of testing and treatment services[22] and active linkage services (e.g., assistance in setting up HIV care appointments, maintaining an active relationship with individuals until linkage is completed, providing linkage case management services)[24-26] bolster linkage to care. Conversely, passive linkage (e.g., only providing names and contact information for treatment centers) is associated with lower linkage to care.

Monitoring Linkage to Care

Linking to HIV care after a new HIV diagnosis is defined as completing an outpatient appointment with a clinical provider who has the skills and ability to treat HIV, including prescribing ART. People with HIV should be linked to care as soon as possible after HIV diagnosis, preferably within 30 days. Monitoring linkage is critical to ensure that interventions can effectively reach people who are not linked to care. If the facilities that diagnose and treat an individual are the same or share the same electronic medical record system, it is relatively straightforward to monitor linkage to care. Monitoring linkage for people whose HIV is diagnosed outside the treatment provider's health care system is difficult and generally is the responsibility of the diagnosing provider or entity and the public health authority. However, once people with HIV make contact with the treating clinical system, they should be engaged in linkage efforts. The referring entity should monitor for successful linkage to and retention in HIV care.

Improving Linkage to Care

Strategies to improve linkage to care are summarized in Table 20 below. Linkage efforts should include immediate referral to care at diagnosis, appointment reminders, and outreach efforts if needed.[24] The only intervention shown to increase linkage to care in a randomized trial conducted in the United States is the Anti-Retroviral Treatment and Access to Services (ARTAS) intervention.[25] In this study, participants randomized to the control arm received information about HIV and care resources and a referral to a local HIV medical provider, whereas participants in the intervention arm worked with an ARTAS interventionist for five sessions, 90 days, or until linkage—whichever came first. The interventionist helped participants to identify and use their strengths, abilities, and skills to

link to HIV care; participants were also linked to community resources. Linkage to care, defined in this study as completing at least one visit with an HIV clinician within the first 6 months, was greater among the ARTAS participants than the control participants (78% vs. 60%, adjusted risk ratio = 1.36, $P < 0.001$). Furthermore, a greater percentage of ARTAS participants were retained in care, defined as visiting an HIV clinician at least once in each of the first two 6-month blocks after enrollment (64% vs. 49% for ARTAS and control participants, respectively; adjusted risk ratio = 1.41, $P = 0.006$). The results from the ARTAS intervention have been replicated in a community-based study.[26] The CDC supports free training in the ARTAS intervention. Other studies support the importance of post-test counseling to educate, motivate, and present positive messages about HIV,[27] peer support,[28] and engaging people with HIV at the clinic in advance of the visit with the provider.[29] Financial incentives did not increase linkage to care within 90 days in a large randomized trial.[30]

Retention in Care

Poor retention in HIV care is associated with a greater risk of death.[31,32] Poor retention is more common in people who use substances, have serious mental health problems, have unmet socioeconomic needs (e.g., housing, food, transportation), lack financial resources or health insurance, have schedules that complicate adherence, have been recently incarcerated, or face stigma.[33-36] At the provider and health system level, low trust in providers and a poor relationship between providers and people with HIV have been associated with lower retention, as has lower satisfaction with the clinic experience.[37-39] Availability of appointments and timeliness of appointments (i.e., long delay between the appointment request and the appointment date) and scheduling convenience are also factors.

Monitoring Retention in Care

Retention in care should be routinely monitored.[8] There are various ways to measure retention, including measures based on attended visits over a defined period of time (constancy measures) and measures based on missed visits.[40] Both approaches are valid and independently predict survival.[41] Missed visits and a prolonged time since the last visit are relatively easy to measure and should trigger efforts to retain or reengage a person in care. Constancy measures (e.g., at least two visits that are at least 90 days apart over 1 year, or at least one visit every 6 months over the last 2 years) can be used as clinic quality assurance measures.

Improving Retention in Care

Strategies to improve retention in care are summarized in Table 20 below. The Retention through Enhanced Personal Contact (REPC) intervention was tested in a randomized trial in six clinics in the United States. The study enrolled people with HIV who had a history of inconsistent clinic attendance. The intervention relied on personal contact and included a brief face-to-face meeting upon returning to care and at each subsequent clinic visit, plus three types of phone calls (check-ins between visits, to provide appointment reminders just before visits, and to attempt to reschedule missed visits). REPC resulted in small but significant improvements in retention in care, including in racial/ethnic minority populations and people with detectable plasma HIV RNA.[42] When necessary, in-clinic opioid replacement therapy helps opioid users remain in care.[43] An intervention using the electronic medical record to alert providers when people had suboptimal follow-up or high viral loads also improved retention in care.[44]

Telehealth has emerged as an important modality for retention in HIV care during the COVID-19 pandemic. A cluster-randomized study conducted in the U.S. Department of Veterans Affairs health facilities before the pandemic showed that the availability of telehealth resulted in improvements in viral suppression and the number of completed visits.[45] Reengaging and retaining people who are out of care remains particularly challenging.

Navigation services for out-of-care individuals with HIV in a New York City Medicaid health plan resulted in faster re-linkage to care but did not improve retention in care.[46] In two randomized trials involving out-of-care, hospitalized people with HIV, peer counselors and patient navigators did not improve re-linkage to care after hospital discharge.[47,48] Two randomized studies tested a Data to Care intervention, which uses clinic and public health data to reach and reengage out-of-care people with HIV.[49] One trial conducted in Seattle found that the intervention did not result in significantly faster time to re-linkage or viral suppression.[50] However, only people with unsuppressed viremia and CD4 T lymphocyte (CD4) cell counts <350 cells/mm^3 or people with no laboratory values in the preceding 12 months were included, reflecting the HIV treatment guidelines at the time. The Cooperative Re-Engagement Controlled Trial (CoRECT) was more recently conducted in the Northeast United States (Connecticut, Massachusetts, Philadelphia) and included people with HIV with no evidence of a clinic visit or laboratory measurement in the preceding 6 months, regardless of their most recent laboratory results. The proportion of people re-linked to care within 90 days and retained in care at 12 months was significantly higher in the intervention group, but no differences were observed in the proportion who achieved viral suppression in 12 months. Time to viral suppression among those who achieved viral suppression in 12 months was shorter for participants who were randomized to the Data to Care arm compared with the standard of care. Using the Data to Care approach requires substantial resources and notable privacy concerns; although short-term re-linkage may be improved, there is no evidence of an impact on long-term re-linkage or time to viral suppression.

Data from nonrandomized studies are less conclusive, but many interventions bear mentioning. Clinic-wide marketing (e.g., posters, brochures) and customer service training of staff to promote attending scheduled visits and provide people with a welcoming and courteous experience have improved retention.[51] People with HIV who rated their experience with their doctor more highly were more likely to stay in care.[52] Stepped-case management and social and outreach services,[53] including mobile health applications that enhance communication and provide support, are beneficial, although the applications that have been developed and studied are not available for widespread public use. Differentiated care approaches reduce the need for appointments and other expectations for people doing well and allow extra resources to be devoted to people not achieving optimal health outcomes. The evidence to support the use of differentiated care is strongest in low-resource settings, whereas in the United States, the evidence is limited to observational data, which suggests the approach has a beneficial impact.[54]

Overall, these data support the concept that all clinic personnel, from the facilities' staff to nurses to providers, play important roles in supporting retention in care by providing the optimal care experiences, constructively affirming attendance rather than criticizing non-attendance, and collaboratively solving problems with people to overcome barriers to care.[38,42,51] Flexible appointment schedules, expanded clinic hours, and copay or other financial or insurance assistance—such as that provided by the RWHAP—also facilitate uninterrupted access to clinical care. Navigation services, telehealth, and engaging with people through mobile health applications are likely to improve outcomes, although the evidence is not sufficient to support their use unequivocally.

The use of financial incentives or rewards to promote retention in care has been studied. A large study randomized clinic sites to financial incentives or standard of care. At baseline, 45% of the participants were retained in care in these clinics. The relative increase in the proportion of participants retained in care was 9% higher in clinics offering incentives than in standard-of-care clinics. Viral suppression also improved by 4% at financial incentive clinics, from a baseline of 62%.[30] Evidence from a *post hoc* analysis of a subset of the sites involved in that trial shows a reduced but persistent improvement in retention in care after the withdrawal of the incentives without a persistent effect on viral suppression.[55] In another large, randomized study of people who were out of care and hospitalized, financial incentives plus patient navigation did not lead to sustained

improvement in retention or viral load suppression compared to standard care.[47] At this time, financial incentives remain experimental in the context of improved retention due to a lack of data supporting their use in routine care.

Adherence to Antiretroviral Therapy

Adherence to ART can be influenced by several factors, including a person's social situation, clinical condition, the prescribed regimen, and the patient–provider relationship.[56] Poor adherence is often a consequence of one or more behavioral, structural, and psychosocial barriers (e.g., depression and other mental illnesses, neurocognitive impairment, low health literacy, low levels of social support, stressful life events, busy or unstructured daily routines, active substance use, homelessness, poverty, nondisclosure of HIV serostatus, denial, stigma, inconsistent access to medications due to financial and insurance status).[57-60]

Characteristics of one or more components of the prescribed regimen can affect adherence. Once-daily regimens,[61] including those with low pill burden (even if not one pill once daily), no food requirement, and few side effects or toxicities, are associated with higher levels of adherence.[62,63] Single-tablet regimens (STRs) that include all antiretroviral (ARV) drugs in one pill taken once daily are easier for people to use. However, data to support or refute the superiority of an STR versus a once-daily multi-tablet regimen (MTR), as might be required for the use of some generic-based ARV regimens, are limited. Comparisons of these regimens are hampered because not all drugs and classes are available as STRs. There are demonstrated beneficial effects on virologic suppression in a meta-analysis of MTRs versus STRs.[64,65] Whether an STR is beneficial in people with HIV who are ART-naive is not known, with observational cohort studies showing the benefit of a once-daily STR versus a once-daily MTR.[63,66-69] On the other hand, observational data from Spain showed that co-formulated dolutegravir (DTG)/abacavir (ABC)/lamivudine (3TC) resulted in similar viral suppression compared to DTG plus ABC/3TC when used both at treatment initiation and when people with viral suppression on STR were switched to the two-pill formulation as a cost-saving strategy.[70] Given these findings and their wide availability, STRs are generally recommended when clinically appropriate, but high-quality evidence to definitively recommend them is lacking, and shared decision-making is essential **(BIII).**

Characteristics of the clinical setting can also have important structural influences on the success or failure of medication adherence. Settings that provide comprehensive multidisciplinary care (e.g., by case managers, pharmacists, social workers, mental health and substance use providers) support the complex needs of individuals, including those related to medication adherence. Treatment programs for substance use may offer services that promote adherence, such as directly observed therapy (DOT) (see Substance Use Disorders and HIV).

Monitoring Adherence to Antiretroviral Therapy

Adherence to ART should be assessed and addressed in a constructive and nonjudgmental manner at every clinic visit. Given the potency of contemporary ART, a detectable viral load identified during chronic care for a person with stable access to ART is most likely the result of poor adherence. Self-report, the most frequently used method for evaluating medication adherence, remains a useful tool. Carefully assessed self-report of high-level adherence to ART has been associated with favorable viral load responses,[71-73] whereas admission of suboptimal adherence is highly correlated with poor therapeutic response. The reliability of self-reporting often depends on how the clinician elicits the information. It is most reliable when ascertained in a simple, nonjudgmental, routine, and structured format that normalizes less-than-perfect adherence and minimizes socially desirable responses. To allow people to disclose lapses in adherence, some experts suggest inquiring about the number of missed doses during a defined period. For example, for a person with a detectable viral load, a provider might state, "I know it is difficult to take medicine every day. Most people miss doses at

least sometimes. Thinking about the last 2 weeks, how many times have you missed doses? Please give me a rough estimate so I can help you take the best care of yourself." Other research supports simply asking people to rate their adherence during the last 4 weeks on a 5- or 6-point Likert scale[74,75] or using qualitative response categories.[73]

Other measures of adherence include pharmacy records and pill counts. Pharmacy records can be valuable when medications are obtained exclusively from a single source. Because pill counts can be altered, are labor intensive, and can be perceived as confrontational, they are generally not used in routine care. Electronic measurement devices are costly and are generally reserved for research settings. Finally, methods to estimate adherence based on drug levels measured in plasma, dried blood spots, urine, and hair samples are available.[76] Some of these are commercially available, but none have been shown in randomized studies to improve outcomes. However, if these methods are used, they should be implemented collaboratively between the provider and the person with HIV to avoid an adversarial relationship.

Improving Adherence to Antiretroviral Therapy

Strategies to improve adherence to ART are summarized in Table 20 below. Just as they support retention in care, all health care team members play integral roles in successful ART adherence programs.[72,77-79] An increasing number of interventions have proven effective in improving adherence to ART (for descriptions of the interventions, see the CDC's Compendium of Evidence-Based Interventions and Best Practices for HIV Prevention). These interventions can be customized to suit a range of needs and settings. Many interventions that are efficacious in randomized trials require specialized training and resources before they can be implemented in routine care, and this has limited their impact. Nonetheless, these interventions have contributed to our knowledge in developing general principles of improving and maintaining adherence.

Every person with HIV must receive and understand basic information about HIV infection, including the goals of therapy (achieving and maintaining viral suppression, which will decrease HIV-associated complications and prevent transmission), the prescribed regimen (including dosing schedule and potential side effects), the importance of adherence to ART, and the potential for the development of drug resistance as a consequence of suboptimal adherence. People with HIV must also be positively motivated to initiate therapy, which can be assessed by simply asking people if they want to start treatment for HIV. Clinicians should assist people with HIV in identifying facilitating factors and potential barriers to adherence and develop multidisciplinary plans to attempt to overcome those barriers. Processes for obtaining medications and refills should be clearly described. Transportation to pharmacy and clinic visits should be assessed with linkage to appropriate services as needed. Plans to ensure uninterrupted access to ART via insurance, copay assistance, pharmaceutical company assistance programs, or AIDS Drug Assistance Programs (ADAP), for example, should be made and reviewed with each person with HIV. Much of this effort to inform, motivate, and reduce barriers can be achieved by nonphysician members of the multidisciplinary team and can be accomplished concomitantly with, or even after, starting therapy.[80-83]

While delaying the initiation of ART is rarely indicated, some people may not be comfortable starting treatment right away. People expressing reluctance to initiate ART should be engaged to understand and overcome barriers to ART initiation. Although homelessness, substance use, and mental health problems are associated with poorer adherence, they are not predictive enough at the individual level to warrant withholding or delaying therapy given the simplicity, potency, and tolerability of contemporary ART. Rapid ART initiation at the time of HIV diagnosis has been pursued as a strategy to increase viral load suppression and retention in care, but safety data, data on intermediate or long-term outcomes, and data from randomized controlled trials conducted in high-resource settings are currently lacking.[80-86] In low-resource settings, data from randomized trials

suggest that rapid ART probably increases ART use and viral suppression at 12 months, but data on other important outcomes—such as retention in care, regimen switching, and mortality—are not sufficient to draw conclusions.[87,88] Rapid access to ART has become a pillar of the United States' plan to end the HIV epidemic, and delays in access to ART should be addressed.[89] For more details, see Initiation of Antiretroviral Therapy.

Successful treatment requires a regimen that the individual can adhere to,[90,91] considering their daily schedule, tolerance of pills (number, size, and frequency), and any issues affecting absorption (e.g., use of acid-suppressing therapy, food requirements). As reviewed above, STRs have been associated with high rates of adherence. People with risk factors for poor adherence or a history of poor adherence should be offered regimens with high genetic barriers to resistance (e.g., a second-generation integrase strand transfer inhibitor [INSTI] or a boosted protease inhibitor), if clinically appropriate. Using shared decision-making, a medication choice and administration schedule should be tailored to each person's daily activities. Clinicians should explain to people that their first regimen is usually the best option for a simple regimen, which affords long-term treatment success. Establishing a trusting patient–provider relationship and maintaining good communication will help to improve adherence and long-term outcomes. Medication adherence can also be enhanced using medication reminder aids. The evidence is strongest for text messaging, although pillbox monitors, pill boxes, and alarms may also improve adherence.[92-96]

Positive reinforcement, such as informing people of their low or suppressed viral load and increased CD4 counts, can greatly help maintain high levels of adherence. Motivational interviewing has also been used with some success.[97-99] Other effective interventions include nurse home visits, a five-session group intervention, and couples- or family-based interventions. Interventions involving several approaches are generally more successful than single-strategy interventions, and interventions based on cognitive behavioral therapy and supporter interventions have been shown to improve viral suppression.[100] Problem-solving approaches that vary in intensity and culturally tailored approaches are also promising.[99,101,102] Providing additional therapy (e.g., for substance use or mental health) and social support may be important to maintain high levels of adherence. DOT has been effective in providing ART to people actively using drugs[103] but not to people in a general clinic population[104] or in home-based settings with partners responsible for DOT.[105,106] The use of incentives or rewards to promote adherence has been studied, demonstrating improved adherence in one study conducted by the HIV Prevention Trials Network (HPTN)[30] and reduce viral load in another study that required very frequent viral load measurement and incentives.[107] Although the durability and feasibility of financial incentives are limited, and behavior change is generally not sustained after the incentives are withdrawn, the HPTN study did find some evidence of sustained adherence after 9 months.[55] Data are too limited to support the use of financial rewards for adherence to routine care.[47,108,109]

Transitions of Care

Transitions of HIV care are critical periods during which people may be more likely to fall out of care. Some important examples of transitions of care are discussed in further detail below.

Transition From Pediatric to Adult HIV Care

The transition from pediatric to adult HIV care requires proactive attention to the medical and psychosocial needs of adolescents as they move from a child-focused to an adult-focused health care system, with the goal of preventing disruption in care and ensuring ART adherence.[110] Recommendations for transition planning from pediatric to adult HIV care can be found in the Adolescents and Young Adults With HIV section of these guidelines and the Pediatric Antiretroviral Guidelines.

Transition From Obstetric to Primary HIV Care Postpartum

Pregnancy and the postpartum period offer a unique opportunity to engage in HIV care, both for people newly diagnosed with HIV during pregnancy and for people with HIV prior to pregnancy. Childcare responsibilities and postpartum depression can contribute to decreased adherence to HIV care in the postpartum period, thus requiring additional support services. Guidance on postpartum follow-up for people with HIV can be found in the Perinatal Guidelines.

Transitions Between Health Care Providers or Settings

Transitions in health care providers or settings can occur between hospitals, primary HIV care practices, ambulatory specialty care practices, long-term care facilities, home health, and rehabilitation facilities.[111] Safe transitions in HIV care can be supported by coordinating with HIV care providers and educating people with HIV and their support systems. In the setting of a health care facility discharge, bedside medication delivery or "Meds to Beds" programs may enhance post-discharge medication adherence by eliminating the need to visit a pharmacy to fill post-discharge medications.[112,113] In the setting of a residential move from one geographic area to another, a new HIV care provider would ideally be identified ahead of the move so that communication and transfer of medical records occur in a timely manner. This is particularly important for people with HIV who are receiving RWHAP services because not all HIV care providers receive RWHAP funding. HRSA provides an online resource for identifying RWHAP providers nationally. Provision of at least a 30-day ART supply at the time of a residential move may mitigate gaps in adherence due to delays in health care access in a new geographic area.

Reengagement in HIV Care After Loss to Follow-up

Adherence along the HIV care continuum is fluid and can change depending on an individual's life circumstances. In general, guidance around reengagement in care is similar to the guidance for individuals who are newly diagnosed with HIV. However, specific attention should be paid to understanding the reasons for previous disengagement from care, and shared decision-making should be used to identify strategies to address these barriers using a multidisciplinary approach. Hospitalization can provide an important opportunity for reengagement when an acute illness may increase an individual's motivation for behavior change. As noted above, bedside medication delivery or "Meds to Beds" programs have the potential to enhance post-discharge medication adherence.[112,113]

Individuals in Custody Released From Jails and Prisons

HIV continues to disproportionately affect individuals who are incarcerated at a rate three times that of the general population. Approximately 1.1% of individuals in custody have HIV, compared with 0.4% of the general population.[114,115] Incarceration presents an opportunity to identify and treat previously undiagnosed people with HIV, reengage those who had fallen out of HIV care in the community before incarceration, and stabilize HIV treatment among those who struggled with adherence and retention in care in the community. HIV treatment inside carceral facilities should mirror treatment in the community with respect to ART selection. Treatment interruptions should be avoided when people enter and leave such facilities. HIV treatment outcomes can be improved by having HIV specialty care teams within carceral facilities to communicate and coordinate care with community-based providers. There are unique considerations when treating HIV inside prisons and jails, given a lack of individual privacy, restricted movement to the health care unit, HIV stigma, and solitary confinement—all of which can negatively impact ART adherence while in custody. Conversely, this setting can allow the individual in custody to focus on adherence and allow the health care team to assess the safety, tolerability, and effectiveness of an ART regimen.

Adherence challenges can increase exponentially upon release from custody and include lapses in medical and prescription benefits (including for mental health and substance use disorders), housing instability, lack of transportation, lack of identification and other important documents (e.g., birth certificate, social security card) needed to secure medical benefits, relapse to substance use, and risk of overdose. Interventions to reduce barriers to HIV treatment should be assessed during the prerelease discharge planning process when feasible and can be enhanced by accessing assistance through community-based organizations that provide post-release services.[116] Factors that promote treatment adherence post-release include registering for health insurance and completing an ADAP application prior to release,[117] coordinating follow-up HIV care with community providers, and providing a 30-day supply of ART at the time of release.[118] Various interventions to improve post-release treatment adherence have demonstrated the efficacy of an interdisciplinary medical team, including case management and patient navigation resources.[119-124]

Long-Acting Antiretroviral Therapy

An ART regimen of long-acting intramuscular cabotegravir and rilpivirine (LA CAB/RPV) given monthly or every 2 months has been studied and approved for use in populations with viral suppression. In addition, preliminary data from a randomized clinical trial suggest that LA CAB/RPV may be safe and effective among people without viral suppression despite intensive adherence support on oral ART; however, final data and long-term outcomes are not yet available.[125] The long pharmacologic tail of LA CAB/RPV after the last dose raises concerns about the emergence of drug-resistance mutations in people who discontinue therapy without rapidly transitioning to oral therapy. Further, efficacy data from randomized clinical trials do not always translate to effectiveness in real-world settings.

The use of the LA CAB/RPV as a complete regimen is generally not recommended in people with viremia due to suboptimal adherence to ART, or in people who have ongoing challenges with retention in HIV care. However, limited data from small observational studies found that LA CAB/RPV can lead to high levels of viral suppression in people who have struggled with adherence to oral ART and who are viremic at treatment initiation.[126-128] It should be noted that these studies were conducted in settings where LA CAB/RPV was available on Medicaid and ADAP formularies. Further, significant social and case management support, including full-time dedicated staff, was provided to ensure adherence to the regimen. This support was provided by multidisciplinary teams involving clinicians, pharmacists, and case managers and included appointment reminders, assistance with transportation, financial incentives, and assistance with rescheduling missed injection appointments. Additionally, injections were offered in people's homes, at harm-reduction sites, and via street medicine. It is unknown whether similar responses can be achieved in clinics without the resources to provide the level of adherence support seen in previous studies.

Based on these limited data, the Panel recommends the use of LA CAB/RPV on a case-by-case basis in select individuals with persistent virologic failure despite intensive adherence support on oral ART, who have no evidence of resistance to RPV or CAB, and with shared decision-making between providers and people with HIV **(CIII)**.

This approach may provide alternatives for individuals with viremia and difficulties with adherence to oral ART, especially for those at the highest risk for disease progression or death. If LA CAB/RPV is used, close monitoring is recommended, with drug-resistance testing performed if virologic response is inadequate. Importantly, conventional adherence support is likely inadequate, and expanded, intensive, multidisciplinary case management and outreach support are needed when using this strategy to assure adherence and adequate monitoring for people while on LA CAB/RPV. People with HIV and providers need to be aware of the significant risk of developing resistance to non-nucleoside reverse transcriptase inhibitors and particularly INSTIs if virologic failure occurs on LA CAB/RPV, which may limit future treatment options and may also lead to

transmission of HIV; these concerns should be balanced with the given individual's HIV-related risk for disease progression and death. See Virologic Failure for a more detailed discussion.

Conclusion

Clinicians should obtain accurate information about a person's adherence and barriers to ART and appointment adherence, followed by meaningful discussions on solutions, rather than simply instructing adherence and warning about potential consequences of poor adherence. The latter approach fails to acknowledge a person's barriers to adherence, fails to provide actionable information, erodes rather than builds the patient–provider relationship, and has been demonstrated to not improve adherence.[129,130] At the same time, however, many of the interventions shown to improve adherence are difficult to implement in routine care. Nonetheless, effective lessons from this body of research can be applied to routine care to improve linkage to care, adherence to ART, and adherence to appointments. These lessons include the following:

- Regularly assess adherence to ART and appointments.
- Engage people struggling with adherence at any step on the care continuum with a constructive, collaborative, nonjudgmental, and problem-solving approach rather than reprimanding them or lecturing them on the importance of adherence.
- Elicit an individual's barriers to adherence, which may include personal, behavioral, medical, or structural barriers (e.g., substance use, housing instability, stigma, lack of transportation), clinic barriers (e.g., limited clinic hours, processes that make it more difficult to obtain prescriptions or schedule appointments), and system barriers (e.g., copays, prior approvals, processes that complicate maintaining pharmacy benefits or obtaining refills).
- Tailor approaches to improve adherence to an individual's specific needs and barriers, for example, by changing ART to simplify dosing or reduce side effects, finding resources to assist with copays or other out-of-pocket costs (see Table 20 below), to maintain an uninterrupted supply of ART, and to assure access to clinicians, or linking people to counseling to overcome stigma, substance use, or mental illness.
- Utilize ART regimens with high genetic barriers to resistance—such as DTG, bictegravir, or boosted darunavir regimens—for people with adherence problems. When selecting the regimen, consider possible side effects, out-of-pocket costs, convenience, and individual preferences, because the only regimen that will work is the one that people can obtain and are willing and able to take.
- Recognize the need for multidisciplinary approaches to identify and address barriers. Clinicians should help people with HIV understand the importance of adherence to the continuum of care, identify and address immediate barriers, and link them to resources for overcoming other obstacles.

Table 20. Strategies to Improve Linkage to Care, Retention in Care, Adherence to Appointments, and Adherence to Antiretroviral Therapy

Strategies	Examples
Provide an accessible, trustworthy, nonjudgmental multidisciplinary health care team.	• Include care providers, nurses, social workers, case managers, pharmacists, medication managers, and administrative staff on the care team; train all members on providing compassionate and person-centered care.
Strengthen early linkage to care and retention in care.	• Encourage health care team participation in linkage to and retention in care. • Use ARTAS training (if available). • Actively support linkage to care with assistance in making appointments and linkage to services to overcome barriers to care. • Streamline Ryan White HIV/AIDS Program eligibility verification processes for uninsured and underinsured clients.
Evaluate an individual's knowledge about HIV, HIV prevention, and HIV treatment and provide information based on this assessment.	• Keeping the current knowledge base in mind, provide information about HIV, including the natural history of the disease, HIV viral load and CD4 count and expected clinical outcomes according to these parameters, therapeutic and prevention consequences of poor adherence, and the importance of staying in HIV care.
Identify facilitators, potential barriers to adherence, and necessary medication management skills both when starting ART and thereafter.	• Assess each individual's cognitive competence and impairment. • Assess behavioral and psychosocial challenges, including mental illnesses, trauma, social support levels, alcohol consumption, substance use, nondisclosure of HIV serostatus, and stigma. • Identify and address language and literacy barriers. • Assess beliefs, perceptions, and expectations about taking ART (e.g., impact on health, side effects, disclosure issues, consequences of poor adherence). • Ask about medication-taking skills and foreseeable challenges with adherence (e.g., past difficulty keeping appointments, adverse effects from previous medications, issues managing other chronic medications, need for medication reminders and organizers). • Assess structural issues, including unstable housing, lack of income, unpredictable daily schedule, lack of prescription drug coverage, lack of continuous access to medications, and transportation problems.
Provide needed resources.	• Provide or refer for mental health and/or substance use treatment. • Provide resources to obtain prescription drug coverage (e.g., AIDS Drug Assistance Programs, Pharmaceutical Company HIV Patient Assistance Programs and Cost-Sharing Assistance Programs). • Assist people during insurance enrollment periods to facilitate enrollment in plans that cover antiretrovirals. • Provide resources about stable housing, social support, transportation assistance, income, and food security.

Table 20. Strategies to Improve Linkage to Care, Retention in Care, Adherence to Appointments, and Adherence to Antiretroviral Therapy

Strategies	Examples
Involve people with HIV in ARV regimen selection.	• Review potential side effects, dosing frequency, pill burden, storage requirements, food requirements, and consequences of poor adherence. • Assess daily activities and tailor a regimen to predictable and routine daily events. • Consider preferential use of ART regimen with a high barrier to resistance, such as BIC-, DTG-, or boosted DRV-based ART if poor adherence is anticipated. • Consider the use of STR or fixed-dose-combination formulations to reduce pill burden and/or dosing frequency. • Consider the use of LA CAB/RPV if clinically appropriate (see the Long-Acting Antiretroviral Therapy section above for further discussion). • Assess if the cost or copayment for drugs will affect adherence and access to medications.
Assess adherence at every clinic visit.	• Monitor viral load as a strong biological measure of adherence. • Use a simple behavioral rating scale or self-reported assessment. • Employ a structured format that normalizes or assumes less-than-perfect adherence and minimizes socially desirable or “white-coat adherence” responses. • Ensure that other members of the health care team also assess and support adherence.
Use positive reinforcement to foster adherence success.	• Inform people of the benefits of low or nondetectable levels of HIV viral load (e.g., “Undetectable = Untransmittable”) and increases in CD4 counts. • Thank people for attending their appointments.
Identify the type of and reasons for poor adherence and target ways to improve adherence.	Identify if any of the following have contributed to poor adherence: • Failure to understand dosing instructions. • Complexity of regimen (e.g., pill burden, size, dosing schedule, food requirements, polypharmacy). • Pill aversion or pill fatigue. • Adverse effects. • Inadequate understanding of drug resistance and its relationship to adherence. • Appointment reminders and incorporation of input from people with HIV in appointment scheduling. • Cost-related issues (e.g., copays for medications or visits, missed work time). • Mental illness, drug and alcohol use, homelessness, or poverty. • Stigma of taking pills or attending HIV-related appointments. • Nondisclosure of status or privacy concerns leading to missed doses, refills, or appointments.

Table 20. Strategies to Improve Linkage to Care, Retention in Care, Adherence to Appointments, and Adherence to Antiretroviral Therapy

Strategies	Examples
Select from among available effective adherence and retention interventions.	• See the CDC's Compendium of Evidence-Based Interventions and Best Practices for HIV Prevention for a summary of best practice interventions to improve linkage, retention, and adherence. • Use adherence-related tools to complement education and counseling interventions (e.g., text messaging, pill box monitors, pill boxes, alarms). • Use community resources to support adherence (e.g., visiting nurses, community workers, family, peer advocates, transportation assistance, pharmacy delivery). • Use prescription assistance programs (see "Provide needed resources" above in this table). • Use motivational interviews. • Provide outreach for people who drop out of care. • Use peer or paraprofessional treatment navigators. • Recognize positive clinical outcomes resulting from better adherence. • Arrange for DOT for people in substance use treatment (if feasible). • Enhance clinic support and structures to promote linkage and retention (e.g., reminder calls, flexible scheduling, assessment of clinic service satisfaction). • Offer telehealth services for primary care, as well as supportive services when appropriate.
Systematically monitor retention in care.	• Record and follow up on missed visits.

Key: ART = antiretroviral therapy; ARTAS = Anti-Retroviral Treatment and Access to Services; ARV = antiretroviral; BIC = bictegravir; CD4 = CD4 T lymphocyte; CDC = Centers for Disease Control and Prevention; DOT = directly observed therapy; DRV = darunavir; DTG = dolutegravir; LA CAB/RPV = long-acting cabotegravir/rilpivirine; STR = single-tablet regimen

Adverse Effects of Antiretroviral Medications

Updated: September 25, 2025
Reviewed: September 25, 2025

Adverse effects have been reported with all antiretroviral (ARV) medications. Commonly reported reasons for switching or discontinuing oral or injectable therapy were due to adverse effects, especially with the initiation of antiretroviral therapy (ART) regimens in the late 1990s and early 2000s.[1] Fortunately, newer ART regimens are associated with fewer serious and intolerable adverse effects. Generally, <10% of participants who are ART-naive and who enrolled in randomized trials of newer agents experience treatment-limiting adverse events.[2,3] However, the short-term and long-term complications of ART may be underestimated because most clinical trials use specific inclusion criteria that exclude individuals with certain underlying medical conditions, and the duration of participant follow-up is relatively short (generally 2–4 years).

ART is recommended for all people with HIV regardless of CD4 T lymphocyte cell count, and with current treatments and approaches/strategies, therapy must be continued indefinitely. To achieve and sustain viral suppression over a lifetime, both long-term and short-term ART adverse effects must be anticipated and managed. From a safety and tolerability standpoint, the focus of management has evolved from identifying and managing toxicities related to early ARVs to individualizing therapy to avoid or mitigate long-term adverse effects, such as atherosclerotic cardiovascular disease, diabetes and other metabolic complications, kidney dysfunction, neuropsychiatric events, and accelerated declines in bone mineral density.

Antiretroviral Regimen Selection

When selecting an ARV regimen, clinicians must consider potential adverse effects and any prior history of drug intolerance. Additionally, several factors may predispose people with HIV to adverse effects of ARV medications. These factors include:

- Concomitant use of medications with overlapping and additive toxicities.
- Comorbid conditions that increase the risk of adverse effects. For example, underlying liver disease from alcohol use, coinfection with viral hepatitis, and/or liver steatosis[4,5] may increase the risk of hepatotoxicity when some protease inhibitors are used; and borderline or mild renal dysfunction increases the risk of nephrotoxicity from tenofovir disoproxil fumarate (TDF).[6]
- Certain ARVs that may exacerbate pre-existing conditions. For example, psychiatric disorders may be exacerbated by efavirenz (EFV), rilpivirine, and, infrequently, by integrase strand transfer inhibitors.[7,8]
- Drug–drug interactions that may increase the toxicities of ARV medications or concomitant medications. For example, when pharmacokinetic boosters such as ritonavir or cobicistat are used.[9]
- Genetic factors that predispose people with HIV to some adverse effects of medications that are no longer commonly used in clinical practice, such as abacavir (ABC) hypersensitivity reaction,[10,11] EFV neuropsychiatric toxicity[9,12] or QTc (QT corrected for heart rate) prolongation,[13,14] and atazanavir (ATV)-associated hyperbilirubinemia.[15]
- Dosing errors, which can predispose people with HIV to adverse effects when medications are administered at incorrect doses—whether at doses that are too high or at inappropriate intervals—and can increase the likelihood of adverse effects.

Management of Adverse Effects

ART-associated adverse effects can range from acute and potentially life-threatening to chronic and insidious. When people with HIV experience treatment-limiting toxicities associated with ART, selecting new ART regimens that pose either no or a lower risk of exacerbating the condition or contributing to further complications is warranted. Serious life-threatening effects (e.g., hypersensitivity reaction due to ABC, symptomatic hepatotoxicity, severe cutaneous reactions) require the immediate discontinuation of all ARV medications and re-initiation of an alternative regimen without overlapping toxicity. Toxicities that are not life-threatening (e.g., urolithiasis with ATV, renal tubulopathy with TDF) can usually be managed by substituting another ARV medication for the presumed causative medication without interrupting ART. Chronic, non–life-threatening adverse effects (e.g., dyslipidemia) can be addressed either by switching the potentially causative medication for another medication or by managing the adverse effect with nonpharmacological interventions or pharmacologic interventions such as statins. Management strategies must be individualized for each person with HIV. When adverse effects occur during the use of long-acting injectable ARV drugs, management may be challenging due to the persistence of drug in the body over the course of many months to years. Oral lead-in regimens for cabotegravir plus rilpivirine are available to assess short-term tolerability.

Switching from an effective ARV agent or regimen to a new agent or regimen must be done carefully and only when the potential benefits of the change outweigh the potential risks of altering treatment. The fundamental principle of regimen switching is to maintain viral suppression. When selecting a new agent or regimen, providers should be aware that drug-resistant viruses previously acquired or selected, even those not detected by past genotypic resistance testing, are archived in HIV reservoirs. The resistant virus, even if absent from subsequent resistance test results, may reappear under selective drug pressure. See Optimizing Antiretroviral Therapy in the Setting of Viral Suppression for further discussion. It is critical that providers review the following information before implementing any treatment switch:

- Medical and complete ARV history, including prior virologic responses to ART
- All previous drug resistance test results
- Viral tropism (if maraviroc is being considered)
- HLA-B*5701 status (if ABC is being considered)
- Comorbidities
- Pregnancy status and the desire and/or ability to become pregnant or use contraceptives
- Hepatitis B virus (HBV) status. People with evidence of chronic HBV infection should not discontinue ARVs active against HBV (e.g., TDF, tenofovir alafenamide, lamivudine, emtricitabine). If discontinuation is necessary due to adverse effects, consult the HBV/HIV Coinfection section for guidance.
- Adherence history
- Prior intolerances to any ARVs
- Concomitant medications and supplements, considering any potential drug interactions with ARVs
- Cost to people with HIV and options for patient assistance programs if needed (see Cost Considerations and Antiretroviral Therapy)

For the first few months after an ART switch, the person should be closely monitored for any new adverse effects, and HIV viral load should be monitored to ensure continued viral suppression.

Information on the adverse effects of ARVs is outlined in several tables in these Guidelines. Table 21 provides clinicians with a list of the most common and/or severe ARV-associated adverse events for each drug class. The most common adverse effects of individual ARV agents are summarized in Appendix A, Tables 3, 4, 5, 6, 7, 8, 9, and 10.

Table 21. Common and/or Severe Adverse Effects Associated With Antiretroviral Medications

This table focuses on antiretroviral (ARV)-associated adverse effects that a person may experience as a result of taking an ARV regimen. The attribution of adverse effects to individual ARVs is inherently limited by the absence of long-term monotherapy trials, making it difficult to delineate the specific contribution of each medication within the combination regimens. These limitations should be considered carefully when assessing causality, as adverse effects may be related to the ARV regimen as a whole rather than to any single component.

Adverse effects for ARV medications that are no longer on the market or are not commonly used in clinical practice (didanosine [ddI], fosamprenavir/ritonavir, indinavir, lopinavir/ritonavir, nelfinavir, nevirapine, saquinavir/ritonavir, stavudine [d4T], tipranavir/ritonavir, zidovudine [ZDV]), with few exceptions, have been removed from this table. Clinicians should refer to the product labels or to the archived July 10, 2019, version of the Guidelines for information regarding the adverse effects associated with select older ARVs. Because some adverse effects may persist long after discontinuation of the older ARVs—such as d4T, ddI, zalcitabine, and ZDV—and people with HIV may still present with these long-lasting toxicities, these medications remain listed among the ARVs associated with adverse effects such as lipodystrophy and peripheral neuropathy.

For information regarding potential adverse effects of ARVs on fetuses and newborns when certain ARVs are taken around the time of conception or during pregnancy, refer to the Perinatal Guidelines.

This table highlights the common and/or severe adverse effects by ARV class and for individual ARVs, when appropriate. For ARV class–specific adverse effects, the table provides relative comparisons among individual ARVs for each class effect. In some cases, the terms “no known effect,” “rarely observed” (for select severe effects), “not common or severe,” or “no or limited data” are used, especially for the entry inhibitor and capsid inhibitor classes, where the evaluation of safety is based mostly on uncontrolled and nonrandomized clinical trials. See Appendix A, Tables 3, 4, 5, 6, 7, 8, 9, and 10 for additional information listed by ARV medication.

Adverse Effect Type	Adverse Effect	NRTIs	NNRTIs	PIs	INSTIs	EIs	CI
Cardiovascular Effects	Cardiac Conduction Effects	No known effect	**RPV and EFV:** QTc prolongation **RPV:** QTc prolongation occurred at 3 and 12 times the recommended dose. Consider alternatives when coadministered with drugs with known risk of Torsade de Pointes.	**ATV:** PR prolongation. Risk factors include pre-existing heart disease and concomitant use of medications that may cause PR prolongation.	No known effect	**FTR:** QTc prolongation was seen at 4 times the recommended dose. Consider alternatives when coadministered with drugs with a known risk of Torsade de Pointes.	No known effect

Table 21. Common and/or Severe Adverse Effects Associated With Antiretroviral Medications

Adverse Effect Type	Adverse Effect	NRTIs	NNRTIs	PIs	INSTIs	EIs	CI
	Cardiovascular Disease	**ABC:** Associated with an increased risk of MI in some cohort studies. Absolute risk greatest in people with traditional CVD risk factors.	No known effect	**DRV/r:** Associated with cardiovascular events in some cohorts.	Not common or severe	No or limited data	No or limited data
Dermatologic Effects, Not Including Systemic Hypersensitivity Reaction	Rash	**FTC:** Skin hyperpigmentation	All NNRTIs	ATV, DRV	All INSTIs	MVC, IBA, FTR	Not common or severe
	Stevens-Johnson Syndrome/Toxic Epidermal Necrosis	No known effect	EFV, ETR > DOR, RPV	Rarely observed with DRV and ATV	Rarely observed with BIC, CAB, and RAL	No or limited data	Not common or severe
Gastrointestinal Effects	Cholelithiasis	No known effect	No or limited data	**ATV:** Cholelithiasis and kidney stones may present concurrently. Median onset is 42 months after ARV initiation.	No known effect	No known effect	No known effect
	Gastrointestinal Effects	**ZDV > other NRTIs:** Nausea and vomiting	Not common or severe	GI intolerance (e.g., diarrhea, nausea, vomiting)	**EVG/c:** Nausea and diarrhea	No known effect	Not common or severe

Table 21. Common and/or Severe Adverse Effects Associated With Antiretroviral Medications

Adverse Effect Type	Adverse Effect	NRTIs	NNRTIs	PIs	INSTIs	EIs	CI
Hepatic Effects	Hepatic Effects	**When TAF, TDF, 3TC, and FTC are withdrawn in people with HBV/HIV coinfection or when HBV resistance develops:** People with HBV/HIV coinfection may develop severe hepatic flares.	**EFV:** Most cases relate to an increase in transaminases. Fulminant hepatitis leading to death or hepatic failure requiring transplantation have been reported. **RPV:** Risk may be further increased in people with HBV or HCV coinfection.	**All PIs:** Drug-induced hepatitis and hepatic decompensation have been reported. **ATV:** Jaundice due to indirect hyperbilirubinemia	**DTG:** Rarely observed, but risk may be further increased in people with HBV or HCV coinfection. **BIC, CAB, EVG/c, RAL:** Not common or severe	**MVC:** Hepatotoxicity with or without rash or HSRs has been reported. **FTR:** Transaminase elevation was seen more commonly in patients with HBV/HCV. Transient elevation of bilirubin observed in clinical trials.	Not common or severe
Hypersensitivity Reactions, Not Including Rash Alone or Stevens-Johnson Syndrome	Hypersensitivity Reaction	**ABC: Contraindicated** if person is HLA-B*5701 positive. Median onset for HSR is 9 days after treatment initiation; 90% of reactions occur within 6 weeks.	Rarely observed	No known effect	Rarely observed	**MVC:** HSR reported as part of a syndrome related to hepatotoxicity. **IBA:** HSR, including infusion-related reactions and anaphylactic reactions, were reported.	No known effect

Table 21. Common and/or Severe Adverse Effects Associated With Antiretroviral Medications

Adverse Effect Type	Adverse Effect	NRTIs	NNRTIs	PIs	INSTIs	EIs	CI
		HSR symptoms (in order of descending frequency): Fever, rash, malaise, nausea, headache, myalgia, chills, diarrhea, vomiting, abdominal pain, dyspnea, arthralgia, and respiratory symptoms Symptoms worsen with continuation of ABC. People should not be rechallenged with ABC if HSR is suspected, regardless of their HLA-B*5701 status.					
Injection Site Reactions	Injection Site Reaction	Not applicable	**RPV IM injection:** Reported in >80% of patients; reactions may include localized pain/discomfort (most common), nodules, induration, swelling, erythema, hematoma. **When given with CAB IM, injection site pain:** RPV > CAB.	Not applicable	**CAB IM injection:** Reported in >80% of patients; reactions may include localized pain/discomfort (most common), nodules, induration, swelling, erythema, hematoma. **When given with RPV IM, injection site pain:** RPV > CAB.	Not applicable	**LEN SQ injection:** Reported in 47–65% of people; reactions may include swelling, erythema, pain, nodules, inflammation, and induration. Nodules and induration may persist for months in some people. Injection site necrosis has been reported.

Table 21. Common and/or Severe Adverse Effects Associated With Antiretroviral Medications

Adverse Effect Type	Adverse Effect	NRTIs	NNRTIs	PIs	INSTIs	EIs	CI
Metabolic Effects	Bone Density Effects	**TDF:** Associated with greater loss of BMD than other NRTIs, especially when given with a PK booster. Osteomalacia may be associated with proximal tubulopathy and urine phosphate wasting. **TAF:** Associated with smaller declines in BMD than those seen with TDF.	No known effect	No known effect	Not common or severe	No known effect	No known effect
	Diabetes Mellitus and Insulin Resistance	**ZDV**	No known effect	Rarely observed	No known effect	No or limited data	No or limited data
	Dyslipidemia	**ABC:** ↑ TG and ↑ LDL **TAF:** ↑ TG, ↑ LDL, and ↑ HDL (no change in TC:HDL ratio) **TDF:** Associated with lower lipid levels than ABC or TAF.	**EFV:** ↑ TG, ↑ LDL, ↑ HDL	**All RTV- or COBI-boosted PIs:** ↑ TG, ↑ LDL, ↑ HDL	**EVG/c:** ↑ TG, ↑ LDL, ↑ HDL	No known effect	No known effect
	Lactic Acidosis	Reported with older NRTIs (e.g., d4T, ZDV, ddI), but not with ABC, 3TC, FTC, TAF, or TDF.	No known effect	No known effect	No known effect	No known effect	No known effect

Table 21. Common and/or Severe Adverse Effects Associated With Antiretroviral Medications

Adverse Effect Type	Adverse Effect	NRTIs	NNRTIs	PIs	INSTIs	EIs	CI
	Lipodystrophy	**Lipoatrophy:** Associated with history of exposure to d4T or ZDV (d4T > ZDV). Not reported with ABC, 3TC or FTC, or TAF or TDF.	**Lipohypertrophy:** Trunk fat increase is observed with EFV-containing regimens; however, a causal relationship has not been established.	**Lipohypertrophy:** Trunk fat increase is observed with PI-containing regimens; however, a causal relationship has not been established.	**Lipohypertrophy:** Trunk fat increase is observed with RAL-containing regimens; however, a causal relationship has not been established.	No known effect	No known effect
	Weight Gain	Weight gain has been associated with initiation of ART and subsequent viral suppression. The increase appears to be greater with INSTIs, especially BIC and DTG, than with other drug classes. Greater weight increase has also been reported with TAF than with TDF and with DOR than with EFV.				No known effect	No known effect
Musculoskeletal Effects	Myopathy/ Rhabdomyolysis	ddI, D4T Rarely observed with ABC, TAF, or TDF.	No known effect	No known effect	Rarely observed	No known effect	No known effect

Table 21. Common and/or Severe Adverse Effects Associated With Antiretroviral Medications

Adverse Effect Type	Adverse Effect	NRTIs	NNRTIs	PIs	INSTIs	EIs	CI
Neuropsychiatric Effects	Nervous System/ Psychiatric Effects	**Peripheral neuropathy (can be irreversible):** Associated with history of exposure to ddI, ddC, or d4T.	**Neuropsychiatric events:** EFV > DOR, RPV > ETR **EFV:** Somnolence, insomnia, abnormal dreams, dizziness, impaired concentration, depression, psychosis, suicidal ideation, ataxia, encephalopathy. Some symptoms may subside or diminish after 2–4 weeks. Bedtime dosing and taking without food may reduce symptoms. **RPV:** Depression, suicidality, sleep disturbances **DOR:** Sleep disorders and disturbances, dizziness, altered sensorium; depression, suicidality, and self-harm	No known effect	Insomnia, depression, and suicidality have been reported with INSTI use, primarily in people with pre-existing psychiatric conditions.	Not common or severe	Not common or severe

Table 21. Common and/or Severe Adverse Effects Associated With Antiretroviral Medications

Adverse Effect Type	Adverse Effect	NRTIs	NNRTIs	PIs	INSTIs	EIs	CI
Renal Effects	Renal Effects/ Nephrolithiasis/ Urolithiasis	**TDF:** ↑ SCr, proteinuria, hypophosphatemia, urinary phosphate wasting, glycosuria, hypokalemia, and non-anion gap metabolic acidosis. Concurrent use of TDF with COBI- or RTV-containing regimens appears to increase risk. **TAF:** Less renal effect than TDF.	**RPV:** Inhibits Cr secretion without reducing renal glomerular function	**ATV:** Associated with increased risk of chronic kidney disease in a large cohort study. **ATV:** Stone or crystal formation; adequate hydration may reduce risk **COBI (as a pharmacokinetic booster for DRV or ATV):** Inhibits Cr secretion without reducing renal glomerular function	**DTG, COBI (as a pharmacokinetic booster for EVG), and BIC:** Inhibits Cr secretion without reducing renal glomerular function	No or limited data	No or limited data

Key: 3TC = lamivudine; ABC = abacavir; ART= antiretroviral therapy; ARV = antiretroviral; ATV = atazanavir; BIC = bictegravir; BMD = bone mineral density; CAB = cabotegravir; CI = capsid inhibitor; COBI = cobicistat; Cr = creatinine; CVD = cardiovascular disease; d4T = stavudine; ddC = zalcitabine; ddI = didanosine; DOR = doravirine; DRV = darunavir; DRV/r = darunavir/ritonavir; DTG = dolutegravir; EFV = efavirenz; EI = entry inhibitor; ETR = etravirine; EVG = elvitegravir; EVG/c = elvitegravir/cobicistat; FTC = emtricitabine; FTR = fostemsavir; GI = gastrointestinal; HBV = hepatitis B virus; HCV = hepatitis C virus; HDL = high-density lipoprotein; HSR = hypersensitivity reaction; IBA = ibalizumab; IDV = indinavir; IM = intramuscular; INSTI = integrase strand transfer inhibitor; LDL = low-density lipoprotein; LEN = lenacapavir; MI = myocardial infarction; MVC = maraviroc; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside reverse transcriptase inhibitor; PI = protease inhibitor; QTc = QT corrected for heart rate; RAL = raltegravir; RPV = rilpivirine; RTV = ritonavir; SCr = serum creatinine; SQ = subcutaneous; TAF = tenofovir alafenamide; TC = total cholesterol; TDF = tenofovir disoproxil fumarate; TG = triglycerides; ZDV = zidovudine

Cost Considerations and Antiretroviral Therapy

Updated: September 25, 2025
Reviewed: September 25, 2025

Key Considerations
• The complexities of the U.S. health care system may require that the costs for antiretroviral therapy (ART), especially out-of-pocket costs for the person with HIV, be one of the considerations in regimen selection, because such expenditures can directly affect affordability and adherence.
• Health insurance and prescription drug coverage can directly affect clinical outcomes for people with HIV; changes to coverage can result in lapses in viral suppression and should be anticipated as best possible.
• The Ryan White HIV/AIDS Program offers opportunities to access essential HIV medical and support services, including medication assistance, to minimize cost as a barrier to care for people with HIV and lower incomes.
• Both medical and nonmedical case management services can be used to identify and address cost-related barriers to ART by linking individuals to private and public funding sources.
• Disengagement from care occurs more frequently during transitions in care and coverage (e.g., transitioning from pediatric to adult care; changing employment status; moving from one state to another; being released from incarceration; switching insurance, including to Medicare).

Introduction

The clinical benefits, public health impact, and cost-effectiveness of HIV treatment are well established,[1-6] and increased uptake and utilization of antiretroviral therapy (ART) is one of the four pillars of the *Ending the HIV Epidemic in the U.S.* initiative.[7,8] However, HIV treatment with ART is costly. A 2023 study estimated that the net Medicaid spending from 2007 through 2019 was $25 billion for 17 million 30-day supplies of antiretroviral (ARV) drugs.[9] Estimated annual spending—inclusive of statutorily required manufacturer rebates to offset federal and state costs of most outpatient prescription drugs dispensed to Medicaid beneficiaries—increased 178%, from $1.1 billion to $3.0 billion during this 12-year period. According to a study of risk-adjusted 2016 Medicare claims, total spending for Medicare beneficiaries with HIV receiving ART was 221% greater than for beneficiaries without HIV, largely driven by ARV drug expenses.[10] Since the initial inclusion of an ARV cost table in these guidelines in 2012, the cost of brand-name, first-line ARV regimens has increased by more than 30% from 2012 to 2018,[11] which is 3.5 times the rate of inflation for that same time period.

This section provides guidance on cost considerations related to HIV clinical care. Ideally, ART costs do not influence regimen selection. However, the complexities of the U.S. health care system, including those related to out-of-pocket costs to people with HIV, may necessitate their consideration in regimen selection, because expenditures may directly or indirectly affect adherence and virologic outcomes. Additionally, health insurance and prescription drug coverage determinations, based in part on ART costs, can directly affect clinical outcomes for people with HIV; the clinical impact of changes to insurance coverage is also discussed in this section. Overall costs to the health care system, insurers, and society are also important, especially given the increasing number of people with HIV, rising drug costs, and increasing multimorbidity among people aging with HIV. Providers should make every effort to understand cost considerations that may limit HIV care and the support services available to mitigate cost as a barrier to effective HIV treatment.

Health Care Coverage to Maximize Access to ART

Health care access in the United States can vary, depending on factors such as location and income, among others. Although the Patient Protection and Affordable Care Act (ACA) has substantially improved access to HIV clinical services in many regions of the United States since 2010, an estimated 35% of people with HIV in the United States live in the 10 states—including Florida, Georgia, and Texas—that had not expanded Medicaid in accordance with the ACA as of November 2024.[12]

The ACA and its Medicaid expansion have greatly improved insurance coverage among people with HIV.[13] Before the ACA, many individuals with HIV were denied insurance due to pre-existing condition exclusions and high costs. Medicaid eligibility was also restricted to specific categories, such as disability, which excluded many low-income individuals from coverage.[14,15] Soon after implementation of the ACA and Medicaid expansion in a growing number of states, HIV testing and diagnoses increased, more individuals started ART and achieved viral suppression, uninsured hospitalizations among people with HIV decreased, and fewer people were unaware of their HIV status.[16-19]

A retrospective analysis of NA-ACCORD data examined the associations between state Medicaid expansion associated with the ACA and HIV outcomes in the United States.[20] The study found a beneficial effect of Medicaid expansion on higher CD4 T lymphocyte (CD4) cell counts at the point of enrollment in care. However, no evidence was observed indicating either a positive or negative impact on additional continuum of care outcomes. The authors suggest the null effect on downstream HIV measures for individuals with HIV may be due to the Ryan White HIV/AIDS Program (RWHAP), the highly cost-effective federal safety net program, potentially concealing HIV outcome deficits that might otherwise be apparent in states foregoing Medicaid expansion.[21] At the population level, Medicaid expansion could have a greater effect on reducing HIV incidence by increasing diagnoses and improving linkage to care.[22]

Changes or lapses in health insurance are common and can result in interruptions in clinical care and virologic suppression. Frequent recertification requirements for AIDS Drug Assistance Programs (ADAPs) or Medicaid can lead to lapses in ART use.[23,24] Providers should be aware of the certification needs for the states in which they provide care. Both ADAPs and Medicaid are administered at the state level; therefore, eligibility criteria and medication formularies differ from state to state. When people with HIV receiving Medicaid or ADAP ARV drug coverage move from one state to another, advanced planning is required to ensure uninterrupted access to ART. For example, specific antivirals covered by Medicaid may not be covered by the state ADAP (e.g., long-acting cabotegravir/rilpivirine [LA CAB/RPV]), potentially resulting in the need for regimen changes if a change from Medicaid to an ADAP is required.

Interruptions in health insurance and prescription drug coverage access are also common for people with HIV involved with the criminal justice system. While incarcerated, some people with HIV may be disenrolled from their healthcare insurance and prescription drug coverage. However, in 2023, the Centers for Medicare & Medicaid Services (CMS) released guidance for states when applying for a partial waiver of this policy, enabling coverage for services provided 30 to 90 days before release.[25] With approval of this waiver, states are expected to suspend (not terminate) Medicaid coverage during incarceration and must collaborate with correctional facilities to assist incarcerated individuals who are not currently enrolled in Medicaid with submitting applications during incarceration using presumptive eligibility. Minimum benefits expected by CMS in state waiver proposals include case management services for pre- and post-release (including linkage to outpatient HIV care), medication-assisted therapy for substance use disorders, and at least a 30-day supply of medications at release. Additionally, although federal RWHAP and ADAP funds cannot cover care

and treatment for individuals in state or federal prison systems, they can provide short-term, transitional support to people with HIV in local correctional facilities (e.g., city or county jails).[26]

Cost Sharing in the United States

Prescription drug pricing in the United States involves complex systems with varying requirements for mandatory and voluntary discounts, rebates, and reimbursement rates, and much of the pricing information is confidential. Prices can vary depending on the state, purchaser, type of public or private insurance coverage in use, and number of generic competitors to branded drugs (see Table 22b below). Therefore, providers may find it difficult to navigate payer cost-containment practices, including formulary restrictions, prior authorization requirements, and cost-sharing arrangements, such as copayments (a fixed dollar amount per prescription), coinsurance (a fixed percentage of the prescription cost), and insurance deductible payments.

Out-of-pocket costs for people with HIV can be prohibitive, creating a barrier to the initiation and continuation of ART. Cost sharing results in higher rates of people not initiating ART, prescription abandonment at the pharmacy, decreased adherence, and more frequent drug discontinuation. In turn, out-of-pocket costs may indirectly lead to worse health outcomes and an increased use of the medical system, especially among people with chronic diseases.[27-32] In 2022, the Centers for Disease Control and Prevention (CDC) Medication Monitoring Project (MMP) reported that less than 5% of people with HIV previously taking ART had stopped; however, among people in the MMP who were no longer taking ART, 34% reported that money or insurance problems were contributors to stopping ART.[33]

Conversely, reducing out-of-pocket costs (e.g., through RWHAP or ADAP cost-sharing assistance, manufacturer copayment-assistance programs, or by prescribing generic drugs instead of more costly brand-name products) has been associated with improved adherence.[34] Given the clear association between out-of-pocket costs and the ability to pay for and adhere to medications, clinicians should minimize out-of-pocket drug-related expenses for people with HIV whenever possible. However, many of the cost-sharing arrangements that determine out-of-pocket costs are not transparent to clinicians or people with HIV at the time decisions on ART are made. Asking people with HIV about their copays and working with case management specialists can help to identify and overcome this structural barrier to improving clinical care.

Maximum allowable copayments are statutorily capped at $4 for preferred drugs; in some states, maximum allowable copayments can increase to up to $8 for certain non-preferred drugs for beneficiaries with income <150% of the federal poverty level. For commercial insurers, cost sharing generally is subject to maximum payment rules under the ACA, which increase annually. Manufacturer cost-sharing assistance programs are available for most brand-name ARV products but may be restricted by pharmacy and by state. Manufacturer copay assistance also may be subject to copay accumulator programs implemented by insurers' pharmacy benefit managers, whereby manufacturer payments do not count toward a person's deductible or out-of-pocket maximum.

ADAPs make ARVs and other prescription drugs accessible to people with HIV who are underinsured and have limited financial resources, particularly during lapses in insurance coverage.[35,36] Furthermore, many ADAPs provide premium and/or cost-sharing assistance to eligible clients covered by Medicaid, commercial insurance plans, employer-sponsored insurance plans, or Medicare.[13]

Medicare Beneficiaries With HIV

ARV cost considerations associated with Medicare coverage are increasingly important as more people with HIV age into Medicare. According to CDC HIV prevalence data, 15% of all people with diagnosed HIV in the United States were aged 65 or older in 2022; an additional 27% were aged 55 to 64, with the vast majority expected to age into Medicare over the next 10 years.[37] Enrollment into Medicare can change out-of-pocket costs, which can cause unexpected changes to ART affordability and, ultimately, adherence.[38,39]

Medicare Part D prescription drug cost sharing includes deductibles and copayments or coinsurance, including out-of-pocket payments of up to 25%. However, beginning in 2025, as required under the Inflation Reduction Act, there will be a $2,000 out-of-pocket spending cap.[40]

Medicare Part B cost sharing is not subject to out-of-pocket caps. Where provider-administered drugs—such as long-acting injectable CAB/RPV, ibalizumab-uiyk (IBA) infusions, or subcutaneously (SQ) administered lenacapavir (LEN)—are covered under Medicare Part B, beneficiary cost sharing can be up to 20% of all medication costs.[41]

Low-income beneficiaries may qualify for subsidies to defray Part D cost-sharing payments or the Qualified Medicare Beneficiary program to defray Part B cost-sharing payments. Medicare Advantage and Part D plans are now required to offer beneficiaries an option to enroll in a Medicare Prescription Payment Plan[42] authorized under the Inflation Reduction Act, which will allow beneficiaries to pay cost sharing associated with high-cost prescription drugs in capped monthly payments instead of a single pharmacy payment. Manufacturer copay assistance programs may not be applied toward Medicare plan cost sharing, but assistance from state/territorial ADAPs, other State Pharmaceutical Assistance Programs, and independent foundations (e.g., Patient Access Network Foundation, Patient Advocate Foundation) may provide cost-sharing support if financial eligibility criteria are met.

In addition to its Medicare Part D cost-sharing provisions intended to lower out-of-pocket costs for beneficiaries, the Inflation Reduction Act also requires the Secretary of the U.S. Department of Health and Human Services to negotiate prices with manufacturers for certain drugs with the highest total Part D and Part B spending. Ten Part D drugs were selected for price negotiation in 2026 (2026 pricing was finalized in 2024), with another 15 Part D drugs selected for 2027, 15 Part D and Part B drugs for 2028, and 20 Part D and Part B drugs selected for 2029 and thereafter. The selected drugs will come from the 50 with the highest total Medicare Part D spending and the 50 with the highest total Medicare Part B spending. Although ARV drugs did not qualify for negotiated pricing during the 2026 and 2027 cycles, several ARV drugs are potentially subject to negotiated pricing going into effect in 2028.[43]

Generic Antiretrovirals and Multi-Tablet Regimens

In 2023, savings to the U.S. health care system generated from the use of generic drugs and biosimilar products totaled $445 billion, including $137 billion and $206 billion in savings to Medicare and commercial insurers, respectively.[42,44] Total generic and biosimilar savings for the past 10 years are estimated to be $3.1 trillion.

With substantial improvements in the long-term safety and effectiveness of contemporary ART, a number of regimens and regimen components in Tables 6a and 6b in the Initial Combination Antiretroviral Regimens for People With HIV section remain listed beyond their patent protection date and are or will be available as lower-cost generic options. Keen interest exists in assessing the economic value of using newer, more expensive drugs compared with older, less expensive generic drugs that have established clinical safety and efficacy, such as generic tenofovir disoproxil

fumarate (TDF), which has been available since 2018. A nationwide cross-sectional analysis of 2019 Medicare Part D formulary and pricing data investigated the cost-effectiveness of generic TDF-based regimens versus branded tenofovir alafenamide (TAF)–based regimens.[45] The study demonstrated that the similar efficacy—but slightly improved toxicity profile—of the TAF-based regimens would justify no more than a $1,000 higher annual premium for the TAF-based regimens than generically available TDF-based regimens. A cost-containment analysis evaluated the use of branded dolutegravir (DTG) plus generic lamivudine (3TC) as a two-pill regimen compared with a branded single-tablet regimen (STR).[46] Model findings supported that if 50% of people with newly diagnosed HIV initiated a two-pill regimen consisting of branded DTG plus generic 3TC, the cost savings would reach $550 million to $800 million over a 5-year period; similarly, if 25% of people with sustained viral suppression switched to branded DTG plus generic 3TC maintenance therapy, the cost savings would exceed $3 billion in 5 years.[46]

Because all commercially available STRs listed among the *Recommended Initial Regimens for Most People With HIV* (Table 6a) and *Other Initial Antiretroviral Regimens for Certain Clinical Scenarios* (Table 6b) are branded products, including STRs that contain ARV components that are no longer patent protected, use of generics in the United States may necessitate modest increases in pill burden, but without changes in drug frequency. One study of Medicare Part D spending, which included expenditures for one ARV fixed-dose combination tablet (abacavir [ABC]/3TC), demonstrated that splitting up brand-name coformulated products into their generic components could have saved Medicare an estimated $2.7 billion from 2011 through 2016, and it highlighted this approach as a critical cost-containment measure.[47]

However, to the extent that pill burden, rather than drug frequency, results in reduced adherence, generic ART could lead to decreased costs but at the potential expense of worsening virologic suppression rates and poorer clinical outcomes.[29,30] An additional benefit of STRs is that they eliminate the risk that one drug in the regimen will be temporarily or permanently discontinued because of prescribing error, unsynchronized refill schedules, or prohibitive out-of-pocket costs. Data to support or refute the superiority of once-daily STRs versus once-daily multi-tablet regimens, particularly based on virologic outcomes and especially following viral suppression, remain limited. One large observational cohort study demonstrated a small but statistically significant virologic efficacy benefit associated with STRs.[46] In this study, the time to treatment discontinuation was shorter for non-STRs than for once-daily STR regimens; however, this difference disappeared when modifications for regimen simplification were included in the analysis. On the other hand, observational data from Spain showed that coformulated DTG/ABC/3TC resulted in similar viral suppression compared with DTG plus ABC/3TC, both when used as an initial ARV regimen and when people with viral suppression on the STR were switched to the two-pill formulation as a cost-saving strategy.[48]

Importantly, when the costs of brand-name drug products and generic ARV drugs are compared, savings associated with generic ARV drugs may vary when branded drugs are subject to discounts or rebates across public and private payer systems. Although generic drug products may be associated with societal cost savings and, specifically, savings for public payers, commercial insurers, and people with HIV with significant out-of-pocket pharmacy expenses, manufacturer copay assistance is not generally available to commercially insured individuals. In cases where manufacturer copay assistance may be available for a brand-name ARV product but not for an equivalent generic ARV product, the generic drug prescription paradoxically may result in higher out-of-pocket costs.

Long-Acting Injectable ART

CAB/RPV, IBA, and LEN are ARVs with unique formulations and pharmacokinetic characteristics that allow for long-acting administration via intramuscular (IM) injection, intravenous (IV) infusion,

and SQ injection, respectively. IBA and LEN are approved for use among highly treatment-experienced people, typically in combination with an optimized background regimen consisting of at least one daily oral ARV drug product, and are associated with unique cost considerations. Conversely, monthly or bimonthly LA CAB/RPV injections can be prescribed and administered as a complete regimen replacement for daily oral ARV regimens.

Wholesale Acquisition Cost (WAC) prices for the LA CAB/RPV formulations are comparable to those of commonly prescribed oral regimens on an annual basis. However, long-acting HIV treatment options requiring administration by a licensed medical provider may be associated with costs not typically associated with oral ART, including clinic visit and administration fees, medical benefit determinations and prior authorization requirements, patient scheduling and follow-up to ensure adherence, upfront medication purchasing costs incurred by clinics, and inadequate "buy-and-bill" insurance reimbursements.

Cost-effectiveness modeling indicates that long-acting ART may be particularly advantageous for people struggling with adherence to daily oral regimens.[49-51] Studies have demonstrated that long-acting ART can achieve similar or better clinical outcomes than oral ART, particularly when adherence is factored into the equation. In cost terms, LA CAB/RPV may lead to lifetime savings, given lower health care expenditures associated with improved viral suppression and reduced risk of HIV transmission.

Costs and Cost-Effectiveness of ARV Regimens for Highly Treatment-Experienced People With Multidrug-Resistant HIV

For people with multidrug-resistant (MDR) HIV, an ARV regimen that includes IV IBA, SQ LEN, or oral fostemsavir can be effective in achieving viral suppression, though costly. Two cost-effectiveness analyses using independent simulation models have demonstrated that IBA-containing ARV regimens would substantially improve survival for people with MDR HIV, but at a high cost per quality-adjusted life years, given the high cost of IBA. However, the overall budget impact of such regimens would be relatively small, given the limited number of people for whom IBA would be necessary.[52,53]

340B Drug Pricing Program, Prescription Drug Affordability, and Program Savings for People With HIV

Created by Congress in 1992, the 340B Drug Discount Program requires pharmaceutical manufacturers to sell drugs at a discount to certain hospitals and federally funded clinics providing safety net care, including RWHAP providers and state/territorial ADAPs. 340B discounts help to ensure the affordability of outpatient prescription drugs for uninsured and underinsured people with HIV and to retain any revenue associated with discounted sales. This revenue, or program savings, is generated when 340B-covered entities are able to purchase discounted drugs but are reimbursed by third-party payers at usual and customary rates that do not account for discounted purchases. Although potentially incentivizing providers to prescribe higher-cost brand-name drugs that yield substantially greater revenue than generic alternatives, 340B savings can be used to "stretch scarce federal resources as far as possible, reaching more eligible patients and providing more comprehensive services."[54]

By purchasing ARV drugs and other essential medicines at significantly reduced prices, covered entities can reinvest savings into essential HIV care and support services, including case management, behavioral health care, offsetting uncompensated care, transportation, adherence support, and outreach efforts. These services can help improve HIV care retention, medication adherence, and viral suppression rates.[13]

Costs and Cost-Effectiveness of Routine Laboratory Services for People With HIV on ART

In the context of lifelong ART, the amount of money to be saved by reducing the frequency of expensive tests (e.g., genotypes, serologies) is modest. Even so, judicious use of laboratory testing, without compromising patient care, can still be an important way to reduce costs. For people with deductibles for laboratory tests, decreasing the use of tests with limited clinical value could reduce costs and improve adherence to a care plan. Several studies have examined the value of laboratory services in HIV care. One cost analysis study suggested that there may be no clinical benefit to continuing CD4 monitoring in people with suppressed viral loads and CD4 counts >200 cells/mm^3 after 48 weeks of therapy.[31] In the United States, reducing biannual CD4 monitoring to annual monitoring could save approximately $10 million per year.[55] Another study reviewed the records of 429 hospitalizations for 274 people with HIV during a 6-month period. The inpatient chart review demonstrated that 45% of ordered laboratory tests were not indicated, including hepatitis serologies, other serologies, and cytomegalovirus polymerase chain reaction. During this 6-month period at this single site, the estimated cost of excess and inappropriate laboratory testing totaled $14,000 to $92,000.[56]

Cost-effectiveness analyses from 2001 and 2005 demonstrated the value of genotypic resistance testing in people who are ART-experienced and ART-naive and supported the Panel on Antiretroviral Guidelines for Adults and Adolescents (the Panel) recommendation to perform resistance testing before ART initiation and at the time of virologic failure.[57,58] More recent cost-effectiveness analyses have revisited the value of baseline, pre-treatment genotype testing in the setting of integrase strand transfer inhibitor (INSTI) plus two–nucleoside reverse transcriptase inhibitor (NRTI) regimens. One modeling study suggested that INSTI-specific genotype testing before initiation of a DTG plus two-NRTI regimen is not cost-effective and may lead to underutilization of INSTIs; the results highlighted that some people with minor INSTI resistance mutations would still become virologically suppressed on a DTG-based regimen.[59] A second modeling study found that standard (NRTI, non-nucleoside reverse transcriptase inhibitor, protease inhibitor) genotype testing before ART initiation also is not cost-effective because it may have little impact on outcomes, given the use of an INSTI plus two NRTIs in first-line treatment.[60] Both modeling studies assessed the use of genotype testing only for decision-making for initial ART and presumed that genotype testing would be available for use at the time of first-line failure. The results of these modeling studies suggest that additional clinical research is needed to define the role of genotypic resistance testing before initiation of an INSTI plus two-NRTI regimen. Importantly, these modeling data do not apply to the initiation of two-drug ARV regimens (e.g., DTG plus 3TC) or to people who have received oral (TDF or TAF) plus (3TC or FTC) or IM cabotegravir (CAB) as pre-exposure prophylaxis (PrEP), which are being prescribed increasingly in clinical practice. It should be noted that the Panel continues to recommend baseline testing for clinically relevant protease and reverse transcriptase mutations for most people, with additional genotypic resistance testing for integrase mutations for individuals with a history of CAB use for PrEP or an INSTI-based regimen for post-exposure prophylaxis (see Drug-Resistance Testing).

Costs and Cost-Effectiveness of Comprehensive HIV Care

Comprehensive person-centered HIV care offers substantial clinical benefits.[61] Such programs include the integration of social service needs and services for mental health, substance use disorders, sexual health, and age-associated multimorbidity (see Substance Use Disorders and HIV, Adherence to the Continuum of Care, and HIV and the Older Person). Integrated services can improve engagement in care and virologic suppression among people with HIV, but they require investment and resources. Several cost-effectiveness analyses have demonstrated that integrated

care programs can offer excellent value, especially if delivered to people at increased risk of disengagement in care.[62-64]

RWHAP provides a critical source of outpatient HIV clinical care for people with HIV who have low incomes and remain uninsured or underinsured under the ACA or who require wraparound support.[26] A recent cost-effectiveness analysis underscored the value of this safety net program and projected its clinical and cost impact over 50 years. Given higher rates of virologic suppression among people with HIV attending RWHAP clinics (compared with estimated virologic suppression in the absence of such supports), the analysis projects fewer HIV incident infections and longer life expectancy and demonstrates the cost-effectiveness of RWHAP.[21] RWHAP funds can be used to provide eligible individuals with services related to the delivery of HIV care, the treatment of related conditions, and support, as well as to address identified barriers to care. However, RWHAP funds cannot be used for inpatient care and services.[65]

Comprehensive HIV care and treatment often requires navigating a complex, dynamic patchwork of service delivery and both payer and financing mechanisms. Provider awareness of this patchwork, including the array of services available to people with HIV eligible for RWHAP, is therefore essential to maximizing clinical outcomes.

Conclusion

Ideally, costs should not drive clinical care, yet they are a factor in contemporary health care. Because regimen costs may affect people's ability to afford and adhere to therapy, understanding ART-related costs in the United States is increasingly important. Providers play a key role in ensuring optimal care while working to both (1) minimize costs for ARV drugs and avoid or minimize unnecessary laboratory monitoring and (2) retain excellent clinical outcomes in an environment of cost-containment strategies, including formulary restrictions, utilization management (e.g., prior authorization), and cost sharing. Providers should, therefore, remain informed of current insurance and payment structures, ART costs (see Table 22b below for estimates of average drug prices), out-of-pocket expenditure requirements, and available generic ARV options. Providers should work with people with HIV and pharmacists, social workers, case managers, financial service providers, and peer navigators to understand their clients' medication benefits and any potential financial hurdles to prescription fulfillment and full adherence. This information will help providers identify treatment options that are safe, effective, and affordable. Engaging people with HIV in discussions about cost constraints during regimen selection will likely facilitate adherence. Additionally, providers should familiarize themselves with ARV affordability resources (such as ADAPs and pharmaceutical company assistance programs for people who qualify) and refer them to such assistance if needed. Similarly, providers should help people with HIV to find comprehensive clinical care coverage when available and consider opportunities to integrate care when feasible.

Table 22a. Insurance and Health Program Prescription Drug Pricing and Access

Insurance/Health Program	Prescription Drug Pricing and Access
Medicaid	Drug manufacturers must participate in the MDRP for their drugs to be covered by Medicaid and Medicare Part B. Manufacturers are required to pay Medicaid programs a rebate of at least 23.1% of the AMP for most brand-name drugs (13% for generics) sold to retail pharmacies or outpatient care providers (notably infused, injected, implanted, inhaled, or instilled drugs). Manufacturers pay additional rebates if this confidential AMP increases faster than the CPI-U rate of inflation. Additionally, many states negotiate with manufacturers for supplemental rebates. States are permitted to require "nominal" cost sharing for medical and pharmacy benefits for some beneficiaries, although many elect not to do so. States can obtain a waiver to allow them to apply higher cost sharing.
Medicare	ARVs are one of six "protected drug classes" under Medicare Part D. Part D plans must provide access to all, or substantially all, FDA-approved ARVs. Part D plan sponsors, or PBMs on their behalf, negotiate rebates on outpatient drugs with manufacturers; the extent of rebating is unclear. Most physician-administered drugs and biologics are covered under Medicare Part B at a set cost: ASP plus 6%. This pricing mechanism controls spending by narrowing the spread between what is actually paid for the drug and what is actually billed to Medicare. Premiums and cost-sharing payments may be significant for both services and prescription drugs, though caps on out-of-pocket spending for drugs covered by Medicare Part D went into effect in 2024; Part A (hospital care) and Part B place no cap on out-of-pocket spending. Some subsidies and supplemental coverage are offered for low-income beneficiaries. Manufacturer copay assistance programs cannot be applied to Part B or Part D cost sharing; cost-sharing support is available from ADAPs, foundations, and other sources and is based on financial eligibility criteria.
Commercial Insurance	Private insurance plans, or PBMs on their behalf, negotiate rebates on inpatient and outpatient drugs with manufacturers; the extent of rebating is unclear. Formulary restrictions and utilization management (prior authorization, step therapy, higher cost sharing) involving drugs and biologics covered under plans' pharmacy benefit or medical benefit (e.g., infused or injected ARVs) are possible cost-containment measures. Cost sharing can be highly variable. Manufacturer copay assistance programs can be applied in most cases but may not count toward annual ACA cost-sharing limits; cost-sharing support is also available from ADAPs, foundations, and other sources and is based on financial eligibility criteria.

Table 22a. Insurance and Health Program Prescription Drug Pricing and Access

Insurance/Health Program	Prescription Drug Pricing and Access
ADAPs	Significant discounting on most ARVs negotiated by the ADAP Crisis Task Force is allowed under the 340B Drug Pricing Program. There is usually no cost sharing for ADAP clients who are uninsured. ADAP can assist with commercial or public insurance out-of-pocket costs.
Veterans Affairs	The FCP is the maximum price manufacturers may charge the four largest federal purchasers of pharmaceuticals (the "Big Four"): the U.S. Department of Veterans Affairs, U.S. Department of Defense, U.S. Public Health Service (including the Indian Health Service), and U.S. Coast Guard. The FCP of a drug includes a 24% discount on a drug's average price paid by nonfederal purchasers. Additional discounts may be applied if nonfederal purchase prices increase faster than the CPI-U inflation rate. Big Four prices may be 40% to 50% below list prices. Veterans Affairs may negotiate further price reductions. Prescription drug cost sharing is generally nominal; medications are not withheld from those who cannot afford cost-sharing expenses.
Community Health Centers	Many community health centers are enrolled in the 340B Drug Pricing Program, which allows discounted drug purchasing using the MDRP formula. Discounts start at 23.1% off AMP, with additional discounts if the AMP increases faster than the CPI-U rate of inflation. Cost sharing in community health centers is first driven by payer source. For clients who are uninsured, cost sharing, if required, is typically based on a sliding fee scale.
Jails and Prisons	Under the U.S. Constitution, correctional facilities have a legal obligation to provide necessary medical care, including prescription drugs, to incarcerated individuals.[a] Jails and prisons generally do not have access to discounted drugs available to government programs, such as Medicaid or "Big Four" purchasers (see Veterans Affairs above), but may benefit from centralized municipal or state purchasing mechanisms. Jails and prisons also may be able to purchase discounted ARV drugs and other medications under the 340B Drug Pricing Program, either as a recipient of certain federal funds associated with STI, HIV, and viral hepatitis prevention, or in partnership with other 340B-covered entities contracted to provide health care services to jailed or incarcerated individuals (e.g., disproportionate share hospital programs, community health centers). RWHAP programs and ADAPs also may provide time-limited HIV care and prescription drug access support for people with HIV in local prisons and jails.

Table 22a. Insurance and Health Program Prescription Drug Pricing and Access

Insurance/Health Program	Prescription Drug Pricing and Access
Manufacturer and Charitable Prescription Drug Assistance Programs	Manufacturer PAPs are run by, or in association with, pharmaceutical companies to provide free or low-cost medications to people who meet certain eligibility requirements, including FPL-based income limits. A CAP is operated by manufacturers to provide assistance with cost-sharing requirements (including deductibles, copayments, and coinsurance) associated with prescription drug fills/refills for individuals with private health insurance. Pharmaceutical company CAPs cannot be used by individuals covered by Medicaid, Medicare, or other state and federal programs. Charitable third-party assistance programs, such as Patient Advocate Foundation Co-pay Relief, provide cost-sharing assistance to people who meet financial eligibility requirements. NASTAD maintains a number of PAP and CAP resources for use in clinical practice.

[a] *Estelle v. Gamble* [66]

Key: ACA = Affordable Care Act; ADAP = AIDS Drug Assistance Program; AMP = average manufacturer price; ARV = antiretroviral; ASP = average sales price; CAP = cost-sharing assistance program; CPI-U = consumer price index-urban; FCP = federal ceiling price; FDA = U.S. Food and Drug Administration; FPL = federal poverty level; NASTAD = National Alliance of State & Territorial AIDS Directors; MDRP= Medicaid Drug Rebate Program; PAP = patient assistance program; PBM = pharmacy benefits manager; RWHAP = Ryan White HIV/AIDS Program; STI = sexually transmitted infection

Table 22b. Monthly Average Prices of Commonly Used Antiretroviral Drugs

Table 22b includes three benchmark prices, rounded to the nearest dollar, for commonly used antiretroviral (ARV) drugs[a] as a general reference for health care providers when considering the cost of HIV treatment. Health care providers should contact pharmacies or payers regarding actual prices, comparative cost savings, formulary restrictions, and cost-sharing requirements. The **wholesale acquisition cost (WAC)** is the list price published by manufacturers for prescription drugs or biologics sold to wholesalers. The WAC price approximates what retail pharmacies pay wholesalers for single-source (e.g., brand-name) drugs. There is a range of WAC prices for generic ARV drugs, because these are multiple-source products with variable list prices. With increasing competition, actual transactional prices of generic drugs decrease substantially among wholesalers and pharmacies. **Average wholesale price (AWP)** has historically been used as the basis for setting public (e.g., Medicaid) and private (e.g., commercial insurer) reimbursement rates for pharmacies. Neither WAC nor AWP includes variable price concessions along supply and payment chains, including discounts and rebates to wholesalers, pharmacies, federal purchasers (e.g., the U.S. Department of Veterans Affairs), pharmacy benefit managers, commercial insurers, Medicaid, 340B pharmacies, and AIDS Drug Assistance Programs. The availability of these discounts and rebates depends on product demand, market competition, and WAC price increases set by manufacturers. Maximum Medicaid payment rates are assigned to generic products with three or more therapeutically and pharmaceutically equivalent products, as determined by the U.S. Food and Drug Administration. This federally established pharmacy reimbursement limit is the **federal upper limit (FUL).** Federal Medicaid will reimburse state Medicaid programs up to this limit for multiple-source drugs (plus the dispensing fee); states may set their own **state maximum allowable costs (SMACs)** and commercial insurers set their own reimbursement upper limits with pharmacies. Whereas WACs and AWPs are generally set annually, FULs are adjusted on a monthly basis, particularly for multiple-source drugs with fluctuating pharmacy acquisition costs. In this table, the FUL for a drug is described as “pending” if a generic drug currently lacks the competition required to trigger a FUL.

DRUG–DRUG INTERACTIONS

Updated: September 12, 2024
Reviewed: September 12, 2024

Overview

Pharmacokinetic (PK) drug–drug interactions between antiretroviral (ARV) drugs and concomitant medications are common and may lead to increased or decreased drug exposure. In some instances, changes in drug exposure may increase the frequency and/or severity of toxicities or affect therapeutic responses. When prescribing or switching one or more drugs in an ARV regimen, clinicians must consider the potential for drug–drug interactions—both those affecting ARVs and those affecting concomitant drugs. A thorough review of concomitant medications in consultation with an expert in ARV pharmacology can help in designing a regimen that minimizes undesirable interactions. Recommendations for managing a specific drug interaction may differ depending on whether a new ARV is being initiated in a patient on a stable concomitant medication or a new concomitant medication is being initiated in a patient on a stable ARV regimen. The magnitude and significance of interactions are difficult to predict when several drugs with competing metabolic pathways and drug transporter systems are prescribed concomitantly. When it is necessary to prescribe interacting drugs, clinicians should be vigilant in monitoring for therapeutic efficacy and/or concentration-related toxicities. Tables 24a through 25b provide information on known or suspected drug interactions between ARV agents and commonly prescribed medications based on published PK data or information from product labels. The tables provide general guidance on drugs that should not be coadministered and recommendations for dose modification of ARVs or concomitant medicines or for alternative therapy.

Mechanisms of Pharmacokinetic Interactions

PK interactions may occur during absorption, metabolism, or elimination of the ARV and/or the interacting drugs. The most common drug interaction mechanisms are described and listed for individual ARV drugs in Table 23 below.

Pharmacokinetic Interactions Affecting Drug Absorption

The extent of oral absorption of drugs can be affected by the following mechanisms:

- Acid-reducing agents—such as proton pump inhibitors, H2 antagonists, or antacids—can reduce the absorption of ARV drugs that require gastric acidity for optimal absorption (i.e., atazanavir and rilpivirine).
- Products that contain polyvalent cations—such as supplements, iron products, or antacids that contain aluminum, calcium, or magnesium—can bind to integrase strand transfer inhibitors (INSTIs) and reduce absorption of these ARV agents.
- Drugs that induce or inhibit the enzyme cytochrome P450 (CYP) 3A4 or efflux transporter P-glycoprotein in the intestines may reduce or promote the absorption of other drugs.

Pharmacokinetic Interactions Affecting Hepatic Metabolism

Two major enzyme systems are most frequently responsible for clinically significant drug interactions:

- The CYP enzyme system is responsible for the metabolism of many drugs, including non-nucleoside reverse transcriptase inhibitors, protease inhibitors, the CCR5 antagonist maraviroc, and the INSTI elvitegravir. CYP3A4 is the most common enzyme responsible for drug metabolism, though multiple enzymes may be involved in the metabolism of a drug. ARV drugs and concomitant medications may be inducers, inhibitors, and/or substrates of these enzymes.
- The uridine diphosphate glucuronosyltransferase (UGT) 1A1 enzyme is the primary enzyme responsible for the metabolism of the INSTIs cabotegravir and raltegravir. Drugs that induce or inhibit the UGT enzyme can affect the PK of these INSTIs.
- The INSTIs bictegravir and dolutegravir (DTG) and the capsid inhibitor lenacapavir have mixed metabolic pathways, including both CYP3A4 and UGT1A1. Drugs that induce or inhibit these enzymes may have variable impact on the PK of these ARVs.

Pharmacokinetic Enhancers (Boosters)

PK enhancing is a strategy used to increase exposure of an ARV by concomitantly administering a drug that inhibits the enzymes that metabolize the ARV. Currently, two agents are used as PK enhancers: ritonavir (RTV) and cobicistat (COBI). Both drugs are potent inhibitors of the CYP3A4 enzyme and, thus, when coadministered with ARVs metabolized by the CYP3A4 pathway, the resultant systemic exposure of the ARVs is higher. Importantly, RTV and COBI have different effects on other CYP- or UGT-metabolizing enzymes and drug transporters. Complex or unknown mechanisms of PK-based interactions preclude extrapolation of RTV drug interactions to certain COBI interactions, such as interactions with warfarin, direct oral anticoagulants, phenytoin, voriconazole, oral contraceptives, and certain hydroxy-methylglutaryl-coenzyme A (HMG-CoA) reductase inhibitors (or statins).

Other Mechanisms of Pharmacokinetic Interactions

Drug transporters are expressed in various tissues, and they play an important role in drug disposition. Knowledge of drug transporters is evolving, elucidating additional drug interaction mechanisms. For example, DTG decreases the renal clearance of metformin by inhibiting organic cation transporters in renal tubular cells. Similar transporters aid hepatic, renal, and biliary clearance of drugs and may be susceptible to drug interactions. ARVs and concomitant medications may be inducers, inhibitors, and/or substrates of these drug transporters. The influence of drug transporters on drug–drug interactions is complex, and the clinical significance of these interactions is unclear but is under investigation. Further research is needed to better understand these pathways and the clinical significance of this drug interaction mechanism.

Role of Therapeutic Drug Monitoring in Managing Drug–Drug Interactions

Therapeutic drug monitoring (TDM) can guide the dosing of certain medications by using measured drug concentrations to improve the likelihood of desired therapeutic and safety outcomes. Drugs suitable for TDM are characterized by a known exposure-response relationship and a therapeutic range of concentrations. The “therapeutic range” is a range of concentrations established through clinical investigations that are associated with a greater likelihood of achieving the desired therapeutic response and/or reducing the frequency of drug-associated adverse reactions.

When concomitant use of an ARV drug and another medication is likely to result in a clinically important drug–drug interaction, the first step is to assess whether other, equally effective treatment options can be used to avoid the interaction. If that is not possible, TDM may be useful in assessing whether a dose adjustment is needed.

Drug concentration assays for some ARV drugs are commercially available; however, result reporting may take 1 week or longer. When interpreting assay results, clinicians should consider the patient's medication adherence, the timing of the patient's last ARV dose and blood draw, and the time elapsed since coadministration of the interacting drug combination. If needed, a specialist in ARV clinical pharmacology should be consulted when interpreting the results and deciding what actions to take. If a dose adjustment is needed, TDM must be repeated after the dose-adjusted drug reaches steady state to ensure appropriate dosing.

TDM information should not be used alone; it must be considered in conjunction with other clinical information—including virologic response, medication adherence, and signs and symptoms of drug toxicities—to assure safe and effective therapy.

Table 23. Mechanisms of Antiretroviral-Associated Drug Interactions

Pharmacokinetic interactions may occur during absorption, metabolism, or elimination of the antiretroviral (ARV) drug and/or the interacting drug. This table does not include a comprehensive list of all possible mechanisms of interactions for individual ARV drugs (e.g., transporters); however, the table lists the most common mechanisms of known interactions and focuses on absorption and cytochrome P450 (CYP)– and uridine diphosphate glucuronosyltransferase (UGT) 1A1–mediated interactions.

Note: N/A indicates that there are no clinically relevant interactions by the mechanism. Identified mechanisms are specific to the ARV drugs described in the row and may not be reflective of complete ARV regimens. Some older ARVs—unboosted atazanavir, fosamprenavir, nelfinavir, nevirapine, tipranavir, and zidovudine—are not commonly used in clinical practice and are **not** included in this table. Please refer to the U.S. Food and Drug Administration product labels for information regarding drug interactions for these ARVs.

ARV Drugs by Drug Class	Mechanisms That May Affect Oral Absorption of ARV Drugs			Enzymes That Metabolize or Are Induced or Inhibited by ARV Drugs			
	Increasing Gastric pH	Cationic Chelation	P-gp	CYP Substrate	CYP Inhibitor	CYP Inducer	UGT1A1

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Updated: September 12, 2024
Reviewed: September 12, 2024

This table provides information on the known or predicted interactions between protease inhibitors (PIs) and non-antiretroviral (ARV) drugs. The term "PI" refers to atazanavir (ATV) or darunavir (DRV) boosted with either ritonavir (RTV or r) or cobicistat (COBI or c). This table does not include interactions for unboosted ATV, fosamprenavir (FPV), lopinavir (LPV), nelfinavir (NFV), or tipranavir (TPV). For information regarding interactions between PIs and other ARV drugs, including dosing recommendations, refer to Tables 24c, 25a, and 25b.

Recommendations for managing particular drug interactions may differ depending on whether a new ARV drug is being initiated in a patient on a stable concomitant medication or whether a new concomitant medication is being initiated in a patient on a stable ARV regimen. The magnitude and significance of drug interactions are difficult to predict when several drugs with competing metabolic pathways are prescribed concomitantly. In cases where an interacting drug needs to be replaced with an alternative, providers should exercise their clinical judgment to select the most appropriate alternative medication.

Note: Unboosted ATV, FPV, LPV/r, NFV, and TPV are no longer commonly used in clinical practice in the United States and are **not** included in this table. Please refer to the U.S. Food and Drug Administration product labels for information regarding drug interactions between these PIs and concomitant medications. Information regarding these agents may also be found in archived versions of this guideline.

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Acid Reducers			
Antacids	ATV/c, ATV/r	**When Given Simultaneously** • ↓ ATV expected	Administer ATV at least 2 hours before or 2 hours after antacids or buffered medications.
H2 Receptor Antagonists	ATV/c, ATV/r	↓ ATV expected	H2RA dose should not exceed a dose equivalent to famotidine 40 mg twice daily in ART-naive patients or famotidine 20 mg twice daily in ART-experienced patients. Give ATV 300 mg (plus COBI 150 mg **or** RTV 100 mg) with food simultaneously with and/or ≥10 hours after the dose of H2RA.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
			If using TDF and H2RA in ART-experienced patients, administer ATV 400 mg plus RTV 100 mg with food simultaneously with and/or ≥10 hours after the dose of H2RA. **Do not coadminister** ATV/c with TDF and H2RA in ART-experienced patients.
	DRV/c, DRV/r	**With Ranitidine** • ↔ DRV/r	No dose adjustment needed
Proton Pump Inhibitors	ATV/c, ATV/r	**With Omeprazole 40 mg** • ATV AUC ↓ 76% **When Omeprazole 20 mg Is Given 12 Hours Before ATV/c or ATV/r** • ATV AUC ↓ 42%	PPI dose should not exceed a dose equivalent to omeprazole 20 mg daily in PI-naive patients. PPIs should be administered at least 12 hours before ATV/c or ATV/r. **Do not coadminister** in PI-experienced patients.
	DRV/c	↔ PI expected	No dose adjustment needed
	DRV/r	↔ DRV/r Omeprazole AUC ↓ 42%	Consider alternative ARV or acid reducer. If coadministered, monitor for omeprazole effectiveness. If the patient does not experience symptomatic relief, increase the dose to no more than omeprazole 40 mg daily.
Alpha-Adrenergic Antagonists for Benign Prostatic Hyperplasia			
Alfuzosin	ATV/c, ATV/r, DRV/c, DRV/r	↑ alfuzosin expected	**Contraindicated**
Doxazosin	ATV/c, ATV/r, DRV/c, DRV/r	↑ doxazosin possible	Initiate doxazosin at lowest dose and titrate. Monitor blood pressure. Dose reduction may be necessary.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Tamsulosin	ATV/c, ATV/r, DRV/c, DRV/r	↑ tamsulosin expected	**Do not coadminister** unless benefits outweigh risks. If coadministered, monitor blood pressure.
Terazosin	ATV/c, ATV/r, DRV/c, DRV/r	↔ or ↑ terazosin possible	Initiate terazosin at lowest dose and titrate. Monitor blood pressure. Dose reduction may be necessary.
Silodosin	ATV/c, ATV/r, DRV/c, DRV/r	↑ silodosin expected	**Contraindicated**
Antibacterials—Antimycobacterials			
Bedaquiline	ATV/c, ATV/r, DRV/c, DRV/r	• ↑ bedaquiline possible	**Do not coadminister** unless benefits outweigh risks. If coadministered, consider therapeutic drug monitoring and monitor for bedaquiline-related adverse effects, including hepatotoxicity and QTc prolongation.
Rifabutin	ATV/r	**Compared With Rifabutin (300 mg Once Daily) Alone, Rifabutin (150 mg Once Daily) Plus ATV/r** • Rifabutin AUC ↑ 110% and metabolite AUC ↑ 2,101%	Recommended dose is rifabutin 150 mg once daily. Monitor for antimycobacterial activity and consider therapeutic drug monitoring. Monitor for rifabutin-related adverse events, including neutropenia and uveitis. PK data in this table are results from healthy volunteer studies. Lower rifabutin exposure has been reported in patients with HIV than in healthy study participants.
	DRV/r	**Compared With Rifabutin (300 mg Once Daily) Alone, Rifabutin (150 mg Every Other Day) Plus DRV/r** • ↔ rifabutin AUC and metabolite AUC ↑ 881%	
	ATV/c, DRV/c	↑ rifabutin expected ↓ COBI expected	**Do not coadminister.**

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Rifampin	ATV/c, ATV/r, DRV/c, DRV/r	↓ PI concentration by >75%	**Contraindicated.** Increasing the dose of RTV does not overcome this interaction and may increase hepatotoxicity. Increasing the COBI dose **is not recommended.** Consider rifabutin if a rifamycin is indicated.
Rifapentine	ATV/c, ATV/r, DRV/c, DRV/r	**Daily and Weekly Dosing** • ↓ PI expected	**Do not coadminister.**
Antibacterials—Macrolides			
Azithromycin	ATV/c, ATV/r	↑ azithromycin possible	No dose adjustment needed
	DRV/c, DRV/r	↔ azithromycin expected	No dose adjustment needed
Clarithromycin	ATV/c, ATV/r, DRV/c	↑ clarithromycin expected ↑ ATV/r and PI/c expected	Consider alternative ARV or azithromycin.
	DRV/r	DRV/r ↑ clarithromycin AUC 57% RTV 500 mg twice daily ↑ clarithromycin 77%	Consider alternative ARV or azithromycin. If use of clarithromycin is necessary in a patient with impaired renal function, reduce clarithromycin dose by 50% in patients with CrCl 30 to 60 mL/min. In patients with CrCl <30 mL/min, reduce clarithromycin dose by 75%. Monitor for clarithromycin-related adverse events, including QTc prolongation.
Erythromycin	ATV/c, ATV/r, DRV/c, DRV/r	↑ erythromycin expected ↑ PI expected	Consider alternative ARV or use azithromycin.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Anticoagulants			
Apixaban	ATV/c, ATV/r, DRV/c, DRV/r	↑ apixaban expected	**Do not coadminister** in patients who require apixaban 2.5 mg twice daily. **In Patients Requiring Apixaban 5 mg or 10 mg Twice Daily** • Reduce apixaban dose by 50%.
Dabigatran	ATV/c, ATV/r	**With COBI 150 mg Alone** • Dabigatran AUC ↑ 110% to 127% **With ATV/r** • ↑ dabigatran expected	**Reduction of Risk of Stroke and Systemic Embolism in Nonvalvular Atrial Fibrillation in Adult Patients** • CrCl >30 mL/min: no dose adjustment needed • CrCl ≤30 mL/min: do not coadminister. **Treatment and Reduction in the Risk of Recurrence of DVT and PE or Prophylaxis of DVT and PE Following Hip Replacement Surgery in Adult Patients** • CrCl ≥50 mL/min: no dose adjustment needed • CrCl <50 mL/min: do not coadminister.
	DRV/c, DRV/r	**With DRV/c** • Single dose DRV/c: dabigatran AUC ↑ 164% • After 14 days of DRV/c: dabigatran AUC ↑ 88% **With DRV/r** • Single dose DRV/r: dabigatran AUC ↑ 72% • After 14 days of daily DRV/r: dabigatran AUC ↑ 18%	
Edoxaban	ATV/c, ATV/r, DRV/c	↑ edoxaban expected	**Treatment of Nonvalvular Atrial Fibrillation** • No dose adjustment needed **Treatment of DVT and PE** • Reduce edoxaban dose to 30 mg once daily.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	DRV/r	↑ edoxaban expected	**Treatment of Nonvalvular Atrial Fibrillation** • No dose adjustment needed **Treatment of DVT and PE** • No dose adjustment needed
Rivaroxaban	ATV/c, ATV/r, DRV/c, DRV/r	↑ rivaroxaban expected	**Do not coadminister.**
Warfarin	ATV/c, DRV/c	↑ warfarin possible	Monitor INR closely when stopping or starting PI/c or PI/r and adjust warfarin dose accordingly. If switching between RTV and COBI, the effect of COBI on warfarin is not expected to be equivalent to RTV's effect on warfarin.
	ATV/r, DRV/r	↓ warfarin possible	
Antidepressants, Anxiolytics, and Antipsychotics Also see the Sedative/Hypnotics section below			
Antidepressants, Anxiolytics			
Bupropion	ATV/r, DRV/r	↓ bupropion possible	Titrate bupropion dose based on clinical response.
	ATV/c, DRV/c	↔ bupropion expected	No dose adjustment needed
Buspirone	ATV/c, ATV/r, DRV/c, DRV/r	↑ buspirone expected	Administer lowest dose of buspirone with caution and titrate buspirone dose based on clinical response. Dose reduction may be necessary. Monitor for buspirone-related adverse events.
Desvenlafaxine	ATV/c, ATV/r, DRV/c, DRV/r	↑ desvenlafaxine possible	No dose adjustment needed

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Duloxetine	ATV/c, DRV/c	↑ duloxetine possible	No dose adjustment needed
	ATV/r, DRV/r	↑ or ↓ duloxetine possible	
Mirtazapine	ATV/c, ATV/r, DRV/c, DRV/r	↑ mirtazapine possible	Monitor for mirtazapine-related adverse events. Mirtazapine dose reduction may be necessary.
Nefazodone	ATV/c, ATV/r, DRV/c, DRV/r	↑ nefazodone expected ↑ PI possible	Monitor for nefazodone-related adverse events and PI tolerability.
Selective Serotonin Reuptake Inhibitors (e.g., citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline, vortioxetine)	DRV/r	Paroxetine AUC ↓ 39% Sertraline AUC ↓ 49%	Titrate SSRI dose based on clinical response.
	ATV/c, ATV/r, DRV/c	↑ or ↓ SSRI possible	Titrate SSRI dose using the lowest available initial or maintenance dose.
Trazodone	ATV/c, ATV/r, DRV/c, DRV/r	**RTV 200 mg Twice Daily (For 2 Days)** • Trazodone ↑ AUC 240%	Administer lowest dose of trazodone and titrate dose based on clinical response. Monitor for trazodone-related adverse events, including CNS and CV adverse events.
Tricyclic Antidepressants (e.g., amitriptyline, doxepin, nortriptyline)	ATV/c, ATV/r, DRV/c, DRV/r	↑ TCA expected	Administer lowest possible TCA dose and titrate based on clinical assessment and/or drug concentrations. Monitor for TCA-related adverse events.
Venlafaxine	ATV/c, ATV/r, DRV/c, DRV/r	↑ venlafaxine and O-desmethylvenlafaxine expected	Monitor for venlafaxine-related adverse events. Consider venlafaxine dose reduction.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antipsychotics			
Aripiprazole	ATV/c, ATV/r, DRV/c, DRV/r	↑ aripiprazole expected	Administer 25% of the usual aripiprazole dose. Titrate dose based on clinical monitoring for effectiveness/adverse events. Refer to aripiprazole label for doses to use in patients who have major depressive disorder or who are known to be CYP2D6-poor metabolizers.
Brexpiprazole	ATV/c, ATV/r, DRV/c, DRV/r	↑ brexpiprazole expected	Administer 25% of the usual brexpiprazole dose. Titrate the dose based on clinical monitoring for effectiveness/adverse events. Refer to brexpiprazole label for doses to use in patients who have major depressive disorder or who are known to be CYP2D6-poor metabolizers.
Cariprazine	ATV/c, ATV/r, DRV/c, DRV/r	↑ cariprazine expected	**Starting Cariprazine in a Patient Who Is Already Receiving a PI** • Administer cariprazine 1.5 mg on Day 1 and Day 3, with no dose given on Day 2. From Day 4 onward, administer cariprazine 1.5 mg daily. Dose can be increased to a maximum of cariprazine 3 mg daily. If the PI is withdrawn, cariprazine dose may need to be increased. **Starting a PI in a Patient Who Is Already Receiving Cariprazine** • For patients receiving cariprazine 3 mg or cariprazine 6 mg daily, reduce the dose by half. For patients taking cariprazine 4.5 mg daily, the dose should be reduced to cariprazine 1.5 mg or cariprazine 3 mg daily. For patients taking cariprazine 1.5 mg daily, change to cariprazine 1.5 mg every other day. If PI is withdrawn, the cariprazine dose may need to be increased.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Iloperidone	ATV/c, ATV/r, DRV/c, DRV/r	↑ iloperidone expected	Decrease iloperidone dose by 50%.
Lumateperone	ATV/c, ATV/r, DRV/c, DRV/r	↑ lumateperone expected	**Do not coadminister.**
Lurasidone	ATV/c, ATV/r, DRV/c, DRV/r	↑ lurasidone expected	**Contraindicated**
Olanzapine, Olanzapine/Samidorphan	ATV/c, DRV/c	↔ olanzapine expected ↑ samidorphan possible	No dose adjustment needed
	ATV/r, DRV/r	↓ olanzapine possible	Monitor for therapeutic effectiveness of olanzapine.
Other Antipsychotics **CYP3A4 and/or CYP2D6 substrates** (e.g., clozapine, perphenazine, risperidone, thioridazine)	ATV/c, ATV/r, DRV/c, DRV/r	↑ antipsychotic possible	Titrate the antipsychotic dose using the lowest initial dose or adjust the maintenance dose accordingly. Monitor for adverse events, including QTc prolongation.
Pimavanserin	ATV/c, ATV/r, DRV/c, DRV/r	↑ pimavanserin expected	Reduce pimavanserin dose to 10 mg once daily.
Pimozide	ATV/c, ATV/r, DRV/c, DRV/r	↑ pimozide expected	**Contraindicated**
Quetiapine	ATV/c, ATV/r, DRV/c, DRV/r	↑ quetiapine expected	**Starting Quetiapine in a Patient Receiving a PI** • Initiate quetiapine at the lowest dose and titrate up as needed. Monitor for quetiapine effectiveness and adverse events, including QTc prolongation.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
			Starting a PI in a Patient Receiving a Stable Dose of Quetiapine • Consider alternative ARV. If coadministered, reduce quetiapine dose to 1/6 of the current dose. Closely monitor for quetiapine effectiveness and adverse events, including QTc prolongation.
Ziprasidone	ATV/c, ATV/r, DRV/c, DRV/r	↑ ziprasidone expected	Monitor for ziprasidone-related adverse events, including QTc prolongation.
Antifungals			
Fluconazole	ATV/c, ATV/r, DRV/c, DRV/r	↔ PI expected ↔ fluconazole expected	No dose adjustment needed
Isavuconazole	ATV/c, DRV/c	↑ isavuconazole expected ↓ PI possible	**Contraindicated**
	ATV/r, DRV/r	↑ isavuconazole expected ↓ PI possible	If coadministered, monitor isavuconazole concentrations and monitor for isavuconazole-related adverse events. Monitor for PI tolerability.
Ibrexafungerp	ATV/c, ATV/r, DRV/c, DRV/r	↑ ibrexafungerp expected	Reduce ibrexafungerp dose to 150 mg twice daily.
Itraconazole	ATV/c, ATV/r, DRV/c, DRV/r	↑ itraconazole expected ↑ PI expected	Itraconazole doses >200 mg/day **are not recommended** unless dosing is guided by itraconazole concentrations.
Posaconazole	ATV/r	ATV AUC ↑ 146% ↔ posaconazole possible	If coadministered, monitor for PI-related adverse events.
	ATV/c, DRV/c, DRV/r	↑ PI expected ↔ posaconazole possible	

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Voriconazole	ATV/c, DRV/c	No data	**Do not coadminister** voriconazole and RTV or COBI unless benefits outweigh risks. If coadministered, monitor voriconazole concentration and adjust dose accordingly.
	ATV/r, DRV/r	RTV 100 mg twice daily ↓ voriconazole AUC 39%	
Antimalarials			
Artemether/Lumefantrine	ATV/c, DRV/c	↑ lumefantrine expected ↑ artemether possible	Clinical significance is unknown. If coadministered, monitor closely for antimalarial effectiveness and lumefantrine-related adverse events, including QTc prolongation.
	DRV/r	↔ artemether expected ↔ DHA[a] expected Lumefantrine AUC ↑ 175% ↔ DRV	
Artesunate	ATV/c	↑ DHA[a] possible	Monitor for artesunate-related adverse effects.
	DRV/c	↔ DHA[a] expected	No dose adjustment needed
	ATV/r, DRV/r	↓ DHA[a] possible	Monitor for clinical response to artesunate.
Atovaquone/Proguanil	ATV/r, DRV/r	**With ATV/r** • Atovaquone AUC ↓ 46% • Proguanil AUC ↓ 41% **With DRV/r** • ↓ atovaquone/proguanil possible	Clinical significance is unknown. Consider alternative ARV or malaria prophylaxis.
	ATV/c, DRV/c	↔ atovaquone/proguanil expected	No dose adjustment needed

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Mefloquine	ATV/c, ATV/r, DRV/c, DRV/r	**With RTV 200 mg Twice Daily** • RTV AUC ↓ 31% and C_{min} ↓ 43% • ↔ mefloquine **With ATV (Unboosted), PI/c, or PI/r** • ↑ mefloquine possible	Clinical significance is unknown. Consider alternative ARV or antimalarial drug. If coadministered, monitor for mefloquine-related adverse events, including psychiatric symptoms and QTc prolongation. Monitor virologic response.
Antimigraine			
Ergot Derivatives	ATV/c, ATV/r, DRV/c, DRV/r	↑ dihydroergotamine, ergotamine, and methylergonovine expected	**Contraindicated**
Calcitonin Gene-Related Peptide (CGRP) Receptor Antagonists			
Atogepant	ATV/c, ATV/r, DRV/c, DRV/r	↑ atogepant expected	Chronic migraine: **Do not coadminister.** Episodic migraine: Administer atogepant at a dose of 10 mg once daily.
Rimegepant	ATV/c, ATV/r, DRV/c, DRV/r	↑ rimegepant expected	**Do not coadminister.**
Ubrogepant	ATV/c, ATV/r, DRV/c, DRV/r	↑ ubrogepant expected	**Contraindicated**
Zavegepant	ATV/r, ATV/c, DRV/c	↑ zavegepant expected	**Do not coadminister.**
	DRV/r	↔ zavegepant expected	No dose adjustment needed

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Serotonin 5-HT1B, 1D Receptor Agonists			
Almotriptan	ATV/c, ATV/r, DRV/c, DRV/r	↑ almotriptan expected	Administer single dose of almotriptan 6.25 mg. Maximum dose should not exceed 12.5 mg in a 24-hour period.
Eletriptan	ATV/c, ATV/r, DRV/c, DRV/r	↑ eletriptan expected	**Contraindicated**
Frovatriptan, Naratriptan, Rizatriptan, Sumatriptan, Zolmitriptan	ATV/c, ATV/r, DRV/c, DRV/r	↔ triptan expected	No dose adjustment needed
Antiplatelets			
Clopidogrel	ATV/c, ATV/r, DRV/c, DRV/r	Clopidogrel active metabolite AUC ↓ 69% in people with HIV on RTV or COBI-boosted regimens compared with healthy volunteers without HIV. Impaired platelet inhibition observed in people with HIV.	**Do not coadminister.**
Prasugrel	ATV/c, ATV/r, DRV/c, DRV/r	Prasugrel active metabolite AUC ↓ 52% in people with HIV on RTV or COBI-boosted regimens compared to healthy volunteers without HIV. Adequate platelet inhibition observed in people with HIV.	No dose adjustment needed
Ticagrelor	ATV/c, ATV/r, DRV/c, DRV/r	↑ ticagrelor expected	**Do not coadminister.**
Vorapaxar	ATV/c, ATV/r, DRV/c, DRV/r	↑ vorapaxar expected	**Do not coadminister.**

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antipneumocystis and Antitoxoplasmosis			
Atovaquone Oral suspension	ATV/r	↔ atovaquone	No dose adjustment needed
	ATV/c, DRV/c, DRV/r	↔ atovaquone expected	No dose adjustment needed
Antiseizure			
Carbamazepine	ATV/r	↑ carbamazepine possible May ↓ PI concentrations substantially	Consider alternative ARV or anticonvulsant. If coadministration is necessary, consider monitoring concentrations of both drugs and assess virologic response. Carbamazepine dose reduction may be necessary.
	DRV/r	Carbamazepine AUC ↑ 45% ↔ DRV	Monitor anticonvulsant concentration and adjust dose accordingly.
	ATV/c, DRV/c	↑ carbamazepine possible ↓ COBI expected ↓ PI expected	**Contraindicated**
Eslicarbazepine	ATV/c, ATV/r, DRV/c, DRV/r	↓ PI possible	Consider alternative ARV or anticonvulsant. If coadministration is necessary, monitor for virologic response. Consider monitoring anticonvulsant and PI concentrations.
Ethosuximide	ATV/c, ATV/r, DRV/c, DRV/r	↑ ethosuximide possible	Monitor for ethosuximide-related adverse events.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Lamotrigine	ATV/r	Lamotrigine AUC ↓ 32%	A dose increase of lamotrigine may be needed; monitor lamotrigine concentration or consider alternative ARV or anticonvulsant.
	DRV/r	↓ lamotrigine possible	
	ATV/c	No data	Monitor anticonvulsant concentration and adjust dose accordingly.
	DRV/c	↔ lamotrigine expected	No dose adjustment needed.
Oxcarbazepine	ATV/c, ATV/r, DRV/c, DRV/r	↓ PI possible	Consider alternative ARV or anticonvulsant. If coadministration is necessary, monitor for virologic response. Consider monitoring anticonvulsant and PI concentrations.
Phenobarbital	ATV/r, DRV/r	↓ phenobarbital possible ↓ PI possible	Consider alternative anticonvulsant. If coadministration is necessary, consider monitoring concentrations of both drugs and assessing virologic response.
	ATV/c, DRV/c	↓ COBI expected ↓ PI expected	**Contraindicated**
Phenytoin	ATV/r, DRV/r	↓ phenytoin possible ↓ PI possible	Consider alternative anticonvulsant. If coadministration is necessary, consider monitoring concentrations of both drugs and assessing virologic response.
	ATV/c, DRV/c	↓ COBI expected ↓ PI expected	**Contraindicated**
Primidone	ATV/c, ATV/r, DRV/c, DRV/r	↓ PI expected	**Do not coadminister.**
Valproic Acid	ATV/c, ATV/r, DRV/c, DRV/r	↓ or ↔ VPA possible	Monitor VPA concentrations and monitor for PI tolerability.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antivirals—Hepatitis C			
Elbasvir/Grazoprevir	ATV/r	Elbasvir AUC ↑ 4.8-fold Grazoprevir AUC ↑ 10.6-fold Elbasvir ↔ ATV Grazoprevir ↑ ATV AUC 43%	**Contraindicated** May increase the risk of ALT elevations due to a significant increase in grazoprevir plasma concentrations caused by OATP1B1/3 inhibition.
	DRV/r	Elbasvir AUC ↑ 66% Grazoprevir AUC ↑ 7.5-fold ↔ DRV	
	ATV/c, DRV/c	↑ grazoprevir expected	
Glecaprevir/Pibrentasvir	ATV/c, ATV/r	**With (ATV 300 mg Plus RTV 100 mg) Once Daily** • Glecaprevir AUC ↑ 6.5-fold • Pibrentasvir AUC ↑ 64%	**Contraindicated**
	DRV/c, DRV/r	**With (DRV 800 mg Plus RTV 100 mg) Once Daily** • Glecaprevir AUC ↑ fivefold • ↔ pibrentasvir	**Do not coadminister.**
Ledipasvir/Sofosbuvir	ATV/r	ATV AUC ↑ 33% Ledipasvir AUC ↑ 113% ↔ sofosbuvir	No dose adjustment needed Coadministration of ledipasvir/sofosbuvir with TDF and a PI/r results in increased exposure to TDF. The safety of the increased TDF exposure has not been established. Consider alternative HCV or ARV drugs to avoid increased risk of TDF toxicities. If coadministration is necessary, monitor for TDF-related adverse events.
	ATV/c, DRV/c, DRV/r	↔ PI expected ↔ ledipasvir and sofosbuvir	

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Sofosbuvir/Velpatasvir	ATV/r	↔ ATV/r ↔ sofosbuvir Velpatasvir AUC ↑ 2.4-fold	No dose adjustment needed
	DRV/r	↔ DRV/r Sofosbuvir AUC ↓ 28% ↔ velpatasvir	No dose adjustment needed
	ATV/c, DRV/c	↔ sofosbuvir and velpatasvir expected	No dose adjustment needed
Sofosbuvir/Velpatasvir/ Voxilaprevir	ATV/c, ATV/r	**With ATV/r** • Voxilaprevir AUC ↑ 4.3-fold • Velpatasvir AUC ↑ 93% • Sofosbuvir AUC ↑ 40%	**Do not coadminister.**
	DRV/c, DRV/r	**With DRV/r** • Voxilaprevir AUC ↑ 2.4-fold • ↔ DRV/r, velpatasvir, and sofosbuvir	No dose adjustment needed
Antivirals—Miscellaneous (e.g., for CMV, Mpox)			
Brincidofovir	ATV/c, ATV/r, DRV/c, DRV/r	↑ brincidofovir possible	Give PI dose at least 3 hours after administering brincidofovir and monitor for brincidofovir-related adverse events (i.e., elevations in ALT/AST and bilirubin and GI adverse events).
Cidofovir	ATV/c, ATV/r, DRV/c, DRV/r	↔ cidofovir	No dose adjustment needed

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Tecovirimat	ATV/c, ATV/r, DRV/c, DRV/r	↔ tecovirimat	No dose adjustment needed
Antivirals—SARS-CoV-2			
Molnupiravir	ATV/c, ATV/r, DRV/c, DRV/r	↔ molnupiravir	No dose adjustment needed
Remdesivir	ATV/c, ATV/r, DRV/c, DRV/r	↔ remdesivir	No dose adjustment needed
Ritonavir-Boosted Nirmatrelvir	ATV/r, ATV/c, DRV/c, DRV/r	↑ PI expected ↑ ritonavir-boosted nirmatrelvir expected	No dose adjustment needed. Monitor for increased ritonavir-boosted nirmatrelvir and PI-related adverse events.
Beta-Agonists, Long-Acting Inhaled			
Arformoterol, Formoterol	ATV/c, ATV/r	↑ arformoterol possible	No dose adjustment needed
	DRV/c, DRV/r	↔ arformoterol expected	No dose adjustment needed
Indacaterol	ATV/c, ATV/r, DRV/c, DRV/r	**With RTV 300 mg Twice Daily** • Indacaterol AUC ↑ 1.7-fold	No dose adjustment needed in patients receiving indacaterol 75 mcg daily.
Olodaterol	ATV/c, ATV/r, DRV/c, DRV/r	↑ olodaterol expected	No dose adjustment needed
Salmeterol	ATV/c, ATV/r, DRV/c, DRV/r	↑ salmeterol possible	**Do not coadminister,** due to potential increased risk of salmeterol-related CV events.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Cardiac Medications			
Antiarrhythmics			
Amiodarone	ATV/r	↑ amiodarone possible ↑ PI possible	**Contraindicated**
	ATV/c, DRV/c, DRV/r	↑ amiodarone possible ↑ PI possible	**Do not coadminister** unless the benefits outweigh the risks. If coadministered, monitor for amiodarone-related adverse events and consider monitoring ECG and amiodarone drug concentration.
Digoxin	ATV/c, ATV/r, DRV/c, DRV/r	RTV 200 mg twice daily ↑ digoxin AUC 29% and ↑ half-life 43% DRV/r ↑ digoxin AUC 36% COBI ↑ digoxin C_{max} 41% and ↔ AUC	Monitor digoxin concentrations. Digoxin dose may need to be decreased. Titrate initial digoxin dose.
Disopyramide	ATV/c, ATV/r, DRV/c, DRV/r	↑ disopyramide possible	**Do not coadminister.**
Dofetilide	ATV/c, ATV/r, DRV/c, DRV/r	↑ dofetilide possible	**Do not coadminister.**
Dronedarone	ATV/c, ATV/r, DRV/c, DRV/r	↑ dronedarone expected	**Contraindicated**
Flecainide	ATV/c, ATV/r, DRV/c, DRV/r	↑ flecainide possible	Consider alternative ARV or antiarrhythmic. If coadministered, monitor flecainide concentrations and for antiarrhythmic-related adverse events.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Lidocaine	ATV/c, ATV/r, DRV/c, DRV/r	↑ lidocaine possible	Consider alternative ARV or antiarrhythmic. If coadministered, monitor lidocaine concentrations and for antiarrhythmic-related adverse events.
Mexiletine	ATV/c, ATV/r, DRV/c, DRV/r	↑ mexiletine possible	Consider alternative ARV or antiarrhythmic. If coadministered, monitor mexiletine concentrations and for antiarrhythmic-related adverse events.
Propafenone	ATV/c, ATV/r, DRV/c, DRV/r	↑ propafenone possible	**Do not coadminister.**
Quinidine	ATV/r	↑ quinidine expected	**Contraindicated**
	ATV/c, DRV/c, DRV/r	↑ quinidine possible	**Do not coadminister.**
Sotalol	ATV/c, ATV/r, DRV/c, DRV/r	↔ sotalol expected	No dose adjustment needed
Beta-Blockers			
Atenolol, Labetalol	ATV/c, ATV/r, DRV/c, DRV/r	↑ beta-blockers possible	No dose adjustment needed
Bisoprolol, Carvedilol, Metoprolol, Nebivolol	ATV/c, ATV/r, DRV/c, DRV/r	↑ beta-blockers possible	May need to decrease beta-blocker dose; adjust dose based on clinical response. Consider using beta-blockers that are not metabolized by CYP2D6 enzymes (e.g., atenolol, labetalol, nadolol).
Calcium Channel Blockers			
Amlodipine, Diltiazem, Felodipine, Nifedipine, Verapamil	ATV/c, ATV/r, DRV/c, DRV/r	↑ dihydropyridine possible ↑ verapamil possible	Titrate CCB dose and monitor closely. ECG monitoring is recommended when CCB is used with ATV.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Diltiazem	ATV/c, ATV/r	Unboosted ATV ↑ diltiazem AUC 125% Greater ↑ of diltiazem AUC is likely with ATV/c or ATV/r	Decrease diltiazem dose by at least 50%. If starting diltiazem, start with the lowest dose and titrate according to clinical response and adverse events. ECG monitoring is recommended.
	DRV/c, DRV/r	↑ diltiazem possible	Titrate diltiazem dose according to clinical response and adverse events.
Cardiac—Other			
Bosentan	ATV/c, ATV/r, DRV/c, DRV/r	**With ATV (Unboosted)** • ↓ ATV expected **With PI/r or PI/c** • ↑ bosentan expected	**Do not coadminister** bosentan and unboosted ATV. **In Patients on a PI (Other Than Unboosted ATV) >10 Days** • Start bosentan at 62.5 mg once daily or every other day. **In Patients on Bosentan Who Require a PI (Other Than Unboosted ATV)** • Stop bosentan ≥36 hours before PI initiation and restart bosentan 10 days after PI initiation at 62.5 mg once daily or every other day. **When Switching Between COBI and RTV** • Maintain same bosentan dose.
Eplerenone	ATV/c, ATV/r, DRV/c, DRV/r	↑ eplerenone expected	**Contraindicated**
Ivabradine	ATV/c, ATV/r, DRV/c, DRV/r	↑ ivabradine expected	**Contraindicated**
Mavacamten	ATV/c, ATV/r, DRV/c, DRV/r	↑ mavacamten expected	**Contraindicated**

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Ranolazine	ATV/c, ATV/r, DRV/c, DRV/r	↑ ranolazine expected	**Contraindicated**
Corticosteroids			
Beclomethasone Inhaled or intranasal	DRV/r	↔ 17-BMP (active metabolite) AUC RTV 100 mg twice daily ↑ 17-BMP AUC 2-fold	No dose adjustment needed
	ATV/c, ATV/r, DRV/c	↔ 17-BMP expected	No dose adjustment needed
Budesonide, Ciclesonide, Fluticasone, Mometasone Inhaled or intranasal	ATV/c, ATV/r, DRV/c, DRV/r	↑ glucocorticoids possible RTV 100 mg twice daily ↑ fluticasone AUC 350-fold	**Do not coadminister** unless the potential benefits of inhaled or intranasal corticosteroid outweigh the risks of adverse events associated with corticosteroids. Coadministration can result in adrenal insufficiency and Cushing's syndrome. Consider alternative inhaled/intranasal corticosteroid (e.g., beclomethasone).
Betamethasone, Budesonide Systemic	ATV/c, ATV/r, DRV/c, DRV/r	↑ glucocorticoids possible ↓ PI possible	**Do not coadminister** unless the potential benefits of systemic corticosteroid outweigh the risks of adverse events associated with systemic corticosteroids. Coadministration can result in adrenal insufficiency and Cushing's syndrome.
Dexamethasone Systemic	ATV/c, ATV/r, DRV/c, DRV/r	↑ glucocorticoids possible ↓ PI possible	Consider alternative corticosteroid for long-term use. If coadministration is necessary, monitor virologic response to ART.
Prednisone, Prednisolone Systemic	ATV/c, ATV/r, DRV/c, DRV/r	↑ prednisolone possible	Coadministration may be considered if the potential benefits outweigh the risks of adverse events associated with systemic corticosteroids. If coadministered, monitor for adrenal insufficiency, Cushing's syndrome, and other corticosteroid-related adverse events.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Betamethasone, Methylprednisolone, Triamcinolone Local injections, including intra-articular, epidural, or intra-orbital	ATV/c, ATV/r, DRV/c, DRV/r	↑ glucocorticoids expected	**Do not coadminister.** Coadministration can result in adrenal insufficiency and Cushing's syndrome.
Glucose-Lowering			
Canagliflozin	ATV/c, DRV/c	↔ canagliflozin	No dose adjustment needed
	ATV/r, DRV/r	↓ canagliflozin expected	If a patient is already tolerating canagliflozin 100 mg daily, increase canagliflozin dose to 200 mg daily. If a patient is already tolerating canagliflozin 200 mg daily and requires additional glycemic control, management strategy is based on renal function. **In Patients With eGFR ≥60 mL/min/1.73 m^2** • Canagliflozin dose may be increased to 300 mg daily. **In Patients With eGFR <60 mL/min/1.73 m^2** • Consider adding another antihyperglycemic agent.
Saxagliptin	ATV/c, ATV/r, DRV/c, DRV/r	↑ saxagliptin expected	Limit saxagliptin dose to 2.5 mg once daily.
Dapagliflozin/Saxagliptin	ATV/c, ATV/r, DRV/c, DRV/r	↑ saxagliptin expected	**Do not coadminister.** Dapagliflozin is only available as a coformulated drug that contains 5 mg of saxagliptin. When coadministered with EVG/c, the dose of saxagliptin should not exceed 2.5 mg once daily; thus, this combination **is not recommended.**

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Herbal Products			
St. John's Wort	ATV/c, ATV/r, DRV/c, DRV/r	↓ PI expected	**Contraindicated**
Hormonal Therapies—Contraceptives			
Injectable Contraceptives Depot MPA	ATV/c, ATV/r, DRV/c, DRV/r	↔ expected	No dose adjustment needed
Oral Contraceptives (e.g., desogestrel, drospirenone, ethinyl estradiol, levonorgestrel, norgestimate, norethindrone)	ATV/c	Drospirenone AUC ↑ 130% Ethinyl estradiol AUC ↓ 22%	**Contraindicated** with drospirenone-containing hormonal contraceptive due to potential for hyperkalemia. Use alternative ARV or alternative contraceptive methods.
		↔ ethinyl estradiol AUC and C_{min} ↓ 25% ↔ levonorgestrel	No dose adjustment needed
	ATV/r	Ethinyl estradiol AUC ↓ 19% and C_{min} ↓ 37% Norgestimate AUC ↑ 85% Norethindrone AUC ↑ 51% and C_{min} ↑ 67%	Oral contraceptive should contain at least 35 mcg of ethinyl estradiol.[c]
		↑ drospirenone expected ↔ estetrol	Clinical monitoring is recommended due to the potential for hyperkalemia. Use alternative ARV or contraceptive methods.
	DRV/c	Drospirenone AUC ↑ 58% Ethinyl estradiol AUC ↓ 30%	Clinical monitoring is recommended due to the potential for hyperkalemia. Use alternative ARV or contraceptive methods.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	DRV/r	Ethinyl estradiol AUC ↓ 44% and C_{min} ↓ 62% Norethindrone AUC ↓ 14% and C_{min} ↓ 30%	**When Used for Contraception** • Consider alternative ARV or contraceptive methods. If combined, consider using an oral contraceptive with at least 35 mcg of ethinyl estradiol. **When Used for Other Clinical Indications (e.g., Acne, Menstrual Cycle Regulation)** • Monitor for clinical effectiveness of hormonal therapy.
Subdermal Implant Contraceptives (e.g., etonogestrel, levonorgestrel)	ATV/c, ATV/r, DRV/c, DRV/r	↑ etonogestrel, levonorgestrel expected	No dose adjustment needed
Transdermal Contraceptives (e.g., ethinyl estradiol/norelgestromin, ethinyl estradiol/levonorgestrel)	ATV/c, ATV/r, DRV/c, DRV/r	↓ ethinyl estradiol possible with ritonavir ↑ ethinyl estradiol possible with cobicistat ↑ norelgestromin, levonorgestrel possible	No dose adjustment needed
Vaginal Ring Contraceptives (e.g., etonogestrel/ethinyl estradiol, segesterone/ethinyl estradiol)	ATV/r	Ethinyl estradiol AUC ↓ 26% Etonogestrel AUC ↑ 79%	No dose adjustment needed with etonogestrel/ethinyl estradiol vaginal rings. Use alternative ARV or contraceptive methods with segesterone/ethinyl estradiol vaginal rings.
	ATV/c, DRV/c, DRV/r	↓ ethinyl estradiol possible with ritonavir ↑ ethinyl estradiol possible with cobicistat	
Emergency Contraceptives Levonorgestrel (oral)	ATV/c, ATV/r, DRV/c, DRV/r	↑ levonorgestrel expected	No dose adjustment needed

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Hormonal Therapies—Miscellaneous			
5-Alpha Reductase Inhibitors (e.g., dutasteride, finasteride)	ATV/c, ATV/r, DRV/c, DRV/r	↑ dutasteride possible ↑ finasteride possible	Adjust dutasteride dose as needed based on clinical effects. No dose adjustment needed for finasteride.
Estradiol	ATV/c, DRV/c	↓ or ↑ estradiol possible	Adjust estradiol dose as needed based on clinical effects.
	ATV/r, DRV/r	↓ estradiol possible	
Goserelin, Leuprolide Acetate, Spironolactone	ATV/c, ATV/r, DRV/c, DRV/r	↔ goserelin, leuprolide acetate, and spironolactone expected	No dose adjustment needed
Menopausal Hormone Replacement Therapy (e.g., conjugated estrogens, drospirenone, estradiol, MPA, progesterone)	ATV/c, ATV/r, DRV/c, DRV/r	↓ or ↑ estrogen possible with estradiol or conjugated estrogen (equine and synthetic)	Adjust estrogen dose as needed based on clinical effects.
	ATV/c, ATV/r, DRV/c, DRV/r	↑ drospirenone possible ↑ MPA ↑ micronized progesterone See the Hormonal Therapies—Contraceptives section for other progestin-PI interactions.	Adjust progestin/progesterone dose as needed based on clinical effects. Drospirenone is not contraindicated with ATV/c products because it is prescribed at a lower dose for menopausal HRT than products used for hormonal contraceptives.
Testosterone	ATV/c, ATV/r, DRV/c, DRV/r	↑ testosterone possible	Adjust testosterone dose as needed based on clinical effects.
Immunosuppressants			
Cyclosporine, Sirolimus, Tacrolimus	ATV/c, ATV/r, DRV/c, DRV/r	↑ immunosuppressant expected	Initiate with an adjusted dose of immunosuppressant to account for potential increased concentrations of the immunosuppressant and monitor for immunosuppressant-related adverse events. Therapeutic drug monitoring of immunosuppressant is recommended. Consult with a specialist as necessary.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Everolimus	DRV/c, DRV/r	↑ immunosuppressant expected	**Do not coadminister.**
	ATV/c, ATV/r	↑ immunosuppressant expected	Initiate with an adjusted dose of immunosuppressant to account for potential increased concentrations of the immunosuppressant and monitor for immunosuppressant-related adverse events. Therapeutic drug monitoring of immunosuppressant is recommended. Consult with a specialist as necessary.
Lipid-Modifying			
Atorvastatin	ATV/r	↑ atorvastatin possible	Administer the lowest effective atorvastatin dose while monitoring for adverse events.
	ATV/c	Atorvastatin AUC ↑ 9.2-fold and C_{max} ↑ 18.9-fold	**Do not coadminister.**
	DRV/c	Atorvastatin AUC ↑ 3.9-fold and C_{max} ↑ 4.2-fold	Administer the lowest effective atorvastatin dose while monitoring for adverse events. Do not exceed 20 mg atorvastatin daily.
	DRV/r	DRV/r plus atorvastatin 10 mg similar to atorvastatin 40 mg administered alone	Administer the lowest effective atorvastatin dose while monitoring for adverse events. Do not exceed 20 mg atorvastatin daily.
Fluvastatin	ATV/c, DRV/c	↑ fluvastatin expected	Administer the lowest effective fluvastatin dose while monitoring for adverse events.
	ATV/r, DRV/r	↑ or ↓ fluvastatin possible	
Lomitapide	ATV/c, ATV/r, DRV/c, DRV/r	↑ lomitapide expected	**Contraindicated**
Lovastatin	ATV/c, ATV/r, DRV/c, DRV/r	Significant ↑ lovastatin expected	**Contraindicated**

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Pitavastatin	ATV/c, DRV/c	No data	No dose adjustment needed. Monitor for pitavastatin-related adverse events.
	ATV/r, DRV/r	**With ATV/r** • ↔ pitavastatin expected • ↔ ATV/r expected **With DRV/r** • ↓ pitavastatin AUC 26% • ↔ DRV/r	No dose adjustment needed
Pravastatin	ATV/c, ATV/r	No data	Administer the lowest effective pravastatin dose while monitoring for adverse events.
	DRV/c, DRV/r	**With DRV/r** • Pravastatin AUC ↑ 81% following single dose of pravastatin • Pravastatin AUC ↑ 23% at steady state	Administer the lowest effective pravastatin dose while monitoring for adverse events.
Rosuvastatin	ATV/r	Rosuvastatin AUC ↑ 3-fold and C_{max} ↑ 7-fold	Administer the lowest effective rosuvastatin dose while monitoring for adverse events. Do not exceed rosuvastatin 10 mg daily.
	ATV/c	Rosuvastatin AUC ↑ 3.4-fold and C_{max} ↑ 10.6-fold	
	DRV/c	Rosuvastatin AUC ↑ 1.9-fold and C_{max} ↑ 3.8-fold	Administer the lowest effective rosuvastatin dose while monitoring for adverse events. Do not exceed rosuvastatin 20 mg daily.
	DRV/r	Rosuvastatin AUC ↑ 48% and C_{max} ↑ 2.4-fold	Administer the lowest effective rosuvastatin dose while monitoring for adverse events.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Simvastatin	ATV/c, ATV/r, DRV/c, DRV/r	Significant ↑ simvastatin expected	**Contraindicated**
Narcotics and Treatment for Opioid Dependence			
Buprenorphine Sublingual, buccal, or implant	ATV/r	Buprenorphine AUC ↑ 66% Norbuprenorphine (active metabolite) AUC ↑ 105%	Monitor for sedation and other signs or symptoms of overmedication. Buprenorphine dose reduction may be necessary. It may be necessary to remove implant and treat with a formulation that permits dose adjustments.
	DRV/r	↔ buprenorphine Norbuprenorphine (active metabolite) AUC ↑ 46% and C_{min} ↑ 71%	No dose adjustment needed. Monitor for buprenorphine-related adverse events. When transferring buprenorphine from transmucosal delivery to implantation, monitor to ensure buprenorphine effect is adequate and not excessive.
	ATV/c, DRV/c	↑ buprenorphine possible	Titrate buprenorphine dose using the lowest initial dose. Dose adjustment of buprenorphine may be needed. It may be necessary to remove implant and treat with a formulation that permits dose adjustments. Monitor for buprenorphine-related adverse events.
Fentanyl	ATV/c, ATV/r, DRV/c, DRV/r	↑ fentanyl possible	Monitor for fentanyl-related adverse events, including potentially fatal respiratory depression.
Lofexidine	ATV/c, ATV/r, DRV/c, DRV/r	↑ lofexidine possible	Monitor for lofexidine-related adverse events, including symptoms of orthostasis and bradycardia.
Methadone	ATV/c, DRV/c	No data	Titrate methadone dose using the lowest feasible initial dose. Dose adjustment of methadone may be needed. Monitor for methadone-related adverse events.
	ATV/r, DRV/r	ATV/r and DRV/r ↓ R-methadone[d] AUC 16% to 18%	Opioid withdrawal is unlikely but may occur. Monitor for opioid withdrawal and increase methadone dose as clinically indicated.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Oxycodone	ATV/c, ATV/r, DRV/c, DRV/r	↑ oxycodone expected	Monitor for opioid-related adverse events, including potentially fatal respiratory depression. Oxycodone dose reduction may be necessary.
Tramadol	ATV/c, ATV/r, DRV/c, DRV/r	↑ tramadol expected ↓ M1 (active metabolite) possible	Tramadol dose adjustments may be necessary. Monitor for clinical response and tramadol-related adverse events.
PDE5 Inhibitors			
Avanafil	ATV/c, ATV/r, DRV/c, DRV/r	RTV 600 mg twice daily (for 5 days) ↑ avanafil AUC 13-fold and ↑ C_{max} 2.4-fold	**Do not coadminister.**
Sildenafil	ATV/c, ATV/r, DRV/c, DRV/r	DRV/r plus sildenafil 25 mg similar to sildenafil 100 mg alone RTV 500 mg twice daily ↑ sildenafil AUC 1,000%	**For Treatment of Erectile Dysfunction** • Start with sildenafil 25 mg every 48 hours and monitor for sildenafil-related adverse events. **Contraindicated** for treatment of PAH.
Tadalafil	ATV/c, ATV/r, DRV/c, DRV/r	RTV 200 mg twice daily ↑ tadalafil AUC 124%	**For Treatment of Erectile Dysfunction** *As-Needed Use* • Start with tadalafil 5 mg and do not exceed a single dose of tadalafil 10 mg every 72 hours. Monitor for tadalafil-related adverse events. *Once-Daily Use* • Do not exceed tadalafil 2.5 mg once daily. Monitor for tadalafil-related adverse events. **For Treatment of PAH** *In Patients on a PI >7 Days* • Start with tadalafil 20 mg once daily and increase to tadalafil 40 mg once daily based on tolerability.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
			In Patients on Tadalafil Who Require a PI • Stop tadalafil ≥24 hours before PI initiation. Seven days after PI initiation, restart tadalafil at 20 mg once daily and increase to tadalafil 40 mg once daily based on tolerability. *In Patients Switching Between COBI and RTV* • Maintain tadalafil dose. **For Treatment of Benign Prostatic Hyperplasia** • Maximum recommended daily dose is tadalafil 2.5 mg per day. Monitor for tadalafil-related adverse events.
Vardenafil	ATV/c, ATV/r, DRV/c, DRV/r	RTV 600 mg twice daily ↑ vardenafil AUC 49-fold	Start with vardenafil 2.5 mg every 72 hours and monitor for vardenafil-related adverse events.
Sedative/Hypnotics			
Benzodiazepines			
Alprazolam, Clonazepam, Diazepam	ATV/c, ATV/r, DRV/c, DRV/r	↑ benzodiazepine possible RTV 200 mg twice daily (for 2 days) ↑ alprazolam half-life 222% and ↑ AUC 248%	Consider alternative benzodiazepines, such as lorazepam, oxazepam, or temazepam.
Lorazepam, Oxazepam, Temazepam	ATV/c, ATV/r, DRV/c, DRV/r	No data	These benzodiazepines are metabolized via non-CYP450 pathways and, therefore, have less interaction potential than other benzodiazepines.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Midazolam	ATV/c, ATV/r, DRV/c, DRV/r	↑ midazolam expected	Oral midazolam is **contraindicated** with PIs. Parenteral midazolam can be used with caution when given in a monitored situation with appropriate medical management available in case of respiratory sedation and/or prolonged sedation. Consider dose reduction, especially if more than a single dose of midazolam is administered.
Triazolam	ATV/c, ATV/r, DRV/c, DRV/r	↑ triazolam expected RTV 200 mg twice daily ↑ triazolam half-life 1,200% and ↑ AUC 2,000%	**Contraindicated**
Orexin Receptor Antagonist			
Daridorexant, Lemborexant, Suvorexant	ATV/c, ATV/r, DRV/c, DRV/r	↑ daridorexant, lemborexant, suvorexant expected	**Do not coadminister.**
Other Sedatives			
Eszopiclone	ATV/c, ATV/r, DRV/c, DRV/r	↑ eszopiclone expected	Start with lowest dose and increase to a maximum of 2 daily; monitor for eszopiclone-related adverse events.
Zolpidem	ATV/c, ATV/r, DRV/c, DRV/r	↑ zolpidem possible	Initiate zolpidem at a low dose and monitor for zolpidem-related adverse events. Dose reduction may be necessary.

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Miscellaneous			
Calcifediol	ATV/c, ATV/r, DRV/c, DRV/r	↑ calcifediol possible	Dose adjustment of calcifediol may be required, and serum 25-hydroxyvitamin D, intact PTH, and serum calcium concentrations should be closely monitored.
Cisapride	ATV/c, ATV/r, DRV/c, DRV/r	↑ cisapride expected	**Contraindicated**
Colchicine	ATV/c, ATV/r, DRV/c, DRV/r	RTV 100 mg twice daily ↑ colchicine AUC 296% and C_{max} ↑ 184% Significant ↑ colchicine expected with all PIs, with or without COBI or RTV	**For Treatment of Gout Flares** • Administer a single dose of colchicine 0.6 mg, followed by colchicine 0.3 mg 1 hour later. Do not repeat dose for at least 3 days. **For Prophylaxis of Gout Flares** • If original dose was colchicine 0.6 mg twice daily, decrease to colchicine 0.3 mg once daily. If dose was 0.6 mg once daily, decrease to 0.3 mg every other day. **For Treatment of Familial Mediterranean Fever** • Do not exceed colchicine 0.6 mg once daily or colchicine 0.3 mg twice daily. **Contraindicated** in patients with hepatic (Child-Pugh Score A, B, or C) or renal impairment (CrCl <60 mL/min)
Dronabinol	ATV/c, ATV/r, DRV/c, DRV/r	↑ dronabinol possible	Monitor for dronabinol-related adverse events.
Eluxadoline	ATV/c, ATV/r, DRV/c, DRV/r	↑ eluxadoline expected	Administer eluxadoline at a dose of 75 mg twice daily and monitor for eluxadoline-related adverse events.
Finerenone	ATV/c, ATV/r, DRV/c, DRV/r	↑ finerenone expected	**Contraindicated**

Table 24a. Drug Interactions Between Protease Inhibitors and Other Drugs

Concomitant Drug	PI	Effect on PI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Flibanserin	ATV/c, ATV/r, DRV/c, DRV/r	↑ flibanserin expected	**Contraindicated**
Naloxegol	ATV/c, ATV/r, DRV/c, DRV/r	↑ naloxegol expected	**Contraindicated**
Praziquantel	ATV/c, ATV/r, DRV/c, DRV/r	↑ praziquantel possible	Consider alternative ARV. If coadministration is necessary, monitor for praziquantel-related adverse events.

[a] DHA is an active metabolite of artemether and artesunate.

[b] The following products contain no more than 30 mcg of ethinyl estradiol combined with norethindrone or norgestimate: Lo Minastrin Fe; Lo Loestrin Fe; Loestrin 1/20, 1.5/30; Loestrin Fe 1/20, 1.5/30; Loestrin 24 Fe; Minastrin 24 Fe; Ortho Tri-Cyclen Lo. Generic formulations also may be available.

[c] The following products contain at least 35 mcg of ethinyl estradiol combined with norethindrone or norgestimate: Brevicon; Femcon Fe; Modicon; Norinyl 1/35; Ortho-Cyclen; Ortho-Novum 1/35, 7/7/7; Ortho Tri-Cyclen; Ovcon 35; Tri-Norinyl. Generic formulations also may be available.

[d] R-methadone is the active form of methadone.

Key to Symbols

↑ = increase
↓ = decrease
↔ = less than 20% change in AUC

Key: 17-BMP = beclomethasone 17-monopropionate; ALT = alanine aminotransferase; ART = antiretroviral therapy; ARV = antiretroviral; AST = aspartate aminotransferase; ATV = atazanavir; ATV/c = atazanavir/cobicistat; ATV/r = atazanavir/ritonavir; AUC = area under the curve; C_{max} = maximum plasma concentration; C_{min} = minimum plasma concentration; CCB = calcium channel blocker; CNS = central nervous system; COBI = cobicistat; CrCl = creatinine clearance; CMV = cytomegalovirus; CV = cardiovascular; CYP = cytochrome P; DHA = dihydroartemisinin; DRV = darunavir; DRV/c = darunavir/cobicistat; DRV/r = darunavir/ritonavir; DVT = deep vein thrombosis; ECG = electrocardiogram; eGFR = estimated glomerular filtration rate; EVG/c = elvitegravir/cobicistat; GI = gastrointestinal; H2RA = H2 receptor antagonist; HCV = hepatitis C virus; HRT = hormone replacement therapy; INR = international normalized ratio; LPV = lopinavir; LPV/r = lopinavir/ritonavir; MPA = medroxyprogesterone acetate; OATP = organic anion-transporting polypeptide; PAH = pulmonary arterial hypertension; PDE5 = phosphodiesterase type 5; PE = pulmonary embolism; PI = protease inhibitor; PI/c = protease inhibitor/cobicistat; PI/r = protease inhibitor/ritonavir; PK = pharmacokinetic; PPI = proton pump inhibitor; PTH = parathyroid hormone; QTc = QT corrected for heart rate; RTV = ritonavir; SSRI = selective serotonin reuptake inhibitor; TCA = tricyclic antidepressant; TDF = tenofovir disoproxil fumarate; VPA = valproic acid

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Updated: September 12, 2024
Reviewed: September 12, 2024

This table provides information on the known or predicted interactions between non-nucleoside reverse transcriptase inhibitors (NNRTIs) and non-antiretroviral drugs. Cabotegravir (CAB) intramuscular (IM) plus rilpivirine (RPV) IM are co-packaged into a single product and are coadministered as a complete regimen; therefore, the dosing recommendations and clinical comments reflect the combination of CAB IM and RPV IM treatments. Drug interaction studies were not conducted with either CAB IM or RPV IM. Drug interaction studies with oral CAB and RPV were leveraged to make the dosing recommendations for CAB IM and RPV IM. For information regarding interactions between NNRTIs and other antiretroviral (ARV) drugs, including dosing recommendations, refer to Tables 24c, 24e, 24f, 25a, and 25b.

Recommendations for managing a particular drug interaction may differ, depending on whether a new ARV drug is being initiated in a patient on a stable concomitant medication or if a new concomitant medication is being initiated in a patient on a stable ARV regimen. The magnitude and significance of drug interactions are difficult to predict when several drugs with competing metabolic pathways are prescribed concomitantly. When an interacting drug needs to be replaced with an alternative, providers should exercise their clinical judgment to select the most appropriate alternative medication.

Oral doses of RPV at 75 mg and 300 mg once daily (equivalent to 3 and 12 times the recommended dose) were associated with prolonged QTc (or QT corrected for heart rate) interval. Known and expected/theoretical pharmacokinetic interactions, resulting in increased RPV exposures, are included in this table due to the safety concern of QTc prolongation. There is limited information about the potential for pharmacodynamic interactions between RPV (in the absence of increased RPV exposures) and drugs that prolong the QTc interval; therefore, these are not included in this table.

Nevirapine (NVP) is no longer commonly used in clinical practice in the United States and is not included in this table. Please refer to the U.S. Food and Drug Administration product labels for information regarding drug interactions between NVP and concomitant medications. Information may also be found in archived versions of this guideline.

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Acid Reducers			
Antacids	DOR, EFV	↔ NNRTI AUC	No dose adjustment needed
	ETR	↔ ETR expected	No dose adjustment needed
	RPV IM	↔ RPV expected	No dose adjustment needed
	RPV PO	↓ RPV expected when given simultaneously	Give antacids at least 2 hours before or at least 4 hours after RPV.
H2 Receptor Antagonists	DOR	↔ DOR expected	No dose adjustment needed
	EFV	↔ EFV AUC	No dose adjustment needed
	ETR	↔ ETR AUC	No dose adjustment needed
	RPV IM	↔ RPV expected	No dose adjustment needed

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	RPV PO	RPV AUC ↓ 76% when famotidine 40 mg is taken 2 hours prior	Give H2 receptor antagonists at least 12 hours before or at least 4 hours after RPV.
Proton Pump Inhibitors	DOR	↔ DOR AUC and C_{min}	No dose adjustment needed
	EFV	↔ EFV expected	
	ETR	**With Omeprazole 40 mg Daily** • ETR AUC ↑ 41%	
	RPV IM	↔ RPV expected	No dose adjustment needed
	RPV PO	**With Omeprazole 20 mg Daily** • RPV AUC ↓ 40% to 65% and C_{min} ↓ 33%	**Contraindicated**
Alpha-Adrenergic Antagonists for Benign Prostatic Hyperplasia			
Alfuzosin, Doxazosin, Silodosin, Terazosin	DOR, RPV IM, RPV PO	↔ alpha-adrenergic antagonists expected	No dose adjustment needed
	EFV, ETR	↓ alpha-adrenergic antagonists expected	Consider alternative ARV or alpha-antagonist therapy. If coadministration is necessary, monitor for therapeutic effectiveness of alpha antagonist.
Tamsulosin	DOR, RPV IM, RPV PO	↔ tamsulosin expected	No dose adjustment needed
	EFV, ETR	↓ tamsulosin expected	Monitor for therapeutic effectiveness of tamsulosin after 2–4 weeks. May need to increase dose to tamsulosin 0.8 mg once daily for patients who fail to respond to the 0.4-mg dose.
Antibacterials—Antimycobacterials			
Bedaquiline	DOR, RPV IM, RPV PO	↔ bedaquiline expected	No dose adjustment needed
	EFV, ETR	↓ bedaquiline possible	**Do not coadminister.**
Rifabutin	DOR	DOR AUC ↓ 50%	Increase DOR dose to 100 mg twice daily. No dose adjustment is needed for rifabutin.
	EFV	Rifabutin ↓ 38%	Increase rifabutin dose to 450–600 mg per day.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	ETR	↔ rifabutin and metabolite AUC ETR AUC ↓ 37%	**Do not coadminister** ETR plus PI/r with rifabutin. Use rifabutin 300 mg once daily if ETR is administered without PI/r.
	RPV IM	↓ RPV expected	**Contraindicated**
	RPV PO	**Rifabutin Plus RPV 50 mg PO Once Daily Compared to RPV 25 mg Once Daily Alone** • ↔ RPV AUC and C_{min}	Increase RPV dose to 50 mg PO once daily during coadministration. No dose adjustment for rifabutin is needed.
Rifampin	DOR	DOR AUC ↓ 88%	**Contraindicated.** After stopping rifampin, wait 4 weeks before initiating DOR.
	EFV	EFV AUC ↓ 26%	**Do not use** EFV 400 mg with rifampin. Maintain EFV dose at 600 mg once daily and monitor for virologic response.
	ETR	Significant ↓ ETR possible	**Do not coadminister.**
	RPV IM	↓ RPV possible	**Contraindicated**
	RPV PO	RPV AUC ↓ 80%	**Contraindicated**
Rifapentine	DOR	**Once-Weekly Rifapentine Plus Isoniazid and DOR 100 mg Twice Daily Compared to DOR 100 mg Twice Daily Alone** • DOR AUC ↓ 29%, C_{min} ↓ 31%	**Contraindicated.** After stopping rifapentine, wait 4 weeks before initiating DOR.
	EFV	**Daily Rifapentine (Max 600 mg) With EFV** • ↔ EFV **Weekly Rifapentine (Max 900 mg) With EFV** • ↔ EFV	No dose adjustment needed
	ETR	↓ ETR possible	**Do not coadminister.**
	RPV IM, RPV PO	↓ RPV possible	**Contraindicated**
Antibacterials—Macrolides			
Azithromycin	DOR, EFV, ETR, RPV IM, RPV PO	↔ azithromycin expected	No dose adjustment needed

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Clarithromycin	DOR	↔ clarithromycin expected ↑ DOR possible	Monitor for ARV tolerability if used in combination.
	EFV	Clarithromycin AUC ↓ 39%	Monitor for effectiveness, or consider alternative agent (e.g., azithromycin) for MAC prophylaxis and treatment.
	ETR	Clarithromycin AUC ↓ 39% ETR AUC ↑ 42%	Consider alternative macrolide (e.g., azithromycin) for MAC prophylaxis and treatment.
	RPV IM, RPV PO	↔ clarithromycin expected ↑ RPV possible	Consider alternative macrolide (e.g., azithromycin) for MAC prophylaxis and treatment. If coadministered, monitor for QTc prolongation.
Erythromycin	DOR	↑ DOR possible	Monitor for ARV tolerability if used in combination.
	EFV, ETR	↑ EFV and ETR possible ↓ erythromycin possible	Monitor for ARV tolerability and antibiotic efficacy if used in combination.
	RPV IM, RPV PO	↑ RPV possible	Consider alternative macrolide (e.g., azithromycin). If coadministered, monitor for QTc prolongation.
Anticoagulants			
Apixaban	DOR, RPV IM, RPV PO	↔ apixaban expected	No dose adjustment needed
	EFV, ETR	↓ apixaban possible	Consider alternative ARV or anticoagulant therapy.
Dabigatran, Edoxaban	DOR, EFV, ETR, RPV IM, RPV PO	↔ DOAC expected	No dose adjustment needed
Rivaroxaban	DOR, RPV IM, RPV PO	↔ rivaroxaban expected	No dose adjustment needed
	EFV, ETR	↓ rivaroxaban possible	Consider alternative ARV or anticoagulant therapy.
Warfarin	DOR, RPV IM, RPV PO	↔ warfarin expected	No dose adjustment needed
	EFV, ETR	↑ or ↓ warfarin possible	Monitor INR and adjust warfarin dose accordingly.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antidepressants, Anxiolytics, and Antipsychotics Also see the Sedative/Hypnotics section below.			
Antidepressants and Anxiolytics			
Bupropion	DOR, ETR, RPV IM, RPV PO	↔ bupropion expected	No dose adjustment needed
	EFV	Bupropion AUC ↓ 55%	Titrate bupropion dose based on clinical response.
Citalopram, Escitalopram	DOR, RPV IM, RPV PO	↔ antidepressant expected	No dose adjustment needed
	EFV, ETR	↓ antidepressant possible	Titrate antidepressant dose based on clinical response.
Desvenlafaxine, Venlafaxine	DOR, EFV, ETR, RPV IM, RPV PO	↔ antidepressant expected	No dose adjustment needed
Duloxetine	DOR, EFV, ETR, RPV IM, RPV PO	↔ antidepressant expected	No dose adjustment needed
Fluoxetine, Fluvoxamine	DOR, EFV, ETR, RPV IM, RPV PO	↔ antidepressant expected	No dose adjustment needed
Mirtazapine	DOR, RPV IM, RPV PO	↔ mirtazapine expected	No dose adjustment needed
	EFV, ETR	↓ mirtazapine possible	Monitor antidepressant effect. Titrate dose as necessary based on clinical response.
Nefazodone	DOR, RPV IM, RPV PO	↑ NNRTI possible	No dose adjustment needed
	EFV, ETR	↓ nefazodone expected ↑ NNRTI possible	Monitor antidepressant effect. Titrate dose as necessary based on clinical response.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Paroxetine	DOR, ETR, RPV IM, RPV PO	↔ paroxetine expected	No dose adjustment needed
	EFV	↔ EFV and paroxetine	No dose adjustment needed
Sertraline	DOR, RPV IM, RPV PO	↔ sertraline expected	No dose adjustment needed
	EFV	Sertraline AUC ↓ 39%	Monitor the antidepressant effect. Titrate dose as necessary based on clinical response.
	ETR	↓ sertraline possible	
Trazodone	DOR, RPV IM, RPV PO	↔ trazodone expected	No dose adjustment needed
	EFV, ETR	↓ trazodone possible	Monitor for therapeutic effectiveness of trazodone and titrate dose as necessary.
Tricyclic Antidepressants (e.g., amitriptyline, doxepin, nortriptyline)	DOR, EFV, ETR, RPV IM, RPV PO	↔ antidepressant expected	No dose adjustment needed
Antipsychotics			
Aripiprazole	DOR, RPV IM, RPV PO	↔ aripiprazole expected	No dose adjustment needed
	EFV, ETR	↓ aripiprazole expected	Monitor for therapeutic effectiveness of antipsychotic. Consider doubling usual dose of aripiprazole over 1–2 weeks. Refer to aripiprazole prescribing information for dose recommendations.
Brexpiprazole	DOR, RPV IM, RPV PO	↔ brexpiprazole expected	No dose adjustment needed
	EFV, ETR	↓ brexpiprazole expected	Monitor for therapeutic effectiveness of antipsychotic. Consider doubling the usual dose of brexpiprazole and making further adjustments based on clinical response. Refer to brexpiprazole prescribing information.
Cariprazine	DOR, RPV IM, RPV PO	↔ cariprazine expected	No dose adjustment needed
	EFV, ETR	↓ cariprazine and ↑ or ↓ active metabolite possible	**Do not coadminister.**

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Iloperidone	DOR, RPV IM, RPV PO	↔ antipsychotic expected	No dose adjustment needed
	EFV, ETR	↓ antipsychotic possible	Monitor for therapeutic effectiveness of antipsychotic.
Lumateperone	DOR, RPV IM, RPV PO	↔ antipsychotic expected	No dose adjustment needed
	EFV, ETR	↓ antipsychotic possible	**Do not coadminister.**
Lurasidone	DOR, RPV IM, RPV PO	↔ antipsychotic expected	No dose adjustment needed
	EFV, ETR	↓ antipsychotic possible	Monitor for therapeutic effectiveness of antipsychotic.
Olanzapine, Olanzapine/ Samidorphan	DOR, ETR, RPV IM, RPV PO	↔ olanzapine expected	No dose adjustment needed
	EFV	↓ olanzapine possible	Monitor for therapeutic effectiveness of olanzapine.
Other Antipsychotics CYP3A4 Substrates (e.g., clozapine, haloperidol, perphenazine, risperidone, thioridazine)	DOR, RPV IM, RPV PO	↔ antipsychotic expected	No dose adjustment needed
	EFV, ETR	↓ antipsychotic possible	Monitor for therapeutic effectiveness of antipsychotic.
Pimavanserin	DOR, RPV IM, RPV PO	↔ pimavanserin expected	No dose adjustment needed
	EFV, ETR	↓ pimavanserin expected	**Do not coadminister.**
Pimozide	DOR, RPV IM, RPV PO	↔ pimozide expected	No dose adjustment needed
	EFV, ETR	↓ pimozide possible	Monitor for therapeutic effectiveness of pimozide.
Quetiapine	DOR, RPV IM, RPV PO	↔ antipsychotic expected	No dose adjustment needed
	EFV, ETR	↓ antipsychotic possible	Monitor for therapeutic effectiveness of antipsychotic.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Ziprasidone	DOR, RPV IM, RPV PO	↔ antipsychotic expected	No dose adjustment needed
	EFV, ETR	↓ antipsychotic possible	Monitor for therapeutic effectiveness of antipsychotic.
Antifungals			
Fluconazole	DOR	↑ DOR possible	No dose adjustment needed
	EFV	↔ fluconazole expected ↔ EFV AUC	No dose adjustment needed
	ETR	ETR AUC ↑ 86%	No dose adjustment needed
	RPV IM, RPV PO	↑ RPV possible	No dose adjustment needed. If coadministered, consider monitoring for QTc prolongation.
Ibrexafungerp	DOR, RPV PO	↑ NNRTI possible	No dose adjustment needed
	EFV, ETR	↓ ibrexafungerp expected ↑ NNRTI possible	**Do not coadminister.**
	RPV IM	↔ ibrexafungerp expected ↔ RPV IM expected	No dose adjustment needed
Isavuconazole	DOR	↑ DOR possible	No dose adjustment needed
	EFV, ETR	↓ isavuconazole possible	Monitor isavuconazole concentration and antifungal response. Dose adjustments for isavuconazole may be necessary.
	RPV IM, RPV PO	↑ RPV possible	No dose adjustment needed. If coadministered, consider monitoring for QTc prolongation.
Itraconazole	DOR	↑ DOR possible	No dose adjustment needed
	EFV	**EFV With Itraconazole Solution** • Itraconazole and OH-itraconazole AUC, C_{max}, and C_{min} ↓ 37% to 44% **EFV With Itraconazole Capsules** • Itraconazole AUC ↓ 86% and OH-itraconazole AUC 84%	**Do not coadminister** unless potential benefits outweigh the risks. Failure to achieve therapeutic itraconazole concentrations has been reported. If coadministration is necessary, closely monitor itraconazole concentration and adjust dose accordingly.
	ETR	↓ itraconazole possible ↑ ETR possible	Dose adjustments for itraconazole may be necessary. Monitor itraconazole concentration and antifungal response.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	RPV IM, RPV PO	↑ RPV possible	No dose adjustment needed. If coadministered, consider monitoring for QTc prolongation.
Posaconazole	DOR, ETR	↑ NNRTI possible	No dose adjustment needed
	EFV	Posaconazole AUC ↓ 50% ↔ EFV AUC	**Do not coadminister** unless potential benefits outweigh the risks. If coadministration is necessary, monitor posaconazole concentration and adjust dose accordingly.
	RPV IM, RPV PO	↑ RPV possible	No dose adjustment needed. If coadministered, consider monitoring for QTc prolongation.
Voriconazole	DOR	↑ DOR possible	No dose adjustment needed
	EFV	Voriconazole AUC ↓ 77% EFV AUC ↑ 44%	**Contraindicated at standard doses** Adjust dose to voriconazole 400 mg twice daily plus EFV 300 mg daily.
	ETR	↔ voriconazole AUC ETR AUC ↑ 36%	No dose adjustment needed
	RPV IM, RPV PO	↑ RPV possible	No dose adjustment needed. If coadministered, consider monitoring for QTc prolongation.
Antimalarials			
Artemether/ Lumefantrine	DOR, RPV IM, RPV PO	↔ antimalarial expected	No dose adjustment needed
	EFV	Artemether AUC ↓ 79% DHA AUC ↓ 75% Lumefantrine AUC ↓ 30% to 56%	Consider alternative ARV or antimalarial drug. If used in combination, monitor closely for antimalarial efficacy.
	ETR	Artemether AUC ↓ 38% ↔ DHA AUC ↔ lumefantrine AUC ↔ ETR AUC	Clinical significance of the reduced antimalarial drug concentrations is unknown. If used in combination with ETR, monitor for antimalarial efficacy.
Atovaquone/Proguanil	DOR, ETR, RPV IM, RPV PO	No data	Monitor for antimalarial efficacy.
	EFV	Atovaquone AUC ↓ 75% Proguanil AUC ↓ 43%	No dose recommendation. Consider alternative drug for malaria prophylaxis, if possible.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antimigraine			
Calcitonin Gene-Related Peptide (CGRP) Receptor Antagonists			
Atogepant	DOR RPV IM, RPV PO	↔ atogepant expected	No dose adjustment needed
	EFV, ETR,	↓ atogepant possible	Episodic migraine: Increase atogepant dose to 30–60 mg once daily. Chronic migraine: **Do not coadminister.**
Rimegepant	DOR, RPV IM, RPV PO	↔ rimegepant expected	No dose adjustment needed
	EFV, ETR,	↓ rimegepant possible	Consider alternative ARV or migraine medication.
Ubrogepant	DOR, RPV IM, RPV PO	↔ ubrogepant expected	No dose adjustment needed
	EFV, ETR	↓ ubrogepant expected	Use initial dose of 100 mg, followed by second dose of 100 mg if needed.
Zavegepant	DOR, RPV IM, RPV PO	↔ zavegepant expected	No dose adjustment needed
	EFV, ETR,	↓ zavegepant possible	
Serotonin 5-HT1B, 1D Receptor Agonists			
Almotriptan, Eletriptan	DOR RPV IM, RPV PO	↔ almotriptan expected	No dose adjustment needed
	EFV, ETR,	↓ almotriptan possible	
Frovatriptan, Naratriptan, Rizatriptan, Sumatriptan, Zolmitriptan	DOR, EFV, ETR, RPV IM, RPV PO	↔ migraine medication expected	No dose adjustment needed
Antiplatelets			
Clopidogrel	DOR, RPV IM, RPV PO	↔ clopidogrel expected	No dose adjustment needed
	EFV, ETR	↓ activation of clopidogrel possible	Consider alternative ARV or antiplatelet. ETR may prevent metabolism of clopidogrel to its active metabolite.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Prasugrel	All NNRTIs	↔ prasugrel expected	No dose adjustment needed
Ticagrelor	DOR, RPV IM, RPV PO	↔ ticagrelor expected	No dose adjustment needed
	EFV, ETR	↓ ticagrelor expected	Consider alternative ARV or anticoagulant therapy.
Vorapaxar	DOR, RPV IM, RPV PO	↔ vorapaxar expected	No dose adjustment needed
	EFV, ETR	↓ vorapaxar expected	Insufficient data to make a dose recommendation.
Antipneumocystis and Antitoxoplasmosis			
Atovaquone (oral solution)	DOR, ETR, RPV IM, RPV PO	No data	Monitor for therapeutic effectiveness of atovaquone.
	EFV	Atovaquone AUC ↓ 44% to 47%	Consider alternative ARV or agent for PCP or toxoplasmosis treatment or prophylaxis. If coadministration is necessary, monitor for therapeutic effectiveness of atovaquone.
Antiseizure			
Carbamazepine, Phenobarbital, Phenytoin, Primidone	DOR	↓ DOR possible	**Contraindicated.** After stopping antiseizure medication, wait 4 weeks before initiating DOR.
	EFV	**Carbamazepine Plus EFV** • Carbamazepine AUC ↓ 27% • EFV AUC ↓ 36% **Phenytoin Plus EFV** • ↓ EFV • ↑ or ↓ phenytoin possible **Phenobarbital or Primidone Plus EFV** • ↓ EFV and antiseizure agent possible	Consider alternative ARV or antiseizure medication. If coadministration is necessary, monitor antiseizure drug and EFV concentrations.
	ETR	↓ antiseizure agent and ETR possible	**Do not coadminister.**
	RPV IM, RPV PO	↓ RPV possible	**Contraindicated**

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Eslicarbazepine	DOR, EFV, ETR, RPV IM, RPV PO	↓ NNRTI possible	Consider alternative ARV or antiseizure medication. If coadministration is necessary, monitor virologic response and consider monitoring plasma concentrations of ARVs.
Oxcarbazepine	DOR, RPV IM, RPV PO	↓ NNRTI possible	**Contraindicated**
	EFV, ETR	↓ NNRTI possible	Consider alternative ARV or antiseizure medication. If coadministration is necessary, monitor virologic response and consider monitoring plasma concentrations of ARVs.
Ethosuximide, Lacosamide, Tiagabine, Zonisamide	DOR, RPV IM, RPV PO	↔ antiseizure agent expected	No dose adjustment needed
	EFV, ETR	↓ antiseizure agent possible	Monitor seizure control. Consider anticonvulsant therapeutic drug monitoring.
Lamotrigine	DOR, ETR, RPV IM, RPV PO	↔ lamotrigine expected	No dose adjustment needed
	EFV	↓ lamotrigine possible	Monitor seizure control and plasma concentrations of lamotrigine.
Antivirals—Hepatitis C			
Elbasvir/Grazoprevir	DOR	↔ elbasvir and grazoprevir DOR AUC ↑ 56% and C_{min} ↑ 41%	No dose adjustment needed
	EFV	Elbasvir AUC ↓ 54% Grazoprevir AUC ↓ 83% ↔ EFV	**Contraindicated**
	ETR	↓ elbasvir and grazoprevir expected	**Do not coadminister.**
	RPV IM	↔ elbasvir and grazoprevir expected ↔ RPV expected	No dose adjustment needed
	RPV PO	↔ elbasvir and grazoprevir ↔ RPV AUC and C_{min}	No dose adjustment needed

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Glecaprevir/ Pibrentasvir	DOR	↑ DOR expected	No dose adjustment needed
	EFV	↓ glecaprevir and pibrentasvir expected	**Do not coadminister.**
	ETR	↓ glecaprevir and pibrentasvir possible	**Do not coadminister.**
	RPV IM	↔ glecaprevir and pibrentasvir expected ↑ RPV expected	No dose adjustment needed
	RPV PO	↔ glecaprevir and pibrentasvir RPV AUC ↑ 84%	No dose adjustment needed
Ledipasvir/Sofosbuvir	DOR	↔ ledipasvir and sofosbuvir ↔ DOR	No dose adjustment needed
	EFV	Ledipasvir AUC, C_{min}, and C_{max} ↓ 34% ↔ sofosbuvir	
	ETR	No significant effect expected	
	RPV IM	↔ ledipasvir, sofosbuvir, and RPV expected	
	RPV PO	↔ ledipasvir and sofosbuvir ↔ RPV	
Sofosbuvir/ Velpatasvir	DOR, RPV IM, RPV PO	No significant effect expected	No dose adjustment needed
	EFV	Velpatasvir AUC ↓ 43%, C_{max} ↓ 37%, and C_{min} ↓ 47%	**Do not coadminister.**
	ETR	↓ velpatasvir expected	**Do not coadminister.**
Sofosbuvir/ Velpatasvir/ Voxilaprevir	DOR, RPV IM, RPV PO	No significant effect expected	No dose adjustment needed.
	EFV	Velpatasvir AUC ↓ 43%, C_{max} ↓ 37%, and C_{min} ↓ 47% ↓ voxilaprevir expected	**Do not coadminister.**
	ETR	↓ voxilaprevir expected ↓ velpatasvir expected	**Do not coadminister.**

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antivirals—Miscellaneous (e.g., for CMV, Mpox)			
Brincidofovir	All NNRTIs	↔ brincidofovir expected	No dose adjustment needed
Cidofovir	All NNRTIs	↔ cidofovir expected	No dose adjustment needed
Maribavir	DOR, RPV IM, RPV PO	↔ maribavir expected	No dose adjustment needed
	EFV, ETR	↓ maribavir possible	
Tecovirimat	DOR, RPV PO	↓ DOR or RPV expected but not likely to be clinically relevant	No dose adjustment needed
	EFV, ETR	↔ EFV or ETR expected	No dose adjustment needed
	RPV IM	↓ RPV expected but not likely to be clinically relevant	No dose adjustment needed. If there is a concern for suboptimal RPV exposure, seek expert consultation. Do not initiate CAB/RPV IM during or within 2 weeks after tecovirimat treatment. (Refer to Table 24d for interaction with CAB.)
Antivirals—SARS-CoV-2			
Molnupiravir	All NNRTIs	↔ expected	No dose adjustment needed
Remdesivir	All NNRTIs	↔ expected	No dose adjustment needed
Ritonavir-Boosted Nirmatrelvir	DOR	**With Ritonavir 100 mg Twice Daily** • DOR AUC ↑ 254%	No dose adjustment needed
	EFV, ETR, RPV PO, RPV IM	↔ expected	No dose adjustment needed
Cardiac Medications			
Beta-Blockers			
Atenolol, Metoprolol, Nebivolol	DOR, EFV, ETR, RPV IM, RPV PO	↔ beta-blocker expected	No dose adjustment needed

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Bisoprolol, Carvedilol	DOR, RPV IM, RPV PO	↔ beta-blocker expected	No dose adjustment needed
	EFV, ETR	↓ beta-blocker possible	No dose adjustment needed. Monitor blood pressure and heart rate and titrate to clinical effect.
Labetalol	DOR, RPV IM, RPV PO	↔ beta-blocker expected	No dose adjustment needed
	EFV, ETR	↑ beta-blocker possible	No dose adjustment needed. Monitor blood pressure and heart rate and adjust dose to achieve desired clinical effect.
Calcium Channel Blockers			
Dihydropyridine Calcium Channel Blockers (e.g., amlodipine, nifedipine)	DOR, RPV IM, RPV PO	↔ CCBs expected	No dose adjustment needed
	EFV, ETR	↓ CCBs possible	Titrate CCB dose based on clinical response.
Non-Dihydropyridine Calcium Channel Blockers (e.g., diltiazem, verapamil)	DOR, RPV IM, RPV PO	↔ CCBs expected ↑ NNRTI possible	No dose adjustment needed
	EFV	Diltiazem AUC ↓ 69% ↓ verapamil possible	Titrate diltiazem or verapamil dose based on clinical response.
	ETR	↓ diltiazem or verapamil possible	
Cardiac—Other			
Bosentan	DOR	↓ DOR possible	Consider alternative ARV or alternative to bosentan. If coadministration is necessary, monitor virologic response.
	EFV, ETR	↓ NNRTI possible ↓ bosentan possible	Consider alternative ARV or alternative to bosentan. If coadministration is necessary, monitor bosentan efficacy and virologic response.
	RPV IM, RPV PO	↓ RPV possible	Consider alternative ARV or alternative to bosentan. If coadministration is necessary, monitor virologic response.
Eplerenone	DOR, RPV IM, RPV PO	↔ eplerenone expected	No dose adjustment needed
	EFV, ETR	↓ eplerenone possible	Titrate eplerenone dose based on clinical response.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Ivabradine	DOR, RPV IM, RPV PO	↔ ivabradine expected	No dose adjustment needed
	EFV, ETR	↓ ivabradine expected	**Contraindicated**
Mavacamten	DOR, RPV IM, RPV PO	↔ mavacamten expected ↓ NNRTI possible	Consider alternative ARV or alternative to mavacamten. If coadministration is necessary, monitor virologic response.
	EFV, ETR	↓ mavacamten expected ↓ NNRTI possible	**Contraindicated**
Ranolazine	DOR, RPV IM, RPV PO	↔ ranolazine expected	No dose adjustment needed
	EFV, ETR	↓ ranolazine expected	**Contraindicated**
Corticosteroids			
Beclomethasone, Ciclesonide	DOR, EFV, ETR, RPV IM, RPV PO	↔ corticosteroid expected	No dose adjustment needed
Budesonide, Fluticasone, Mometasone	DOR, RPV IM, RPV PO	↔ corticosteroid expected	No dose adjustment needed
	EFV, ETR,	↓ corticosteroid possible	Monitor corticosteroid efficacy and titrate as needed. May consider alternative corticosteroid for long-term use.
Dexamethasone	DOR, EFV, ETR	↓ NNRTI possible	Consider alternative corticosteroid for long-term use. If dexamethasone is used with NNRTI, monitor virologic response.
	RPV IM, RPV PO	Significant ↓ RPV possible	**Contraindicated** with more than a single dose of dexamethasone.
Prednisone, Prednisolone	DOR, RPV IM, RPV PO	↔ corticosteroid expected	No dose adjustment needed
	EFV, ETR,	↓ corticosteroid possible	Monitor corticosteroid efficacy and titrate as needed. May consider alternative corticosteroid for long-term use.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Glucose-Lowering			
Linagliptin, Sitagliptin	DOR, RPV IM, RPV PO	↔ antihyperglycemic expected	No dose adjustment needed
	EFV, ETR	↓ antihyperglycemic possible	Monitor glycemic control.
Metformin	DOR	↔ metformin AUC DOR AUC ↓ 26% and C_{max} ↓ 24%	No dose adjustment needed
	EFV, ETR, RPV IM	↔ metformin expected	No dose adjustment needed
	RPV PO	↔ metformin AUC	No dose adjustment needed
Sodium-Glucose Cotransporter-2 Inhibitors (e.g., canagliflozin, dapagliflozin, empagliflozin)	DOR, EFV, ETR, RPV IM, RPV PO	↔ antihyperglycemic expected	No dose adjustment needed
Herbal Products			
St. John's Wort	DOR	↓ DOR expected	**Contraindicated.** After stopping St. John's Wort, wait 4 weeks before initiating DOR.
	EFV, ETR	↓ EFV or ETR expected	**Do not coadminister.**
	RPV IM, RPV PO	↓ RPV expected	**Contraindicated**
Hormonal Therapies—Contraceptives			
Injectable Contraceptives **Depot MPA**	DOR, ETR, RPV IM, RPV PO	↔ MPA expected	No dose adjustment needed
	EFV	↔ MPA	No dose adjustment needed. Refer to Women With HIV section for people on EFV and RIF.
Oral Contraceptives (e.g., desogestrel, drospirenone, ethinyl estradiol, levonorgestrel, norgestimate)	DOR	↔ ethinyl estradiol ↔ levonorgestrel ↔ drospirenone expected	No dose adjustment needed
	EFV	↔ ethinyl estradiol Etonogestrel (metabolite of oral desogestrel) C_{min} ↓ 61%	**When Used for Contraception** Use alternative ARV or contraceptive methods.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
		Levonorgestrel (metabolite of oral norgestimate) AUC ↓ 83% Norelgestromin (metabolite of oral norgestimate) AUC ↓ 64% ↓ drospirenone possible	**When Used for Other Clinical Indications (e.g., Acne, Menstrual Cycle Regulation)** Monitor for clinical effectiveness of hormonal therapy.
	ETR	Ethinyl estradiol AUC ↑ 22% ↔ norethindrone ↓ drospirenone possible	No dose adjustment needed for regimens that do not contain drospirenone For drospirenone-containing regimens used for contraception, use alternative ARV or alternative contraceptive method. If using drospirenone for other clinical indications, monitor for clinical effectiveness of hormonal therapy.
	RPV IM	↔ ethinyl estradiol expected ↔ norethindrone expected ↔ drospirenone expected	No dose adjustment needed
	RPV PO	↔ ethinyl estradiol ↔ norethindrone ↔ drospirenone expected	No dose adjustment needed
Subdermal Implant Contraceptives (e.g., etonogestrel, levonorgestrel)	DOR, RPV IM, RPV PO	↔ etonogestrel expected ↔ levonorgestrel expected	No dose adjustment needed
	EFV	Etonogestrel AUC ↓ 63% to 82% Levonorgestrel AUC ↓ 42% to 47% **Levonorgestrel 300 mg Implant With 600 mg EFV Compared to Levonorgestrel 150 mg Implant** • Levonorgestrel AUC ↓ 34%	Use alternative ARV or contraceptive methods. Unintended pregnancies were observed in women who used EFV and levonorgestrel implant concomitantly.
	ETR	↓ etonogestrel possible ↓ levonorgestrel possible	Consider using alternative ARV or contraceptive methods.
Transdermal Contraceptives (e.g., ethinyl estradiol/ norelgestromin, ethinyl estradiol/levonorgestrel)	DOR, RPV IM, RPV PO	↔ ethinyl estradiol or norelgestromin expected	No dose adjustment needed
	EFV	↓ ethinyl estradiol or norelgestromin possible	Consider alternative ARV or contraceptive method.
	ETR	↓ ethinyl estradiol or norelgestromin possible	Consider alternative ARV or contraceptive method.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Vaginal Ring Contraceptives (e.g., etonogestrel/ethinyl estradiol, segesterone/ethinyl estradiol)	DOR, RPV IM, RPV PO	↔ etonogestrel and ethinyl estradiol expected ↔ segesterone and ethinyl estradiol expected	No dose adjustment needed
	EFV	Ethinyl estradiol (intravaginal ring) AUC ↓ 56% Etonogestrel (intravaginal ring) AUC ↓ 81%	Use alternative ARV or contraceptive method.
		↓ segesterone and ethinyl estradiol possible	Consider alternative ARV or contraceptive method.
	ETR	↓ etonogestrel and ethinyl estradiol possible ↓ segesterone and ethinyl estradiol possible	Consider alternative ARV or contraceptive method.
Emergency Contraceptives Levonorgestrel (oral)	DOR, RPV IM, RPV PO	↔ levonorgestrel expected	No dose adjustment needed.
	EFV	**Levonorgestrel 1.5 mg Plus 600 mg EFV** • Levonorgestrel AUC ↓ 58% **Levonorgestrel 3 mg Plus 600 mg EFV Compared to Levonorgestrel 1.5 mg Alone** • ↔ levonorgestrel AUC	Increase dose of levonorgestrel to 3 mg when used for emergency postcoital contraception.
	ETR	↓ levonorgestrel possible	Consider alternative ARV or contraceptive method.
Hormonal Therapies—Miscellaneous			
5-Alpha Reductase Inhibitors (e.g., dutasteride, finasteride)	DOR, RPV IM, RPV PO	↔ dutasteride and finasteride expected	No dose adjustment needed
	EFV, ETR	↓ dutasteride and finasteride possible	Monitor effects of testosterone. Titrate testosterone dose as necessary to achieve therapeutic goals.
Cyproterone, Goserelin Acetate, Leuprolide, Progestogens, Spironolactone	DOR, RPV IM, RPV PO	↔ hormonal concentrations expected	No dose adjustment needed
	EFV, ETR	↓ cyproterone and progestogens possible ↔ goserelin, leuprolide acetate, and spironolactone expected	Monitor effects of estrogen and antiandrogen therapy. Titrate dose as necessary to achieve therapeutic goals.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Estradiol	DOR, RPV IM, RPV PO	↔ estradiol expected	No dose adjustment needed
	EFV	Estradiol AUC ↓ 28% ↔ EFV AUC	Monitor effects of estrogen and therapy. Titrate dose as necessary to achieve therapeutic goals
	ETR	↓ estradiol possible	
Menopausal Hormone Replacement Therapy (e.g., conjugated estrogens, drospirenone, estradiol, medroxyprogesterone, progesterone)	DOR, RPV IM, RPV PO	↔ hormonal concentrations expected	No dose adjustment needed
	EFV, ETR	↓ estrogen possible with estradiol or conjugated estrogen (equine and synthetic) ↓ medroxyprogesterone possible ↓ micronized progesterone possible ↓ drospirenone possible See Contraceptives—Oral above for other progestin-NNRTI interactions	Monitor menopausal symptoms. Titrate to the dose of hormonal therapy that achieves menopausal symptom relief.
Testosterone	DOR, RPV IM, RPV PO	↔ testosterone expected	No dose adjustment needed
	EFV, ETR	↓ testosterone possible	Monitor effects of testosterone. Titrate testosterone dose as necessary to achieve therapeutic goals.
Immunosuppressants			
Cyclosporine	DOR, RPV IM, RPV PO	↔ cyclosporine expected ↑ NNRTI possible	No dose adjustment needed
	EFV, ETR	↓ cyclosporine possible	Increase in immunosuppressant dose may be necessary. Therapeutic drug monitoring of immunosuppressant is recommended. Consult with specialist as necessary.
Everolimus, Sirolimus, Tacrolimus	DOR, RPV IM, RPV PO	↔ immunosuppressant expected	No dose adjustment needed
	EFV, ETR	↓ immunosuppressant possible	Increase in immunosuppressant dose may be necessary. Therapeutic drug monitoring of immunosuppressant is recommended. Consult with specialist as necessary.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Lipid-Modifying			
Atorvastatin	DOR	↔ atorvastatin AUC	No dose adjustment needed
	EFV, ETR	Atorvastatin AUC ↓ 32% to 43%	Adjust atorvastatin dose according to lipid response, but do not exceed the maximum recommended dose.
	RPV IM	↔ atorvastatin expected	No dose adjustment needed
	RPV PO	↔ atorvastatin AUC	No dose adjustment needed
Fluvastatin	DOR, RPV IM, RPV PO	↔ fluvastatin expected	No dose adjustment needed
	EFV, ETR	↑ fluvastatin possible	Dose adjustments for fluvastatin may be necessary. Monitor for fluvastatin toxicity.
Lovastatin, Simvastatin	DOR, RPV IM, RPV PO	↔ lovastatin and simvastatin expected	No dose adjustment needed
	EFV	Simvastatin AUC ↓ 60% to 68% Simvastatin active metabolite AUC ↓ 60%	Adjust simvastatin dose according to lipid response, but do not exceed the maximum recommended dose.
	ETR	↓ lovastatin possible ↓ simvastatin possible	Adjust lovastatin or simvastatin dose according to lipid response, but do not exceed the maximum recommended dose.
Pitavastatin	DOR, ETR, RPV IM, RPV PO	↔ pitavastatin expected	No dose adjustment needed
	EFV	↔ pitavastatin AUC	No dose adjustment needed
Pravastatin	DOR, RPV IM, RPV PO	↔ pravastatin expected	No dose adjustment needed
	EFV	Pravastatin AUC ↓ 44%	Adjust statin dose according to lipid responses, but do not exceed the maximum recommended dose.
	ETR	↓ pravastatin possible	
Rosuvastatin	DOR, EFV, ETR, RPV IM, RPV PO	↔ rosuvastatin expected	No dose adjustment needed

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Narcotics and Treatment for Opioid Dependence			
Buprenorphine Sublingual or buccal	DOR, RPV IM, RPV PO	↔ buprenorphine expected	No dose adjustment needed
	EFV	Buprenorphine AUC ↓ 50% Norbuprenorphine (active metabolite) AUC ↓ 71%	No dose adjustment needed, monitor for withdrawal symptoms.
	ETR	Buprenorphine AUC ↓ 25%	No dose adjustment needed
Buprenorphine Implant	DOR, RPV IM, RPV PO	↔ buprenorphine expected	No dose adjustment needed
	EFV, ETR	No data	Clinical monitoring is recommended when NNRTI is initiated after insertion of buprenorphine implant.
Lofexidine	DOR, EFV, ETR, RPV IM, RPV PO	↔ lofexidine expected	No dose adjustment needed
Methadone	DOR	↔ methadone AUC DOR AUC ↓ 26%	No dose adjustment needed
	EFV	Methadone AUC ↓ 52%	Opioid withdrawal common; monitor and increase methadone dose as necessary.
	ETR	↔ methadone AUC	No dose adjustment needed
	RPV IM	↓ methadone AUC expected	No dose adjustment needed; monitor for withdrawal symptoms.
	RPV PO	↔ R-methadone[a] AUC	No dose adjustment needed; monitor for withdrawal symptoms.
PDE5 Inhibitors			
Avanafil, Tadalafil, Vardenafil	DOR, RPV IM, RPV PO	↔ PDE5 inhibitor expected	No dose adjustment needed
	EFV, ETR	↓ PDE5 inhibitor possible	May need to titrate dose based on clinical effect.

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Sildenafil	DOR	↔ sildenafil expected	No dose adjustment needed
	EFV	↓ sildenafil possible	May need to titrate sildenafil dose based on clinical effect.
	ETR	Sildenafil AUC ↓ 57%	May need to titrate sildenafil dose based on clinical effect.
	RPV IM	↔ sildenafil expected	No dose adjustment needed
	RPV PO	↔ sildenafil AUC and C_{max}	No dose adjustment needed
Sedative/Hypnotics			
Benzodiazepines			
Alprazolam, Triazolam	DOR, RPV IM, RPV PO	↔ alprazolam or triazolam expected	No dose adjustment needed
	EFV, ETR	↓ alprazolam or triazolam possible	Monitor for therapeutic effectiveness of benzodiazepine.
Diazepam	DOR, RPV IM, RPV PO	↔ diazepam expected	No dose adjustment needed
	EFV	↓ diazepam possible	Monitor for therapeutic effectiveness of diazepam.
	ETR	↑ diazepam possible	Decreased dose of diazepam may be necessary. Monitor for diazepam toxicity.
Lorazepam	DOR, ETR, RPV IM, RPV PO	↔ lorazepam expected	No dose adjustment needed
	EFV	↔ lorazepam AUC	No dose adjustment needed
Midazolam	DOR	↔ midazolam AUC	No dose adjustment needed
	EFV	↑ or ↓ midazolam possible	Monitor for therapeutic effectiveness and toxicity of midazolam.
	ETR	Midazolam AUC ↓ 31% Midazolam active metabolite C_{max} ↑ 57%	Monitor for therapeutic effectiveness of midazolam.
	RPV IM, RPV PO	↔ midazolam expected	No dose adjustment needed
Orexin Receptor Antagonists			
Daridorexant	DOR, RPV IM, RPV PO	↔ daridorexant expected	No dose adjustment needed
	EFV	Daridorexant AUC ↓ 61%	**Do not coadminister.**
	ETR	↓ daridorexant possible	

Table 24b. Drug Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Other Drugs

Concomitant Drug	NNRTI	Effect on NNRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Lemborexant, Suvorexant	DOR, RPV IM, RPV PO	↔ lemborexant expected	No dose adjustment needed
	EFV, ETR	↓ lemborexant possible	**Do not coadminister.**
Other Sedatives			
Eszopiclone, Zolpidem	DOR, RPV IM, RPV PO	↔ eszopiclone or zolpidem expected	No dose adjustment needed
	EFV, ETR	↓ eszopiclone or zolpidem possible	Monitor for therapeutic effectiveness of sedative and titrate to clinical effect.
Miscellaneous			
Finerenone	DOR, RPV IM, RPV PO	↔ finerenone expected	No dose adjustment needed
	EFV, ETR	↓ finerenone expected	Consider alternative ARV or alternative to finerenone. If coadministration is necessary, monitor finerenone efficacy.
Praziquantel	DOR, RPV IM, RPV PO	↔ praziquantel expected	No dose adjustment needed
	EFV	R-praziquantel and S-praziquantel AUC ↓ 74% to 75%	**Do not coadminister**. If coadministration is necessary, consider alternative ARVs.
	ETR	↓ praziquantel possible	**Do not coadminister.** If coadministration is necessary, consider alternative ARVs.

[a] R-methadone is the active form of methadone.

Key to Symbols

↑ = increase
↓ = decrease
↔ = less than 20% change in AUC

Key: ARV = antiretroviral; AUC = area under the curve; C_{max} = maximum plasma concentration; C_{min} = minimum plasma concentration; CAB = cabotegravir; CCB = calcium channel blocker; DAA = direct-acting antiviral; DHA = dihydroartemisinin; DOAC = direct oral anticoagulants; DOR = doravirine; EFV = efavirenz; ETR = etravirine; IM = intramuscular; INR = international normalized ratio; isoniazid = isonicotinic acid hydrazide; MAC = *Mycobacterium avium* complex; MPA = medroxyprogesterone acetate; CMV = cytomegalovirus; NNRTI = non-nucleoside reverse transcriptase inhibitor; OH-itraconazole = active metabolite of itraconazole; PCP = *Pneumocystis jirovecii* pneumonia; PDE5 = phosphodiesterase type 5; PI/r = protease inhibitor/ritonavir; PO = orally; QTc = QT corrected for heart rate; RPV = rilpivirine

Table 24c. Drug Interactions Between Nucleoside Reverse Transcriptase Inhibitors and Other Drugs (Including Antiretroviral Agents)

Updated: September 12, 2024
Reviewed: September 12, 2024

This table provides information on the known or predicted interactions between nucleoside reverse transcriptase inhibitors (NRTIs) and non-antiretroviral drugs.

Recommendations for managing a particular drug interaction may differ depending on whether a new antiretroviral (ARV) drug is being initiated in a patient on a stable concomitant medication or whether a new concomitant medication is being initiated in a patient on a stable ARV regimen. The magnitude and significance of drug interactions are difficult to predict when several drugs with competing metabolic pathways are prescribed concomitantly. In cases where an interacting drug needs to be replaced with an alternative, providers should exercise their clinical judgment to select the most appropriate alternative medication.

This table focuses on interactions with pharmacokinetic study data and interactions without study data but where there is a clinical recommendation. Interactions associated with zidovudine (ZDV) are **not** included in this table. Please refer to the U.S. Food and Drug Administration product labels for information regarding drug interactions between ZDV and other drugs.

Concomitant Drug	NRTI	Effect on NRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antibacterials—Antimycobacterials			
Rifabutin	3TC, ABC, FTC,	↔ expected	No dose adjustment needed
	TAF	↓ TAF possible	**Use with caution.** If coadministered, monitor virologic response.
	TDF	↔ AUC TFV	No dose adjustment needed
Rifampin	3TC, ABC, FTC	↔ expected	No dose adjustment needed
	TAF	**TAF With Rifampin Compared With TDF Alone** • TFV-DP AUC ↑ 4.2-fold **TAF With Rifampin Compared With TAF Alone** • TAF AUC ↓ 55% • TFV-DP AUC ↓ 36% **TAF 25 mg Twice Daily With Rifampin Compared With TAF Once Daily Alone** • TAF AUC ↓ 14% • TFV-DP AUC ↓ 24%	**Use with caution.** If coadministered, monitor virologic response. Intracellular TFV-DP levels are higher when TAF is coadministered with rifampin than when TDF is administered alone, but clinical outcomes have not been studied.
	TDF	↔ AUC TFV	No dose adjustment needed

Table 24c. Drug Interactions Between Nucleoside Reverse Transcriptase Inhibitors and Other Drugs (Including Antiretroviral Agents)

Concomitant Drug	NRTI	Effect on NRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Rifapentine	3TC, ABC, FTC,	↔ expected	No dose adjustment needed
	TAF	↓ TAF possible	**Use with caution.** If coadministered, monitor virologic response.
	TDF	↔ AUC TFV	No dose adjustment needed
Antiretrovirals			
Capsid Inhibitor			
LEN (SQ and PO)	3TC, ABC, FTC	↔ 3TC, ABC, FTC, LEN expected	No dose adjustment needed
	TAF	TAF AUC ↑ 32% ↔ LEN	No dose adjustment needed
	TDF	TDF AUC ↑ 47% ↔ LEN	No dose adjustment needed
INSTIs			
DTG	3TC, ABC, FTC	↔ expected	No dose adjustment needed
	TAF	↔ TAF AUC	No dose adjustment needed
	TDF	↔ TDF AUC ↔ DTG AUC	No dose adjustment needed
RAL	3TC, ABC, FTC, TAF	↔ expected	No dose adjustment needed
	TDF	RAL AUC ↑ 49%	No dose adjustment needed
PIs			
ATV/c, ATV/r	3TC, ABC, FTC	↔ expected	No dose adjustment needed
	TAF	**TAF 10 mg With ATV/r** • TAF AUC ↑ 91% **TAF 10 mg With ATV/c** • TAF AUC ↑ 75%	No dose adjustment needed (use TAF 25 mg)
	TDF	**With ATV (Unboosted)** • ATV AUC ↓ 25% and C_{min} ↓ 23% to 40% (higher C_{min} with RTV than without RTV) • TFV AUC ↑ 24% to 37%	Use ATV 300 mg plus (RTV 100 mg or COBI 150 mg) daily when coadministering TDF 300 mg daily. If using TDF and an H2 receptor antagonist in an ART-experienced patient, use ATV 400 mg plus (RTV 100 mg or COBI 150 mg) daily. Monitor for TDF-associated toxicities.

Table 24c. Drug Interactions Between Nucleoside Reverse Transcriptase Inhibitors and Other Drugs (Including Antiretroviral Agents)

Concomitant Drug	NRTI	Effect on NRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
DRV/c	3TC, ABC, FTC	↔ expected	No dose adjustment needed
	TAF	**TAF 25 mg With DRV/c** • ↔ TAF	No dose adjustment needed
	TDF	TFV ↑ possible	Monitor for TDF-associated toxicities.
DRV/r	3TC, ABC, FTC	↔ expected	No dose adjustment needed
	TAF	**TAF 10 mg With DRV/r** • ↔ TAF AUC	No dose adjustment needed
	TDF	TFV AUC ↑ 22% and C_{min} ↑ 37%	Clinical significance is unknown. If coadministered, monitor for TDF-associated toxicities.
Antiseizure			
Carbamazepine, Oxcarbazepine, Phenobarbital, Phenytoin	ABC	↑ carbamazepine possible ↓ ABC possible with oxcarbazepine, phenobarbital, phenytoin	No dose adjustment needed
	3TC, FTC, TDF	↔ expected	No dose adjustment needed
	TAF	**With Carbamazepine** • TAF AUC ↓ 55% • ↓ TAF possible with other anticonvulsants	**Do not coadminister.**
Antivirals—Hepatitis C			
Glecaprevir/Pibrentasvir	3TC, ABC, FTC	↔ expected	No dose adjustment needed
	TAF	↔ TFV AUC	No dose adjustment needed
	TDF	TFV AUC ↑ 29%	No dose adjustment needed
Ledipasvir/Sofosbuvir	3TC, ABC, FTC	↔ expected	No dose adjustment needed
	TAF	TFV AUC ↑ 27%	No dose adjustment needed
	TDF	Ledipasvir ↑ TFV AUC 35% to 98% when TDF is given with various PIs and NNRTIs. Ledipasvir ↑ TFV C_{min} 55% to 80% when TDF is given with various PIs, NNRTIs, or INSTIs.	**Do not coadminister** with EVG/c, TDF, or FTC. If TDF is used, monitor for TDF toxicities. Consider using TAF in patients at risk of TDF-associated adverse events.

Table 24c. Drug Interactions Between Nucleoside Reverse Transcriptase Inhibitors and Other Drugs (Including Antiretroviral Agents)

Concomitant Drug	NRTI	Effect on NRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
		Further ↑ TFV AUC and C_{max} possible when TDF, ledipasvir/sofosbuvir, and PIs are coadministered.	Consider using TAF or alternative HCV therapy in patients on TDF plus a PI/r or PI/c. The safety of increased TFV exposure with this combination has not been established.
Ribavirin	3TC	↔ 3TC AUC	No dose adjustment needed
	ABC, FTC, TAF	↔ expected	No dose adjustment needed
	TDF	**Ribavirin With Sofosbuvir 400 mg** • ↔ TFV AUC	No dose adjustment needed
Sofosbuvir/Velpatasvir	3TC, ABC, FTC, TAF	↔ expected	No dose adjustment needed
	TDF	TFV C_{max} ↑ 44% to 46% and AUC ↑ 40% when coadministered with various ARV combinations.	If TDF is used in these patients, monitor for TDF-related toxicities. Consider using TAF in patients at risk of TDF-related adverse events.
Sofosbuvir/Velpatasvir/ Voxilaprevir	3TC, ABC, FTC	↔ expected	No dose adjustment needed
	TAF	TAF AUC ↑ 52% to 57%	No dose adjustment needed
	TDF	TFV C_{max} ↑ 48% and AUC ↑ 39% when coadministered with various ARV combinations.	Monitor for TDF-related toxicities. Consider using TAF in patients at risk of TDF-related adverse events.
Antivirals—Miscellaneous (e.g., for Herpesvirus, CMV, HBV, Mpox)			
Adefovir	3TC, ABC, FTC	↔ expected	No dose adjustment needed
	TAF	↑ TFV possible	**Do not coadminister.** Serum concentrations of TDF and/or other renally eliminated drugs may increase.
	TDF	↔ TFV	**Do not coadminister.**
Brincidofovir	3TC, ABC, FTC, TAF, TDF	↔ brincidofovir expected	No dose adjustment needed
Cidofovir	3TC, ABC, FTC, TAF	↔ cidofovir expected	No dose adjustment needed
	TDF	↑ TDF and cidofovir possible	Potential for renal toxicity when TDF is given with a nephrotoxic agent, such as cidofovir. If concomitant use is necessary, closely monitor renal function.

Table 24c. Drug Interactions Between Nucleoside Reverse Transcriptase Inhibitors and Other Drugs (Including Antiretroviral Agents)

Concomitant Drug	NRTI	Effect on NRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Famciclovir	3TC, ABC, TAF, TDF	↔ expected	No dose adjustment needed
	FTC	↔ AUC FTC, famciclovir	No dose adjustment needed
Ganciclovir, Valganciclovir	3TC, ABC, FTC	↔ expected	No dose adjustment needed
	TAF, TDF	↑ ganciclovir or TFV possible	Monitor for dose-related toxicities.
Tecovirimat	3TC, ABC, FTC, TAF, TDF	↔ tecovirimat expected	No dose adjustment needed
Antivirals—SARS-CoV-2			
Molnupiravir	3TC, ABC, FTC, TAF, TDF	↔ expected	No dose adjustment needed
Remdesivir	3TC, ABC, FTC, TAF, TDF	↔ expected	No dose adjustment needed
Ritonavir-Boosted Nirmatrelvir	3TC, ABC, FTC, TAF, TDF	↔ expected	No dose adjustment needed
Hormonal Therapies—Contraceptives			
Injectable Contraceptives Depot MPA	3TC, ABC, TAF	↔ expected	No dose adjustment needed
	FTC, TDF	↔ FTC AUC ↔ TFV AUC	No dose adjustment needed
Oral Contraceptives (e.g., desogestrel, drospirenone, ethinyl estradiol, levonorgestrel, norelgestromin, norgestimate, norgestrel)	3TC, ABC, FTC, TDF	↔ expected	No dose adjustment needed
	TAF	↔ ethinyl estradiol AUC ↔ norelgestromin AUC ↔ norgestrel AUC	No dose adjustment needed
Hormonal Therapies—Menopause			
17-β-estradiol	3TC, ABC, TAF	↔ expected	No dose adjustment needed
	FTC	FTC AUC ↓ 14% to 24%	
	TDF	TFV AUC ↓ 12% to 27%	

Table 24c. Drug Interactions Between Nucleoside Reverse Transcriptase Inhibitors and Other Drugs (Including Antiretroviral Agents)

Concomitant Drug	NRTI	Effect on NRTI and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Estradiol Valerate	3TC, ABC, TAF	↔ expected	No dose adjustment needed
	FTC	↔ FTC AUC ↔ estradiol AUC	
	TDF	↔ TFV AUC ↔ estradiol	
Narcotics and Treatment for Opioid Dependence			
Buprenorphine	ABC, FTC	↔ expected	No dose adjustment needed
	3TC, TDF	↔ 3TC, TDF, and buprenorphine	No dose adjustment needed
	TAF	↔ TAF expected	No dose adjustment needed
Methadone	3TC, FTC, TAF, TDF	↔ expected	No dose adjustment needed
	ABC	Methadone clearance ↑ 22%	No dose adjustment needed
Miscellaneous			
Ethanol	ABC	ABC AUC ↑ 41%	No dose adjustment needed
Riociguat	3TC, FTC, TAF, TDF	↔ expected	No dose adjustment needed
	ABC	Riociguat AUC ↑ 200%	If coadministered, initiate riociguat at 0.5 mg three times daily and monitor for riociguat-related adverse effects (e.g., hypotension).
St. John's Wort	3TC, ABC, FTC, TDF	↔ expected	No dose adjustment needed
	TAF	↓ TAF possible	**Do not coadminister.**

Key to Symbols

↑ = increase
↓ = decrease
↔ = less than 20% change in AUC

Key: 3TC = lamivudine; ABC = abacavir; ART = antiretroviral therapy; ARV = antiretroviral; ATV = atazanavir; ATV/c = atazanavir/cobicistat; ATV/r = atazanavir/ritonavir; AUC = area under the curve; C_{max} = maximum plasma concentration; C_{min} = minimum plasma concentration; COBI = cobicistat; CMV = cytomegalovirus; DRV/c = darunavir/cobicistat; DRV/r = darunavir/ritonavir; DTG = dolutegravir; EVG/c = elvitegravir/cobicistat; FTC = emtricitabine; HBV = hepatitis B virus; HCV = hepatitis C virus; INSTI = integrase strand transfer inhibitor; LEN = lenacapavir; MPA = medroxyprogesterone acetate; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside reverse transcriptase inhibitor; PI = protease inhibitor; PI/c = protease inhibitor/cobicistat; PI/r = protease inhibitor/ritonavir; PO: oral; RAL = raltegravir; RTV = ritonavir; SQ = subcutaneous; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate; TFV = tenofovir; TFV-DP = tenofovir diphosphate

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Updated: September 12, 2024
Reviewed: September 12, 2024

This table provides information on the known or predicted interactions between integrase strand transfer inhibitors (INSTIs) (bictegravir [BIC], dolutegravir [DTG], elvitegravir [EVG], or raltegravir [RAL]) and non-antiretroviral drugs. EVG is always coadministered with cobicistat (COBI or c). Cabotegravir (CAB) intramuscular (IM) plus rilpivirine (RPV) IM are co-packaged into a single product and are coadministered as a complete regimen; therefore, the dosing recommendations and clinical comments reflect the combination of CAB IM and RPV IM treatments. Because drug interaction studies were not conducted with either IM CAB or RPV, dosing recommendations for the IM formulations are based on drug interaction studies using oral CAB and RPV. For information regarding interactions between INSTIs and other antiretroviral (ARV) drugs, including dosing recommendations, refer to Tables 24c, 24e, 24f, and 25b.

Recommendations for managing a particular drug interaction may differ, depending on whether a new ARV drug is being initiated in a patient on a stable concomitant medication or whether a new concomitant medication is being initiated in a patient on a stable ARV regimen. The magnitude and significance of drug interactions are difficult to predict when several drugs with competing metabolic pathways are prescribed concomitantly. In cases where an interacting drug needs to be replaced with an alternative, providers should exercise their clinical judgment to select the most appropriate alternative medication.

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Acid Reducers			
Al, Mg **+/–** **Ca-Containing Antacids** Please refer to the Miscellaneous Drugs section of this table for recommendations on use with other polyvalent cation products (e.g., Fe and Ca supplements, multivitamins).	BIC	**Al/Mg Hydroxide Antacid** • ↔ BIC AUC if antacid is administered 2 hours after BIC and under fasting conditions • BIC AUC ↓ 52% if antacid is administered 2 hours before BIC • BIC AUC ↓ 47% to 79% if administered simultaneously with antacid **$CaCO_3$ Antacid** • ↔ BIC AUC if administered with food • BIC AUC ↓ 33% if administered under fasting conditions	**With Antacids That Contain Al/Mg** • Administer antacids that contain Al/Mg at least 2 hours after or 6 hours before BIC. **With Antacids That Contain Ca** • Administer BIC and antacids that contain Ca together with food. • **Do not coadminister** BIC simultaneously with antacids that contain Ca on an empty stomach.
	CAB PO	CAB PO ↓ expected	**With Antacids That Contain Polyvalent Cations (Al, Mg, or Ca)** • Administer antacid products at least 2 hours before or 4 hours after taking CAB PO.
	CAB IM	↔ CAB IM expected	No dose adjustment needed

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	DTG	DTG AUC ↓ 74% if administered simultaneously with antacid DTG AUC ↓ 26% if administered 2 hours before antacid	Administer DTG at least 2 hours before or at least 6 hours after antacids that contain polyvalent cations.
	EVG/c	EVG AUC ↓ 40% to 50% if administered simultaneously with antacid EVG AUC ↓ 15% to 20% if administered 2 hours before or after antacid; ↔ with a 4-hour interval	Separate EVG/c and antacid administration by more than 2 hours.
	RAL	**Al/Mg Hydroxide Antacid** • RAL C_{min} ↓ 49% to 63% **$CaCO_3$ Antacid** • RAL 400 mg twice daily: C_{min} ↓ 32% • RAL 1,200 mg once daily: C_{min} ↓ 48% to 57%	**Do not coadminister** RAL and Al/Mg hydroxide antacids. Use alternative acid-reducing agent. **With $CaCO_3$ Antacids** • RAL 1,200 mg once daily: **Do not coadminister.** • RAL 400 mg twice daily: No dose adjustment or separation needed
H2-Receptor Antagonists	BIC, CAB (PO and IM), DTG, EVG/c	↔ INSTI	No dose adjustment needed
	RAL	RAL AUC ↑ 44% and C_{max} ↑ 60%	No dose adjustment needed
Proton Pump Inhibitors	BIC, CAB (PO and IM), DTG, EVG/c	↔ INSTI	No dose adjustment needed
	RAL	RAL AUC ↑ 37% and C_{min} ↑ 24%	No dose adjustment needed
Alpha-Adrenergic Antagonists for Benign Prostatic Hyperplasia			
Alfuzosin	BIC, CAB (PO and IM), DTG, RAL	↔ alfuzosin expected	No dose adjustment needed
	EVG/c	↑ alfuzosin expected	**Contraindicated**
Doxazosin	BIC, CAB (PO and IM), DTG, RAL	↔ doxazosin expected	No dose adjustment needed

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	EVG/c	↑ doxazosin possible	Initiate doxazosin at lowest dose. Titrate based on doxazosin efficacy. Monitor blood pressure. Doxazosin dose reduction may be needed.
Tamsulosin	BIC, CAB (PO and IM), DTG, RAL	↔ tamsulosin expected	No dose adjustment needed
	EVG/c	↑ tamsulosin expected	**Do not coadminister** unless the benefits outweigh the risks. If coadministered, monitor blood pressure.
Terazosin	BIC, CAB (PO and IM), DTG, RAL	↔ terazosin expected	No dose adjustment needed
	EVG/c	↑ terazosin possible	Initiate terazosin at lowest dose. Titrate based on terazosin efficacy. Monitor blood pressure. Terazosin dose reduction may be necessary.
Silodosin	BIC, CAB (PO and IM), DTG, RAL	↔ silodosin expected	No dose adjustment needed
	EVG/c	↑ silodosin expected	**Contraindicated**
Antibacterials—Antimycobacterials			
Bedaquiline	BIC, CAB (PO and IM), DTG, RAL	↔ bedaquiline	No dosage adjustment needed
	EVG/c	↑ bedaquiline possible	**Do not coadminister** unless benefits outweigh risks. If coadministered, consider therapeutic drug monitoring and monitor for bedaquiline-related adverse effects, including hepatotoxicity and QTc prolongation.
Rifabutin	BIC	**Rifabutin 300 mg Once Daily** • BIC AUC ↓ 38% and C_{min} ↓ 56%	**Do not coadminister.**
	CAB PO	CAB PO AUC ↓ 23% and C_{min} ↓ 26% ↔ rifabutin	No dose adjustment needed
	CAB IM	↓ CAB IM and RPV expected ↔ rifabutin expected	**Contraindicated** due to ↓ RPV, which is co-packaged and coadministered with CAB IM.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	DTG	**Rifabutin 300 mg Once Daily** • ↔ DTG AUC and C_{min} ↓ 30%	No dose adjustment needed
	EVG/c	**Rifabutin 150 mg Every Other Day With EVG/c Once Daily Compared to Rifabutin 300 mg Once Daily Alone** • ↔ rifabutin AUC • 25-O-desacetyl-rifabutin AUC ↑ 625% • EVG AUC ↓ 21% and C_{min} ↓ 67%	**Do not coadminister.**
	RAL	↔ RAL AUC and C_{min} ↓ 20%	No dose adjustment needed
Rifampin	BIC	BIC AUC ↓ 75%	**Contraindicated**
	CAB PO	CAB PO AUC ↓ 59% and C_{min} ↓ 50%	**Contraindicated**
	CAB IM	CAB IM ↓ expected	**Contraindicated**
	DTG	**Rifampin With DTG 50 mg Twice Daily Compared to DTG 50 mg Twice Daily Alone** • DTG AUC ↓ 54% and C_{min} ↓ 72% **Rifampin With DTG 50 mg Twice Daily Compared to DTG 50 mg Once Daily Alone** • DTG AUC ↑ 33% and C_{min} ↑ 22%	Use DTG 50 mg twice daily (instead of DTG 50 mg once daily) in patients without suspected or documented INSTI-associated resistance mutations. Consider an alternative to rifampin, such as rifabutin, in patients with certain suspected or documented INSTI-associated resistance mutations.
	EVG/c	Significant ↓ EVG and COBI expected	**Contraindicated**
	RAL	**RAL 400 mg** • RAL AUC ↓ 40% and C_{min} ↓ 61% **Rifampin With RAL 800 mg Twice Daily Compared to RAL 400 mg Twice Daily Alone** • RAL AUC ↑ 27% and C_{min} ↓ 53%	Use RAL 800 mg twice daily instead of 400 mg twice daily. **Do not coadminister** RAL 1,200 mg once daily with rifampin. Monitor closely for virologic response or consider using rifabutin as an alternative rifamycin.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Rifapentine	BIC, EVG/c	Significant ↓ BIC, EVG, and COBI expected	**Do not coadminister.**
	CAB (PO and IM)	Significant ↓ CAB (PO and IM) expected	**Contraindicated**
	DTG	**Rifapentine 900 mg Once Weekly** • DTG AUC ↓ 26% and C_{min} ↓ 47% **Rifapentine 600 mg Once Daily With DTG 50 mg Twice Daily vs DTG 50 mg Once Daily Alone** • ↔ DTG AUC and C_{min}	With **once-weekly** rifapentine, DTG 50 mg daily may be used in patients with viral suppression on daily DTG. Monitor for virologic efficacy. **Do not coadminister** in patients who require twice-daily DTG. With **once-daily** rifapentine for 4 weeks (1HP), use DTG 50 mg twice daily. See Tuberculosis/HIV Coinfection for more on rifapentine and DTG use.
	RAL	**Rifapentine 900 mg Once Weekly** • RAL AUC ↑ 71% and C_{min} ↓ 12% **Rifapentine 600 mg Once Daily** • RAL C_{min} ↓ 41%	For once-weekly rifapentine and RAL 400 mg twice daily, no dose adjustment is needed. **Do not coadminister** with once-daily rifapentine.
Antibacterials—Macrolides			
Azithromycin	All INSTIs	↔ azithromycin expected	No dose adjustment needed
Clarithromycin	BIC	↑ BIC possible	No dose adjustment needed
	CAB (PO and IM), DTG, RAL	↔ clarithromycin expected	No dose adjustment needed
	EVG/c	↑ clarithromycin expected ↑ COBI possible	Reduce clarithromycin dose by 50% in patients with CrCl 50 to 60 mL/min. **Do not coadminister** in patients with CrCl <50 mL/min. Consider alternative ARV or use azithromycin.
Erythromycin	BIC	↑ BIC possible	No dose adjustment needed
	CAB (PO and IM), DTG, RAL	↔ INSTI expected ↔ erythromycin expected	No dose adjustment needed
	EVG/c	↑ erythromycin expected ↑ COBI possible	No data available for dose recommendation. Consider alternative ARV or use azithromycin.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Anticoagulants			
Apixaban	BIC, CAB (PO and IM), DTG, RAL	↔ apixaban expected	No dose adjustment needed
	EVG/c	↑ apixaban expected	**Do not coadminister** in patients who require apixaban 2.5 mg twice daily. Reduce apixaban dose by 50% in patients who require apixaban 5 mg or 10 mg twice daily.
Dabigatran	BIC, CAB (PO and IM), DTG, RAL	↔ dabigatran expected	No dose adjustment needed
	EVG/c	↑ dabigatran expected **With COBI 150 mg Alone** • Dabigatran AUC ↑ 110% to 127%	**Reduction of Risk of Stroke and Systemic Embolism in Nonvalvular Atrial Fibrillation in Adult Patients** • CrCl >30 mL/min: no dose adjustment needed • CrCl ≤30 mL/min: **do not coadminister.** **Treatment and Reduction in the Risk of Recurrence of DVT and PE or Prophylaxis of DVT and PE Following Hip Replacement Surgery in Adult Patients** • CrCl ≥50 mL/min: no dose adjustment needed • CrCl <50 mL/min: **do not coadminister.**
Edoxaban	BIC, CAB (PO and IM), DTG, RAL	↔ edoxaban expected	No dose adjustment needed
	EVG/c	↑ edoxaban expected	**Stroke Prevention in Nonvalvular Atrial Fibrillation** • No dose adjustment needed **DVT and PE** • Administer edoxaban 30 mg once daily.
Rivaroxaban	BIC, CAB (PO and IM), DTG, RAL	↔ rivaroxaban expected	No dose adjustment needed
	EVG/c	↑ rivaroxaban expected	**Do not coadminister.**

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Warfarin	BIC, CAB (PO and IM), DTG, RAL	↔ warfarin expected	No dose adjustment needed
	EVG/c	↑ or ↓ warfarin possible	Monitor INR and adjust warfarin dose accordingly.
Antidepressants, Anxiolytics, and Antipsychotics Also see the Sedative/Hypnotics section below			
Antidepressants, Anxiolytics			
Bupropion	BIC, CAB (PO and IM), DTG, RAL	↔ bupropion expected	No dose adjustment needed
	EVG/c	↑ bupropion possible	Titrate bupropion dose based on clinical response.
Buspirone	BIC, CAB (PO and IM), DTG, RAL	↔ buspirone expected	No dose adjustment needed
	EVG/c	↑ buspirone possible	Initiate buspirone at a low dose. Buspirone dose reduction may be needed.
Desvenlafaxine	All INSTIs	↔ desvenlafaxine expected	No dose adjustment needed
Duloxetine	BIC, CAB (PO and IM), DTG, RAL	↔ duloxetine expected	No dose adjustment needed
	EVG/c	↑ duloxetine possible	No dose adjustment needed
Mirtazapine	BIC, CAB (PO and IM), DTG, RAL	↔ mirtazapine expected	No dose adjustment needed
	EVG/c	↑ mirtazapine possible	Monitor for mirtazapine-related adverse events. Mirtazapine dose reduction may be necessary.
Nefazodone	BIC, CAB (PO and IM), DTG, RAL	↔ nefazodone expected	No dose adjustment needed
	EVG/c	↑ nefazodone expected	Consider alternative ARV or antidepressant.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Trazodone	BIC, CAB (PO and IM), DTG, RAL	↔ trazodone expected	No dose adjustment needed
	EVG/c	↑ trazodone possible	Titrate dose based on antidepressant response and monitor for trazodone-related adverse events.
Tricyclic Antidepressants (e.g., amitriptyline, desipramine, doxepin, imipramine, nortriptyline)	BIC, CAB (PO and IM), DTG, RAL	↔ TCA expected	No dose adjustment needed
	EVG/c	Desipramine AUC ↑ 65%	Initiate with lowest dose of TCA and titrate dose carefully.
		↑ TCA expected	Initiate with lowest dose of TCA. Titrate dose carefully based on antidepressant response and/or drug concentrations.
Selective Serotonin Reuptake Inhibitors (e.g., citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline, vortioxetine)	EVG/c	↔ sertraline	No dose adjustment needed
	EVG/c	↑ other SSRIs possible	Initiate with lowest dose of SSRI. Titrate dose carefully based on antidepressant response.
	BIC, CAB (PO and IM), DTG, RAL	↔ SSRI expected	No dose adjustment needed
Venlafaxine	BIC, CAB (PO and IM), DTG, RAL	↔ venlafaxine expected	No dose adjustment needed
	EVG/c	↑ venlafaxine possible	Monitor for venlafaxine-related adverse events.
Antipsychotics			
Aripiprazole	BIC, CAB (PO and IM), DTG, RAL	↔ aripiprazole expected	No dose adjustment needed
	EVG/c	↑ aripiprazole expected	Administer 25% of the usual aripiprazole dose. Titrate based on aripiprazole effectiveness and adverse events. Refer to aripiprazole label for dosing recommendations in patients who are known to be CYP2D6-poor metabolizers or who have major depressive disorder.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Brexpiprazole	BIC, CAB (PO and IM), DTG, RAL	↔ brexpiprazole expected	No dose adjustment needed
	EVG/c	↑ brexpiprazole expected	Administer 25% of the usual brexpiprazole dose. Titrate based on brexpiprazole effectiveness and adverse events. Refer to brexpiprazole label for dosing recommendations in patients who are known to be CYP2D6-poor metabolizers or who have major depressive disorder.
Cariprazine	BIC, CAB (PO and IM), DTG, RAL	↔ cariprazine expected	No dose adjustment needed
	EVG/c	↑ cariprazine expected	**Starting Cariprazine in a Patient Who Is Already Receiving EVG/c** • Administer cariprazine 1.5 mg on Day 1 and Day 3, with no dose given on Day 2. From Day 4 onward, administer cariprazine 1.5 mg daily. Dose can be increased to a maximum of cariprazine 3 mg daily. If EVG/c is withdrawn, cariprazine dose may need to be increased. **Starting EVG/c in a Patient Who Is Already Receiving Cariprazine** • For patients receiving cariprazine 3 mg or cariprazine 6 mg daily, reduce the dose by half. For patients receiving cariprazine 4.5 mg daily, reduce dose to cariprazine 1.5 mg or cariprazine 3 mg daily. For patients receiving cariprazine 1.5 mg daily, change to cariprazine 1.5 mg every other day. If EVG/c is withdrawn, cariprazine dose may need to be increased.
Iloperidone	BIC, CAB (PO and IM), DTG, RAL	↔ iloperidone expected	No dose adjustment needed
	EVG/c	↑ iloperidone expected	Decrease iloperidone dose by 50%.
Lumateperone	BIC, CAB (PO and IM), DTG, RAL	↔ lumateperone expected	No dose adjustment needed
	EVG/c	↑ lumateperone expected	**Do not coadminister.**
Lurasidone	BIC, CAB (PO and IM), DTG, RAL	↔ lurasidone expected	No dose adjustment needed
	EVG/c	↑ lurasidone expected	**Contraindicated**

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Olanzapine, Olanzapine/ Samidorphan	All INSTIs	↔ olanzapine expected	No dose adjustment needed
	EVG/c	↔ olanzapine expected ↑ samidorphan possible	No dose adjustment needed
Other Antipsychotics CYP3A4 and/or CYP2D6 substrates (e.g., perphenazine, risperidone, thioridazine)	EVG/c	↑ antipsychotic possible	Initiate antipsychotic at a low dose. Antipsychotic dose reduction may be needed.
Pimavanserin	BIC, CAB (PO and IM), DTG, RAL	↔ pimavanserin expected	No dose adjustment needed
	EVG/c	↑ pimavanserin expected	Reduce pimavanserin dose to 10 mg.
Pimozide	BIC, CAB (PO and IM), DTG, RAL	↔ pimozide expected	No dose adjustment needed
	EVG/c	↑ pimozide expected	**Contraindicated**
Quetiapine	BIC, CAB (PO and IM), DTG, RAL	↔ quetiapine expected	No dose adjustment needed
	EVG/c	↑ quetiapine AUC expected	**Starting Quetiapine in a Patient Receiving EVG/c** • Start quetiapine at the lowest dose and titrate up as needed. Monitor for quetiapine efficacy and adverse events. **Starting EVG/c in a Patient Receiving a Stable Dose of Quetiapine** • Reduce quetiapine dose to 1/6 of the current dose. Closely monitor for quetiapine efficacy and adverse events.
Ziprasidone	BIC, CAB (PO and IM), DTG, RAL	↔ ziprasidone expected	No dose adjustment needed
	EVG/c	↑ ziprasidone possible	Monitor for ziprasidone-related adverse events.
Antifungals			
Ibrexafungerp	BIC, CAB (PO and IM), DTG, RAL	↔ ibrexafungerp expected	No dose adjustment needed

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	EVG/c	↑ ibrexafungerp expected	Reduce ibrexafungerp dose to 150 mg twice daily.
Isavuconazole	BIC, CAB (PO and IM), DTG, RAL	↑ INSTI possible	No dose adjustment needed
	EVG/c	↑ isavuconazole expected ↑ or ↓ EVG and COBI possible	**Contraindicated**
Itraconazole	BIC	↑ BIC expected	No dose adjustment needed
	CAB (PO and IM), DTG, RAL	↔ INSTI expected ↔ itraconazole expected	No dose adjustment needed
	EVG/c	↑ itraconazole expected ↑ EVG and COBI possible	Consider monitoring itraconazole concentrations to guide dose adjustments. **Do not coadminister** with high itraconazole doses (>200 mg/day) unless guided by itraconazole concentrations.
Posaconazole	BIC	↑ BIC expected	No dose adjustment needed
	CAB (PO and IM), DTG, RAL	↔ INSTI expected ↔ posaconazole expected	No dose adjustment needed
	EVG/c	↑ EVG and COBI possible ↑ posaconazole possible	If coadministered, monitor posaconazole concentrations.
Voriconazole	BIC	↑ BIC possible	No dose adjustment needed
	CAB (PO and IM), DTG, RAL	↔ INSTI expected ↔ voriconazole expected	No dose adjustment needed
	EVG/c	↑ voriconazole expected ↑ EVG and COBI possible	**Do not coadminister** voriconazole and COBI, unless the benefit outweighs the risk. If coadministered, consider monitoring voriconazole concentrations and adjust dose accordingly.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antimalarials			
Artemether/ Lumefantrine	BIC	↔ antimalarial expected	No dose adjustment needed
	CAB (PO and IM), DTG, RAL	↔ antimalarial expected	No dose adjustment needed
	EVG/c	↑ artemether and lumefantrine possible	Monitor for artemether and lumefantrine-related adverse events, including QTc prolongation.
Artesunate	All INSTIs	↔ dihydroartemisinin expected	No dose adjustment needed
Atovaquone/ Proguanil	All INSTIs	↔ atovaquone/proguanil expected	No dose adjustment needed
Mefloquine	CAB (PO and IM), DTG, RAL	↔ mefloquine expected	No dose adjustment needed
	EVG/c	↑ mefloquine possible	Monitor for mefloquine-related adverse events, including psychiatric symptoms and QTc prolongation.
Antimigraine			
Ergot Derivatives	BIC, CAB (PO and IM), DTG, RAL	↔ dihydroergotamine, ergotamine, and methylergonovine expected	No dose adjustment needed
	EVG/c	↑ dihydroergotamine, ergotamine, and methylergonovine expected	**Contraindicated**
Calcitonin Gene-Related Peptide (CGRP) Receptor Antagonists			
Atogepant	BIC, CAB (PO and IM), DTG, RAL	↔ atogepant expected ↑ atogepant expected	No dose adjustment needed
	EVG/c	↑ atogepant expected	Chronic migraine: **Do not coadminister.** Episodic migraine: Administer atogepant at a dose of 10 mg once daily.
Rimegepant	BIC, CAB (PO and IM), DTG, RAL	↔ rimegepant expected	No dose adjustment needed
	EVG/c	↑ rimegepant expected	**Do not coadminister.**

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Ubrogepant	BIC, CAB (PO and IM), DTG, RAL	↔ ubrogepant expected	No dose adjustment needed
	EVG/c	↑ ubrogepant expected	**Contraindicated**
Zavegepant	BIC, CAB (PO and IM), DTG, RAL	↔ zavegepant expected	No dose adjustment needed
	EVG/c	↑ zavegepant expected	**Do not coadminister.**
Serotonin 5-HT1B, 1D Receptor Agonist			
Almotriptan	BIC, CAB (PO and IM), DTG, RAL	↔ almotriptan expected	No dose adjustment needed
	EVG/c	↑ almotriptan expected	Administer single dose of almotriptan 6.25 mg. Maximum dose should not exceed 12.5 mg in a 24-hour period.
Eletriptan	BIC, CAB (PO and IM), DTG, RAL	↔ eletriptan expected	No dose adjustment needed
	EVG/c	↑ eletriptan expected	**Contraindicated**
Frovatriptan, Naratriptan, Rizatriptan, Sumatriptan Zolmitriptan	All INSTIs	↔ triptan expected	No dose adjustment needed
Antiplatelets			
Clopidogrel	BIC, CAB (PO and IM), DTG, RAL	↔ clopidogrel expected	No dose adjustment needed
	EVG/c	↓ clopidogrel active metabolite, with impaired platelet inhibition expected	**Do not coadminister.**
Prasugrel	BIC, CAB (PO and IM), DTG, RAL	↔ prasugrel expected	No dose adjustment needed
	EVG/c	↓ prasugrel active metabolite, with no impairment of platelet inhibition expected	No dose adjustment needed

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Ticagrelor	BIC, CAB (PO and IM), DTG, RAL	↔ ticagrelor expected	No dose adjustment needed
	EVG/c	↑ ticagrelor expected	**Do not coadminister.**
Vorapaxar	BIC, CAB (PO and IM) DTG, RAL	↔ vorapaxar expected	No dose adjustment needed
	EVG/c	↑ vorapaxar expected	**Do not coadminister.**
Antipneumocystis and Antitoxoplasmosis			
Atovaquone	All INSTIs	↔ atovaquone expected	No dose adjustment needed
Antiseizure			
Carbamazepine	BIC	↓ BIC possible	**Do not coadminister.**
	CAB (PO and IM)	↓ CAB expected	**Contraindicated**
	DTG	DTG AUC ↓ 49%	Increase DTG dose to 50 mg twice daily in ART-naive or ART-experienced (but INSTI-naive) patients. **Do not coadminister** in INSTI-experienced patients with known or suspected INSTI resistance.
	EVG/c	Carbamazepine AUC ↑ 43% EVG AUC ↓ 69% and C_{min} ↓ >99% ↓ COBI expected	**Contraindicated**
	RAL	↓ or ↔ RAL possible	**Do not coadminister.**
Eslicarbazepine	All INSTIs	↓ INSTI possible ↓ COBI possible	Consider alternative ARV or anticonvulsant.
Ethosuximide	BIC, CAB (PO and IM), DTG, RAL	↔ ethosuximide expected	No dose adjustment needed
	EVG/c	↑ ethosuximide possible	Monitor for ethosuximide-related adverse events.
Lamotrigine	BIC, CAB (PO and IM), DTG, RAL	↔ lamotrigine expected	No dose adjustment needed
	EVG/c	No data	Monitor anticonvulsant concentrations and adjust dose accordingly.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Oxcarbazepine	BIC, DTG	↓ BIC and DTG possible	**Do not coadminister.**
	CAB (PO and IM)	↓ CAB expected	**Contraindicated**
	EVG/c, RAL	↓ EVG/c and RAL possible	Consider alternative ARV or anticonvulsant.
Phenobarbital, Phenytoin, Primidone	BIC, DTG, RAL	↓ BIC and DTG possible ↓ or ↔ RAL possible	**Do not coadminister.**
	CAB (PO and IM), EVG/c	↓ CAB and EVG/c expected	**Contraindicated**
Valproic Acid	DTG	DTG ↓ possible	No dose adjustment needed. Take with food and monitor virologic response.
	BIC, CAB (PO and IM), RAL	No data	No dose adjustment needed. Monitor virologic response.
Antivirals—Hepatitis C			
Elbasvir/ Grazoprevir	BIC	↔ BIC expected	No dose adjustment needed
	CAB (PO and IM)	↔ CAB, elbasvir, and grazoprevir expected	No dose adjustment needed
	DTG	↔ DTG ↔ elbasvir ↔ grazoprevir	No dose adjustment needed
	EVG/c	↑ elbasvir expected ↑ grazoprevir expected	**Do not coadminister.**
	RAL	↔ RAL with elbasvir RAL AUC ↑ 43% with grazoprevir ↔ elbasvir ↔ grazoprevir	No dose adjustment needed
Glecaprevir/ Pibrentasvir	BIC, CAB (PO and IM)	↔ BIC or CAB expected	No dose adjustment needed
	DTG	↔ DTG and glecaprevir/ pibrentasvir	No dose adjustment needed
	RAL	No significant effect RAL AUC ↑ 47%	

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	EVG/c	Glecaprevir AUC ↑ 3-fold Pibrentasvir AUC ↑ 57% EVG AUC ↑ 47%	No dose adjustment needed If coadministered with TDF, monitor for TDF-related adverse events. Consider monitoring for hepatotoxicity if coadministered with TDF or TAF.
Ledipasvir/ Sofosbuvir	BIC, DTG, RAL	↔ BIC, DTG, and RAL	No dose adjustment needed
	CAB (PO and IM)	↔ CAB expected	No dose adjustment needed
	EVG/c/ TDF/FTC	↑ TDF expected ↑ ledipasvir expected	**Do not coadminister.**
	EVG/c/ TAF/FTC	↔ EVG/c/TAF/FTC expected	No dose adjustment needed
Sofosbuvir	BIC, CAB (PO and IM), DTG, EVG/C	↔ INSTI expected ↔ sofosbuvir expected	No dose adjustment needed
	RAL	↔ RAL and sofosbuvir	No dose adjustment needed
Sofosbuvir/ Velpatasvir	BIC, DTG, RAL	↔ sofosbuvir and velpatasvir	No dose adjustment needed. If coadministered with TDF, monitor for TDF-related adverse events.
	CAB (PO and IM)	↔ CAB expected ↔ sofosbuvir and velpatasvir expected	
	EVG/c	↔ EVG/c/TAF/FTC Velpatasvir AUC ↑ 50%	
Sofosbuvir/ Velpatasvir/ Voxilaprevir	BIC	**When Administered With Sofosbuvir/Velpatasvir/ Voxilaprevir (400 mg/ 100 mg/100 mg) Plus Voxilaprevir 100 mg** • ↔ BIC, sofosbuvir, velpatasvir, voxilaprevir	No dose adjustment needed
	EVG/c	**When Administered With Sofosbuvir/Velpatasvir/ Voxilaprevir (400 mg/ 100 mg/100 mg) Plus Voxilaprevir 100 mg** • Sofosbuvir AUC ↑ 22% • ↔ velpatasvir • Voxilaprevir AUC ↑ 2-fold	No dose adjustment needed. If coadministered with TDF, monitor for TDF-related adverse events. Consider monitoring for hepatotoxicity if coadministered with TDF or TAF.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	BIC, CAB (PO and IM), DTG, RAL	↔ INSTI expected ↔ sofosbuvir, velpatasvir, and voxilaprevir expected	No dose adjustment needed
Antivirals—Miscellaneous (e.g., for CMV, Mpox)			
Brincidofovir	BIC, CAB (PO and IM), DTG, RAL	↔ INSTI expected	No dose adjustment needed
	EVG/c	↑ brincidofovir possible ↑ EVG possible	Administer EVG/c dose at least 3 hours after administering brincidofovir and monitor for brincidofovir-related adverse events, including elevations in ALT/AST and bilirubin and GI adverse events.
Cidofovir	BIC, CAB (PO and IM), DTG, EVG/c, RAL	↔ INSTI expected ↔ cidofovir expected	No dose adjustment needed
Tecovirimat	CAB (IM)	↔ CAB expected	No dose adjustment needed Do not initiate CAB/RPV IM during or within 2 weeks after tecovirimat treatment. (Refer to Table 24b for interaction with RPV.)
	BIC, CAB (PO), DTG, EVG/c, RAL	↔ INSTI expected	No dose adjustment needed
Antivirals—SARS-CoV-2			
Molnupiravir	BIC, CAB (PO and IM), DTG, EVG/c, RAL	↔ INSTI and molnupiravir expected	No dose adjustment needed
Ritonavir-boosted Nirmatrelvir	BIC, CAB (PO and IM), DTG, RAL	↔ INSTI and ritonavir-boosted nirmatrelvir expected	No dose adjustment needed.
	EVG/c/ FTC/TAF	↑ TAF possible ↔ ritonavir-boosted nirmatrelvir expected	No dose adjustment needed
Remdesivir	BIC, CAB (PO and IM), DTG, EVG/c, RAL	↔ INSTI and remdesivir expected	No dose adjustment needed

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Beta-Agonists, Long-Acting Inhaled			
Arformoterol, Formoterol	All INSTIs	↔ arformoterol or formoterol expected	No dose adjustment needed
Indacaterol	BIC, CAB (PO and IM), DTG, RAL	↔ indacaterol expected	No dose adjustment needed
	EVG/c	↑ indacaterol expected	
Olodaterol	BIC, CAB (PO and IM), DTG, RAL	↔ olodaterol expected	No dose adjustment needed
	EVG/c	↑ olodaterol expected	
Salmeterol	BIC, CAB (PO and IM), DTG, RAL	↔ salmeterol expected	No dose adjustment needed
	EVG/c	↑ salmeterol possible	**Do not coadminister** due to the potential for increased risk of salmeterol-associated cardiovascular events.
Cardiac Medications			
Antiarrhythmics			
Amiodarone	BIC, CAB (PO and IM), DTG, RAL	↔ INSTI expected ↔ amiodarone expected	No dose adjustment needed
	EVG/c	↑ amiodarone expected	**Do not coadminister** unless the benefits outweigh the risks. If coadministration is necessary, monitor for amiodarone-related adverse events and consider monitoring ECG and amiodarone concentrations.
Digoxin	BIC, CAB (PO and IM), RAL	↔ digoxin expected	No dose adjustment needed
	EVG/c	Digoxin C_{max} ↑ 41% and ↔ AUC	Therapeutic drug monitoring for digoxin is recommended if available.
Dofetilide	CAB (PO and IM)	↔ dofetilide expected	No dose adjustment needed
	BIC, DTG	↑ dofetilide expected	**Contraindicated**
	EVG/c	↑ dofetilide possible	**Do not coadminister.**

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Disopyramide	BIC, CAB (PO and IM), RAL	↔ disopyramide expected	No dose adjustment needed
	DTG	↑ disopyramide possible	Consider alternative ARV or antiarrhythmics. If coadministered, monitor disopyramide concentrations and for antiarrhythmic-related adverse events.
	EVG/c	↑ disopyramide expected	**Do not coadminister.**
Dronedarone	BIC, CAB (PO and IM), DTG, RAL	↔ dronedarone expected	No dose adjustment needed
	EVG/c	↑ dronedarone expected	**Contraindicated**
Flecainide	BIC, CAB (PO and IM), DTG, RAL	↔ flecainide expected	No dose adjustment needed
	EVG/c	↑ flecainide possible	Consider alternative ARV or antiarrhythmics. If coadministered, monitor flecainide concentrations and for antiarrhythmic-related adverse events.
Propafenone	BIC, CAB (PO and IM), DTG, RAL	↔ propafenone expected	No dose adjustment needed
	EVG/c	↑ propafenone possible	Consider alternative ARV or antiarrhythmics. If coadministered, monitor propafenone concentrations and for antiarrhythmic-related adverse events.
Mexiletine	BIC, CAB (PO and IM), DTG, RAL	↔ mexiletine expected	No dose adjustment needed
	EVG/c	↑ mexiletine possible	Consider alternative ARV or antiarrhythmics. If coadministered, monitor mexiletine concentrations and for antiarrhythmic-related adverse events.
Systemic Lidocaine	BIC, CAB (PO and IM), DTG, RAL	↔ lidocaine expected	No dose adjustment needed
	EVG/c	↑ lidocaine possible	Consider alternative ARV or antiarrhythmics. If coadministered, monitor lidocaine concentrations and for antiarrhythmic-related adverse events.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Quinidine	BIC, CAB (PO and IM), DTG, RAL	↔ quinidine expected	No dose adjustment needed
	EVG/c	↑ quinidine possible	Consider alternative ARV or antiarrhythmics. If coadministered, monitor quinidine concentrations and for antiarrhythmic-related adverse events.
Beta-Blockers			
Atenolol, Bisoprolol, Carvedilol, Metoprolol, Nadolol, Nebivolol, Sotalol	CAB (PO and IM), RAL	↔ beta-blocker expected	No dose adjustment needed
	BIC, DTG, EVG/c	↑ beta-blocker possible	Beta-blocker dose may need to be decreased; adjust dose based on clinical response.
Calcium Channel Blockers			
Calcium Channel Blockers	BIC	↑ BIC possible with diltiazem ↔ expected for all other CCBs	No dose adjustment needed
	CAB (PO and IM), DTG, RAL	↔ CCB expected	No dose adjustment needed
	EVG/c	↑ CCB possible	Titrate CCB dose and monitor for CCB efficacy and adverse events.
Cardiac—Other			
Bosentan	BIC, DTG	↓ BIC and DTG possible	No dose adjustment needed
	CAB (PO and IM)	↔ bosentan expected	Consider using alternative ARV or an alternative to bosentan because bosentan may ↓ RPV, which is co-packaged and coadministered with CAB IM. If bosentan is used with RPV, monitor virologic response to ART.
	RAL	↔ bosentan expected	No dose adjustment needed
	EVG/c	↑ bosentan possible	**In Patients on EVG/c ≥10 Days** • Start bosentan at 62.5 mg once daily or every other day based on individual tolerability. **In Patients on Bosentan Who Require EVG/c** • Stop bosentan ≥36 hours before EVG/c initiation. At least 10 days after initiation of EVG/c, resume bosentan at 62.5 mg once daily or every other day based on individual tolerability.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Eplerenone	BIC, CAB (PO and IM), DTG, RAL	↔ eplerenone expected	No dose adjustment needed
	EVG/c	↑ eplerenone expected	**Contraindicated**
Ivabradine	BIC, CAB (PO and IM), DTG, RAL	↔ ivabradine expected	No dose adjustment needed
	EVG/c	↑ ivabradine expected	**Contraindicated**
Mavacamten	BIC, CAB (PO and IM), DTG, RAL	↔ mavacamten expected	No dose adjustment needed
	EVG/c	↑ mavacamten expected	**Contraindicated**
Ranolazine	BIC, CAB (PO and IM), DTG, RAL	↔ ranolazine expected	No dose adjustment needed
	EVG/c	↑ ranolazine expected	**Contraindicated**
Corticosteroids			
Beclomethasone Inhaled or intranasal	BIC, CAB (PO and IM), DTG, EVG/c, RAL	↔ glucocorticoid expected	No dose adjustment needed
Budesonide, Ciclesonide, Fluticasone, Mometasone Inhaled or intranasal	BIC, CAB (PO and IM), DTG, RAL	↔ glucocorticoid expected	No dose adjustment needed
	EVG/c	↑ glucocorticoid possible	**Do not coadminister** unless the potential benefits of inhaled or intranasal corticosteroid outweigh the risks of systemic corticosteroid adverse effects. Coadministration can result in adrenal insufficiency and Cushing's syndrome. Consider using an alternative corticosteroid (e.g., beclomethasone).
Betamethasone, Budesonide Systemic	BIC, CAB (PO and IM), DTG, RAL	↔ INSTI expected ↔ glucocorticoid expected	No dose adjustment needed

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	EVG/c	↑ glucocorticoid possible ↓ EVG possible	**Do not coadminister** unless the potential benefits of systemic budesonide outweigh the risks of systemic corticosteroid adverse effects. Coadministration can result in adrenal insufficiency and Cushing's syndrome.
Dexamethasone Systemic	BIC	↓ BIC possible	Consider alternative corticosteroid for long-term use or alternative ARV. If coadministration is necessary, monitor virologic response to ART.
	CAB (PO and IM), DTG, RAL	↔ INSTI expected	No dose adjustment needed
	EVG/c	↓ EVG and COBI possible	Consider alternative corticosteroid for long-term use or alternative ARV. If coadministration is necessary, monitor virologic response to ART.
Prednisone, Prednisolone Systemic	BIC, CAB (PO and IM), DTG, RAL	↔ glucocorticoid expected	No dose adjustment needed
	EVG/c	↑ prednisolone possible	Coadministration may be considered if the potential benefits outweigh the risks of systemic corticosteroid adverse effects. If coadministration is necessary, monitor for adrenal insufficiency and Cushing's syndrome.
Betamethasone, Methylprednisolone, Prednisolone, Triamcinolone Local injections, including intra-articular, epidural, or intra-orbital	BIC, CAB (PO and IM), DTG, RAL	↔ glucocorticoid expected	No dose adjustment needed
	EVG/c	↑ glucocorticoid expected	**Do not coadminister.** Coadministration may result in adrenal insufficiency and Cushing's syndrome.
Glucose-Lowering			
Metformin	BIC	Metformin AUC ↑ 39%	Monitor for adverse events of metformin.
	CAB (PO and IM), RAL	↔ metformin expected	No dose adjustment needed
	DTG	**DTG 50 mg Once Daily Plus Metformin 500 mg Twice Daily** • Metformin AUC ↑ 79% and C_{max} ↑ 66%	Start metformin at the lowest dose and titrate based on glycemic control. Monitor for adverse events of metformin. When starting/stopping DTG in patients on metformin, dose adjustment of metformin may be necessary to maintain optimal glycemic control and/or minimize adverse events of metformin.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
		DTG 50 mg Twice Daily Plus Metformin 500 mg Twice Daily • Metformin AUC ↑ 2.4-fold and C_{max} ↑ 2-fold	
	EVG/c	↑ metformin possible	No dose adjustment needed
Saxagliptin	BIC, CAB (PO and IM), DTG, RAL	↔ saxagliptin expected	No dose adjustment needed
	EVG/c	↑ saxagliptin expected	Limit saxagliptin dose to 2.5 mg once daily.
Dapagliflozin/ Saxagliptin	BIC, CAB (PO and IM), DTG, RAL	↔ dapagliflozin or saxagliptin expected	No dose adjustment needed
	EVG/c	↑ saxagliptin expected	**Do not coadminister.** Dapagliflozin is available only as a coformulated drug that contains 5 mg of saxagliptin. When coadministered with EVG/c, the dose of saxagliptin should not exceed 2.5 mg once daily; thus, this combination **is not recommended.**
Herbal Products			
St. John's Wort	BIC, CAB (PO and IM), DTG	↓ BIC and DTG possible	**Do not coadminister.**
	EVG/c	↓ EVG and COBI expected	**Contraindicated**
Hormonal Therapies			
Injectable Contraceptives **Depot MPA**	BIC, CAB (PO and IM), DTG, RAL	↔ INSTI and injectable contraceptive expected	No dose adjustment needed
	EVG/c	↑ MPA possible	No dose adjustment needed
Oral Contraceptives (e.g., desogestrel, drospirenone, ethinyl estradiol, levonorgestrel, norethindrone, norgestimate)	BIC, CAB (PO, IM), DTG, RAL	↔ ethinyl estradiol and norgestimate with DTG ↔ ethinyl estradiol and levonorgestrel with CAB PO ↔ ethinyl estradiol and norgestimate expected with BIC, RAL ↔ norgestimate expected with CAB PO and IM	No dose adjustment needed

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
		↔ levonorgestrel expected ↔ drospirenone expected ↔ norethindrone expected	
	EVG/c	Norgestimate AUC, C_{max}, and C_{min} ↑ > 2-fold Ethinyl estradiol AUC ↓ 25% and C_{min} ↓ 44%	The effects of increases in progestin (norgestimate) are not fully known and may include insulin resistance, dyslipidemia, acne, and venous thrombosis. Decreased ethinyl estradiol may lead to more intermenstrual bleeding. Weigh the risks and benefits of using the drug and consider using an alternative ARV or contraceptive method.
		↑ drospirenone possible	Clinical monitoring is recommended due to the potential for hyperkalemia. Consider using alternative ARV or contraceptive method.
		↑ levonorgestrel possible ↑ norethindrone expected	No dose adjustment needed
Subdermal Implant Contraceptives (e.g., etonogestrel, levonorgestrel)	BIC, CAB (PO and IM), DTG, RAL	Etonogestrel ↑ 27% with DTG ↔ etonogestrel or levonorgestrel expected with BIC, CAB, RAL	No dose adjustment needed
	EVG/c	↑ etonogestrel expected ↑ levonorgestrel expected	No dose adjustment needed
Transdermal Contraceptives (e.g., ethinyl estradiol/ norelgestromin, ethinyl estradiol/ levonorgestrel)	BIC, CAB (PO, IM), DTG, RAL	↔ contraceptive expected	No dose adjustment needed
	EVG/c	↑ progestin possible ↓ ethinyl estradiol possible	No dose adjustment needed
Vaginal Ring Contraceptives (e.g., etonogestrel/ ethinyl estradiol, segesterone/ethinyl estradiol)	BIC, CAB (PO, IM), DTG, RAL	↔ contraceptive expected	No dose adjustment needed
	EVG/c	↑ progestin possible ↓ ethinyl estradiol possible	For segesterone/ethinyl estradiol vaginal rings, use alternative ARV or contraceptive methods.
Emergency Contraceptives **Levonorgestrel (PO)**	BIC, CAB (PO, IM), DTG, RAL	↔ levonorgestrel expected	No dose adjustment needed
	EVG/c	↑ levonorgestrel possible	No dose adjustment needed

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Hormonal Therapies—Miscellaneous			
Menopausal Replacement Therapy	BIC, CAB (PO and IM), DTG, RAL	↔ estrogen expected with estradiol or conjugated estrogen (equine and synthetic) ↔ drospirenone, MPA, and micronized progesterone expected	No dose adjustment needed
	EVG/c	↓ or ↑ estrogen possible ↑ drospirenone possible ↑ oral MPA possible ↑ oral micronized progesterone possible	Adjust estrogen and progestin dose as needed based on clinical effects.
Miscellaneous	BIC, CAB (PO and IM), DTG, EVG/c, RAL	↔ goserelin, leuprolide acetate, and spironolactone expected	No dose adjustment needed
	BIC, CAB (PO and IM), DTG, RAL	↔ estrogen expected	No dose adjustment needed
		↔ testosterone expected	No dose adjustment needed
	EVG/c	↑ or ↓ estradiol possible ↑ cyproterone, dutasteride, and finasteride possible	Adjust dutasteride dose as needed based on clinical effects.
		↑ testosterone possible	Monitor effects of testosterone and monitor for adverse effects. Adjust testosterone dose as necessary.
Immunosuppressants			
Cyclosporine, Everolimus, Sirolimus, Tacrolimus	BIC, CAB (PO and IM), DTG, RAL	↔ immunosuppressant expected	No dose adjustment needed
	EVG/c	↑ immunosuppressant possible	Initiate with an adjusted dose of immunosuppressant to account for potential increased concentrations of the immunosuppressant. Monitor for immunosuppressant-related adverse events. Therapeutic drug monitoring of immunosuppressant is recommended. Consult with a specialist as necessary.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Lipid-Modifying			
Atorvastatin	BIC, CAB (PO and IM), DTG, RAL	↔ atorvastatin expected	No dose adjustment needed
	EVG/c	Atorvastatin AUC ↑ 2.6-fold and C_{max} ↑ 2.3-fold	Administer the lowest effective dose while monitoring for adverse events. Do not exceed 20 mg atorvastatin daily.
Fluvastatin	BIC, CAB (PO and IM), DTG, RAL	↔ fluvastatin expected	No dose adjustment needed
	EVG/c	↑ fluvastatin possible	Administer the lowest effective fluvastatin dose while monitoring for adverse events.
Lomitapide	BIC, CAB (PO and IM), DTG, RAL	↔ lomitapide expected	No dose adjustment needed
	EVG/c	↑ lomitapide expected	**Contraindicated**
Lovastatin	BIC, CAB (PO and IM), DTG, RAL	↔ lovastatin expected	No dose adjustment needed
	EVG/c	Significant ↑ lovastatin expected	**Contraindicated**
Pitavastatin, Pravastatin	BIC, CAB (PO and IM), DTG, RAL	↔ statin expected	No dose adjustment needed
	EVG/c	No data	No dose adjustment needed. Monitor for adverse events.
Rosuvastatin	BIC, CAB (PO and IM), DTG, RAL	↔ rosuvastatin expected	No dose adjustment needed
	EVG/c	Rosuvastatin AUC ↑ 38% and C_{max} ↑ 89%	Administer the lowest effective dose while monitoring for adverse events.
Simvastatin	BIC, CAB (PO and IM), DTG, RAL	↔ simvastatin expected	No dose adjustment needed
	EVG/c	Significant ↑ simvastatin expected	**Contraindicated**

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Narcotics and Treatment for Opioid Dependence			
Buprenorphine Sublingual, buccal, or implant	BIC, CAB (PO and IM), DTG	↔ buprenorphine and norbuprenorphine (active metabolite) expected	No dose adjustment needed
	EVG/c	Buprenorphine AUC ↑ 35% and C_{min} ↑ 66% Norbuprenorphine (active metabolite) AUC ↑ 42% and C_{min} ↑ 57%	No dose adjustment needed. Monitor for adverse events of buprenorphine. When transferring buprenorphine from transmucosal administration to implantation, monitor to ensure buprenorphine effect is adequate and not excessive.
	RAL	↔ buprenorphine and norbuprenorphine (active metabolite) (sublingual) ↔ buprenorphine or norbuprenorphine (active metabolite) expected (implant)	No dose adjustment needed
Fentanyl	BIC, CAB (PO and IM), DTG, RAL	↔ fentanyl expected	No dose adjustment needed
	EVG/c	↑ fentanyl	Monitor for fentanyl efficacy and adverse events, including potentially fatal respiratory depression.
Lofexidine	BIC, CAB (PO and IM), DTG, RAL	↔ lofexidine expected	No dose adjustment needed
	EVG/c	↑ lofexidine possible	Monitor for lofexidine-related adverse events, including symptoms of orthostasis and bradycardia.
Methadone	All INSTIs	↔ methadone	No dose adjustment needed
Tramadol	BIC, CAB (PO and IM), DTG, RAL	↔ tramadol and M1 (active metabolite) expected	No dose adjustment needed
	EVG/c	↑ tramadol expected ↓ M1 (active metabolite) possible	Tramadol dose adjustments may be necessary. Monitor for clinical response and tramadol-related adverse events.
PDE5 Inhibitors			
Avanafil	BIC, CAB (PO and IM), DTG, RAL	↔ avanafil expected	No dose adjustment needed
	EVG/c	No data	**Do not coadminister.**

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Sildenafil	BIC, CAB (PO and IM), DTG, RAL	↔ sildenafil expected	No dose adjustment needed
	EVG/c	↑ sildenafil expected	**For Treatment of Erectile Dysfunction** • Start with sildenafil 25 mg every 48 hours and monitor for sildenafil-related adverse events. **Contraindicated** for treatment of PAH.
Tadalafil	BIC, CAB (PO and IM), DTG, RAL	↔ tadalafil expected	No dose adjustment needed
	EVG/c	↑ tadalafil expected	**For Treatment of Erectile Dysfunction** • Start with tadalafil 5 mg. Do not exceed a single dose of tadalafil 10 mg every 72 hours. Monitor for tadalafil-related adverse events. **For Treatment of PAH** *In Patients on EVG/c >7 Days* • Start with tadalafil 20 mg once daily. Increase to tadalafil 40 mg once daily based on tolerability. *In Patients on Tadalafil who Require EVG/c* • Stop tadalafil ≥24 hours before EVG/c initiation. Seven days after EVG/c initiation, restart tadalafil at 20 mg once daily and increase to tadalafil 40 mg once daily based on tolerability.
Vardenafil	BIC, CAB (PO and IM), DTG, RAL	↔ vardenafil expected	No dose adjustment needed
	EVG/c	↑ vardenafil expected	Start with vardenafil 2.5 mg every 72 hours and monitor for vardenafil-related adverse events.
Sedative/Hypnotics			
Benzodiazepines			
Alprazolam, Clonazepam, Clorazepate, Diazepam, Estazolam, Flurazepam	BIC, CAB (PO and IM), DTG, RAL	↔ benzodiazepine expected	No dose adjustment needed
	EVG/c	↑ benzodiazepine possible	Dose reduction of benzodiazepine may be necessary. Initiate with a low dose and monitor for benzodiazepine-related adverse events. Consider using an alternative benzodiazepine, such as lorazepam, oxazepam, or temazepam.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Midazolam, Triazolam	BIC, CAB (PO and IM), RAL	↔ benzodiazepine expected	No dose adjustment needed
	DTG	**With DTG 25 mg** • ↔ midazolam AUC	No dose adjustment needed
	EVG/c	↑ midazolam expected ↑ triazolam expected	**Contraindicated** **Do not coadminister** triazolam or oral midazolam and EVG/c. Parenteral midazolam can be administered in a closely monitored setting. Consider dose reduction, especially if >1 dose is administered.
Orexin Receptor Antagonists			
Daridorexant, Lemborexant, Suvorexant	BIC, CAB (PO and IM), DTG, RAL	↔ daridorexant, lemborexant, suvorexant expected	No dose adjustment needed
	EVG/c	↑ daridorexant, lemborexant, suvorexant expected	**Do not coadminister.**
Other Sedatives			
Eszopiclone	BIC, CAB (PO and IM), DTG, RAL	↔ eszopiclone expected	No dose adjustment needed
	EVG/c	↑ eszopiclone expected	Start with lowest dose and increase to a max of 2 mg daily. Monitor for eszopiclone-related adverse events.
Zolpidem	BIC, CAB (PO and IM), DTG, RAL	↔ zolpidem expected	No dose adjustment needed
	EVG/c	↑ zolpidem expected	Initiate zolpidem at a low dose. Dose reduction of zolpidem may be necessary.
Miscellaneous Drugs			
Calcifediol	BIC, CAB (PO and IM), DTG, RAL	↔ calcifediol expected	No dose adjustment needed
	EVG/c	↑ calcifediol possible	Dose adjustment of calcifediol may be required. Monitor serum 25-hydroxyvitamin D, intact PTH, and serum Ca concentrations.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Cisapride	BIC, CAB (PO and IM), DTG, RAL	↔ cisapride expected	No dose adjustment needed
	EVG/c	↑ cisapride expected	**Contraindicated**
Colchicine	BIC, CAB (PO and IM), DTG, RAL	↔ colchicine expected	No dose adjustment needed
	EVG/c	↑ colchicine expected	**Do not coadminister** in patients with hepatic or renal impairment. **For Treatment of Gout Flares** • Administer a single dose of colchicine 0.6 mg, followed by colchicine 0.3 mg 1 hour later. Do not repeat dose for at least 3 days. **For Prophylaxis of Gout Flares** • If original dose was colchicine 0.6 mg twice daily, decrease to colchicine 0.3 mg once daily. If dose was 0.6 mg once daily, decrease to 0.3 mg every other day. **For Treatment of Familial Mediterranean Fever** • Do not exceed colchicine 0.6 mg once daily or 0.3 mg twice daily.
Dronabinol	BIC, CAB (PO and IM), DTG, RAL	↔ dronabinol expected	No dose adjustment needed
	EVG/c	↑ dronabinol possible	Monitor for dronabinol-related adverse events.
Eluxadoline	BIC, CAB (PO and IM), DTG, RAL	↔ eluxadoline expected	No dose adjustment needed
	EVG/c	↑ eluxadoline possible	Monitor for eluxadoline-related adverse events.
Ergot Derivatives	BIC, CAB (PO and IM), DTG, RAL	↔ dihydroergotamine, ergotamine, and methylergonovine expected	No dose adjustment needed
	EVG/c	↑ dihydroergotamine, ergotamine, and methylergonovine expected	**Contraindicated**

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Finerenone	BIC, CAB (PO and IM), DTG, RAL	↔ finerenone expected	No dose adjustment needed
	EVG/c	↑ finerenone expected	**Contraindicated**
Flibanserin	BIC, CAB (PO and IM), DTG, RAL	↔ flibanserin expected	No dose adjustment needed
	EVG/c	↑ flibanserin expected	**Contraindicated**
Naloxegol	BIC, CAB (PO and IM), DTG, RAL	↔ naloxegol expected	No dosage adjustment needed
	EVG/c	↑ naloxegol expected	**Contraindicated**
Polyvalent Cation Supplements Mg, Al, Fe, Ca, Zn, including multivitamins with minerals. **Note:** Please refer to the Acid Reducers section in this table for recommendations on use with Al-, Mg-, and Ca-containing antacids.	BIC	↔ BIC AUC if administered simultaneously with Fe or Ca and food BIC AUC ↓ 33% if administered simultaneously with $CaCO_3$ under fasting conditions BIC AUC ↓ 63% if administered simultaneously with Fe under fasting conditions	**With Supplements That Contain Ca or Fe** • Administer BIC and supplements that contain Ca or Fe together with food. **Do not coadminister** BIC under fasting conditions simultaneously with, or 2 hours after, supplements that contain Ca or Fe.
	CAB	↓ INSTI possible	If coadministration is necessary, administer INSTI at least 2 hours before or at least 4 hours after supplements that contain polyvalent cations, including but not limited to the following products: cation-containing laxatives; Fe, Ca, or Mg supplements; and sucralfate. Monitor for virologic response. Many oral multivitamins also contain varying amounts of polyvalent cations; the extent and significance of chelation is unknown.

Table 24d. Drug Interactions Between Integrase Strand Transfer Inhibitors and Other Drugs

Concomitant Drug	INSTI	Effect on INSTI or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
	DTG	DTG AUC ↓ 39% if administered simultaneously with $CaCO_3$ under fasting conditions DTG AUC ↓ 54% if administered simultaneously with Fe under fasting conditions ↔ DTG when administered with Ca or Fe supplement simultaneously with food	**With Supplements That Contain Ca or Fe** • Administer DTG and supplements that contain Ca or Fe together with food, or administer DTG at least 2 hours before or at least 6 hours after supplement. **Do not coadminister** DTG under fasting conditions simultaneously with, or 2 hours after, supplements that contain Ca or Fe.
	EVG/c, RAL	↓ INSTI possible	If coadministration is necessary, administer INSTI at least 2 hours before or at least 6 hours after supplements that contain polyvalent cations, including but not limited to the following products: cation-containing laxatives; Fe, Ca, or Mg supplements; and sucralfate. Monitor for virologic response. Many oral multivitamins also contain varying amounts of polyvalent cations; the extent and significance of chelation is unknown.
Praziquantel	BIC, CAB (PO and IM), DTG, RAL	↔ praziquantel and INSTI expected	No dose adjustment needed
	EVG/c	↑ praziquantel possible	Consider alternative ARV. If coadministration is necessary, monitor for praziquantel-related adverse events.

Key to Symbols

↑ = increase
↓ = decrease
↔ = less than 20% change in AUC

Key: Al = aluminum; ALT = alanine aminotransferase; ART = antiretroviral therapy; ARV = antiretroviral; AST = aspartate aminotransferase; AUC = area under the curve; BIC = bictegravir; Ca = calcium; CAB = cabotegravir; $CaCO_3$ = calcium carbonate; CCB = calcium channel blocker; C_{max} = maximum plasma concentration; C_{min} = minimum plasma concentration; CMV = cytomegalovirus; COBI = cobicistat; CrCl = creatinine clearance; CYP = cytochrome P450; DTG = dolutegravir; DVT = deep vein thrombosis; ECG = electrocardiogram; EVG = elvitegravir; EVG/c = elvitegravir/cobicistat; Fe = iron; FTC = emtricitabine; GI = gastrointestinal; IM = intramuscular; INR = international normalized ratio; INSTI = integrase strand transfer inhibitor; Mg = magnesium; MPA = medroxyprogesterone acetate; PAH = pulmonary arterial hypertension; PDE5 = phosphodiesterase type 5; PE = pulmonary embolism; PO = orally; PTH = parathyroid hormone; QTc = QT corrected for heart rate; RAL = raltegravir; RPV = rilpivirine; SSRI = selective serotonin reuptake inhibitors; TAF = tenofovir alafenamide; TCA = tricyclic antidepressants; TDF = tenofovir disoproxil fumarate; Zn = zinc

Table 24e. Drug Interactions Between the CCR5 Antagonist Maraviroc and Other Drugs (Including Antiretroviral Agents)

Updated: September 12, 2024
Reviewed: September 12, 2024

In the table below, "no dose adjustment needed" indicates that the U.S. Food and Drug Administration–approved dose of maraviroc (MVC) 300 mg twice daily should be used. Recommendations for managing a particular drug interaction may differ, depending on whether a new antiretroviral (ARV) drug is being initiated in a patient on a stable concomitant medication or a new concomitant medication is being initiated in a patient on a stable ARV regimen. The magnitude and significance of drug interactions are difficult to predict when several drugs with competing metabolic pathways are prescribed concomitantly. In cases where an interacting drug needs to be replaced with an alternative, providers should exercise their clinical judgment to select the most appropriate alternative medication.

Concomitant Drug Class/ Name	Effect on CCR5 Antagonist and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antibacterials—Macrolides		
Azithromycin	↔ MVC expected	No dose adjustment needed
Clarithromycin	↑ MVC possible	MVC 150 mg twice daily
Erythromycin	↑ MVC possible	No dose adjustment needed
Antifungals		
Fluconazole	↑ MVC possible	No dose adjustment needed
Isavuconazole	↑ MVC possible	No dose adjustment needed
Itraconazole	↑ MVC possible	MVC 150 mg twice daily
Posaconazole	↑ MVC possible	MVC 150 mg twice daily
Voriconazole	↑ MVC possible	MVC 150 mg twice daily
Antimycobacterials		
Rifabutin	MVC AUC ↔ and C_{min} ↓ 30%	**If Used *Without* a Strong CYP3A Inhibitor** • MVC 300 mg twice daily **If Used *With* a Strong CYP3A Inhibitor** • MVC 150 mg twice daily
Rifampin	MVC AUC ↓ 63%	**If Used *Without* a Strong CYP3A Inhibitor** • MVC 600 mg twice daily **If Used *With* a Strong CYP3A Inhibitor** • Consider alternative ARV or antimycobacterial
Rifapentine	**Rifapentine Weekly and Daily** ↓ MVC expected	Do not coadminister.

Table 24e. Drug Interactions Between the CCR5 Antagonist Maraviroc and Other Drugs (Including Antiretroviral Agents)

St. John's Wort	↓ MVC expected	**Do not coadminister.**
Hormonal Therapies		
Hormonal Contraceptives	↔ ethinyl estradiol or levonorgestrel	No dose adjustment needed
Menopausal Hormone Replacement Therapy	↔ MVC or hormone replacement therapies expected	No dose adjustment needed

[a] FTR is a prodrug metabolized to its active moiety, TMR. Therefore, the effect on gp120-directed attachment inhibitor in the table refers to TMR concentrations.

Key to Symbols

↑ = increase
↓ = decrease
↔ = no change

Key: ARV = antiretroviral; ATV = atazanavir; ATV/c = atazanavir/cobicistat; ATV/r = atazanavir/ritonavir; AUC = area under the curve; BIC = bictegravir; CAB = cabotegravir; C_{min} = minimum plasma concentration; CMV = cytomegalovirus; CYP = cytochrome P; DOR = doravirine; DRV/c = darunavir/cobicistat; DRV/r = darunavir/ritonavir; DTG = dolutegravir; EFV = efavirenz; ETR = etravirine; EVG/c = elvitegravir/cobicistat; FTR = fostemsavir; IM = intramuscular; INSTI = integrase strand transfer inhibitor; LEN = lenacapavir; MVC = maraviroc; NNRTI = non-nucleoside reverse transcriptase inhibitor; ; PI = protease inhibitor; PO = orally; RAL = raltegravir; RPV = rilpivirine; RTV = ritonavir; SQ = subcutaneous; TMR = temsavir

Table 24f. Drug Interactions Between HIV-1 gp120-Directed Attachment Inhibitors and Other Drugs (Including Antiretroviral Agents)

Updated: September 12, 2024
Reviewed: September 12, 2024

Fostemsavir (FTR), an HIV-1 gp120-directed attachment inhibitor, is a prodrug of temsavir (TMR). In this table, the effect on gp120-directed attachment inhibitor refers to TMR concentrations. Recommendations for managing a particular drug interaction may differ depending on whether a new antiretroviral (ARV) drug is being initiated in a patient on a stable concomitant medication or whether a new concomitant medication is being initiated in a patient on a stable ARV regimen. The magnitude and significance of drug interactions are difficult to predict when several drugs with competing metabolic pathways are prescribed concomitantly. Providers should exercise their clinical judgment to select the most appropriate alternative medication to use in cases where an interacting drug needs to be replaced with an alternative.

Concomitant Drug Class/ Name	Effect on gp120-Directed Attachment Inhibitor and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Acid Reducers		
H2 Receptor Antagonists	↔ TMR	No dose adjustment needed
Antibacterials—Antimycobacterials		
Rifabutin	**With Rifabutin 300 mg Once Daily and Without RTV** • TMR AUC ↓ 30% **With Rifabutin 150 mg Once Daily and With RTV 100 mg Once Daily** • TMR AUC ↑ 66%	**If Used *Without* PI/r** • No dose adjustment needed **If Used *With* PI/r** • Recommended dose is rifabutin 150 mg once daily. • No dose adjustment of FTR
Rifampin	TMR AUC ↓ 82%	**Contraindicated**
Rifapentine	**Daily and Weekly Dosing** ↓ TMR expected	**Do not coadminister.**
Antiretroviral Drugs		
Capsid Inhibitor		
LEN (SQ and PO)	↔ TMR expected ↔ LEN expected	No dose adjustment needed

Table 24f. Drug Interactions Between HIV-1 gp120-Directed Attachment Inhibitors and Other Drugs (Including Antiretroviral Agents)

Concomitant Drug Class/ Name	Effect on gp120-Directed Attachment Inhibitor and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
CCR5 Antagonist		
MVC	↔ TMR MVC AUC ↑ 25%	No dose adjustment needed
CD4 Post-Attachment Inhibitor		
IBA	↔ expected	No dose adjustment needed
INSTIs		
BIC, CAB (IM and PO), DTG, EVG/c	↔ TMR expected	No dose adjustment needed
RAL plus TDF	↔ TMR	No dose adjustment needed

TDF	↔ TMR ↔ TDF	No dose adjustment needed
NNRTIs		
DOR, RPV (IM and PO)	↔ TMR expected	No dose adjustment needed
EFV	↓ TMR possible ↔ EFV expected	No dose adjustment needed
ETR	TMR AUC ↓ 50% ↔ ETR	No dose adjustment needed
ETR plus DRV/r	TMR C_{max} and AUC ↑ 34% to 53% ↔ DRV, RTV ETR AUC ↑ 28%	No dose adjustment needed

Table 24f. Drug Interactions Between HIV-1 gp120-Directed Attachment Inhibitors and Other Drugs (Including Antiretroviral Agents)

Concomitant Drug Class/ Name	Effect on gp120-Directed Attachment Inhibitor and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
PIs		
ATV/c	↑ TMR expected ↔ ATV expected	No dose adjustment needed
ATV/r	TMR C_{max} and AUC ↑ 54% to 58% ↔ ATV, RTV	No dose adjustment needed
DRV/c	TMR C_{max} and AUC ↑ 79% to 97% ↔ DRV, RTV expected	No dose adjustment needed
DRV/r	TMR C_{max} and AUC ↑ 52% to 63% ↔ DRV, RTV	No dose adjustment needed
Antiseizure		
Carbamazepine, Phenobarbital, Phenytoin	↓ TMR expected	**Contraindicated**
Antivirals—Hepatitis C Direct-Acting Antivirals		
Elbasvir/Grazoprevir	↑ grazoprevir expected	Increased grazoprevir exposures may increase the risk of ALT elevations. **Use an alternative** HCV regimen.
Ledipasvir/Sofosbuvir	↔ expected	No dose adjustment needed
Glecaprevir/Pibrentasvir	↔ expected	No dose adjustment needed
Sofosbuvir	↔ expected	No dose adjustment needed
Sofosbuvir/Velpatasvir	↔ expected	No dose adjustment needed
Sofosbuvir/Velpatasvir/Voxilaprevir	↑ voxilaprevir expected	**Use an alternative** HCV regimen if possible.
Antivirals—Miscellaneous (e.g., for CMV, Mpox)		
Brincidofovir	↑ brincidofovir possible	Give FTR dose at least 3 hours after administering brincidofovir, and monitor for brincidofovir-related adverse events (i.e., elevations in ALT/AST and bilirubin and GI adverse events).

Table 24f. Drug Interactions Between HIV-1 gp120-Directed Attachment Inhibitors and Other Drugs (Including Antiretroviral Agents)

Concomitant Drug Class/ Name	Effect on gp120-Directed Attachment Inhibitor and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Cidofovir	↔ TMR expected	No dose adjustment needed
Tecovirimat	↔ TMR expected	No dose adjustment needed
Antivirals—SARS-CoV-2		
Molnupiravir	↔ expected	No dose adjustment needed
Ritonavir-Boosted Nirmatrelvir	TMR AUC ↑ 45%	No dose adjustment needed
Remdesivir	↔ expected	No dose adjustment needed
Herbal Products		
St. John's Wort	↓ TMR expected	**Contraindicated**
Hormonal Therapies		
Hormonal Contraceptives	Ethinyl estradiol AUC ↑ 40% ↔ norethindrone	Prescribe oral contraceptive that contains no more than 30 mcg of ethinyl estradiol[a] or use alternative ARV or contraceptive methods.
Menopausal Hormone Replacement Therapy (e.g., conjugated estrogens, drospirenone, estradiol, medroxyprogesterone, progesterone)	↑ estrogens, estradiol possible	Use lowest effective dose for estrogen-containing regimens.
Lipid-Modifying Agents		
Atorvastatin, Fluvastatin, Pitavastatin, Simvastatin	↑ statin possible ↔ expected	Increased statin concentration may not be clinically relevant. Follow clinical guidelines. Administer the lowest effective statin dose while monitoring for adverse events.
Rosuvastatin	Rosuvastatin AUC ↑ 69%	Increased rosuvastatin concentration may not be clinically relevant. Follow clinical guidelines. Administer the lowest effective dose while monitoring for adverse events.

Table 24f. Drug Interactions Between HIV-1 gp120-Directed Attachment Inhibitors and Other Drugs (Including Antiretroviral Agents)

Concomitant Drug Class/ Name	Effect on gp120-Directed Attachment Inhibitor and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Narcotics and Treatment for Opioid Dependence		
Buprenorphine/Naloxone	Buprenorphine AUC ↑ 30% Norbuprenorphine (active metabolite) AUC ↑ 39%	No dose adjustment needed
Methadone	↔ Total methadone ↔ R(−) methadone (active metabolite) ↔ S(+) methadone	No dose adjustment needed

[a] The following products contain no more than 30 mcg of ethinyl estradiol combined with norethindrone or norgestimate: Lo Minastrin Fe; Lo Loestrin Fe; Loestrin 1/20, 1.5/30; Loestrin Fe 1/20, 1.5/30; Loestrin 24 Fe; Minastrin 24 Fe; Ortho Tri-Cyclen Lo. Generic formulations also may be available.

Key to Symbols

↑ = increase
↓ = decrease
↔ = less than 20% change in AUC

Key: ALT = alanine aminotransferase; ARV = antiretroviral; AST = aspartate aminotransferase; ATV/c = atazanavir/cobicistat; ATV/r = atazanavir/ritonavir; AUC = area under the curve; BIC = bictegravir; C_{max} = maximum plasma concentration; CAB = cabotegravir; CCR5 = C-C chemokine receptor type 5; CMV = cytomegalovirus; DOR = doravirine; DRV = darunavir; DRV/c = darunavir/cobicistat; DRV/r = darunavir/ritonavir; DTG = dolutegravir; EFV = efavirenz; ETR = etravirine; EVG/c = elvitegravir/cobicistat; FTR = fostemsavir; GI = gastrointestinal; gp120 = glycoprotein 120; HCV = hepatitis C virus; IBA = ibalizumab; IM = intramuscular; INSTI = integrase strand transfer inhibitor; LEN = lenacapavir; MVC = maraviroc; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside reverse transcriptase inhibitor; PI = protease inhibitor; PI/r = ritonavir-boosted PI; PO = orally; RAL = raltegravir; RPV = rilpivirine; RTV = ritonavir; SQ = subcutaneous; TDF = tenofovir disoproxil fumarate; TMR = temsavir

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Updated: September 12, 2024
Reviewed: September 12, 2024

This table provides information on the known or predicted interactions between lenacapavir (LEN), an HIV capsid inhibitor, and other drugs, including antiretroviral (ARV) drugs.

LEN is available as an oral tablet (to be used only as initial therapy) and a long-acting injectable formulation that is administered every 6 months. LEN is a moderate cytochrome P450 (CYP) 3A4 inhibitor and may increase the concentration of drugs metabolized by CYP3A4. Due to the long half-life of the injectable formulation, this inhibitory effect may persist, and clinicians should continue to assess for drug interactions for up to 9 months after the last LEN injection. Recommendations for managing a particular drug interaction may differ depending on whether LEN is being initiated in a patient on a stable concomitant medication or whether a new medication is being initiated in a patient on a stable LEN-containing ARV regimen.

The magnitude and significance of drug interactions are difficult to predict when several drugs with competing metabolic pathways are prescribed concomitantly. Providers should exercise their clinical judgment to select the most appropriate alternative medication to use in cases where an interacting drug needs to be replaced with an alternative. People with HIV should be counseled about the importance of informing all their health care providers about their HIV regimen prior to starting any new concomitant medications (e.g., prescription, over-the-counter, and herbal or dietary supplements) to minimize the risk of drug–drug interactions.

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Acid Reducers		
Antacids, H2 Receptor Antagonists, Proton Pump Inhibitors	↔ expected	No dose adjustment needed
Alpha-Adrenergic Antagonists for Benign Prostatic Hyperplasia		
Alfuzosin	↑ alfuzosin expected	Consider an alternative to alfuzosin or an alternative ARV. If coadministered, monitor blood pressure.
Doxazosin	↑ doxazosin possible	No dose adjustment needed. Monitor blood pressure.
Tamsulosin	↑ tamsulosin possible	Initiate tamsulosin at 0.4 mg/day. Monitor blood pressure.
Terazosin	↔ expected	No dose adjustment needed
Silodosin	↑ silodosin possible	No dose adjustment needed

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antibacterials—Antimycobacterials		
Bedaquiline	↑ bedaquiline expected	Consider alternatives unless benefits outweigh risks. Monitor liver function and ECG for QTc prolongation.
Rifabutin	↓ LEN expected	**Do not coadminister.**
Rifampin	LEN AUC ↓ 84%	**Contraindicated**
Rifapentine	**Daily and Weekly Dosing** • ↓ LEN expected	**Do not coadminister.**
Antibacterials—Macrolides		
Azithromycin	↔ expected	No dose adjustment needed
Clarithromycin	↑ LEN possible	No dose adjustment needed
Erythromycin	↑ LEN possible	No dose adjustment needed
Anticoagulants		
Apixaban	↑ apixaban possible	No dose adjustment needed Monitor for apixaban-related adverse events, such as increased bleeding.
Dabigatran	↑ dabigatran possible	No dose adjustment needed Monitor for dabigatran-related adverse events, such as increased bleeding.
Edoxaban	↑ edoxaban possible	No dose adjustment needed Monitor for edoxaban-related adverse events, such as increased bleeding.
Rivaroxaban	↑ rivaroxaban possible	Monitor for rivaroxaban-related adverse events, such as increased bleeding, and adjust rivaroxaban dose accordingly.
Warfarin	↑ warfarin possible	Monitor INR and adjust warfarin dose accordingly.

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antidepressants, Anxiolytics, and Antipsychotics Also see the Sedative/Hypnotics section below.		
Bupropion	↔ expected	No dose adjustment needed
Buspirone	↑ buspirone expected	Administer lowest dose of buspirone with caution and titrate buspirone dose based on clinical response. Dose reduction may be necessary. Monitor for buspirone-related adverse events.
Desvenlafaxine	↔ expected	No dose adjustment needed
Duloxetine	↔ expected	No dose adjustment needed
Mirtazapine	↑ mirtazapine possible	No dose adjustment needed. Monitor for mirtazapine-related adverse events.
Nefazodone	↑ LEN possible	No dose adjustment needed
Selective Serotonin Reuptake Inhibitor (e.g., citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline, vortioxetine)	↑ paroxetine possible ↔ citalopram, escitalopram, fluoxetine, fluvoxamine, sertraline, vortioxetine expected	Dose reduction may be necessary with paroxetine. No dose adjustment needed
Trazodone	↑ trazodone expected	Administer lowest dose of trazodone and monitor for CNS and CV adverse events.
Tricyclic Antidepressants (e.g., amitriptyline, doxepin, nortriptyline)	↔ expected	No dose adjustment needed
Venlafaxine	↔ expected	No dose adjustment needed
Antipsychotics		
Aripiprazole	↑ aripiprazole possible	No dose adjustment needed
Brexpiprazole	↑ brexpiprazole expected	If patient is a known CYP2D6 poor metabolizer, then administer one-quarter of usual brexpiprazole dose.
Cariprazine	↑ cariprazine possible	No dose adjustment needed
Iloperidone	↑ iloperidone possible	No dose adjustment needed or consider dose reduction. Monitor for iloperidone-related adverse events.

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Lumateperone	↑ lumateperone expected	Reduce dose of lumateperone to 21 mg once daily.
Lurasidone	↑ lurasidone expected	If LEN is added to lurasidone therapy, administer half of lurasidone dose. If lurasidone is added to LEN therapy, the recommended starting dose of lurasidone is 20 mg daily, and the maximum recommended dose is 80 mg daily.
Olanzapine **Olanzapine/Samidorphan**	↔ LEN olanzapine expected ↑ samidorphan possible	No dose adjustment needed
Other Antipsychotics (e.g., clozapine, risperidone, thioridazine)	↑ clozapine possible	No dose adjustment needed. Monitor for clozapine-related adverse events.
	↑ risperidone possible	No dose adjustment needed
	↑ thioridazine possible ↓ LEN possible	**Do not coadminister.**
Pimavanserin	↑ pimavanserin possible	No dose adjustment needed. Monitor ECG for QTc prolongation.
Pimozide	↑ pimozide expected	**Contraindicated**
Quetiapine	↑ quetiapine expected	Consider alternatives unless benefits outweigh risks. Monitor ECG for QTc prolongation and consider dose reduction accordingly.
Ziprasidone	↔ expected	No dose adjustment needed
Antifungals		
Fluconazole	↑ LEN possible	No dose adjustment needed
Ibrexafungerp	↑ ibrexafungerp possible	No dose adjustment needed
Isavuconazole	↔ expected	No dose adjustment needed
Itraconazole	↑ LEN possible	No dose adjustment needed
Posaconazole	↑ LEN possible	No dose adjustment needed
Voriconazole	↑ LEN AUC 41%	No dose adjustment needed

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antimalarials		
Artemether/Lumefantrine	↑ artemether and lumefantrine possible	Monitor for lumefantrine-related adverse events, including QTc prolongation.
Artesunate	↔ expected	No dose adjustment needed
Atovaquone/Proguanil	↔ expected	No dose adjustment needed
Mefloquine	↑ mefloquine possible	Monitor for mefloquine-related adverse events, including QTc prolongation.
Antimigraine		
Ergot Derivatives	↑ dihydroergotamine, ergotamine, and methylergonovine expected	**Do not coadminister.**
Calcitonin Gene-Related Peptide (CGRP) Receptor Antagonists		
Atogepant	↑ atogepant expected	No dose adjustment needed
Rimegepant	↑ rimegepant expected	Avoid a second dose of rimegepant within 48 hours.
Ubrogepant	↑ ubrogepant expected	Avoid a second dose of ubrogepant within 24 hours.
Zavegepant	↔ expected	No dose adjustment needed
Serotonin 5-HT1B, 1D Receptor Agonist		
Almotriptan	↔ expected	No dose adjustment needed
Eletriptan	↑ eletriptan expected	No dose adjustment needed. Monitor for eletriptan-related adverse events.
Frovatriptan, Naratriptan, Rizatriptan, Sumatriptan, Zolmitriptan	↔ expected	No dose adjustment needed
Antiplatelets		
Clopidogrel	↓ clopidogrel active metabolite possible	Consider alternative ARV or antiplatelet drug. If coadministered, monitor for clopidogrel-related adverse events.
Prasugrel	↔ expected	No dose adjustment needed

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Ticagrelor	↑ ticagrelor possible	No dose adjustment needed. Monitor for ticagrelor-related adverse events.
Vorapaxar	↑ vorapaxar possible	No dose adjustment needed
Antipneumocystis and Antitoxoplasmosis		
Atovaquone Oral suspension	↔ expected	No dose adjustment needed
Antiretroviral Drugs		
CCR5 Antagonist		
MVC	↔ expected	No dose adjustment needed
CD4 Post-attachment Inhibitor		
IBA	↔ expected	No dose adjustment needed
gp120 Attachment Inhibitor		
FTR	↔ expected	No dose adjustment needed
INSTIs		
BIC, CAB (IM or PO), DTG, EVG/c, RAL	↔ expected	No dose adjustment needed
NRTIs		
ABC, 3TC, FTC	↔ expected	No dose adjustment needed
TAF	TAF AUC ↑ 32%	No dose adjustment needed
TDF	TDF AUC ↑ 47%	No dose adjustment needed
NNRTIs		
EFV	LEN AUC↓ 56%	**Do not coadminister.**
ETR	↓ LEN expected	**Do not coadminister.**
DOR	↑ DOR possible	No dose adjustment needed
RPV (IM or PO)	↑ RPV possible	No dose adjustment needed
PIs		
ATV/r	↑ LEN expected	**Do not coadminister.**
ATV/c	LEN AUC ↑ 4-fold	**Do not coadminister.**
DRV/c	DRV/c AUC ↑ 94%	No dose adjustment needed
DRV/r	↑ LEN expected	No dose adjustment needed

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Antiseizure		
Carbamazepine	↓ LEN expected	**Contraindicated**
Eslicarbazepine	↓ LEN expected	**Do not coadminister.**
Ethosuximide	↑ ethosuximide possible	Monitor for ethosuximide-related adverse events and adjust ethosuximide dose accordingly.
Lamotrigine	↔ expected	No dose adjustment needed
Oxcarbazepine	↓ LEN expected	**Do not coadminister.**
Phenobarbital	↓ LEN expected	**Do not coadminister.**
Phenytoin	↓ LEN expected	**Contraindicated**
Primidone	↓ LEN expected	**Do not coadminister.**
Valproic Acid	↔ expected	No dose adjustment needed
Antivirals—Hepatitis C		
Elbasvir/Grazoprevir	↔ expected	No dose adjustment needed
Glecaprevir/Pibrentasvir	↔ expected	No dose adjustment needed
Ledipasvir/Sofosbuvir	↔ expected	No dose adjustment needed
Sofosbuvir/Velpatasvir	↔ expected	No dose adjustment needed
Sofosbuvir/Velpatasvir/Voxilaprevir	↔ expected	No dose adjustment needed
Antivirals—Miscellaneous (e.g., for CMV, Mpox)		
Brincidofovir	↔ expected	No dose adjustment needed
Cidofovir	↔ expected	No dose adjustment needed
Maribavir	↔ expected	No dose adjustment needed
Tecovirimat	↓ LEN possible	No dose adjustment needed
Valganciclovir	↔ expected	No dose adjustment needed
Antivirals—SARS-CoV-2		
Molnupiravir	↔ expected	No dose adjustment needed
Ritonavir-Boosted Nirmatrelvir	↑ LEN possible	No dose adjustment needed
Remdesivir	↔ expected	No dose adjustment needed

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Beta-Agonists, Long-Acting Inhaled		
Arformoterol, Formoterol, Indacaterol, Olodaterol, Salmeterol	↔ expected	No dose adjustment needed
Cardiac Medications		
Antiarrhythmics		
Amiodarone	↑ amiodarone expected ↑ LEN possible	**Do not coadminister.**
Digoxin	↑ digoxin expected	Consider alternative ARV or antiarrhythmic. If coadministered, monitor digoxin therapeutic concentration.
Disopyramide	↑ disopyramide expected	**Do not coadminister.**
Dofetilide	↔ expected	No dose adjustment needed
Dronedarone	↑ dronedarone possible ↑ LEN possible	Consider alternative ARV or cardiac medication. If coadministered, monitor for dronedarone-related adverse events.
Flecainide	↔ expected	No dose adjustment needed
Lidocaine	↑ propafenone possible	Consider alternative ARV or antiarrhythmics. If coadministered, monitor for antiarrhythmic-related adverse events and monitor concentrations, if available.
Mexiletine	↔ expected	No dose adjustment needed
Propafenone	↑ propafenone possible	Consider alternative ARV or antiarrhythmics. If coadministered, monitor for antiarrhythmic-related adverse events and monitor concentrations, if available.
Quinidine	↑ quinidine expected	**Do not coadminister.**
Sotalol	↔ expected	No dose adjustment needed

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Beta-Blockers		
Atenolol, Bisoprolol, Carvedilol, Labetalol, Metoprolol, Nebivolol, Timolol	↔ expected	No dose adjustment needed
Calcium Channel Blockers		
Amlodipine, Felodipine, Nifedipine	↑ amlodipine, felodipine expected ↑ nifedipine possible	Monitor and dose adjust according to clinical response and adverse events.
Diltiazem, Verapamil	↑ diltiazem possible ↔ verapamil expected	No dose adjustment needed
Cardiac – Other		
Bosentan	↓ LEN expected	**Do not coadminister.**
Eplerenone	↑ eplerenone expected	**For Post-MI CHF** • Dosing of eplerenone should not exceed 25 mg daily. **For Hypertension** • Initiate at 25 mg once daily. Dosing may be increased to a maximum of 25 mg twice daily.
Ivabradine	↑ ivabradine expected	**Do not coadminister.**
Mavacamten	↓ LEN possible ↑ mavacamten expected	Initiate mavacamten at the recommended starting dose of 5 mg daily in patients who are on stable therapy with LEN. Reduce dose of mavacamten by one level (i.e., 15 to 10 mg, 10 to 5 mg, or 5 to 2.5 mg) in patients who are on mavacamten treatment and intend to initiate LEN.
Ranolazine	↑ ranolazine expected	Limit ranolazine to 500 mg twice daily.
Corticosteroids		
Beclomethasone Inhaled or intranasal **Ciclesonide** Inhaled	↔ expected	No dose adjustment needed

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Budesonide, Fluticasone, Mometasone Inhaled or intranasal	↑ glucocorticoids possible	Initiate with the lowest starting dose and titrate carefully and monitor for adrenal insufficiency, Cushing's syndrome, and other corticosteroid-related adverse events.
Betamethasone Systemic	↑ betamethasone possible ↓ LEN possible	**Do not coadminister.**
Budesonide, Prednisone, Prednisolone Systemic	↑ glucocorticoids expected	Initiate with the lowest starting dose, titrate carefully, and monitor for adrenal insufficiency, Cushing's syndrome, and other corticosteroid-related adverse events.
Dexamethasone Systemic	↑ dexamethasone expected ↓ LEN expected if used with dexamethasone >16 mg/day	Initiate with the lowest starting dose, titrate carefully, and monitor for adrenal insufficiency, Cushing's syndrome, and other corticosteroid-related adverse events. **Do not coadminister** with dexamethasone >16 mg/day**.**
Betamethasone, Methylprednisolone, Triamcinolone Local injections, including intra-articular, epidural, or intra-orbital	↑ glucocorticoids possible	Monitor for adrenal insufficiency, Cushing's syndrome, and other corticosteroid-related adverse events.
Glucose-Lowering		
Canagliflozin	↔ expected	No dose adjustment needed
Saxagliptin	↑ saxagliptin possible	No dose adjustment needed
Dapagliflozin/Saxagliptin	↑ saxagliptin possible	No dose adjustment needed
Herbal Products		
St. John's Wort	↓ LEN expected	**Contraindicated**
Hormonal Therapies—Contraceptives		
Injectable Contraceptives Depot MPA	↑ MPA possible	No dose adjustment needed

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Oral Contraceptives (e.g., desogestrel, drospirenone, ethinyl estradiol, levonorgestrel, norgestimate)	↑ contraceptive exposures possible	No dose adjustment needed
Subdermal Implant Contraceptives (e.g., etonogestrel, levonorgestrel)	↑ contraceptive exposures possible	No dose adjustment needed
Transdermal Contraceptives (e.g., ethinyl estradiol/norelgestromin, ethinyl estradiol/levonorgestrel)	↑ contraceptive exposures possible	No dose adjustment needed
Vaginal Ring Contraceptives (e.g., etonogestrel/ethinyl estradiol, segesterone/ethinyl estradiol)	↑ contraceptive exposures possible	No dose adjustment needed
Emergency Contraceptives Levonorgestrel (oral)	↑ levonorgestrel possible	No dose adjustment needed
Hormonal Therapies—Miscellaneous		
5-Alpha Reductase Inhibitors (e.g., dutasteride, finasteride)	↑ dutasteride and finasteride possible	No dose adjustment needed
Estradiol	↔ expected	No dose adjustment needed
Goserelin, Leuprolide Acetate	↔ expected	No dose adjustment needed
Menopausal Hormone Replacement Therapy (e.g., conjugated estrogens, drospirenone, estradiol, medroxyprogesterone, progesterone)	↑ estrogen and progesterone possible ↑ drospirenone possible	No dose adjustment needed
Testosterone	↑ testosterone possible	No dose adjustment needed
Immunosuppressants		
Cyclosporine, Everolimus, Sirolimus, Tacrolimus	↑ immunosuppressant expected	Initiate with an adjusted dose of immunosuppressant to account for potential increased concentrations of the immunosuppressant and monitor for immunosuppressant-related adverse events. Therapeutic drug monitoring of immunosuppressant is recommended. Consult with a specialist as necessary.

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Lipid-Modifying		
Atorvastatin	↑ atorvastatin possible	No dose adjustment needed
Fluvastatin	↔ expected	No dose adjustment needed
Lomitapide	↑ lomitapide expected	**Contraindicated**
Lovastatin	↑ lovastatin expected	Administer the lowest effective lovastatin dose while monitoring for adverse events.
Pitavastatin	↔ expected	No dose adjustment needed
Pravastatin	↔ expected	No dose adjustment needed
Rosuvastatin	↑ rosuvastatin possible	No dose adjustment needed
Simvastatin	↑ simvastatin expected	Administer the lowest effective simvastatin dose while monitoring for adverse events.
Narcotics and Treatment for Opioid Dependence		
Buprenorphine Sublingual, buccal, or implant	↑ buprenorphine possible	**Initiation of Buprenorphine in Patients Taking LEN** • Titrate buprenorphine dose to desired effect and use the lowest feasible initial dose. **Initiation of LEN in Patients Taking Buprenorphine** • Dose adjustment for buprenorphine may be needed. Monitor for buprenorphine-related adverse events.
Fentanyl	↑ fentanyl possible	Monitor for fentanyl-related adverse events, including potentially fatal respiratory depression. Fentanyl dose reduction may be necessary.
Lofexidine	↔ expected	No dose adjustment needed
Methadone	↑ methadone possible	**Initiation of Methadone in Patients Taking LEN** • Titrate methadone dose to desired effect and use the lowest feasible initial dose.

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
		Initiation of LEN in Patients Taking Methadone • Dose adjustment for methadone may be needed. Monitor for buprenorphine-related adverse events.
Oxycodone	↑ oxycodone possible	Monitor for opioid-related adverse events, including potentially fatal respiratory depression. Oxycodone dose reduction may be necessary.
Tramadol	↑ tramadol possible	Tramadol dose adjustments may be necessary. Monitor for clinical response and tramadol-related adverse events.
PDE5 Inhibitors		
Avanafil	↑ avanafil expected	Avanafil dose should not exceed 50 mg once every 24 hours.
Sildenafil	↑ sildenafil expected	**For Treatment of Erectile Dysfunction** • Start with sildenafil 25 mg and monitor for sildenafil-related adverse events. **For Treatment of PAH** • Reduce the dose of sildenafil to 20 mg three times a day when discontinuing treatment with LEN.
Tadalafil	↑ tadalafil expected	**For Treatment of Erectile Dysfunction** • For once-daily use: Consider maximum dose of 2.5 mg daily. If higher dose is needed, consider alternative PDE5 inhibitor. • For use as needed: Consider maximum dose of 10 mg every 72 hours. If higher dosing is needed, consider alternative PDE5 inhibitor. **For Treatment of PAH** • **Do not coadminister.**

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
		For Treatment of Benign Prostatic Hyperplasia • Consider maximum dose of 2.5 mg daily. Use caution and monitor for AEs if dose increases to 5 mg.
Vardenafil	↑ vardenafil expected	Vardenafil dose should not exceed 5 mg once every 24 hours.
Sedative/Hypnotics		
Benzodiazepines		
Alprazolam, Diazepam, Triazolam	↑ benzodiazepine expected	Consider lowest dose and monitor for benzodiazepine-related adverse events.
Clonazepam	↑ clonazepam possible	Use with caution and consider alternative benzodiazepines.
Lorazepam, Oxazepam, Temazepam	↔ expected	No dose adjustment needed
Midazolam (Oral)	↑ midazolam AUC 259–308%	Use with caution and consider alternative benzodiazepine.
Orexin Receptor Antagonist		
Daridorexant, Lemborexant, Suvorexant	↑ daridorexant expected ↑ lemborexant expected ↑ suvorexant expected	Maximum recommended daridorexant dose is 25 mg. **Do not coadminister** with lemborexant. Initiate suvorexant dose at 5 mg daily. Suvorexant dose can be increased to 10 mg once per night if the 5 mg dose is not effective. **Do not exceed** 10 mg per night.
Other Sedatives		
Eszopiclone	↑ eszopiclone expected	Consider lowest dose and monitor for eszopiclone-related adverse events.
Zolpidem	↑ zolpidem possible	Consider initiating zolpidem at a low dose.
Miscellaneous Drugs		
Calcifediol	↑ calcifediol possible	No dose adjustment needed

Table 24g. Drug Interactions Between the Capsid Inhibitor Lenacapavir and Other Drugs (Including Antiretroviral Drugs)

Concomitant Drug Class/ Name	Effect on LEN and/or Concomitant Drug Concentrations	Dosing Recommendations and Clinical Comments
Cisapride	↑ cisapride expected	**Do not coadminister.**
Colchicine	↑ colchicine expected	**For Treatment of Gout Flares** • Administer single colchicine dose of 1.2 mg. Do not repeat dose for at least 3 days. **For Treatment of Familial Mediterranean Fever** • Colchicine dose should not exceed 1.2 mg daily (may be given as 0.6 mg twice a day).
Dronabinol	↔ expected	No dose adjustment needed
Eluxadoline	↔ expected	No dose adjustment needed
Finerenone	↑ finerenone expected	Monitor serum potassium at initiation and during therapy according to finerenone product labeling.
Flibanserin	↑ flibanserin expected	**Contraindicated**
Naloxegol	↑ naloxegol expected	Avoid use; if coadministration is necessary, decrease dosage of naloxegol and monitor for naloxegol-related adverse events.
Praziquantel	↑ praziquantel possible	Consider alternative antiretroviral. If coadministration is necessary, monitor for praziquantel-related adverse events.

Key to Symbols

↑ = increase
↓ = decrease
↔ = less than 20% change in AUC

Table 25a. Interactions Between Non-Nucleoside Reverse Transcriptase Inhibitors and Protease Inhibitors

Updated: September 12, 2024
Reviewed: September 12, 2024

Note: Interactions associated with unboosted atazanavir (ATV), delavirdine (DLV), fosamprenavir (FPV), indinavir (IDV), lopinavir (LPV), nelfinavir (NFV), nevirapine (NVP), saquinavir (SQV), and tipranavir (TPV) are **not** included in this table. Please refer to the U.S. Food and Drug Administration product labels for information regarding interactions between these drugs and other concomitant drugs.

Rilpivirine (RPV) intramuscular (IM) is not included in this table, because the combination of cabotegravir (CAB) IM plus RPV IM is a two-drug co-packaged product. Therefore, RPV IM is not expected to be used with a protease inhibitor.

Table 25b. Interactions Between Integrase Strand Transfer Inhibitors and Non-Nucleoside Reverse Transcriptase Inhibitors or Protease Inhibitors

Updated: September 12, 2024
Reviewed: September 12, 2024

Recommendations for managing a particular drug interaction may differ depending on whether a new antiretroviral (ARV) drug is being initiated in a patient on a stable concomitant medication, or a new concomitant medication is being initiated in a patient on a stable ARV regimen. The magnitude and significance of drug interactions are difficult to predict when several drugs with competing metabolic pathways are prescribed concomitantly.

Information on drug interactions with oral (PO) cabotegravir (CAB) is not included in this table. The CAB PO tablet is not available in retail pharmacies and will be provided directly to people with HIV for short-term use only (PO lead-in and to bridge if intramuscular [IM] administration is delayed).

CAB IM and rilpivirine (RPV) IM are not included in this table because the combination is a two-drug, co-packaged product. Therefore, it is not anticipated that they will be used with PO non-nucleoside reverse transcriptase inhibitors (NNRTIs) or protease inhibitors (PIs).

APPENDIX A. DRUG CHARACTERISTICS TABLES

Appendix A, Table 1. Coformulated and Copackaged Antiretroviral Regimens

Updated: September 12, 2024
Reviewed: September 25, 2025

The following table includes dose recommendations for U.S. Food and Drug Administration (FDA)–approved coformulated and copackaged antiretroviral regimens for adults with HIV. Not all products are FDA approved for adolescents with HIV. For information regarding the use of these medications in adolescents with HIV, including weight limitations and additional dosage forms, please consult FDA product labeling or Appendix A in the Pediatric Antiretroviral Guidelines. Please see the class-specific drug characteristics tables (Appendix A, Tables 3, 4, 5, and 6) for details about the individual drugs included in these products, including information on elimination and metabolic pathways, serum and intracellular half-lives, and adverse effects. The products in this table are listed by drug class and arranged **in alphabetical order** by generic name within each class.

Generic Name (Abbreviation) *Trade Name*	**ARV Drugs Included in the Regimen**	**Dosing Recommendation**[a]
INSTI Plus Two NRTIs		
Bictegravir/Tenofovir Alafenamide/Emtricitabine (BIC/TAF/FTC) *Biktarvy*	BIC 50 mg/TAF 25 mg/FTC 200 mg	One tablet PO once daily
Dolutegravir/Abacavir/Lamivudine (DTG/ABC/3TC) *Triumeq*	DTG 50 mg/ABC 600 mg/3TC 300 mg	One tablet PO once daily
Elvitegravir/Cobicistat/Tenofovir Alafenamide/Emtricitabine (EVG/c/TAF/FTC) *Genvoya*	EVG 150 mg/COBI 150 mg/TAF 10 mg/FTC 200 mg	One tablet PO once daily with food
Elvitegravir/Cobicistat/Tenofovir Disoproxil Fumarate/Emtricitabine (EVG/c/TDF/FTC) *Stribild*	EVG 150 mg/COBI 150 mg/TDF 300 mg/FTC 200 mg	One tablet PO once daily with food

Dolutegravir/Rilpivirine (DTG/RPV) *Juluca*	DTG 50 mg/RPV 25 mg	One tablet PO once daily with food
NNRTI Plus Two NRTIs		
Doravirine/Tenofovir Disoproxil Fumarate/Lamivudine (DOR/TDF/3TC) *Delstrigo*	DOR 100 mg/TDF 300 mg/3TC 300 mg	One tablet PO once daily

Appendix A, Table 1. Coformulated and Copackaged Antiretroviral Regimens

Generic Name (Abbreviation) *Trade Name*	**ARV Drugs Included in the Regimen**	**Dosing Recommendation**[a]
Efavirenz/Tenofovir Disoproxil Fumarate/Emtricitabine (EFV/TDF/FTC) *Generic Only*	EFV 600 mg/TDF 300 mg/FTC 200 mg	One tablet PO once daily on an empty stomach, preferably at bedtime
Efavirenz/Tenofovir Disoproxil Fumarate/Lamivudine (EFV/TDF/3TC) *Symfi*	EFV 600 mg/TDF 300 mg/3TC 300 mg	One tablet PO once daily on an empty stomach, preferably at bedtime
Rilpivirine/Tenofovir Alafenamide/Emtricitabine (RPV/TAF/FTC) *Odefsey*	RPV 25 mg/TAF 25 mg/FTC 200 mg	One tablet PO once daily with food
Rilpivirine/Tenofovir Disoproxil Fumarate/Emtricitabine (RPV/TDF/FTC) *Complera*	RPV 25 mg/TDF 300 mg/FTC 200 mg	One tablet PO once daily with food
PI Plus Two NRTIs		
Darunavir/Cobicistat/Tenofovir Alafenamide/Emtricitabine (DRV/c/TAF/FTC) *Symtuza*	DRV 800 mg/COBI 150 mg/TAF 10 mg/FTC 200 mg	One tablet PO once daily with food

[a] For dose adjustments in people with renal or hepatic insufficiency, see Appendix B. When no food restriction is listed, the product can be taken with or without food.

Key: 3TC = lamivudine; ABC = abacavir; ARV = antiretroviral; BIC = bictegravir; c or COBI = cobicistat; CAB = cabotegravir; DOR = doravirine; DRV = darunavir; DRV/c = darunavir/cobicistat; DTG = dolutegravir; EFV = efavirenz; EVG = elvitegravir; EVG/c = elvitegravir/cobicistat; FTC = emtricitabine; IM = intramuscularly; INSTI = integrase strand transfer inhibitor; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside reverse transcriptase inhibitor; PI = protease inhibitor; PO = orally; RPV = rilpivirine; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate

Appendix A, Table 2. Nucleoside Reverse Transcriptase Inhibitor–Based, Fixed-Dose Combination Tablets for Use as Part of an Antiretroviral Regimen

Updated: September 25, 2025
Reviewed: September 25, 2025

The following table includes dose recommendations for U.S. Food and Drug Administration (FDA)–approved dual nucleoside reverse transcriptase inhibitor fixed-dose combination (FDC) products for adults with HIV. For information regarding the use of these medications in adolescents with HIV, including weight limitations and additional dosage forms, please consult FDA product labeling or Appendix A in the Pediatric Antiretroviral Guidelines. These FDC tablets are not complete regimens and must be administered in combination with other antiretroviral drugs. FDC products that contain zidovudine (ZDV) have been removed from this table. Please refer to the FDA product labels for information regarding ZDV-containing FDCs. Please see the class-specific drug characteristics tables (Appendix A, Tables 3, 4, 5, and 6) for details about the individual drugs contained in these FDC products, including information on elimination and metabolic pathways, serum and intracellular half-lives, and adverse effects. The FDC tablets in this table are listed by generic name.

Generic Name (Abbreviation) *Trade Name*	**ARV Drugs Included in the FDC Tablet**	**Dosing Recommendation**[a]
Abacavir/Lamivudine (ABC/3TC) *Generic Only*	ABC 600 mg/3TC 300 mg	One tablet PO once daily
Tenofovir Alafenamide/Emtricitabine (TAF/FTC) *Descovy*	TAF 25 mg/FTC 200 mg	One tablet PO once daily
Tenofovir Disoproxil Fumarate/Emtricitabine (TDF/FTC) *Truvada* **Note:** Generic product available.	TDF 300 mg/FTC 200 mg	One tablet PO once daily
Tenofovir Disoproxil Fumarate/Lamivudine (TDF/3TC) *Cimduo*	TDF 300 mg/3TC 300 mg	One tablet PO once daily

[a] For dose adjustments in people with renal or hepatic insufficiency, see Appendix B. All FDC tablets listed in this table can be taken without regard to food.

Key: 3TC = lamivudine; ABC = abacavir; ARV = antiretroviral; FDC = fixed-dose combination; FTC = emtricitabine; NRTI = nucleoside reverse transcriptase inhibitor; PO = orally; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate

Appendix A, Table 3. Characteristics of Nucleoside Reverse Transcriptase Inhibitors

Updated: September 25, 2025
Reviewed: September 25, 2025

The following table includes dose recommendations for U.S. Food and Drug Administration (FDA)–approved nucleoside reverse transcriptase inhibitor products for adults with HIV. For information regarding the use of these medications in adolescents with HIV, including weight limitations and additional dosage forms, please consult FDA product labeling or Appendix A in the Pediatric Antiretroviral Guidelines. The older nucleoside reverse transcriptase inhibitors didanosine (ddI) and stavudine (d4T) have been discontinued in the United States. Zidovudine (ZDV) is no longer used commonly in clinical practice. Therefore, these antiretrovirals have been removed from this table. Please refer to the FDA product label for ZDV for information regarding this drug.

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathway**	**Serum/ Intracellular Half-Lives**	**Adverse Events**[b]
Abacavir (ABC) *Ziagen* **Note:** Generic products are available.	**Ziagen** • 20-mg/mL oral solution **Generic** • 300-mg tablet • Also available as FDC with 3TC **FDC Tablets That Contain ABC**[c] • ABC/3TC **STRs That Contain ABC**[d] • Triumeq (DTG/ABC/3TC)	• ABC 600 mg PO once daily, *or* • ABC 300 mg PO twice daily See Appendix A, Tables 1 and 2 for dosing information for FDC tablets that contain ABC.	Metabolized by alcohol dehydrogenase and glucuronyl transferase 82% of ABC dose is excreted in the urine as metabolites of ABC. Dose adjustment is recommended in people with hepatic insufficiency (see Appendix B).	1.5 hours/ 12–26 hours	People who test positive for HLA-B*5701 are at the highest risk of experiencing HSRs. HLA screening should be done before initiating ABC. For people with a history of HSRs, rechallenge **is not recommended.** Symptoms of HSRs may include fever, rash, nausea, vomiting, diarrhea, abdominal pain, malaise, fatigue, or respiratory symptoms (e.g., sore throat, cough, or shortness of breath). Some cohort studies suggest an increased risk of MI with recent or current use of ABC, but this risk is not substantiated in other studies.

Appendix A, Table 3. Characteristics of Nucleoside Reverse Transcriptase Inhibitors

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathway**	**Serum/ Intracellular Half-Lives**	**Adverse Events**[b]
Emtricitabine (FTC) *Emtriva* **Note:** Generic products are available.	**Emtriva** • 200-mg hard gelatin capsule • 10-mg/mL oral solution **Generic** • 200-mg capsule • Also available as FDC with TDF **FDC Tablets That Contain FTC**[c] • Descovy (TAF/FTC) • Truvada (TDF/FTC) **STRs That Contain FTC**[d] • Biktarvy (BIC/TAF/FTC) • Complera (RPV/TDF/FTC) • EFV/TDF/FTC (generic) • Genvoya (EVG/c/TAF/FTC) • Odefsey (RPV/TAF/FTC) • Stribild (EVG/c/TDF/FTC) • Symtuza (DRV/c/TAF/FTC)	*Capsule* • FTC 200 mg PO once daily *Oral Solution* • FTC 240 mg (24 mL) PO once daily See Appendix A, Tables 1 and 2 for dosing information for FDC tablets that contain FTC.	86% of FTC dose is excreted renally. See Appendix B for dosing recommendations in people with renal insufficiency.	10 hours/ >20 hours	Minimal toxicity Hyperpigmentation/skin discoloration Severe acute exacerbation of hepatitis may occur in people with HBV/HIV coinfection who discontinue FTC.
Lamivudine (3TC) *Epivir* **Note:** Generic products are available.	**Epivir** • 150-mg and 300-mg tablets • 10-mg/mL oral solution **Generic** • 100-mg, 150-mg, and 300-mg tablets • 10-mg/mL oral solution • Also available as FDC with ABC	• 3TC 300 mg PO once daily, *or* • 3TC 150 mg PO twice daily See Appendix A, Tables 1 and 2 for dosing information for FDC tablets that contain 3TC.	70% of 3TC dose is excreted renally. See Appendix B for dose recommendations in people with renal insufficiency.	5–7 hours/ 18–22 hours	Minimal toxicity Severe acute exacerbation of hepatitis may occur in people with HBV/HIV coinfection who discontinue 3TC.

Appendix A, Table 3. Characteristics of Nucleoside Reverse Transcriptase Inhibitors

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathway**	**Serum/ Intracellular Half-Lives**	**Adverse Events**[b]
	FDC Tablets That Contain 3TC[c] • ABC/3TC (generic) • Cimduo (TDF/3TC) **STRs That Contain 3TC**[d] • Delstrigo (DOR/TDF/3TC) • Dovato (DTG/3TC) • Symfi (EFV/TDF/3TC) • Triumeq (DTG/ABC/3TC)				
Tenofovir Alafenamide (TAF) *Vemlidy* **Note:** Vemlidy is available as a 25-mg tablet for the treatment of HBV.	**FDC Tablets That Contain TAF**[c] • Descovy (TAF/FTC) **STRs That Contain TAF**[d] • Biktarvy (BIC/TAF/FTC) • Genvoya (EVG/c/TAF/FTC) • Odefsey (RPV/TAF/FTC) • Symtuza (DRV/c/TAF/FTC)	See Appendix A, Tables 1 and 2 for dosing information for FDC tablets that contain TAF.	Metabolized by cathepsin A See Appendix B for dosing recommendations in people with renal insufficiency.	0.5 hour/ 150–180 hours	Renal insufficiency, Fanconi syndrome, and proximal renal tubulopathy are less likely to occur with TAF than with TDF. Osteomalacia and decreases in BMD are less likely to occur with TAF than with TDF. Severe acute exacerbation of hepatitis may occur in people with HBV/HIV coinfection who discontinue TAF. Diarrhea, nausea, headache Greater weight increase has been reported with TAF than with TDF.

Appendix A, Table 3. Characteristics of Nucleoside Reverse Transcriptase Inhibitors

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathway**	**Serum/ Intracellular Half-Lives**	**Adverse Events**[b]
Tenofovir Disoproxil Fumarate (TDF) *Viread* **Note:** Generic products are available.	**Viread** • 300-mg tablet • 40-mg/g oral powder **Generic** • 300-mg tablet • Also available as FDC with FTC **FDC Tablets That Contain TDF**[c] • Cimduo (TDF/3TC) • Truvada (TDF/FTC) **STRs That Contain TDF**[d] • Complera (RPV/TDF/FTC) • Delstrigo (DOR/TDF/3TC) • EFV/TDF/FTC (generic) • Stribild (EVG/c/TDF/FTC) • Symfi (EFV/TDF/3TC)	• TDF 300 mg PO once daily, *or* • 7.5 level scoops of oral powder PO once daily (dosing scoop dispensed with each bottle; one level scoop contains 1 g of oral powder). Mix oral powder with 2–4 ounces of a soft food that does not require chewing (e.g., applesauce, yogurt). **Do not mix oral powder with liquid.** See Appendix A, Tables 1 and 2 for dosing information for FDC tablets that contain TDF.	Renal excretion is the primary route of elimination. See Appendix B for dose recommendations in people with renal insufficiency.	17 hours/ >60 hours	Renal insufficiency, Fanconi syndrome, proximal renal tubulopathy Osteomalacia, decrease in BMD Asthenia, headache, diarrhea, nausea, vomiting, flatulence Severe acute exacerbation of hepatitis may occur in people with HBV/HIV coinfection who discontinue TDF.

[a] For dose adjustments in people with renal or hepatic insufficiency, see Appendix B. When no food restriction is listed, the antiretroviral drug can be taken with or without food.

[b] Also see Table 21.

[c] See Appendix A, Table 2 for information about these formulations.

[d] See Appendix A, Table 1 for information about these formulations.

Key: 3TC = lamivudine; ABC = abacavir; BIC = bictegravir; BMD = bone mineral density; DOR = doravirine; DRV/c = darunavir/cobicistat; DTG = dolutegravir; EFV = efavirenz; EVG/c = elvitegravir/cobicistat; FDC = fixed-dose combination; FTC = emtricitabine; HBV = hepatitis B virus; HLA = human leukocyte antigen; HSR = hypersensitivity reaction; MI = myocardial infarction; PO = orally; RPV = rilpivirine; STR = single-tablet regimen; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate

Appendix A, Table 4. Characteristics of Non-Nucleoside Reverse Transcriptase Inhibitors

Updated: September 25, 2025
Reviewed: September 25, 2025

The following table includes dose recommendations for U.S. Food and Drug Administration (FDA)–approved non-nucleoside reverse transcriptase inhibitor (NNRTI) products for adults with HIV. For information regarding the use of these medications in adolescents with HIV, including weight limitations and additional dosage forms, please consult FDA product labeling or Appendix A in the Pediatric Antiretroviral Guidelines. The older NNRTIs delavirdine (DLV) and nevirapine (NVP) are **not** listed in this table; DLV has been discontinued and NVP is no longer commonly used in clinical practice in the United States.

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathway**	**Serum Half-Life**	**Adverse Events**[b]
Doravirine (DOR) *Pifeltro*	**Pifeltro** • 100-mg tablet **STRs That Contain DOR**[c] • Delstrigo (DOR/TDF/3TC)	• DOR 100 mg PO once daily See Appendix A, Table 1 for dosing information for Delstrigo.	CYP3A4/5 substrate	15 hours	Rash, including Stevens-Johnson syndrome Nausea Dizziness Abnormal dreams
Efavirenz (EFV) **Note:** Generic only	**Efavirenz** (generic) • 600-mg tablet **STRs That Contain EFV**[c] • EFV/TDF/FTC (generic) • Symfi (EFV/TDF/3TC)	• EFV 600 mg PO once daily on an empty stomach, preferably at or before bedtime See Appendix A, Table 1 for dosing information for STRs that contain EFV.	Metabolized by CYP2B6 (primary), 3A4, and 2A6 CYP3A4 mixed inducer/inhibitor (more an inducer than an inhibitor) CYP2B6 and 2C19 inducer	40–55 hours	Rash, including Stevens-Johnson syndrome Neuropsychiatric symptoms[d] Serum transaminase elevations Hyperlipidemia QT interval prolongation Use of EFV may lead to false-positive results with some cannabinoid and benzodiazepine screening assays.
Etravirine (ETR) *Intelence* **Note:** Generic products are available.	**Intelence** • 100-mg and 200-mg tablets **Generic** • 100-mg and 200-mg tablets	• ETR 200 mg PO twice daily following a meal.	CYP3A4, 2C9, and 2C19 substrate CYP3A4 inducer CYP2C9 and 2C19 inhibitor	41 hours	Rash, including Stevens-Johnson syndrome HSRs, characterized by rash, constitutional findings, and sometimes organ dysfunction (including hepatic failure), have been reported. Nausea

Appendix A, Table 4. Characteristics of Non-Nucleoside Reverse Transcriptase Inhibitors

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathway**	**Serum Half-Life**	**Adverse Events**[b]
Rilpivirine (RPV) *Edurant*	**Edurant** • 25-mg tablet **STRs That Contain RPV**[c] • Complera (RPV/TDF/FTC) • Juluca (DTG/RPV) • Odefsey (RPV/TAF/FTC) **Copackaged IM Regimen** • Cabenuva (CAB plus RPV)	• RPV 25 mg PO once daily with food See Appendix A, Table 1 for dosing information for coformulated and copackaged regimens that contain RPV.	CYP3A4 substrate	PO: 50 hours IM: 13–28 weeks	Rash, including Stevens-Johnson syndrome Depressive disorders, insomnia, headache Hepatotoxicity QT interval prolongation **IM Formulation Only** • Injection site reactions (pain, induration, swelling, nodules) • Rare postinjection reaction (dyspnea, agitation, abdominal cramps, flushing) occurring within a few minutes after RPV IM injection; possibly associated with inadvertent IV administration.

[a] For dose adjustments in people with renal or hepatic insufficiency, see Appendix B. When no food restriction is listed, the antiretroviral drug can be taken with or without food.

[b] Also see Table 21.

[c] See Appendix A, Table 1 for information about these formulations.

[d] Adverse events can include dizziness, somnolence, insomnia, abnormal dreams, depression, suicidality (e.g., suicide, suicide attempt or ideation), confusion, abnormal thinking, impaired concentration, amnesia, agitation, depersonalization, hallucinations, and euphoria. Approximately 50% of people who are receiving EFV may experience any of these symptoms. Symptoms usually subside spontaneously after 2–4 weeks, but discontinuation of EFV may be necessary in a small percentage of people. Late-onset neurotoxicities, including ataxia and encephalopathy, have been reported.

Key: 3TC = lamivudine; ARV = antiretroviral; CAB = cabotegravir; CD4 = CD4 T lymphocyte; CYP = cytochrome P; DOR = doravirine; DTG = dolutegravir; EFV = efavirenz; ETR = etravirine; FTC = emtricitabine; HSR = hypersensitivity reaction; IM = intramuscular; IV = intravenous; NNRTI = non-nucleoside reverse transcriptase inhibitor; PO = orally; RPV = rilpivirine; STR = single-tablet regimen; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate

Appendix A, Table 5. Characteristics of Protease Inhibitors

Updated: September 25, 2025
Reviewed: September 25, 2025

The following table includes dose recommendations for U.S. Food and Drug Administration (FDA)–approved protease inhibitor products for adults with HIV. For information regarding the use of these medications in adolescents with HIV, including weight limitations and additional dosage forms, please consult FDA product labeling or Appendix A in the Pediatric Antiretroviral Guidelines. The older protease inhibitors indinavir (IDV) and saquinavir (SQV) have been discontinued in the United States; fosamprenavir (FPV), lopinavir/ritonavir (LPV/r), nelfinavir (NFV), and tipranavir (TPV) are no longer used commonly in clinical practice. These agents have been removed from this table. Please refer to the July 10, 2019, version of the guidelines (found in the Adult and Adolescent Antiretroviral Archived Guidelines section of the Archived Guidelines webpage on the Clinicalinfo website) or to the FDA product labels for information regarding these drugs.

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathway**	**Serum Half-Life**	**Adverse Events**[b]
Atazanavir (ATV) *Reyataz* **Note:** Generic products are available.	**Reyataz** • 200-mg and 300-mg capsules • 50-mg oral powder/packet **Generic** • 200-mg and 300-mg capsules **FDCs That Contain ATV** • Evotaz (ATV 300mg/COBI 150mg)	**Reyataz** *In People Without Prior ARV Treatment* • (ATV 300 mg plus RTV 100 mg) PO once daily with food; *or* • ATV 400 mg PO once daily with food. *With TDF or in ARV-Experienced People* • (ATV 300 mg plus RTV 100 mg) PO once daily with food. • Unboosted ATV is not recommended. *With EFV in People Without Prior ARV Treatment* • (ATV 400 mg plus RTV 100 mg) PO once daily with food. **Evotaz** • One tablet PO once daily with food.	**ATV** • CYP3A4 inhibitor and substrate • Weak CYP2C8 inhibitor • UGT1A1 inhibitor **COBI** • CYP3A inhibitor and substrate • CYP2D6 inhibitor Dose adjustment is recommended in people with hepatic insufficiency (see Appendix B).	7 hours	Indirect hyperbilirubinemia Cholelithiasis Nephrolithiasis Renal insufficiency Serum transaminase elevations Hyperlipidemia (especially with RTV boosting) Skin rash Hyperglycemia Lipodystrophy An increase in serum creatinine may occur when ATV is administered with COBI. PR interval prolongation: First-degree symptomatic AV block has been reported. Use with caution in people who have underlying conduction defects or who are on concomitant medications that can cause PR prolongation.

Appendix A, Table 5. Characteristics of Protease Inhibitors

Generic Name (Abbreviation) *Trade Name*	Formulations	Dosing Recommendations[a]	Elimination/ Metabolic Pathway	Serum Half-Life	Adverse Events[b]
		• The use of ATV/c **is not recommended** for people who are taking TDF and who have baseline CrCl <70 mL/min (see Appendix B for the equation for calculating CrCl). For dosing recommendations for people who also are receiving H2 antagonists and PPIs, refer to Table 24a.			
Darunavir (DRV) *Prezista* **Note:** Generic products are available.	**Prezista** • 600-mg and 800-mg tablets • 100-mg/mL oral suspension **Generic** • 600-mg and 800-mg tablets **FDCs That Contain DRV** • Prezcobix (DRV 800mg/COBI 150mg) **STRs That Contain DRV** • Symtuza (DRV/c/TAF/FTC)	**Prezista** *In People Without Prior ARV Treatment or ARV-Experienced Treatment With No DRV Mutations* • (DRV 800 mg plus RTV 100 mg) PO once daily with food *In ARV-Experienced People With One or More DRV Resistance Mutations* • (DRV 600 mg plus RTV 100 mg) PO twice daily with food DRV is not available as an FDC tablet with RTV. Unboosted DRV **is not recommended.** **Prezcobix** • One tablet PO once daily with food. • **Not recommended** for people with one or more DRV resistance-associated mutations. • Coadministering Prezcobix and TDF **is not recommended** for people with baseline CrCl <70 mL/min (see Appendix B for the equation for calculating CrCl). See Appendix A, Table 1 for dosing information for Symtuza.	**DRV** • CYP3A4 inhibitor and substrate • CYP2C9 inducer **COBI** • CYP3A inhibitor and substrate • CYP2D6 inhibitor	15 hours when combined with RTV 7 hours when combined with COBI	Hepatotoxicity Diarrhea, nausea Headache Hyperlipidemia Serum transaminase elevation Hyperglycemia Lipodystrophy An increase in serum creatinine may occur when DRV is administered with COBI. Skin rash: DRV has a sulfonamide moiety; however, incidence and severity of rash are similar in those with or without a sulfonamide allergy—Stevens-Johnson syndrome, toxic epidermal necrolysis, acute generalized exanthematous pustulosis, and erythema multiforme have been reported.

Appendix A, Table 5. Characteristics of Protease Inhibitors

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathway**	**Serum Half-Life**	**Adverse Events**[b]
Ritonavir (RTV) *Norvir* **Note:** Generic product available. RTV was initially developed as a PI for HIV treatment but is now used at a lower dose of 100 mg once or twice daily as a PK enhancer to increase the concentrations of other PIs.	**Norvir** • 100-mg tablet • 100-mg single packet oral powder **Generic** • 100-mg tablet Also available as an FDC tablet of LPV/r in both brand (Kaletra) and generic versions	**As a PK Booster (or Enhancer) for Other PIs** • RTV 100–200 mg PO per day in one or two divided doses (refer to other PIs for specific dosing recommendations) with food	CYP3A4 > 2D6 substrate Potent CYP3A4 and 2D6 inhibitor Inducer of UGT1A1 and CYPs 1A2, 2C8, 2C9, and 2C19	3–5 hours	GI intolerance, nausea, vomiting, diarrhea Paresthesia (circumoral and extremities) Hyperlipidemia (especially hypertriglyceridemia) Hepatitis Asthenia Dysgeusia Hyperglycemia Fat maldistribution

[a] For dose adjustments in people with hepatic insufficiency, see Appendix B.

[b] Also see Table 21.

Key: ARV = antiretroviral; ATV = atazanavir; ATV/c = atazanavir/cobicistat; AV = atrioventricular; COBI = cobicistat; CrCl = creatinine clearance; CYP = cytochrome P; DRV = darunavir; DRV/c = darunavir/cobicistat; EFV = efavirenz; FDC = fixed-dose combination; FTC = emtricitabine; GI = gastrointestinal; H2 = histamine H2 receptor; LPV/r = lopinavir/ritonavir; PI = protease inhibitor; PK = pharmacokinetic; PO = orally; PPI = proton pump inhibitor; RTV = ritonavir; STR = single-tablet regimen; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate; UGT1 = uridine diphosphate glucuronyl transferase 1 family

Appendix A, Table 6. Characteristics of Integrase Strand Transfer Inhibitors

Updated: September 12, 2024
Reviewed: September 25, 2025

The following table includes dose recommendations for U.S. Food and Drug Administration (FDA)–approved integrase strand transfer inhibitor products for adults with HIV. Not all formulations are FDA approved for adolescents with HIV. For information regarding the use of these medications in adolescents with HIV, including weight limitations and additional dosage forms, please consult FDA product labeling or Appendix A in the Pediatric Antiretroviral Guidelines.

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathways**	**Serum Half-Life**	**Adverse Events**[b]
Bictegravir (BIC)	BIC is available only as a component of the STR Biktarvy (BIC/TAF/FTC).[c]	• One tablet PO once daily	CYP3A4 substrate UGT1A1-mediated glucuronidation	~17 hours	Diarrhea Nausea Headache Weight gain
Cabotegravir (CAB)	**Available as part of the copackaged IM long-acting regimen Cabenuva (CAB IM and RPV IM)** • 400-mg/2-mL vial • 600-mg/3-mL vial **Also available in oral tablet formulation Vocabria (CAB PO)** • 30-mg tablet • Must be obtained from manufacturer for oral lead-in and oral bridging during administration of Cabenuva (CAB IM/RPV IM)	See Appendix A, Table 1 for dosing information for coformulated and copackaged regimens that contain CAB.	UGT1A1 and UGT1A9-mediated glucuronidation	PO: 41 hours IM: 6–12 weeks	**CAB Plus RPV** • Headache • Nausea • Abnormal dreams • Anxiety • Insomnia • Depressive disorders • Hepatotoxicity **IM Formulation Only** • Injection site reactions (e.g., pain, induration, swelling, nodules)

Appendix A, Table 6. Characteristics of Integrase Strand Transfer Inhibitors

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathways**	**Serum Half-Life**	**Adverse Events**[b]
Dolutegravir (DTG) *Tivicay*	**Tivicay** • 50-mg tablet **STRs That Contain DTG**[c] • Dovato (DTG/3TC) • Juluca (DTG/RPV) • Triumeq (DTG/ABC/3TC)	**In People Without Prior ARV Treatment or ARV-Experienced People Who Had Never Received INSTIs** • DTG 50 mg PO once daily **In People Without Prior ARV Treatment or ARV-Experienced People Who Had Never Received INSTIs When Coadministered With EFV, FPV/r, TPV/r, or Rifampin** • DTG 50 PO mg twice daily **In INSTI-Experienced People With Certain INSTI Mutations (See Product Label) or With Clinically Suspected INSTI Resistance** • DTG 50 mg PO twice daily See Appendix A, Table 1 for dosing information for STRs that contain DTG.	UGT1A1-mediated glucuronidation Minor substrate of CYP3A4	~14 hours	Insomnia Headache Depressive disorders and suicidal ideation (rare; usually occurs in people with preexisting psychiatric conditions) Weight gain Hepatotoxicity HSRs, including rash, constitutional symptoms, and organ dysfunction (including liver injury), have been reported.
Elvitegravir (EVG)	EVG is only available as a component of an STR tablet that also contains COBI, FTC, and either TDF or TAF. **STRs That Contain EVG**[c] • Genvoya (EVG/c/TAF/FTC) • Stribild (EVG/c/TDF/FTC)	**Genvoya** • One tablet PO once daily with food. • See Appendix B for recommendations on dosing in persons with renal insufficiency. **Stribild** • One tablet PO once daily with food. • **Not recommended** for people with baseline CrCl <70 mL/min (see Appendix B for the CrCl calculation equation).	**EVG** • CYP3A and UGT1A1/3 substrate **COBI** • CYP3A inhibitor and substrate • CYP2D6 inhibitor	EVG/c: ~13 hours	Nausea Diarrhea Depression and suicidal ideation (rare; usually occurs in people with preexisting psychiatric conditions)

Appendix A, Table 6. Characteristics of Integrase Strand Transfer Inhibitors

Generic Name (Abbreviation) *Trade Name*	**Formulations**	**Dosing Recommendations**[a]	**Elimination/ Metabolic Pathways**	**Serum Half-Life**	**Adverse Events**[b]
Raltegravir (RAL) *Isentress* *Isentress HD*	**Isentress** • 400-mg tablet • 100-mg single-use packet for oral suspension **Isentress HD** • 600-mg tablet	**Isentress** • 400 mg PO twice daily *With Rifampin* • 800 mg PO twice daily **Isentress HD** *In People Without Prior ARV Treatment or ARV-Experienced People With Virologic Suppression on a Regimen Containing RAL 400 mg Twice Daily* • 1,200 mg (two 600-mg tablets) PO once daily *With Rifampin* • Not recommended	UGT1A1-mediated glucuronidation	~9 hours	Rash, including Stevens-Johnson syndrome, HSR, and toxic epidermal necrolysis Nausea Headache Diarrhea Pyrexia CPK elevation, muscle weakness, and rhabdomyolysis Weight gain Insomnia Depression and suicidal ideation (rare; usually occurs in people with preexisting psychiatric conditions)

[a] For dose adjustments in people with hepatic insufficiency, see Appendix B. When no food restriction is listed, the antiretroviral drug can be taken with or without food.

[b] Also see Table 21.

[c] See Appendix A, Table 1 for information about these formulations.

Key: 3TC = lamivudine; ABC = abacavir; AE = adverse event; ARV = antiretroviral; BIC = bictegravir; CAB = cabotegravir; COBI = cobicistat; CPK = creatine phosphokinase; CrCl = creatinine clearance; CYP = cytochrome P; DTG = dolutegravir; EFV = efavirenz; EVG = elvitegravir; EVG/c = elvitegravir/cobicistat; FPV/r = fosamprenavir/ritonavir; FTC = emtricitabine; HSR = hypersensitivity reaction; IM = intramuscular; INSTI = integrase strand transfer inhibitor; NTD = neural tube defect; PO = orally; RAL = raltegravir; RPV = rilpivirine; STR = single-tablet regimen; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate; TPV/r = tipranavir/ritonavir; UGT1 = uridine diphosphate glucuronyl transferase 1 family

Appendix A, Table 7. Characteristics of the CCR5 Antagonist

Updated: September 25, 2025
Reviewed: September 25, 2025

The following table includes dose recommendations for the U.S. Food and Drug Administration (FDA)–approved CCR5 antagonist. For additional information regarding the use of this medication in adolescents with HIV, please consult FDA product labeling or Appendix A in the Pediatric Antiretroviral Guidelines.

Generic Name (Abbreviation) *Trade Name*	**Formulation**	**Dosing Recommendations**[a]	**Serum Half-Life**	**Elimination/ Metabolic Pathway**	**Adverse Events**[b]
Maraviroc (MVC) *Selzentry* **Note:** Generic products are available.	**Selzentry** • 150-mg and 300-mg tablets • 20-mg/1-mL oral solution **Generic** • 150-mg and 300-mg tablets	• MVC 150 mg PO twice daily when given with drugs that are strong CYP3A inhibitors (with or without CYP3A inducers), including PIs (except TPV/r) • MVC 300 mg PO twice daily when given with NRTIs, TPV/r, NVP, RAL, and other drugs that are not strong CYP3A inhibitors or inducers • MVC 600 mg PO twice daily when given with drugs that are CYP3A inducers, including EFV, ETR, etc. (without a CYP3A inhibitor) Take MVC without regard to food.	14–18 hours	CYP3A4 substrate	Abdominal pain Cough Dizziness Musculoskeletal symptoms Pyrexia Rash Upper respiratory tract infections Hepatotoxicity, which may be preceded by severe rash or other signs of systemic allergic reactions Orthostatic hypotension, especially in people with severe renal insufficiency

[a] For dose adjustments in people with hepatic insufficiency, see Appendix B.

[b] Also see Table 21.

Key: CYP = cytochrome P; EFV = efavirenz; ETR = etravirine; MVC = maraviroc; NRTI = nucleoside reverse transcriptase inhibitor; NVP = nevirapine; PI = protease inhibitor; PO = orally; RAL = raltegravir; TPV/r = tipranavir/ritonavir

Appendix A, Table 8. Characteristics of the CD4 Post-Attachment Inhibitor

Updated: May 26, 2023
Reviewed: September 25, 2025

The following table includes dose recommendations for the U.S. Food and Drug Administration (FDA)–approved CD4 post-attachment inhibitor. Ibalizumab is not FDA approved for use in adolescents with HIV.

Generic Name (Abbreviation) *Trade Name*	**Formulation**	**Dosing Recommendations**	**Serum Half-Life**	**Elimination/ Metabolic Pathway**	**Adverse Events**[a]
Ibalizumab (IBA) *Trogarzo*	• Single-dose 2-mL vial containing 200 mg/1.33 mL (150 mg/mL) of ibalizumab	• Administer a single loading dose of IBA 2,000-mg IV infusion over 30 minutes, followed by a maintenance dose of IBA 800-mg IV infusion over 15 minutes or IV push over 30 seconds every 2 weeks. • See prescribing information for additional instructions for preparing, storing, and administering IBA, and for monitoring people who are receiving IBA.	~64 hours	Not well defined	Diarrhea Dizziness Nausea Rash HSRs, including anaphylaxis and infusion-related reactions, have been reported.

[a] Also see Table 21.

Key: HSR = hypersensitivity reaction; IBA = ibalizumab; IV = intravenous

Appendix A, Table 9. Characteristics of the gp120 Attachment Inhibitor

Updated: May 26, 2023
Reviewed: September 25, 2025

The following table includes dose recommendations for the U.S. Food and Drug Administration (FDA)–approved gp120 attachment inhibitor. Fostemsavir is not FDA approved for use in adolescents with HIV.

Generic Name (Abbreviation) *Trade Name*	**Formulation**	**Dosing Recommendations**	**Serum Half-Life**	**Elimination/ Metabolic Pathway**	**Adverse Events**[a]
Fostemsavir (FTR) *Rukobia*	• 600-mg extended-release tablets	• FTR 600 mg PO twice daily	11 hours	Hydrolysis (esterases), CYP3A4	Nausea Transaminase elevation; transient bilirubin elevation Sleep disturbance, dizziness QTc prolongation was seen at four times the recommended dose. Use with caution in people with preexisting heart disease, QTc prolongation, or concomitant use of medications that may prolong QTc interval.

[a] Also see Table 21.

Key: CYP = cytochrome P; FTR = fostemsavir; PO = orally; QTc = corrected QT interval

Appendix A, Table 10. Characteristics of the Capsid Inhibitor

Updated: September 25, 2025
Reviewed: September 25, 2025

The following table includes dose recommendations for the U.S. Food and Drug Administration (FDA)–approved capsid inhibitor. Lenacapavir is not FDA approved for use in adolescents with HIV.

Generic Name (Abbreviation) *Trade Name*	**Formulation**	**Dosing Recommendations**	**Serum Half-Life**	**Elimination/ Metabolic Pathway**	**Adverse Events**[a]
Lenacapavir (LEN) *Sunlenca*	• 300-mg tablet • Single-dose 463.5-mg/1.5-mL vial for injection	**Initiation Option 1** • Day 1: 927 mg SQ x 1 dose + 600 mg PO x 1 dose • Day 2: 600 mg PO x 1 dose **Initiation Option 2** • Day 1: 600 mg PO x 1 dose • Day 2: 600 mg PO x 1 dose • Day 8: 300 mg PO x 1 dose • Day 15: 927 mg SQ x 1 dose **Maintenance Dosing** • 927 mg by SQ injection every 6 months from the date of the last injection (+/-2 weeks) **Note:** Each SQ dose requires two injections.	PO: 10–12 days SQ: 8–12 weeks	Substrate of P-glycoprotein, CYP3A (minor), UGT1A1 (minor) CYP3A4 inhibitor (moderate)	Injection site reactions, including nodules, induration, and necrosis Serious injection site reactions (e.g., necrosis and ulcer) may occur when LEN is improperly administered intradermally instead of subcutaneously. Nausea, diarrhea, headache

[a] Also see Table 21.

Key: CYP = cytochrome P; LEN = lenacapavir; PO = orally; SQ = subcutaneous

APPENDIX B. ANTIRETROVIRAL DOSING RECOMMENDATIONS IN ADULTS WITH RENAL OR HEPATIC INSUFFICIENCY

Updated: September 25, 2025
Reviewed: September 25, 2025

These tables include antiretroviral (ARV) products that are not approved by the U.S. Food and Drug Administration (FDA) for use in adolescents with HIV. For information regarding the use of ARV medications in adolescents with HIV, including weight limitations and additional dosage forms, please consult FDA product labeling or Appendix A in the Pediatric Antiretroviral Guidelines.

Renal dosing information for fixed-dose combination products, as well as coformulated and copackaged antiretroviral regimens, is included in the tables below. The older antiretroviral drugs fosamprenavir (FPV), lopinavir/ritonavir (LPV/r), nelfinavir (NFV), nevirapine (NVP), tipranavir (TPV), and zidovudine (ZDV) have been removed from this table. Please refer to the FDA product labels for these drugs for recommendations on dosing in adults and adolescents with renal or hepatic insufficiency.

Please refer to the National Institute of Diabetes and Digestive and Kidney Diseases Determining Drug Dosing in Adults With Chronic Kidney Disease webpage for a discussion on using estimated creatinine clearance (CrCl) versus estimated glomerular filtration rate (eGFR) in determining renal function. eGFR based on the 2021 Chronic Kidney Disease Epidemiology Collaboration (or CKD-EPI) equation can be determined using this eGFR calculator. In FDA prescribing information, renal dosing recommendations for most ARVs are based on CrCl using the Cockroft-Gault formula.

See the section at the end of this table for criteria for Child-Pugh Classifications.

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**	**Dosing in Adults With Hepatic Impairment**
Nucleoside Reverse Transcriptase Inhibitors			
Abacavir (ABC) *Ziagen*	ABC 300 mg PO twice daily *or* ABC 600 mg PO once daily	No dose adjustment.	*Child-Pugh Class A:* ABC 200 mg PO twice daily (use oral solution) *Child-Pugh Class B or C:* **Contraindicated**

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**	**Dosing in Adults With Hepatic Impairment**
Abacavir/Lamivudine (ABC/3TC)	One tablet PO once daily	Not FDA recommended if CrCl <30 mL/min due to the 3TC component. **Note:** There is insufficient evidence to recommend for or against the use of full-dose 3TC in people with CrCl <30 mL/min. To allow people to remain on the FDC product, some Panel members use full-dose 3TC. See the 3TC entry for more information.	*Child-Pugh Class A:* People with mild hepatic impairment require a dose reduction of ABC (as noted above). Use the individual drugs instead of the FDC tablet in these people. *Child-Pugh Class B or C:* **Contraindicated** due to the ABC component
Emtricitabine (FTC) *Emtriva*	FTC 200-mg oral capsule once daily *or* FTC 240-mg (24-mL) oral solution once daily **Note:** There is insufficient evidence to recommend for or against the use of full-dose, daily FTC in people with CrCl <30 mL/min who are not on HD. To allow people to remain on TAF-containing FDC products, some Panel members use full-dose, daily FTC in people with CrCl 15–29 mL/min who are not on HD.	**Dose by Formulation** **CrCl (mL/min)** / **Capsule** / **Solution** 30–49[b] — No dose adjustment. 15–29 (see **Note**) — 200 mg every 72 hours — 80 mg every 24 hours <15 (not on HD) (see **Note**) — 200 mg every 96 hours — 60 mg every 24 hours On HD[b] — No dose adjustment. On HD days, administer after dialysis.	No dose recommendation

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**			**Dosing in Adults With Hepatic Impairment**
Lamivudine (3TC) *Epivir*	3TC 300 mg PO once daily *or* 3TC 150 mg PO twice daily **Note:** PK and safety data are limited on the use of 3TC doses higher than those recommended by the FDA in people with CrCl <30 mL/min. Clinicians may consider using the nearest available tablet strength (100 mg or 150 mg), as outlined in the "Alternative Dose" column **(BIII)** (see rationale[d]). There is insufficient evidence to recommend for or against the use of full-dose 3TC in people with CrCl <30 mL/min. To allow people to remain on certain ABC and/or DTG-containing FDC products, some Panel members use full-dose 3TC.	**CrCl (mL/min)**	**Epivir Label Dose**	**Alternative Dose**[d]	No dose adjustment
		30–49[c]	No dose adjustment.		
		15–29 (see **Note**)	1 × 150 mg, then 100 mg every 24 hours	100–150 mg every 24 hours	
		5–14 (see **Note**)	1 × 150 mg, then 50 mg every 24 hours	100–150 mg every 24 hours	
		<5 or on HD (see **Note**)	1 × 50 mg, then 25 mg every 24 hours	100–150 mg every 24 hours	
Tenofovir Alafenamide (TAF) *Vemlidy*	Vemlidy is available as a 25-mg tablet given PO once daily for the treatment of HBV.	**CrCl (mL/min)**	**Dose**		*Child-Pugh Class A:* No dose adjustment *Child-Pugh Class B or C:* **Not recommended**
		<15 (not on HD)	**Not recommended**		
		On HD	No dose adjustment. On HD days, administer after dialysis.		

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**		**Dosing in Adults With Hepatic Impairment**
Tenofovir Alafenamide/ Emtricitabine (TAF/FTC) *Descovy*	TAF for HIV treatment is only available as a component of FDC tablets (i.e., in Biktarvy, Descovy, Genvoya, Odefsey, and Symtuza). • TAF 10 mg PO once daily with EVG/c (Genvoya) or DRV/c (Symtuza) • TAF 25 mg PO once daily in other FDC tablets	**CrCl (mL/min)**	**Dose**	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C*: No dose recommendation
		15–29	**Not recommended** **Note:** There is insufficient evidence to recommend for or against the use of full-dose, daily FTC in people with CrCl <30 mL/min. To allow people to remain on the FDC product, some Panel members use full-dose FTC in people with CrCl 15–29 mL/min.	
		<15 (not on HD)	**Not recommended**	
		On HD	No dose adjustment. On HD days, administer after dialysis.	
Tenofovir Disoproxil Fumarate (TDF) *Viread*	TDF 300 mg PO once daily	**CrCl (mL/min)**	**Dose**	No dose adjustment
		30–49	300 mg every 48 hours	
		10–29	300 mg twice weekly (every 72–96 hours)	
		<10 (not on HD)	No dose recommendation	
		On HD	300 mg every 7 days (administer after completion of HD)	
Tenofovir Disoproxil Fumarate/Emtricitabine (TDF/FTC) *Truvada*	One tablet PO once daily	**CrCl (mL/min)**	**Dose**	No dose recommendation
		30–49	One tablet every 48 hours	
		<30 or on HD	FDC of TDF/FTC **not recommended**	

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**		**Dosing in Adults With Hepatic Impairment**
Tenofovir Disoproxil Fumarate/Lamivudine (TDF/3TC) *Cimduo*	One tablet PO once daily	**CrCl (mL/min)**	**Dose**	No dose recommendation
		<50 or on HD	FDC of TDF/3TC **not recommended**	
Non-Nucleoside Reverse Transcriptase Inhibitors				
Doravirine (DOR) *Pifeltro*	DOR 100 mg PO once daily	No dose adjustment		*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation
Doravirine/Tenofovir Disoproxil Fumarate/ Lamivudine (DOR/TDF/3TC) *Delstrigo*	One tablet PO once daily	FDC of DOR/TDF/3TC **not recommended** if CrCl <50 mL/min or on HD		*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation
Efavirenz (EFV)	EFV 600 mg PO once daily on an empty stomach, preferably at bedtime	No dose adjustment		No dose recommendation; use with caution in people with hepatic impairment.
Efavirenz/Tenofovir Disoproxil Fumarate/ Emtricitabine (EFV/TDF/FTC)	One tablet PO once daily on an empty stomach, preferably at bedtime	FDC of EFV/TDF/FTC **not recommended** if CrCl <50 mL/min or on HD		No dose recommendation; use with caution in people with hepatic impairment.
Efavirenz/ Tenofovir Disoproxil Fumarate/ Lamivudine (EFV/TDF/3TC) *Symfi*	One tablet PO once daily on an empty stomach, preferably at bedtime	FDC of EFV/TDF/3TC **not recommended** if CrCl <50 mL/min or on HD		*Child-Pugh Class A:* Use with caution *Child-Pugh Class B or C:* **Not recommended**
Etravirine (ETR) *Intelence*	ETR 200 mg PO twice daily	No dose adjustment		*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**	**Dosing in Adults With Hepatic Impairment**
Rilpivirine (RPV PO) *Edurant*	RPV 25 mg PO once daily with food	No dose adjustment	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation
Rilpivirine IM Plus Cabotegravir IM (RPV IM and CAB IM) *Cabenuva*	**Monthly Dosing** • Loading dose: RPV 900 mg/3 mL IM × 1 dose and CAB 600 mg/3 mL IM × 1 dose • Continuation phase: RPV 600 mg/ 2 mL IM every 4 weeks and CAB 400 mg/2 mL IM every 4 weeks **Every-2-Months Dosing** • Loading dose: RPV 900 mg/3 mL IM and CAB 600 mg/3 mL IM monthly for 2 doses • Continuation phase: RPV 900 mg/ 3 mL IM and CAB 600 mg/3 mL IM every 2 months	No dose adjustment CrCl <30 or on HD: No dose adjustment; increase monitoring for adverse events.	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation
Rilpivirine/Tenofovir Alafenamide/ Emtricitabine (RPV/TAF/FTC) *Odefsey*	One tablet PO once daily with food	**In People With CrCl 15–29 mL/min** • **Not recommended** • **Note:** There is insufficient evidence to recommend for or against the use of full-dose, daily FTC in people with CrCl <30 mL/min. To allow people to remain on the FDC product, some Panel members use full-dose, daily FTC in people with CrCl 15–29 mL/min. **In People With CrCl <15 mL/min (not on HD)** • **Not recommended** **In People on Chronic HD** • No dose adjustment. On HD days, administer after dialysis.	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**	**Dosing in Adults With Hepatic Impairment**
Rilpivirine/Tenofovir Disoproxil Fumarate/ Emtricitabine (RPV/TDF/FTC) *Complera*	One tablet PO once daily with food	FDC of RPV/TDF/FTC **not recommended** if CrCl <50 mL/min or on HD	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation
Rilpivirine/Dolutegravir (RPV/DTG) *Juluca*	One tablet PO once daily with food	No dose adjustment In people with CrCl <30 mL/min: No dose adjustment, monitor closely for adverse effects.	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation
Protease Inhibitors			
Atazanavir (ATV) *Reyataz*	ATV 400 mg PO once daily with food *or* (ATV 300 mg plus RTV 100 mg) PO once daily with food	**In People Without Prior ARV Treatment on HD** • (ATV 300 mg plus RTV 100 mg) once daily with food. **In ARV-Experienced People on HD** • ATV and ATV/r **are not recommended.**	**For Boosted ATV** • RTV boosting **is not recommended** in people with any degree of hepatic impairment. **For Unboosted ATV** • *Child-Pugh Class A:* No dose adjustment • *Child-Pugh Class B:* ATV 300 mg once daily (unboosted) for people without prior ARV treatment • *Child-Pugh Class C:* **Not recommended**
Atazanavir/Cobicistat (ATV/c) *Evotaz*	One tablet PO once daily with food	**If Used With TDF** • **Not recommended** if CrCl <70 mL/min	**Not recommended** in people with any degree of hepatic impairment.

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**	**Dosing in Adults With Hepatic Impairment**
Darunavir (DRV) *Prezista*	**In People Without Prior ARV Treatment or ARV-Experienced Treatment With No DRV Mutations** • (DRV 800 mg plus RTV 100 mg) PO once daily with food. **In ARV-Experienced People With at Least One DRV Resistance Mutation** • (DRV 600 mg plus RTV 100 mg) PO twice daily with food.	No dose adjustment	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* **Not recommended**
Darunavir/Cobicistat (DRV/c) *Prezcobix*	One tablet PO once daily with food	**If Used With TDF** • **Not recommended** if CrCl <70 mL/min	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* **Not recommended**
Darunavir/Cobicistat/ Tenofovir Alafenamide/ Emtricitabine (DRV/c/TAF/FTC) *Symtuza*	One tablet PO once daily with food	**In People With CrCl 15–29 mL/min** • **Not recommended** • **Note:** There is insufficient evidence to recommend for or against the use of full-dose, daily FTC in people with CrCl <30 mL/min. To allow people to remain on the FDC product, some Panel members use full-dose, daily FTC in people with CrCl 15–29 mL/min. **In People With CrCl <15 mL/min (not on HD)** • **Not recommended** **In People on Chronic HD** • No dose adjustment. On HD days, administer after dialysis.	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* **Not recommended**
Ritonavir (RTV) *Norvir*	**As a PI-Boosting Agent** • RTV 100–400 mg PO per day with food.	No dose adjustment	Refer to recommendations for the primary (i.e., boosted) PI.

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**	**Dosing in Adults With Hepatic Impairment**
Integrase Strand Transfer Inhibitors			
Bictegravir/Tenofovir Alafenamide/ Emtricitabine (BIC/TAF/FTC) *Biktarvy*	One tablet PO once daily	**In People With CrCl 15–29 mL/min** • **Not recommended** • **Note:** There is insufficient evidence to recommend for or against the use of full-dose, daily FTC in people with CrCl <30 mL/min. To allow people to remain on the FDC product, some Panel members use full-dose, daily FTC in people with CrCl 15–29 mL/min. **In People With CrCl <15 mL/min (not on HD)** • **Not recommended** **In People on Chronic HD** • No dose adjustment. On HD days, administer after dialysis.	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* **Not recommended**
Cabotegravir (CAB PO) *Vocabria*	**Treatment (As Optional Oral Lead-In or As Oral Bridging)** • CAB 30 mg PO once daily, given with RPV 25 mg PO, with food before switching to CAB IM and RPV IM	No dose adjustment	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**	**Dosing in Adults With Hepatic Impairment**
Cabotegravir IM Plus Rilpivirine IM (CAB IM plus RPV IM) *Cabenuva*	**Monthly Dosing** • Loading dose: CAB 600 mg/3 mL IM × 1 dose and RPV 900 mg/3 mL IM × 1 dose • Continuation phase: CAB 400 mg/2 mL IM every 4 weeks and RPV 600 mg/2 mL IM every 4 weeks **Every-2-Months Dosing** • Loading dose: CAB 600 mg/3 mL IM and RPV 900 mg/3 mL IM monthly for 2 doses • Continuation phase: CAB 600 mg/3 mL IM and RPV 900 mg/3 mL IM every 2 months	No dose adjustment CrCl <30 or on HD: No dose adjustment; increase monitoring for adverse events.	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation
Dolutegravir (DTG) *Tivicay*	DTG 50 mg PO once daily *or* DTG 50 mg PO twice daily	No dose adjustment	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* **Not recommended**
Dolutegravir/Abacavir/ Lamivudine (DTG/ABC/3TC) *Triumeq*	One tablet PO once daily	Not FDA recommended if CrCl <30 mL/min due to the 3TC component **Note:** There is insufficient evidence to recommend for or against the use of full-dose 3TC in people with CrCl <30 mL/min. To allow people to remain on the FDC product, some Panel members use full-dose 3TC.[d]	*Child-Pugh Class A:* People with mild hepatic impairment require a dose reduction of ABC. Use the individual drugs instead of the FDC tablet in these people. *Child-Pugh Class B or C:* **Contraindicated** due to the ABC component

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**	**Dosing in Adults With Hepatic Impairment**
Dolutegravir/ Lamivudine (DTG/3TC) *Dovato*	One tablet PO once daily	Not FDA recommended if CrCl <30 mL/min due to 3TC component **Note:** There is insufficient evidence to recommend for or against the use of full-dose 3TC in people with CrCl <30 mL/min. To allow people to remain on the FDC product, some Panel members use full-dose 3TC.[d]	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* **Not recommended**
Dolutegravir/ Rilpivirine (DTG/RPV) *Juluca*	One tablet PO once daily with food	No dose adjustment CrCl <30 or on HD: No dose adjustment; increase monitoring for adverse events.	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation
Elvitegravir/Cobicistat/ Tenofovir Alafenamide/ Emtricitabine (EVG/c/TAF/FTC) *Genvoya*	One tablet PO once daily with food	**In People With CrCl 15–29 mL/min** • **Not recommended** • **Note:** There is insufficient evidence to recommend for or against the use of full-dose, daily FTC in people with CrCl <30 mL/min. To allow people to remain on the FDC product, some Panel members use full-dose, daily FTC in people with CrCl 15–29 mL/min. **In People With CrCl <15 mL/min (not on HD)** • **Not recommended** **In People on Chronic HD** • No dose adjustment. On HD days, administer after dialysis.	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* **Not recommended**
Elvitegravir/Cobicistat/ Tenofovir Disoproxil Fumarate/Emtricitabine (EVG/c/TDF/FTC) *Stribild*	One tablet PO once daily with food	EVG/c/TDF/FTC **should not be initiated** in people with CrCl <70 mL/min. Discontinue EVG/c/TDF/FTC if CrCl declines to <50 mL/min while on therapy.	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* **Not recommended**

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**	**Dosing in Adults With Hepatic Impairment**
Raltegravir (RAL) *Isentress* *Isentress HD*	RAL 400 mg PO twice daily (using Isentress formulation) *or* RAL 1,200 mg PO once daily (using Isentress HD formulation only)	No dose adjustment	**For Isentress** • *Child-Pugh Class A or B:* No dose adjustment • *Child-Pugh Class C:* No dose recommendation **For Isentress HD** • **Not recommended** for people with hepatic impairment.
CCR5 Antagonist			
Maraviroc (MVC) *Selzentry*	The recommended dose differs based on concomitant medications and potential for drug–drug interactions. See Appendix A, Table 7 for detailed dosing information.	**In People With CrCl <30 mL/min or People Who Are on HD** *Without Potent CYP3A Inhibitors or Inducers* • MVC 300 mg twice daily; if postural hypotension occurs, reduce to MVC 150 mg twice daily *With Potent CYP3A Inducers or Inhibitors* • **Not recommended**	No dose recommendations. MVC concentrations will likely be increased in people with hepatic impairment.
CD4 Post-Attachment Inhibitor			
Ibalizumab (IBA) *Trogarzo*	Loading dose: IBA 2,000 mg IV Maintenance dose: IBA 800 mg IV every 2 weeks	No dose adjustment	No dose recommendation
gp-120 Attachment Inhibitor			
Fostemsavir (FTR) *Rukobia*	FTR 600 mg PO twice daily	No dose adjustment	No dose adjustment

Appendix B. Antiretroviral Dosing Recommendations in Adults With Renal or Hepatic Insufficiency

Generic Name (Abbreviation) *Trade Name*	**Usual Dose**[a]	**Dosing in Adults With Renal Insufficiency**	**Dosing in Adults With Hepatic Impairment**
Capsid Inhibitor			
Lenacapavir (LEN) *Sunlenca*	**Initiation Option 1** • Day 1: 927 mg SQ x 1 dose plus 600 mg PO x 1 dose • Day 2: 600 mg PO x 1 dose **Initiation Option 2** • Day 1: 600 mg PO x 1 dose • Day 2: 600 mg PO x 1 dose • Day 8: 300 mg PO x 1 dose • Day 15: 927 mg SQ x 1 dose **Maintenance Dosing** • 927 mg by SQ injection every 6 months from the date of the last injection (+/-2 weeks)	No dose adjustment	*Child-Pugh Class A or B:* No dose adjustment *Child-Pugh Class C:* No dose recommendation

[a] Refer to Appendix A, Tables 1–10 for additional dosing information.

[b] The prescribing information for FTC (Emtriva) recommends adjusted doses for people with CrCl 30–49 mL/min and people on hemodialysis. However, the prescribing information for several FDC products that contain FTC (including Descovy, Biktarvy, Genvoya, and Odefsey) recommends that the standard dose (FTC 200 mg) can be given once daily in these people. The recommendations in this table incorporate the dosing guidance from the FDC products.

[c] The prescribing information for 3TC (Epivir) recommends dosage adjustment from 300 mg once daily to 150 mg once daily for people with CrCl 30–49 mL/min. However, the prescribing information for several FDC products that contain 3TC (including ABC plus 3TC, Dovato, and Triumeq) recommends no dose adjustment for CrCl 30–49 mL/min. The recommendation in this table incorporates the dosing guidance from the FDC products.

[d] Use of 3TC doses higher than those recommended by the FDA for people with CrCl <30 mL/min has been reported in clinical practice[1-4] and endorsed in the *Guidelines for Chronic Kidney Disease in People With HIV* for many years[5]; limited published literature has supported the safety of this practice.[2,3] 3TC has a wide therapeutic index with no established correlation between elevated concentrations and adverse events. Serious adverse events, such as lactic acidosis and severe hematologic toxicities, have been reported in rare cases; however, these effects typically occurred when 3TC was used in combination with older nucleoside reverse transcriptase inhibitors (such as didanosine, stavudine, zidovudine). Clinicians may consider using the nearest available tablet strength (100 mg or 150 mg) to avoid the need for 3TC oral solution, thereby simplifying ARV regimens and facilitating adherence **(BIII).** See the Alternative Dose column in 3TC table entry. There is insufficient evidence to recommend for or against the use of full-dose 3TC in people with CrCl <30 mL/min. To allow people to remain on certain FDC products, some Panel members use full-dose 3TC.

Key: 3TC = lamivudine; ABC = abacavir; AE = adverse effect; ARV = antiretroviral; ATV = atazanavir; ATV/c = atazanavir/cobicistat; ATV/r = atazanavir/ritonavir; BIC = bictegravir; CAB = cabotegravir; CrCl = creatinine clearance; CYP = cytochrome P450; DOR = doravirine; DRV = darunavir; DRV/c = darunavir/cobicistat; DTG = dolutegravir; EFV = efavirenz; ETR = etravirine; EVG/c = elvitegravir/cobicistat; FDA = U.S. Food and Drug Administration; FDC = fixed-dose combination; FTC = emtricitabine; FTR = fostemsavir; HBV = hepatitis B virus; HD = hemodialysis; IBA = ibalizumab; IM = intramuscular; IV = intravenous; LEN = lenacapavir; MVC = maraviroc; the Panel = Panel on Antiretroviral Guidelines for Adults and Adolescents; PK = pharmacokinetic; PI = protease inhibitor; PO = orally; RAL = raltegravir; RPV = rilpivirine; RTV = ritonavir; SQ = subcutaneous; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate

Child-Pugh Classifications

Child-Pugh Score			
Component	**Points Scored**		
	1	**2**	**3**
Encephalopathy[a]	None	Grade 1–2	Grade 3–4
Ascites	None	Mild or controlled by diuretics	Moderate or refractory despite diuretics
Albumin	>3.5 g/dL	2.8–3.5 g/dL	<2.8 g/dL
Total Bilirubin, *or*	<2 mg/dL (<34 μmol/L)	2–3 mg/dL (34–50 μmol/L)	>3 mg/dL (>50 μmol/L)
Modified Total Bilirubin[b]	<4 mg/dL	4–7 mg/dL	>7 mg/dL
Prothrombin Time (Seconds Prolonged), *or*	<4	4–6	>6
International Normalized Ratio (INR)	<1.7	1.7–2.3	>2.3

[a] Encephalopathy Grades

Grade 1: Mild confusion, anxiety, restlessness, fine tremor, slowed coordination

Grade 2: Drowsiness, disorientation, asterixis

Grade 3: Somnolent but rousable, marked confusion, incomprehensible speech, incontinence, hyperventilation

Grade 4: Coma, decerebrate posturing, flaccidity

[b] Modified total bilirubin is used for people who have Gilbert's syndrome or who are taking atazanavir.

Child-Pugh Classification	Total Child-Pugh Score[a]
Class A (Mild)	5–6 points
Class B (Moderate)	7–9 points
Class C (Severe)	>9 points

[a] Sum of points for each component of the Child-Pugh Score.

APPENDIX C. KEY TO ACRONYMS

Updated: September 25, 2025
Reviewed: September 25, 2025

Drug Name Abbreviations

Abbreviation	Definition
3TC	lamivudine
ABC	abacavir
ATV	atazanavir
ATV/c	atazanavir/cobicistat
ATV/r	atazanavir/ritonavir
BIC	bictegravir
CAB	cabotegravir
CAB-LA	long-acting cabotegravir
COBI or c	cobicistat
d4T	stavudine
ddC	zalcitabine
ddI	didanosine
DLV	delavirdine
DOR	doravirine
DRV	darunavir
DRV/c	darunavir/cobicistat
DRV/r	darunavir/ritonavir
DTG	dolutegravir
EFV	efavirenz
ETR	etravirine
EVG	elvitegravir
EVG/c	elvitegravir/cobicistat
FPV	fosamprenavir
FPV/r	fosamprenavir/ritonavir
FTC	emtricitabine
FTR	fostemsavir
IBA	ibalizumab or ibalizumab-uiyk

Abbreviation	Definition
IDV	indinavir
LA CAB/RPV	long-acting cabotegravir plus rilpivirine
LEN	lenacapavir
LPV	lopinavir
LPV/r	lopinavir/ritonavir
MVC	maraviroc
NFV	nelfinavir
NVP	nevirapine
RAL	raltegravir
RPV	rilpivirine
RTV or r	ritonavir
SQV	saquinavir
T-20	enfuvirtide
TAF	tenofovir alafenamide
TDF	tenofovir disoproxil fumarate
TFV	tenofovir
TFV-DP	tenofovir-diphosphate
TMP-SMX	trimethoprim-sulfamethoxazole
TMR	temsavir
TPV	tipranavir
TPV/r	tipranavir/ritonavir
ZDV	zidovudine

General Terms

Abbreviation	Definition
17-BMP	beclomethasone 17-monopropionate
ACA	Affordable Care Act
ACC	American College of Cardiology
ADAP	AIDS Drug Assistance Program
AE	adverse event
Ag/Ab	antigen/antibody
AHA	American Heart Association
AHC-HRSN	Accountable Health Communities Health-Related Social Needs
Al	aluminum
ALT	alanine aminotransferase
AMP	average manufacturer price
ART	antiretroviral therapy
ARTAS	Anti-Retroviral Treatment and Access to Services
ARV	antiretroviral
ASP	average sales price
ASCVD	atherosclerotic cardiovascular disease
AST	aspartate aminotransferase
AUC	area under the curve
AUD	alcohol use disorder
AUDIT-C	Alcohol Use Disorders Identification Test-Consumption
AV	atrioventricular
AWP	average wholesale price
AYA	adolescents and young adults
BMD	bone mineral density
BMI	body mass index
BMT	bone marrow transplant
BUN	blood urea nitrogen
Ca	calcium
$CaCO_3$	calcium carbonate
CAP	cost-sharing assistance program

Abbreviation	Definition
CBC	complete blood count
CCB	calcium channel blocker
CD4	CD4 T lymphocyte
CDC	Centers for Disease Control and Prevention
CGRP	calcitonin gene-related peptide
CHF	congestive heart failure
CI	confidence interval capsid inhibitor
CKD	chronic kidney disease
Cl	chloride
C_{max}	maximum plasma concentration
C_{min}	minimum plasma concentration
CMS	Centers for Medicare & Medicaid Services
CMV	cytomegalovirus
CNS	central nervous system
COC	combined oral contraceptive
CPI-U	consumer price index-urban
CPK	creatine phosphokinase
Cr	creatinine
CrCl	creatinine clearance
CsA	cyclosporine
CSF	cerebrospinal fluid
CV	cardiovascular
CVD	cardiovascular disease
CYP	cytochrome P450
D/M	dual/mixed
DAA	direct-acting antiviral
DDI	drug–drug interaction
DHA	dihydroartemisinin
DILI	drug-induced liver injury
DM	diabetes mellitus
DMPA	depo-medroxyprogesterone acetate

Abbreviation	Definition
DOAC	direct oral anticoagulant
DOT	directly observed therapy
DSMB	Data Safety Monitoring Board
DVT	deep vein thrombosis
EBV	Epstein-Barr virus
ECG	electrocardiogram
eGFR	estimated glomerular filtration rate
EI	entry inhibitor
ESRD	end-stage renal disease
FCP	federal ceiling price
FDA	U.S. Food and Drug Administration
FDC	fixed-dose combination
Fe	iron
FPL	federal poverty level
FUL	federal upper limit
GHB	gamma-hydroxybutyrate
GI	gastrointestinal
GIP	glucose-dependent insulinotropic polypeptide
GLP-1	glucagon-like peptide-1
GVHD	graft versus host disease
H2	histamine type 2
H2RA	H2 receptor antagonist
HAND	HIV-associated neurocognitive disorder
HAV	hepatitis A virus
HbA1C	hemoglobin A1c
HBcAb	hepatitis B core antibody
HBeAg	hepatitis B e antigen
HBsAb	hepatitis B surface antibody
HBsAg	hepatitis B surface antigen
HBV	hepatitis B virus
HCC	hepatocellular carcinoma
HCO_3	bicarbonate

Abbreviation	Definition
HCT	hematopoietic cell transplant
HCV	hepatitis C virus
HD	hemodialysis high-dose
HDL	high-density lipoprotein
HDV	hepatitis D virus
HHS	U.S. Department of Health and Human Services
HIV	human immunodeficiency virus
HIV RNA	HIV viral load
HIV-1	human immunodeficiency virus type 1
HIV-2	human immunodeficiency virus type 2
HIVMA/IDSA	HIV Medicine Association of the Infectious Diseases Society of America
HLA	human leukocyte antigen
HMG-CoA	hydroxy-methylglutaryl-coenzyme A
HPTN	HIV Prevention Trials Network
HR	hazard ratio
HRSA	Health Resources and Services Administration
HRT	hormone replacement therapy
hs-CRP	high-sensitivity C-reactive protein
HSR	hypersensitivity reaction
HTLV-1	human T-lymphotropic virus-1 type I
IC_{50}	median inhibitory concentration
IL	interleukin
IL-2	Interleukin-2
IL-6	Interleukin-6
IL-7	Interleukin-7
IM	intramuscular
IMF	illicitly manufactured fentanyl
IN	integrase
INR	international normalized ratio
INSTI	integrase strand transfer inhibitor
IPT	isoniazid preventive therapy

Abbreviation	Definition
IQR	interquartile range
IRIS	immune reconstitution inflammatory syndrome
IRR	incident rate ratio
ISR	injection site reactions
IUD	intrauterine device
IV	intravenous
K	potassium
LA	long-acting
LDL	low-density lipoprotein
LDL-C	low-density lipoprotein cholesterol
LLOD	lower limits of detection
LTBI	latent tuberculosis infection
MAC	*Mycobacterium avium* complex
MACE	major adverse cardiovascular events
MDMA	methylenedioxymethamphetamine
MDR	multidrug resistant
MDR-TB	multidrug-resistant tuberculosis
MDRP	Medicaid Drug Rebate Program
MET	motivational enhancement therapy
Mg	magnesium
MHC	major histocompatibility complex
MI	motivational interviewing myocardial infarction
MMP	Medication Monitoring Project
MPA	medroxyprogesterone acetate
MRI	magnetic resonance imaging
MSM	men who have sex with men
MTR	multi-tablet regimen
N/A	not applicable
Na	sodium
NASTAD	National Alliance of State & Territorial AIDS Directors
NIH	National Institutes of Health

Abbreviation	Definition
NNRTI	non-nucleoside reverse transcriptase inhibitor
NNT_5	number needed to treat over 5 years
NRTI	nucleoside/nucleotide reverse transcriptase inhibitor
NTD	neural tube defect
OARAC	Office of AIDS Research Advisory Council
OATP	organic anion-transporting polypeptide
OBR	optimized background regimen
OCT2	organic cation transporter 2
OH-itraconazole	active metabolite of itraconazole
OI	opportunistic infection
ONDCP	Office of National Drug Control Policy
OR	odds ratio
OTP	opioid treatment program
OUD	opioid use disorder
P	phosphorus
P-gp	p-glycoprotein
PAH	pulmonary arterial hypertension
PAP	patient assistance program
PBM	pharmacy benefit manager
PCE	Pooled Cohort Equations
PCP	*Pneumocystis jirovecii* pneumonia
PCR	polymerase chain reaction
PDAY	Pathobiological Determinants of Atherosclerosis in Youth
PDE5	phosphodiesterase type 5
PEP	post-exposure prophylaxis
PI	protease inhibitor
PI/b	boosted protease inhibitor
PI/c	cobicistat-boosted protease inhibitor
PI/r	ritonavir-boosted protease inhibitor
PK	pharmacokinetic
PO	orally
PPI	proton pump inhibitor

Abbreviation	Definition
PR	protease
PRAPARE	Protocol for Responding to and Assessing Patients' Assets, Risks, and Experiences
PrEP	pre-exposure prophylaxis
PREVENT	Predicting Risk of CVD EVENTs
PTH	parathyroid hormone
QTc	QT corrected for heart rate
RA	receptor agonist
REPC	Retention through Enhanced Personal Contact
RNA	ribonucleic acid
RT	reverse transcriptase
RWHAP	Ryan White HIV/AIDS Program
SAMHSA	Substance Abuse and Mental Health Services Administration
SCr	serum creatinine
SDOH	social determinants of health
SMAC	state maximum allowable cost
SMR	sexual maturity rating
SOT	solid organ transplantation
SPT	skin patch test
SQ	subcutaneous
SSP	syringe service program
SSRI	selective serotonin reuptake inhibitor
STI	sexually transmitted infection
STR	single-tablet regimen
SUD	substance use disorder
TasP	treatment as prevention
TB	tuberculosis
TC	total cholesterol
TCA	tricyclic antidepressant
TDM	therapeutic drug monitoring
TDR	transmitted drug resistance
TG	triglyceride

Abbreviation	Definition
The Panel	The Panel on Antiretroviral Guidelines for Adults and Adolescents
U=U	Undetectable = Untransmittable
UGT	uridine diphosphate glucuronosyltransferase
UGT1	uridine diphosphate glucuronosyltransferase 1 family
UGT1A1	uridine diphosphate glucuronosyltransferase 1A1
ULN	upper limit of normal
USPSTF	U.S. Preventive Services Task Force
UW	University of Washington

Drug Interactions with Gender-Affirming Hormone Therapy: Focus on Antiretrovirals and Direct Acting Antivirals

Lauren R. Cirrincione[a], Tessa Senneker[b], Kimberly K. Scarsi[c] and Alice Tseng[d,e]

[a]Department of Pharmacy, University of Washington School of Pharmacy, Seattle, WA, USA; [b]Department of Pharmacy, Kingston General Hospital, Kingston, ON, Canada; [c]Department of Pharmacy Practice and Science, College of Pharmacy, University of Nebraska Medical Center, Omaha, NE, USA; [d]Faculty of Pharmacy, University of Toronto, Toronto, ON, Canada; [e]University Health Network, Toronto, ON, Canada

ABSTRACT

Introduction: Gender-affirming care may include hormonal therapy to attain desired health outcomes in transgender (trans) individuals. To provide safe, affirming medical care for trans patients, health care providers must identify and manage drug-drug interactions (DDIs) between gender affirming hormonal therapy (GAHT) and other medication therapies.

Areas covered: This review summarizes available data on DDIs between GAHT and antiretrovirals (ARVs) or hepatitis C direct acting antivirals (DAAs). Potential pharmacokinetic and pharmacodynamic DDIs are predicted based on GAHT, ARV, and DAA pharmacology and adverse event profiles. Clinical management strategies are discussed.

Expert opinion: GAHT may be involved in pharmacokinetic and/or pharmacodynamic DDIs. Certain ARV classes (non-nucleoside reverse transcriptase inhibitors, protease inhibitors) may alter GAHT disposition, whereas selected ARVs (unboosted integrase inhibitors, doravirine, or rilpivirine) may have less impact on GAHT. DAAs may interact with GAHT, but the clinical relevance is unclear. ARV- and/or DAA-associated side effects (including depression, cardiovascular disease, hyperlipidemia) are important to consider in the clinical management of trans patients. Clinicians must evaluate potential DDIs and overlapping side effects between ARVs, DAAs and GAHT when providing care for trans patients.

KEYWORDS
Androgen blockers; antiretrovirals; direct acting antivirals; drug interactions; estradiol; gender-affirming therapy; transgender care; hiv; hepatitis C; testosterone

1. Introduction

Transgender (trans) persons are those whose gender identity differs from the sex that was assigned at birth. Approximately 25 million people are estimated to be trans worldwide [1], yet this population remains medically underserved. Gender-affirming care involves a multi-disciplinary treatment approach, and often includes the use of hormones to develop physical characteristics of the individual's affirmed gender [2]. Hormonal agents include estrogens with or without an androgen blocker, oral 5α-reductase inhibitors and/or oral progestogens in trans women and testosterone in trans men to support development of identified sex characteristics. Medication therapy used to affirm the individual's gender will be referred to as gender affirming hormone therapy (GAHT).

Recent literature demonstrates that trans persons face a disproportionately high rate of HIV infection, in part due to the intersection of factors such as stigmatization, discrimination, ethnicity, social class, economic barriers, and power differences as well as transgender rights, policies and attitudes, which may differ between countries [3]. Globally, trans women have 49-fold greater HIV prevalence compared with cis-gender (cis) adults [4], but HIV prevalence estimates for trans men, who also are at risk for HIV acquisition, are unavailable. In the United States, laboratory-confirmed HIV prevalence estimates are 14% among trans women and 3.2% among trans men (ages 16–66 years) [5], compared to a 0.3% prevalence estimate in the U.S. population [6]. In addition, HCV infection is increasingly recognized as an emerging public health issue in trans persons [7]. In a retrospective review of 145 sexually active trans youth, the overall prevalence of HCV infection was 2.8% (3.2% in trans women and 2.4% in trans men) [8]. In a recent cross-sectional survey among trans women in San Francisco, hepatitis C prevalence was 23.8%, which is nine-fold higher than that of the general population in San Francisco [9]. Population-based estimates among trans men are lacking; similar risk factors that increase HCV acquisition may exist [10].

The HIV and HCV care continua involve engaging patients in care and providing antiretroviral therapy (ART) or HCV treatment to prevent viral transmission and decrease morbidity and mortality. Combination ART traditionally consists of two nucleoside analogues plus an agent from a third ARV class (integrase inhibitors, protease inhibitors, or non-nucleoside reverse transcriptase inhibitors). Dual regimens including an integrase inhibitor plus a nucleoside or non-nucleoside analogue are emerging [11].

For hepatitis C, treatment with a combination of direct acting antivirals (DAAs), usually for a duration of 8 to 12 weeks, is recommended to prevent spread of infection, reduce the extent of liver damage, and to obtain a sustained virologic response (SVR). Fixed-dose formulations consisting of

Article highlights

- Antiretrovirals including nucleoside reverse transcriptase inhibitors, non-nucleoside reverse transcriptase inhibitors rilpivirine or doravirine, and unboosted integrase inhibitors, are not expected to have clinically significant effects on gender-affirming hormonal therapy concentrations.
- Non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine, and nevirapine may decrease plasma concentrations of estradiol, cyproterone, 5α-reductase inhibitors, progestogens and testosterone.
- Cobicistat-containing regimens may increase plasma exposure to estradiol, while ritonavir-containing regimens may either increase or decrease exposure to estradiol, and both cobicistat and ritonavir are expected to increase exposure to cyproterone, 5α-reductase inhibitors, progestogens and testosterone.
- Direct acting antiviral therapies for the treatment of hepatitis C virus, including glecaprevir/pibrentasvir, sofosbuvir/velpatasvir, and sofobuvir/velpatasvir/voxilaprevir may theoretically increase estradiol concentrations via inhibition of organic anion transport protein 1B1, but it is unclear whether this occurs to a clinically relevant extent.
- Trans individuals taking GAHT may have an elevated risk for depression, cardiovascular disease, hyperlipidemia, and altered bone mineral density; therefore, ARVs or direct acting antiviral agents with minimal influence on these conditions are recommended.
- Tenofovir disoproxil fumarate is associated with decreased bone mineral density and nephrotoxicity, boosted regimens may increase lipids and abacavir should be avoided in trans patients with other cardiac risk factors.
- Integrase inhibitors and tenofovir alafenamide can cause unwanted weight gain, and efavirenz and some integrase inhibitors may have psychiatric effects.

This box summarizes key points contained in the article.

an NS5A inhibitor plus an NS5B inhibitor and/or an NS3/4A protease inhibitor are available [12].

Due to their route of metabolism and concurrent impact on both cytochrome P450 (CYP) enzymes and drug transporters, both ARVs and DAAs are associated with a high risk of clinically significant drug-drug interactions with co-prescribed medications [13–16]. For ARVs, retrospective analyses identify at least one potential drug-drug interaction in 53–63% of persons receiving ART, with 1–16% of regimens associated with contraindicated drug combination, and the highest incidence of drug-drug interactions occurring in patients receiving protease inhibitors [13–15]. For DAAs, the rate of clinically significant drug-drug interactions was 76% in an analysis of U.S. veterans initiating hepatitis C therapy [16].

Interactions between ARVs and GAHT are a commonly cited concern among the transgender population. In a cross-sectional survey of trans women living with HIV, 40% reported not taking either ART, GAHT, or both due to concerns about drug-drug interactions; however, only 49% of participants had discussed ART-GAHT drug-drug interactions with their provider [17]. These concerns may contribute to treatment interruptions or detectable viral loads that may occur more frequently in trans patients compared with cis individuals [18,19]. Data regarding barriers to ART adherence in trans men are limited, but similar challenges may exist.

Given the improved health and quality of life outcomes associated with GAHT [20], the high rate of HIV infection among trans persons, and the risk of HIV-HCV co-infection, clinicians must be able to identify and manage potential drug-drug interactions with GAHT [21]. This review evaluates the potential for drug-drug interactions between GAHT and either ART or DAAs. For this review, we focus on treatment, not prevention, of both HIV and HCV.

2. Methods

A literature search was completed using the PubMed electronic database for English language literature from 1996 published up to February 2020. Search terms included the following: transgender persons (transsexualism, transgender, gender dysphoria, gender identity disorder, trans*), HIV, Hepatitis C, drug interactions, gender affirming therapy, feminizing hormones, masculinizing hormones, names of individual hormone agents (bicalutamide, conjugated equine estrogens, cyproterone, dutasteride, estradiol, finasteride, goserelin, leuprolide, medroxyprogesterone, progesterone, spironolactone, testosterone), generic names of commonly used individual antiretrovirals (abacavir, atazanavir, bictegravir, cabotegravir, cobicistat, darunavir, dolutegravir, doravirine, efavirenz, elvitegravir, emtricitabine, etravirine, lamivudine, lopinavir, nevirapine, raltegravir, rilpivirine, ritonavir, tenofovir) and generic names of commonly used direct acting antivirals (elbasvir, glecaprevir, grazoprevir, ledipasvir, pibrentasvir, sofosbuvir, velpatasvir, voxilaprevir). Abstracts from international HIV and viral hepatitis conferences were also searched for relevant literature. Randomized, non-randomized and observational studies as well as case reports were included.

3. Pharmacology of gender affirming hormones

Pharmacokinetic interactions may be predicted by the drug metabolism and transport pathways of each agent. A summary of metabolism and transporter characteristics of all GAHT agents is provided in Table 1.

3.1. Feminizing hormonal therapy

For many trans women, GAHT is an important part of gender-affirming care. GAHT supports the development of secondary sex characteristics, including breast development, decreased muscle mass, body fat redistribution, and softening of the skin. Estrogen (as 17β-estradiol) is the mainstay of GAHT. It is available as oral, transdermal, or injectable (intramuscular, subcutaneous) preparations [2]. Adjunctive agents may include an oral antiandrogen: spironolactone, cyproterone acetate, 5α-reductase inhibitors (dutasteride or finasteride), progestogens (medroxyprogesterone or micronized progesterone) or bicalutamide. Gonadotropin releasing hormone analogues (GnRH, leuprolide or goserelin) are also available. During GAHT, desired serum estradiol and total testosterone concentrations are between 367–734 pmol/L and <1.7 nmol/L, respectively [2].

Ethinyl estradiol and conjugated estrogens are not recommended for GAHT due to the potential for elevated venous thromboembolism risk [2]. Conjugated estrogens contain multiple estrogens that are rapidly conjugated to estradiol, estrone, and estriol; therefore, if used for GAHT, their interaction potential is expected to be similar to 17β-estradiol (Table 1 and Figure 1). In contrast, synthetic ethinyl estradiol (EE) metabolism differs from oral estradiol metabolism (Figure 1). Despite this difference,

Table 1. Metabolic pathways and major drug transport of estrogens, anti-androgens, progestogens, and testosterone.

	Drug (Route)	Metabolizing Enzymes	Drug Transporters	References
Estrogens	17β-estradiol (PO/SL, TD); estradiol valerate (PO); Estradiol valerate or cypionate (IM/SC); Conjugated estrogens (PO)[a]	Substrate: CYP3A4 (primary), CYP1A2 (secondary), 2A6, 1B1, 2B6, 2C19, 2C9, 2D6, 2E1, UGT1A1 Inhibition: CYP1A2 Induction: CYP2A6, 2B6, 3A4 (not clinically relevant)	Substrate: OATP1B1, OATP1B3	[22,32,27]
	Ethinyl estradiol[a]	Substrate: CYP3A4 (primary), CYP2C9 (secondary), UGT1A1	None.	[34]
Antiandrogens	Bicalutamide (PO)	Inhibition: CYP3A4 (weak)	None.	[23]
	Cyproterone acetate (PO)	Substrate: CYP3A4 Inhibition: CYP2C8, 2C9, 2C19, 3A4 and 2D6 Induction: CYP1A2, 2E1	None.	[37]
	Dutasteride (PO)	Substrate: CYP3A4	None.	[78]
	Finasteride (PO)	Substrate: CYP3A4	None.	[78]
	Goserelin (SC)	None.	None.	[25]
	Leuprolide (IM/SC)	None.	None.	[24]
	Spironolactone (PO)	None.	None.	[35]
Progestogens	Medroxyprogesterone acetate (PO)	Substrate: CYP3A4	…	[26]
	Progesterone (PO)	Substrate: CYP3A4	…	[134]
Testosterone	Cypionate, enanthate, undecanoate (IM/SC), undecanoate (PO)	Substrate: CYP2B6, 2C19, 2C9, 3A4	…	[41]

[a]Note that conjugated estrogens and ethinyl estradiol are included in this table to highlight pharmacokinetic similarities and differences with estradiol. Ethinyl estradiol and conjugated estrogens are NOT recommended as an estrogen agent for gender affirming therapy.

most estrogen-related drug-drug interaction data are derived from studies with oral EE, which is used in oral contraceptive pills. Herein, we highlight similarities and differences between ethinyl estradiol and estradiol pharmacology to inform the application of these data across products.

3.1.1. Metabolism and elimination

Most GAHT agents are extensively metabolized. To improve bioavailability, oral and injectable estradiol preparations are formulated as ester prodrugs (valerate or cypionate), which are hydrolyzed to the parent drug, 17β-estradiol (Figure 1).

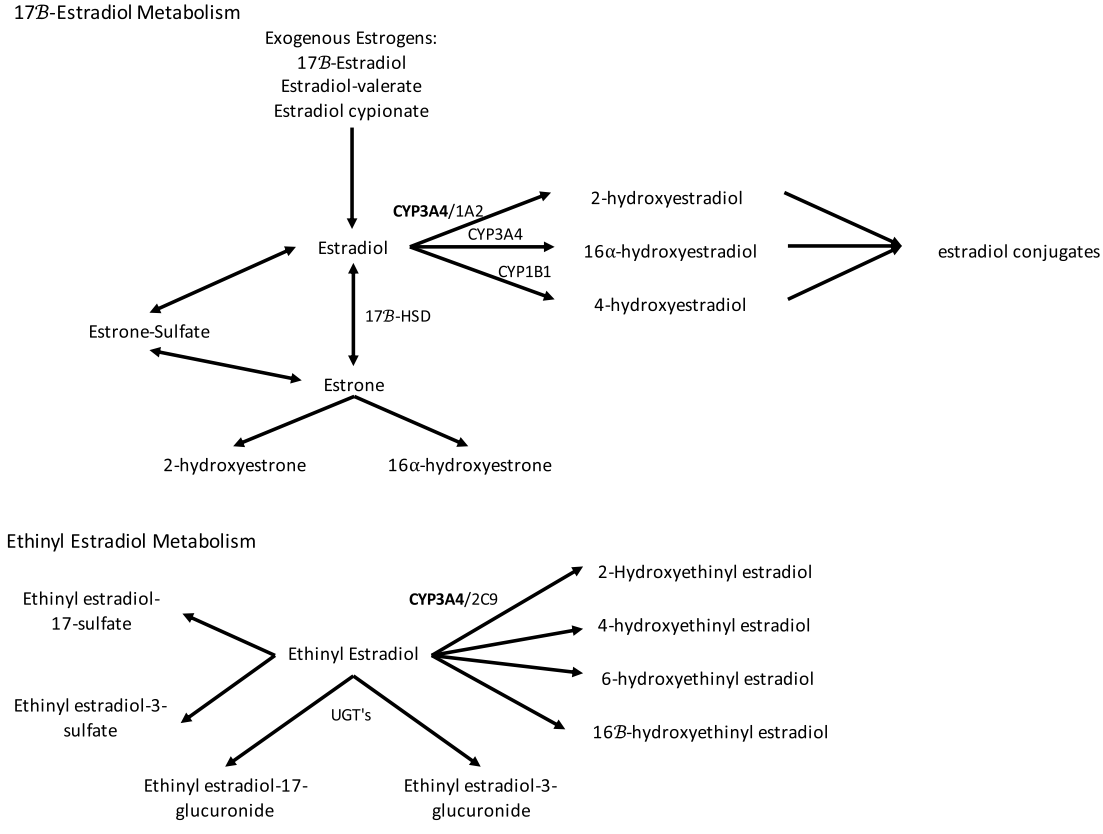

Figure 1. Metabolic pathways of exogenous 17β-estradiol and ethinyl estradiol. Estradiol ester prodrug preparations are cleaved to 17β-estradiol which is metabolized via 17β-hydroxysteroid dehydrogenase to estrone. Estrone is primarily sulfated in the liver and estrone-sulfate may be converted back to estradiol. Estradiol may also be metabolized via cytochrome P450 enzymes to less active catechol estrogens. The main metabolic pathways for ethinyl estradiol include hydroxylation by cytochrome P450 enzymes and glucuronide conjugation. Ethinyl estradiol is not a substrate for 17β-hydroxysteroid dehydrogenase [33–35].

Oral 17β-estradiol tablets are also available as a non-prodrug preparation (micronized estradiol, Estrace®). Estradiol is highly protein-bound in plasma (~98%) [28]. Oral estradiol undergoes extensive first-pass metabolism and is rapidly converted to its active metabolite (estrone) by 17β-hydroxysteroid dehydrogenase (17β-HSD) (Table 1). Estrone is conjugated and excreted in the bile [28] where it undergoes enterohepatic recirculation [29–31]. Estradiol and estrone are extensively hydroxylated by cytochrome P450 (CYP) enzymes (primary: CYP3A4; secondary: CYP1A2). Estradiol and its metabolites are also conjugated by uridine 5′-diphosphoglucuronosyltransferase (UGT) isoenzymes, including UGT1A1 [32]. Drug-drug interaction data specific to 17β-estradiol are limited. *In vitro*, estradiol induces CYP2A6, 2B6, and 3A4 expression at supraphysiologic concentrations [33]. For trans women, desired estradiol concentrations are within physiologic ranges for premenopausal cis women [2]; therefore, estradiol is not expected to induce or inhibit CYP isoenzymes when used as GAHT.

Ethinyl estradiol has higher oral bioavailability than estradiol. Ethinyl estradiol is not metabolized to estrone by 17β-HSD; rather it is directly conjugated (UGT) and hydroxylated (primary: CYP3A4; secondary: CYP2C9) to 2-hydroxy-ethinyl estradiol (Figure 1) [34]. While the clinical implications of these different metabolic pathways are incompletely understood, it is important to consider this difference when predicting drug-drug interactions for GAHT extrapolated from oral contraceptive data. For instance, estradiol may be less susceptible to CYP3A4 or UGT mediated interactions than ethinyl estradiol, as estradiol has an alternative metabolic route via 17β-HSD. Conversely, estradiol may be susceptible to transporter-mediated drug interactions when compared to ethinyl estradiol, as estradiol and estrone conjugates are substrates for organic-anion transporting polypeptide (OATP) as discussed below.

Most antiandrogens are hepatically metabolized. Spironolactone is rapidly and extensively metabolized to active metabolites by hepatic esterases and transferase [35]. No significant drug-drug interactions are expected between spironolactone and CYP inducers or inhibitors [36]. Cyproterone is excreted unchanged in feces and urine (60% and 33%, respectively); it is hydroxylated to 15-hydroxycyproterone, an active metabolite, by CYP3A4 [37]. Cytochrome P450 3A4 inducers or inhibitors may alter the 15-hydroxycyproterone concentration in plasma, although clinical data are limited. At doses used for GAHT (25 to 50 mg daily) cyproterone is not expected to alter CYP isoenzyme activity. The 5α-reductase inhibitors (dutasteride and finasteride) and progestogens (medroxyprogesterone and progesterone) are extensively metabolized by CYP3A isoenzymes, but they do not induce or inhibit CYP isoenzymes. Bicalutamide, a racemic mixture, is predominantly metabolized by conjugation. Its active R-bicalutamide isomer inhibits and it may increase the concentration of CYP3A4 substrates, although this may only be clinically relevant for drugs with a narrow therapeutic range. GnRH analogues (leuprolide, goserelin) are neither metabolized via CYP isoenzyme nor expected to have significant drug-drug interactions.

3.1.2. Drug transporters

Limited *in vitro* data describe the influence of feminizing sex hormones on drug transporter protein expression (mRNA and protein levels). Two efflux drug transporter proteins – breast cancer resistance protein (BCRP) and p-glycoprotein – are either decreased (BCRP: 17β-estradiol) and/or increased (BCRP: progesterone; p-glycoprotein: estrone metabolite) by sex hormones [38,39]. Estradiol (as its glucuronidated form) is a substrate OATP 1B1/1B3, a hepatic uptake transporter [40]. Clinical implications of these *in vitro* findings for GAHT are incompletely understood.

3.2. Masculinizing hormonal therapy

The goal of GAHT in trans men include increasing secondary sex characteristics such as muscle mass and facial hair, while minimizing other secondary sex characteristics. For trans men, testosterone is the mainstay of GAHT. Testosterone is available as several preparations: intramuscular or subcutaneous injection (cypionate, enanthate, undecanoate), transdermal preparations (gel, patch), oral tablet (undecanoate), nasal spray, or implantable pellet. During GAHT, desired serum total testosterone concentrations are between 11.1–34.7 nmol/L [2].

3.2.1. Metabolism and elimination

Testosterone is primarily metabolized to two major metabolites: dihydrotestosterone (DHT) and estradiol. Metabolism to DHT, a potent metabolite, occurs via steroid 5α-reductase in the skin, liver, and urogenital tract. Testosterone is metabolized to estradiol by CYP19 (aromatase) in the brain, fat, and testes [41]. Testosterone is a CYP3A4/5 substrate, and CYP3A4/5 induction or inhibition may alter testosterone concentrations [40].

3.2.2. Drug transporters

Based on available data, neither testosterone nor its active metabolite DHT are expected to induce or inhibit drug transporters during GAHT. *In vitro* data indicates that testosterone and DHT may be substrates of p-glycoprotein but the clinical relevance is unknown [42].

4. Pharmacology of antiretrovirals and direct acting antivirals

ARV and DAA metabolism and transport pathways are summarized in Table 2.

4.1. Antiretrovirals

Antiretroviral therapy includes two or three ARVs selected from different ARV classes. Clinicians must consider the pharmacokinetic properties of each class when predicting potential drug-drug interactions. Based on U.S. guidelines, nucleoside reverse transcriptase inhibitors (NRTIs) combined with an unboosted integrase strand transfer inhibitor (INSTI) are recommended for treatment-naïve individuals [11]. Non-nucleoside reverse transcriptase inhibitors (NNRTIs) are recommended for certain treatment-naïve individuals in US

Table 2. Antiretroviral and hepatitis C direct acting antivirals and major drug transport and metabolic pathways[a].

Agent	Main route(s) of metabolism and drug transport	CYP and UGT Effects: Inhibitor	CYP and UGT Effects: Inducer	Transporters (Inhibitor)
A) Antiretroviral Agents				
Integrase Strand Transfer Inhibitors (INSTIs)				
Bictegravir	UGT1A1, CYP3A4 (similar contribution)	No known effects.	No known effects.	OCT2, MATE1
Cabotegravir	UGT1A1, UGT1A9	No known effects.	No known effects.	OCT1, OCT3
Dolutegravir	UGT1A1, CYP3A4 (10–15%); UGT1A3, UGT1A9 P-gp and BCRP in vitro		No known effects.	OCT2, MATE1
Elvitegravir	CYP3A4		CYP2C9 (modest)	
Raltegravir	UGT1A1	No known effects.	No known effects.	
Protease Inhibitors (PIs)				
Atazanavir	CYP3A4 P-gp, MRP1	3A4, UGT1A1 ≫2C8 (weak)		P-gp, MRP1, OATP1B1, OATP1B3, BCRP
Darunavir	CYP3A P-gp	CYP3A4		BCRP, OATP1B1
Lopinavir/ ritonavir	CYP3A4 P-gp, MRP1	CYP3A4		P-gp, OATP1B1, OATP1B3
Pharmacokinetic Enhancers				
Ritonavir	CYP3A4 P-gp, MRP1	CYP3A4 (potent)> >2D6* *negligible effect at boosting doses	UGT, CYP1A2, 2B6, 2C8, 2C9, 2C19	P-gp, OATP1B1, OATP1B3, BCRP, OATP2B1, OCT2, MATE1
Cobicistat	CYP3A, 2D6 (minor)	CYP3A, CYP2D6		P-gp, BCRP, OATP1B1 and OATP1B3, MATE1
Non-nucleoside Reverse Transcriptase Inhibitors (NNRTIs)				
Doravirine	CYP3A4/5	No known effects.	No known effects.	No known effects.
Efavirenz	CYP3A4, 2B6 (minor)	2C9, 2C19 (? Clinical significance).	3A4 (potent), 2B6, UGT1A1	***Inducer***: OATP1B1, MRP2
Etravirine	CYP3A4, CYP2C9, and CYP2C19	CYP2C9 (weak), CYP2C19 (moderate), p-gp (weak)	3A4 (weak)	
Nevirapine	CYP3A4, 2B6 (minor)		3A4, 2B6 (potent)	
Rilpivirine	CYP3A4 (major)	No known effects.	2C19 (moderate)	OCT2
Nucleotide Reverse Transcriptase Inhibitor (NRTI)				
Tenofovir alafenamide	Minimal metabolism via 3A4 P-gp, BCRP	No known effects.	No known effects.	
CCR5 Inhibitors				
Maraviroc	CYP3A4 P-gp	Does not inhibit major CYP isozymes at clinically relevant concentrations.		P-gp (in gut; systemic effects unlikely).
B) DIRECT ACTING ANTIVIRALS FOR HEPATITIS C				
NS5B Inhibitor				
Sofosbuvir	P-gp, BCRP GS-331,007 (primary systemic nucleoside metabolite, accounts for >90% of systemic drug exposure), which is not a P-gp substrate	No known effects.	No known effects.	No known effects.
NS5A Inhibitors				
Elbasvir	CYP3A4 P-gp and OATP in vitro.	No known effects.	No known effects.	BCRP (intestinal)
Ledipasvir	P-gp, BCRP	No known effects.	No known effects.	Weak inhibitor of P-gp and BRCP (intestinal, not systemic). Inhibitor of OATP1B1/1B3 only at concentrations exceeding those achieved in clinic.
Pibrentasvir	P-gp and/or BCRP	CYP1A2, 3A4 and UGT1A1 (weak)		P-gp, BCRP, OATP1B1/3.
Velpatasvir	CYP3A4, 2C8, 2B6 OATP1B1, OATP1B3, P-gp, BCRP	No known effects.	No known effects.	P-gp, OATP1B1, OATP1B3, BCRP (limited to intestinal efflux and hepatic uptake – clinically relevant interactions in systemic circulation not expected).
NS3/4A Protease Inhibitor				
Glecaprevir	P-gp and/or BCRP; OATP1B1, OATP1B3 CYP3A4 (secondary role)	CYP1A2, 3A4 and UGT1A1 (weak)		P-gp, BCRP, OATP1B1/3.
Grazoprevir	CYP3A4 P-gp and OATP1B1	3A4 (weak), UGT1A1 (weak)	No known effects.	BCRP (intestinal)
Voxilaprevir	CYP3A4≫CYP1A2, 2C8 P-gp, BCRP, OATP1B1, OAT1B3	No known effects.		P-gp, BCRP, OATP1B1, OATP1B3.

[a]Key: Substrate = route of hepatic elimination of that specific drug (specified by a specific cytochrome P450 isoenzyme); inducer = leads to more rapid clearance of substrates of a specific hepatic isoenzyme (lowers serum concentrations of the respective drug and may lead to decreased efficacy); inhibitor = leads to decreased clearance of substrates of a specific hepatic isoenzyme (increases serum concentrations of a respective drug and may lead to toxicity).

guidelines, but are widely used globally. Finally, protease inhibitors are commonly reserved for individuals with some ARV resistance.

4.1.1. ARV metabolism and elimination

Most NRTIs are eliminated via the kidneys as unchanged parent drug, and none are expected to inhibit or induce major CYP or UGT isozymes. INSTIs are substrates of either CYP3A4 or UGT1A1, (Table 2) [43–46], but most INSTIs have insignificant induction or inhibitory effects on CYP enzymes. The exception is elvitegravir, which is co-formulated with the potent CYP3A4 inhibitor cobicistat, resulting in a high potential for drug-drug interactions [43]. Additionally, elvitegravir may induce CYP2C9 [43].

Protease inhibitors and NNRTIs are CYP3A4 substrates and often cause drug-drug interactions but are also susceptible to drug-drug interactions. Most protease inhibitors are known for CYP inhibition, particularly of CYP3A4 [47–49], and atazanavir also inhibits UGT1A1 (Table 2) [47]. Ritonavir and cobicistat are used as pharmacokinetic enhancers to prevent CYP-mediated metabolism and to improve bioavailability of protease inhibitors or elvitegravir. Ritonavir has mixed inhibition and induction effects on CYP and UGT enzymes in vivo (Table 2) [50]. Some NNRTIs, including efavirenz, nevirapine and etravirine are significant inducers of CYP3A4 and other CYP enzymes [51–53]. Efavirenz and etravirine also inhibit CYP2C9 and 2C19. Other NNRTIs, including rilpivirine and doravirine, do not cause significant hepatic enzyme-mediated interactions, but are highly susceptible to interactions mediated by CYP3A4 [54,55].

4.1.2. ARV drug transporters

Most INSTIs and protease inhibitors are p-glycoprotein substrates. Certain INSTIs (bictegravir, dolutegravir) inhibit drug transporter proteins, specifically organic cation transporter 2 (OCT2) and/or MATE1 – transporters in the renal proximal tubule cell [44,46]. Ritonavir and cobicistat inhibit p-glycoprotein, BCRP, OATP1B1, and OATP1B3. NNRTIs influence several transporter proteins: OCT2 inhibition (rilpivirine), MRP2 induction (efavirenz) [56]; p-gp inhibition (etravirine) [57]; OATP1B1 induction (efavirenz) [56]. Tenofovir alafenamide (TAF) and tenofovir disoproxil fumarate (TDF) are p-glycoprotein and BCRP substrates but do not inhibit or induce either transporter. Parent tenofovir is not a substrate of these transporters. Interactions with p-glycoprotein inducers or inhibitors are primarily clinically significant with the TAF prodrug [11,58].

4.2. Direct acting antivirals

DAA classes include non-structural protein 5A (NS5A) and 5B (NS5B) inhibitors, which reduce viral replication and packaging, and NS3/4A protease inhibitors, which inhibit post-translational processing of HCV proteins. In combination, these agents dramatically improve HCV outcomes in patients, with 95–99% of patients achieving SVR after 8–12 weeks of therapy.

Commonly used DAA regimens include fixed dose formulations of glecaprevir/pibrentasvir, velpatasvir or ledipasvir with sofosbuvir, or elbasvir/grazoprevir. Regimens including voxilaprevir may be considered for patients who have not responded to previous DAA treatment [12]. Clinicians should review a patient's medication history upon DAA initiation to reduce adverse outcomes related to complex drug-drug interactions with these agents [12].

4.2.1. DAA metabolism and elimination

Many DAAs, including elbasvir, velpatasvir, glecaprevir, grazoprevir, and voxilaprevir are metabolized via CYP3A isoenzymes. Velpatasvir is also metabolized via CYP2B6 and CYP2C8. Ledipasvir and pibrentasvir are primarily excreted unchanged in feces. Sofosbuvir is extensively metabolized via non-CYP/UGT isoenzymes and renally eliminated as an inactive metabolite, GS-33,100.

The NS5A and 5B inhibitors velpatasvir, ledipasvir, elbasvir, and sofosbuvir do not induce or inhibit CYP enzymes [59–61]. Pibrentasvir weakly inhibits CYP1A2, 3A4 and UGT 1A1 [62]. The HCV protease inhibitors glecaprevir and grazoprevir have weak inhibitory properties on CYP and/or UGT isoenzymes (27% and 34%, respectively, increase in midazolam area under the curve (AUC), a probe substrate of CYP3A4). Voxilaprevir does not inhibit CYP or UGT enzymes [59].

4.2.2. DAA drug transporters

Drug transporters are common routes of potential drug-drug interactions for DAAs. All of the DAAs currently used in clinical practice are substrates of p-glycoprotein. In addition, elbasvir, glecaprevir, ledipasvir, pibrentasvir, velpatasvir and voxilaprevir are inhibitors of p-glycoprotein. Glecaprevir, ledipasvir, pibrentasvir, velpatasvir, voxilaprevir are both substrates and inhibitors of BCRP. Elbasvir and grazoprevir are intestinal inhibitors of BCRP, and sofosbuvir is a substrate of BCRP. Grazoprevir is a substrate of OATP1B1/1B3. Glecaprevir, velpatasvir and voxilaprevir are OATP1B1/1B3 substrates and inhibitors while pibrentasvir is an inhibitor but not a substrate [63].

5. Pharmacokinetic interactions

A summary of potential pharmacokinetic interactions between ARVs, DAAs and GAHT is provided in Table 3.

5.1. Feminizing hormonal therapy

5.1.1. Estradiol and antiretrovirals

One published case series and one pharmacokinetic study concerning the interaction potential between feminizing hormones and ART were identified during this review. The case series reviewed three transwomen who were taking estradiol plus an efavirenz-based ART regimen [64]. Two of the patients took oral 17β-estradiol, both of whom had subtherapeutic serum estradiol concentrations (<367 pmol/L) and elevated serum testosterone concentrations (>3.47 nmol/L). One patient was switched to rilpivirine-based ART and concurrently switched from oral estradiol (8 mg daily) to conjugated equine estrogen (5 mg daily). Testosterone was suppressed following these modifications (<3.47 nmol/L), but the influence of ART, GAHT, or both changes is unclear. The second patient underwent gender-affirming surgery (orchiectomy and vaginoplasty) and

Table 3. Potential pharmacokinetic interactions between GAHT and ARVs and DAAs.

	Feminizing GAHT					Masculinizing GAHT
	17β-estradiol	Androgen blockers and adjunctive therapies				Testosterone
		cyproterone	dutasteride, finasteride	Progestogens (oral medroxyprogesterone, micronized progesterone)	Spironolactone. Bicalutamide, leuprolide, goserelin

Caution	G/P, SOF/VEL, SOF/VEL/VOX (↑estradiol)					

achieved desired estradiol concentrations during EFV-based ART after switching from oral 17β-estradiol (8 mg daily) to transdermal patches (0.1 mg/24 h weekly). The third patient also underwent gender-affirming surgery and achieved estradiol concentrations similar to other trans women taking the same dose of transdermal estradiol (0.05 mg/24 h weekly). While there is high inter-patient variability in these outcomes, these cases suggest a potential interaction between efavirenz and oral 17β-estradiol, possibly by efavirenz-mediated CYP3A4 induction [64]. Transdermal estradiol may avoid potential drug-drug interactions that occur via first-pass metabolism, although minimization of metabolism-related drug-drug interaction potential has not been observed in studies with non-oral routes of hormone administration. For example, the extent of the interaction between ethinyl estradiol and efavirenz was greater when administered intravaginally compared to orally [65,66] and the observed interaction between lopinavir/ritonavir plus transdermal ethinyl estradiol was similar to oral ethinyl estradiol [67].

The iFACT study, a prospective study among 40 ART-naïve Thai trans women living with HIV, enrolled participants into a single-arm, three-phase pharmacokinetic study: GAHT alone (oral estradiol valerate 2 mg daily plus oral cyproterone 25 mg daily); GAHT plus ART (TDF/emtricitabine/efavirenz); and ART alone [68]. The estradiol AUC, maximum concentration (C_{max}), and concentration at 24 hours (C_{24}) were decreased by 28%, 19%, and 36%, respectively (all $P< 0.01$) in the presence of TDF/emtricitabine/efavirenz. The geometric mean ratios (GMR) of tenofovir AUC and C_{24} (with versus without GAHT) were 0.86 (90% CI: 0.8, 0.93) and 0.83 (90% CI: 0.75, 0.93), respectively. Plasma efavirenz pharmacokinetic parameters were not significantly altered by GAHT, although the C_{24} of efavirenz was decreased by 9% ($P= 0.02$) which is unlikely to be clinically significant. Despite altered tenofovir pharmacokinetics, the majority of participants (90%) achieved viral suppression 12 weeks after initiating ART. Another arm of the iFACT study investigated GAHT with and without TDF/emtricitabine in 20 HIV-negative trans women [69]. Investigators observed decreased tenofovir AUC and C_{24} with GAHT (versus without: 12%, $P< 0.001$; 18%, $P= 0.03$, respectively). Estradiol concentrations were unaltered by TDF/emtricitabine. These findings suggest that the efavirenz component of the iFACT ART regimen decreased estradiol concentrations. Further studies are needed to determine whether estradiol concentrations are consistently decreased by other CYP-inducing ARVs.

Recent PK studies suggest TDF/emtricitabine disposition (either alone or as part of suppressive ART) may be altered in trans women taking GAHT. In a small sample (n = 4) of trans women living with HIV and taking GAHT, no difference was observed in plasma tenofovir and emtricitabine concentrations compared with cis adults [70]; intracellular tenofovir-diphosphate and emtricitabine-triphosphate concentrations (from peripheral blood mononuclear cells) were similar to cis adults. Investigators noted altered ratios of tenofovir-diphosphate to endogenous triphosphate in trans women, but larger studies are needed to fully understand these findings. PK studies investigating TDF/emtricitabine in HIV-negative trans women taking GAHT are reviewed extensively elsewhere [71]. Plasma tenofovir and emtricitabine exposure are modestly decreased in trans women taking GAHT (non-standardized regimens) compared with cis controls (plasma tenofovir AUC: ↓24 to 27%, $P< 0.065$; emtricitabine AUC: ↓14-24%, $P< 0.07$) [72,73]. Overall, these studies were small, and none included trans men. Further studies are needed to

understand potential drug-drug interactions between GAHT and NRTIs.

Clinical data on potential drug-drug interactions between 17β-estradiol and other ARVs are not yet available. Based on the pharmacology of each agent (Tables 1 and 2), unboosted INSTIs and the non-inducing NNRTIs, doravirine and rilpivirine, are not anticipated to interact with estradiol. When possible, it may be preferable to avoid NNRTIs that induce estradiol metabolizing pathways, such as efavirenz, etravirine, and nevirapine, due to risk of decreased estradiol concentrations. In contrast, cobicistat-boosted regimens may increase estradiol via inhibition of CYP3A4 and OATP1B1/3. While ritonavir also inhibits CYP3A4 and OATP transporters, it also induces certain CYP enzymes (Table 2); the net effect of ritonavir on estradiol concentrations is unknown. When ART that is not expected to interact with estradiol is not available or not indicated for trans individuals, drug-drug interactions may be managed through therapeutic drug monitoring guided dosage adjustment and clinical monitoring for estradiol efficacy as well as toxicity.

5.1.2. Estradiol and direct acting antivirals

No literature evaluating direct acting antivirals with 17β-estradiol in trans persons was identified. Theoretically, glecaprevir, pibrentasvir, velpatasvir and voxilaprevir may increase estradiol exposures via inhibition of OATP1B1/1B3, but these combinations have not been studied, and the clinical significance of this theoretical interaction is unclear. Additional discussion on hepatic safety of these DAAs and estradiol is included in section 6.2.8 below, but are not thought to be related to DAA or estradiol pharmacokinetics.

5.1.3. Adjunctive feminizing therapies and antiretrovirals or direct acting antivirals

We identified no drug-drug interaction studies between oral progestogens and either ART or DAAs. However, several investigators have studied potential drug-drug interactions between ART and intramuscular depot-medroxyprogesterone (DMPA) for contraception, which may inform our understanding of the potential for drug-drug interactions. In cis women living with HIV and receiving either lopinavir/ritonavir-, nelfinavir-, or nevirapine-based ART, medroxyprogesterone concentrations were compared with cis women living with HIV who were either not on ART or receiving ART that was not expected to cause a drug-drug interaction [74,75]. Medroxyprogesterone concentrations were similar between participants receiving either nelfinavir- or nevirapine-based ART compared with the control group [75], while the medroxyprogesterone AUC over 12 weeks was higher in women receiving lopinavir/ritonavir-based ART compared to the control group [geometric mean (IQR) 18.08 (16.22, 24.10) versus 12.38 (8.88, 13.88) ng•wk/mL, respectively] [76]. Three studies evaluated DMPA in combination with efavirenz-based ART with variable results. Two studies reported no change in medroxyprogesterone exposure over 12 weeks [74,75], while one study in Malawian cis women found lower medroxyprogesterone exposure at week 13 in participants receiving efavirenz-based ART compared to HIV-negative cis women [mean (SD) 603 (296) vs 1146 (850) pg/mL, P= 0.03] [77]. Mngqibisa *et al* evaluated cis women receiving both efavirenz-based ART and rifampicin/isoniazid for TB therapy and found that the combination of CYP3A inducers efavirenz and rifampin increased the clearance of medroxyprogesterone compared with historical controls (19,681 L/week versus 12,118 L/week, respectively) [78]. Given that oral medroxyprogesterone may be more susceptible to drug-drug interactions than DMPA, drugs that induce or inhibit CYP3A are expected to impact the systemic exposure of this progestogen.

We identified no pharmacokinetic studies evaluating drug-drug interactions between adjunctive antiandrogens (spironolactone, cyproterone, 5α-reductase inhibitors, GnRH analogues, or bicalutamide), or testosterone and either ART or DAAs. Participants in the iFACT study (described in section *5.1.1: Estradiol and Antiretrovirals*) took oral cyproterone 25 mg daily; investigators measured bioavailable testosterone (as a surrogate marker of cyproterone efficacy) before and during TDF/emtricitabine/efavirenz therapy. While cyproterone and efavirenz plasma concentrations were not measured, the bioavailable testosterone serum trough concentrations did not increase during ART. This may suggest that cyproterone concentrations are unaltered by efavirenz-based ART, but further studies are needed [68].

Antiretrovirals that inhibit CYP3A4, such as ritonavir or cobicistat, may inhibit metabolism of CYP3A substrates, including cyproterone, 5α-reductase inhibitors, progestogens, and testosterone, potentially increase systemic concentrations of these agents [79]. Close monitoring of GAHT, including clinical efficacy/toxicity profiles and serum measurement of estradiol and total testosterone, is suggested when coadministered with ART that inhibit CYP3A isoenzymes. GAHT dosage reduction of cyproterone or testosterone may be considered if toxicity occurs. Among DAAs, the NS3/4A protease inhibitors glecaprevir and grazoprevir are weak inhibitors of CYP3A4 and are not anticipated to inhibit metabolism of cyproterone, 5α-reductase inhibitors, and progestogens to a clinically relevant extent.

Conversely, CYP3A4 inducers like efavirenz, etravirine and nevirapine may induce metabolism of these GAHT that are CYP3A substrates, potentially leading to decreased circulating concentrations of these agents. In a cisgender volunteer study, the AUC of finasteride was reduced by over 50% when coadministered with St. John's wort [80]. Monitoring of clinical efficacy and serum hormone concentrations with potential increase in GAHT doses may be required. Unboosted INSTIs, doravirine, or rilpivirine are not anticipated to alter the metabolism of CYP3A substrates.

Given the lack of overlapping CYP isoenzyme involvement in the metabolism of spironolactone with ARVs or DAAs, no pharmacokinetic interactions are expected when these agents are used in combination.

5.2. Masculinizing hormonal therapy

We identified no clinical pharmacokinetic studies evaluating drug-drug interactions between testosterone and either ART or DAAs. Since testosterone is a substrate of CYP3A4/5,

concentrations can be increased by potent inhibitors such as ritonavir or cobicistat. Conversely, testosterone concentrations may be decreased by efavirenz, etravirine and nevirapine. The clinical relevance of these postulated interactions is not clear. Close monitoring of clinical efficacy and toxicity and measurement of total serum testosterone is suggested when using testosterone with enzyme inhibiting or inducing antiretrovirals. Dose reduction of testosterone with ritonavir or cobicistat, or dose increases with enzyme-inducing NNRTIs efavirenz, etravirine or nevirapine may be required. ARV regimens including unboosted INSTIs, doravirine or rilpivirine are not anticipated to alter the metabolism of testosterone.

The NS3/4A protease inhibitors glecaprevir and grazoprevir are weak inhibitors of CYP3A4; as such, significant interactions with testosterone are not anticipated. No other DAAs are expected to interact with testosterone.

6. Pharmacodynamic interactions

Pharmacodynamic drug-drug interactions may alter ARV, DAA, and/or GAHT efficacy and safety by additive, synergistic, or antagonistic mechanisms. Pharmacodynamic interactions between GAHT and ART or DAA regimens are poorly characterized. A summary of potential pharmacodynamic interactions between ARVs, DAAs and GAHT is provided in Table 4. Further details are discussed below.

6.1. Antiretroviral and DAA efficacy

No pharmacologic studies have investigated the influence of GAHT on ARV or DAA efficacy. In a respondent-driven sampling study of trans women living with HIV in San Francisco, 65% of respondents reported taking ART, yet less than half of respondents were virologically suppressed (HIV-RNA ≤200 copies/mL) [81]. Barriers in the HIV treatment cascade may be responsible for decreased virologic suppression rates rather than pharmacologic interactions between GAHT and ART.

In vitro data suggests estradiol inhibits the HCV replication cycle [82], but the clinical significance of these findings is unknown.

6.2. Antiretroviral and DAA toxicities

We identified no studies that investigated ART or DAA pharmacodynamic interactions in trans persons taking GAHT. We predicted overlapping toxicities between GAHT, ART, and DAAs based on data extrapolated from cis adults.

6.2.1. Bone density effects

Recently, the first study investigating fracture outcomes in trans adults was published [83]. This was a retrospective cohort study of trans adults in the Netherlands taking GAHT. Investigators observed 1.9 times higher odds of fracture among trans women (≥50 years) compared with age-matched cis men (95% CI: 1.32, 2.74). No difference in fracture odds was observed compared with cis women. Among trans men, no difference in fracture odds was observed compared with cis men or women [83]. This study suggests that GAHT may adequately maintain bone health in trans adults in the Netherlands, but GAHT regimens used across clinical settings differ – including dosing variations, different routes of administration, variable durations of use. The influence of different GAHT regimens on skeletal health remains incompletely understood [84]. In trans women, a systematic review and meta-analysis observed increased lumbar spine bone mineral density (BMD) from baseline through 24 months of GAHT (0.06 g/cm2; 95% CI: 0.04, 0.08 g/cm^2) [85]. Among trans men taking GAHT, no change was observed in BMD at any skeletal site through 24 months compared with baseline [85]. A prospective study by the same investigators observed that bone turnover markers were decreased following 12 months

Table 4. Potential pharmacodynamic interactions between GAHT and ART and DAAs.

	ARV or DAAs of concern	Potential therapeutic options	Other comments
Bone density	TDF may↓bone mineral density	TAF or other NRTIs	T-scores: use female reference range for both trans women & men; Z-score: use reference range for affirmed gender (trans women and trans men)
Cardiovascular concerns	Abacavir, PK-enhanced darunavir, lopinavir/ritonavir:↑CVD risk	TAF, TDF, INSTIs, doravirine, rilpivirine	Determine cardiovascular risk score using affirmed gender.
Weight gain	INSTIs, TAF	Use alternative ARV from another class	Regular monitoring of body mass index, waist circumference.
Cholelithiasis	Atazanavir	Use alternative PI or ARV from another class	Atazanavir no longer first-line option
Dyslipidemia	TAF, boosted regimens	TDF may have a beneficial effect on lipids. Unboosted INSTIs are lipid neutral.	Regular monitoring of lipid panel.
Psychiatric effects	Efavirenz, bictegravir, dolutegravir	NNRTIs: doravirine, rilpivirine INSTIs: RAL, EVG/c PIs	Monitor for changes in mood or sleep.
QT interval prolongation	Rilpivirine, PIs	INSTIs, other NNRTIs	Use with caution in patients on anti-androgen therapy or with other risk factors for QT prolongation (electrolyte abnormalities, other QT interval prolonging drugs)
Renal effects	Risk of nephrotoxicity with TDF	TAF or other NRTIs	TAF can be used if Clcr>30 mL/minute; consider using affirmed gender in creatinine clearance calculator
Transaminitis	G/P, SOF/VEL/VOX	SOF/VEL, SOF/LDV, ELB/GZR	Measure ALT, AST during DAA therapy, particularly during first 4 weeks

of GAHT in trans adults [86], but the GAHT regimens were standardized according to a study protocol, and generalizability to other settings is unknown.

Long-term bone health outcomes related to ART in trans persons are unknown. TDF is associated with decreased bone mineral density in cis adults taking either suppressive ART or TDF-based pre-exposure prophylaxis [87,88]. TAF may be preferred for individuals taking GAHT with risk factors for osteoporosis (including older age, low body mass index, and smoking). The Endocrine Society recommends monitoring bone mineral density in trans adults with osteoporosis risk factors using sex assigned at birth on a case-by-case basis [2]. Additionally, we encourage adherence to U.S. DHHS recommendations for monitoring TDF- or TAF-based ART [11]. The International Society for Clinical Densitometry recommends using a female reference when calculating T-scores for both trans men and women [89].

6.2.2. Cardiovascular disease

Among trans women taking GAHT, venous thromboembolism and stroke incidence are elevated compared with cis women and men [90,91]. Getahun *et al*. reported higher venous thromboembolism (VTE) incidence in trans women who initiated GAHT (n = 853) compared with cis men (aHR: 3.2; 95% CI: 1.5, 6.5) and cis women (aHR: 2.5; 95% CI: 1.2, 5.0) [90]. Similarly, Nota *et al*. reported higher VTE incidence in trans women taking GAHT compared with cis men and women [91]. Neither analysis adjusted for different GAHT regimens (duration, preparations). One single-center retrospective study in the U.S. investigated VTE incidence among trans women taking oral 17β-estradiol [92]. Over 600 U.S. trans women were included, and only one participant had a VTE (incidence rate: 7.8/10,000 person-years) [92]. All patients took oral 17β-estradiol, and most took spironolactone (>90%); less than 10% took at least one of each of the following: conjugated equine estrogen, oral progesterone, and/or DMPA. These findings suggest that the thrombogenicity of modern GAHT (excluding oral ethinyl estradiol and conjugated equine estrogens) may be low. Among trans men initiating testosterone (n = 585), VTE incidence was modestly higher compared with cis men (aHR: 2.7; 95% CI: 0.6, 12.1) and cis women (aHR: 1.5; 95% CI: 0.4, 5.6) [89]. Nota *et al*. observed higher myocardial infarction incidence in trans men taking testosterone compared with cis women only (standardized incidence ratio: 3.69; 95% CI: 1.94, 6.42), although this study was limited by lack of adjustment for smoking or psychosocial stressors [91].

Abacavir and protease inhibitors (pharmacokinetically-enhanced darunavir and lopinavir/ritonavir) are associated with myocardial infarction in cis adults [87,93]. Clinicians should calculate a cardiovascular disease risk score in all trans patients living with HIV, and consider alternative ART options, as appropriate. Clinicians may consider using a patient's affirmed gender rather than sex assigned at birth to calculate the cardiovascular disease risk scores, accounting for factors such as duration of GAHT use, hormone doses, and history of gonadectomy [94–97]. Among trans patients with an elevated cardiovascular disease risk score, unboosted INSTI-based regimens are preferred, due to the lipid-neutral effect of this ARV class (see section 6.2.4 *Dyslipidemia*). NNRTI-based ART, including doravirine- or rilpivirine-based regimens, may be an alternative.

Clinicians should consider the potential cumulative effect of GAHT- and ART-associated weight gain on cardiovascular disease risk in trans patients. A meta-analysis reported that total body weight was increased among trans women taking GAHT (up to 3.7 kg, pooled total body weight change estimate: +1.8 kg [95% CI: 0.2, 3.4]); investigators observed similar outcomes in trans men taking GAHT (total body weight increase up to 3.5 kg, pooled estimate effect: +1.7 kg [95% CI: 0.7, 2.7]) [98]. Many ARV classes are associated with weight gain: INSTIs, second-generation protease inhibitors (darunavir, lopinavir/ritonavir), and NNRTIs [99]. Data are limited to cis adults living with HIV, but mean weight gain is higher following bictegravir- (4.24 kg, 95% CI: 3.71, 4.78) or dolutegravir-based ART (4.07 kg, 95% CI: 3.51, 4.62) compared with elvitegravir/cobicistat-based ART (2.72 kg, 95%: 2.45, 3.00) [100]. For NRTIs, mean weight gain is higher during TAF- (4.25 kg, 95% CI: 3.94, 4.56) compared with TDF-containing ART (2.07 kg, 95% CI: 1.84, 2.30) [100]. Cis adults who switched to TAF- from TDF-containing ART experienced increased body mass index (mean increase: 0.45 kg/m^2, 95% CI: 0.14, 0.76) and increased ASCVD risk scores (mean increase: 13%, 95% CI: 4%, 23%) [101].

Clinicians should monitor body mass index within the first 12 months of ART initiation, as short-term weight gain is associated with increased diabetes or cardiovascular disease risk [102]. Waist circumference, a measure of visceral obesity, is recommended by the European AIDS Clinical Society in adults living with HIV and initiating ART [103], and may also be considered in trans adults [104]. Patients should be counselled on lifestyle modifications for weight management, including smoking cessation, dietary changes and increased physical activity [100].

6.2.3. Cholelithiasis

No studies are available describing cholelithiasis in trans women taking GAHT, although at least one case study has described cholelithiasis in a trans woman taking estrogen (dose, formulation not reported) [105]. Estrogen therapy is linked with gallstone formation in cis adults [106,107], likely from decreased gallbladder motility [28]. Atazanavir precipitates in the bile [108], and long-term (>2 years) exposure is associated with cholelithiasis [109]. Additive cholelithiasis risk when taking feminizing GAHT and atazanavir are unknown. During GAHT, the role of laboratory monitoring for gallstone-induced complications is unclear. Among cis adults (n = 14, 86% cis men), serum total bilirubin is elevated during confirmed atazanavir-associated cholelithiasis (median, range: 34.5, 7–180 umol/L) [108]. However, laboratory abnormalities (including grade 3 or 4 total bilirubin elevations) may occur during atazanavir-based ART [110], particularly because it competitively inhibits UGT1A1 and increases the unconjugated bilirubin fraction. In accordance with U.S. DHHS guidance [11], clinicians may monitor liver function tests in trans women taking GAHT plus atazanavir-based ART. Clinicians should also monitor patient-reported symptoms like right upper quadrant abdominal pain, and refer patients

to a gastroenterologist as needed for appropriate follow-up care.

6.2.4. Dyslipidemia

No studies have systematically evaluated dyslipidemia in trans adults taking GAHT plus ART. Among HIV-negative trans women taking GAHT for 24 months, a systematic review and meta-analysis observed increased triglyceride levels compared with baseline (0.36 mmol/L, 95% CI: 0.04, 0.68) [111]. Triglyceride concentrations were increased among participants taking oral compared with transdermal estrogen (P= 0.04). In the same study, trans men had altered lipids through at least 24 months of GAHT compared with baseline: increased serum triglycerides (0.24 mmol/L; 95% CI: 0.00, 0.48) and low-density lipoprotein cholesterol (LDL-C) (0.46 mmol/L; 95% CI: 0.09, 0.83); decreased high-density lipoprotein cholesterol (HDL-C) (−0.22 mmol/L; 95% CI: −0.34, −0.10) [111].

While no data are available in trans adults, several ARVs (pharmacokinetically enhanced protease inhibitors, efavirenz) are associated with increased triglycerides, LDL-C, and altered HDL-C concentrations in cis adults [11,112]. Unboosted INSTIs have a lipid-neutral profile [87], and switching to INSTIs from PI-based regimens may decrease triglycerides, total cholesterol, and non-HDL cholesterol [113]. NRTIs have varied influences on lipid profiles. TDF significantly improves lipid concentrations in patients with dyslipidemia [114], whereas TAF, zidovudine, and abacavir are associated with dyslipidemia [11]. The cumulative effect of ART-associated dyslipidemia in trans adults taking GAHT is unclear. However, given the link between dyslipidemia and increased risk of cardiovascular disease, unboosted INSTI-based regimens are preferred when possible, and clinicians can monitor patients according to U.S. DHHS Antiretroviral Guidelines [11].

6.2.5. Psychiatric effects

Depression, anxiety, and substance use are more prevalent among trans individuals compared with the general population [115], but psychological outcomes improve during GAHT [116,117]. NNRTIs and INSTIs have well-characterized neuropsychiatric adverse effects in cis adults. Efavirenz and rilpivirine are linked with anxiety, depression, and increased suicidality [118–120]. Doravirine, a novel NNRTI, has lower neuropsychiatric adverse event rates than efavirenz ($P\leq$ 0.033) [121]. Among INSTIs, bictegravir and dolutegravir have similar neuropsychiatric adverse event rates, which are elevated compared with other INSTIs [87]. The risk of cross-reactivity between dolutegravir and bictegravir is unknown.

Routine monitoring is recommended for trans patients with a history of mental health diagnoses who are taking GAHT plus ART, particularly among individuals taking dolutegravir, bictegravir, or efavirenz. Given the apparent concentration-response relationship between daily 600 mg efavirenz-based ART and neuropsychiatric adverse events, [122] low-dose efavirenz (400 mg)-based ART may be an alternative, although this dosage is not widely available as a single-tablet regimen. Other NNRTIs (doravirine) or INSTIs may be considered if depression develops or worsens after ART initiation.

6.2.6. QT Interval prolongation

Electrocardiographic (ECG) abnormalities are poorly characterized among trans individuals taking GAHT. Among cis men, androgen deprivation therapy is used as first-line therapy for disseminated prostate cancer [123]. Similar to GAHT in trans women, the goal of androgen depletion therapy in advanced prostate cancer is to suppress total testosterone serum concentrations (<3.47 nmol/L) either surgically or with medication therapy. Randomized clinical studies among cis men receiving advanced prostate cancer treatment report consistent associations between androgen depletion therapy and QT interval prolongation (up to 20 ms) [123]. While extension of these findings to trans patients is unknown, clinicians should carefully evaluate ART regimens that may potentiate QT interval prolongation during GAHT. In modern ART, NNRTIs and protease inhibitors are associated with QT interval prolongation. Efavirenz-based ART is associated with an increased corrected QT interval (QTc) through 48 weeks of therapy [124], and there is a concentration-response relationship between efavirenz plasma exposure and QTc prolongation [125]. Rilpivirine is also associated with QT interval prolongation in HIV-negative adults, however the QTc gradually stabilizes after 48 weeks following standard daily dosing (25 mg) [126,127]. Similarly, protease inhibitor-based ART is associated with QTc prolongation [128].

Given the link between androgen suppression and QT interval prolongation, efavirenz-, rilpivirine-, or protease inhibitor-based ART may have an additive impact on overall QT prolongation risk in trans women receiving feminizing GAHT and should be used with caution in trans individuals taking GAHT. In patients with other risk factors for torsades de pointes, alternative ART classes should be considered.

6.2.7. Renal effects

No data are available to characterize the impact of GAHT on renal function. Recent retrospective studies of clinical laboratory data from trans adults have observed altered serum creatinine concentrations before and during GAHT, with significant increases at 12 months in trans men on masculinizing hormones, and significant decreases at 12 months in trans women taking femininizing hormones. In 28–40% of individuals, the changes in creatinine resulted in shifting of eGFR category compared to baseline, when using birth sex in the Modification of Diet in Renal Disease (MDRD) equation [97]. ARVs, including certain INSTIs (bictegravir, dolutegravir), rilpivirine, and pharmacokinetic-enhancers (cobicistat), inhibit creatinine secretion and may elevate serum creatinine concentrations. These changes occur soon after ART initiation and remain stable throughout therapy, and are not associated with altered renal function [129]. Nephrotoxicity may occur among HIV-infected patients taking TDF-containing regimens, and regular renal function monitoring is recommended [11].

The combined influence of GAHT and ART on serum creatinine concentrations and glomerular filtration rate estimates in trans adults is unknown. When monitoring renal function during HIV and/or HCV treatment in trans patients taking GAHT, clinicians may consider estimating renal function

based on a patient's affirmed gender rather than sex assigned at birth, taking into account factors such as time on GAHT, changes in weight/muscle mass, etc [94,130]. Further, alternative renal function biomarkers like cystatin-C may be considered among trans patients with marginal renal function [11].

6.2.8. Transaminitis

Certain DAAs are associated with elevated ALT concentrations in cis adults, although clinical data specific to trans patients taking GAHT with DAAs are not yet available. In cis adults, coadministration of glecaprevir/pibrentasvir with ethinyl estradiol-containing oral contraceptive medications resulted in grade 1–3 ALT and AST elevations, with no substantial changes noted in the exposures of glecaprevir, pibrentasvir, or components of the oral contraceptives which could explain these observations. No ALT/AST elevations were seen when glecaprevir/pibrentasvir was administered with the progesterone only contraceptive norethindrone [131]. As such, the coadministration of glecaprevir/pibrentasvir with medications containing ethinyl estradiol is not recommended. The product monograph recommends that EE-containing products including combined oral contraceptives, vaginal ring or patch should be discontinued prior to starting glecaprevir/pibrentasvir and may be restarted two weeks after completion of glecaprevir/pibrentasvir therapy [62]. It is unclear whether these precautions with ethinyl estradiol can be extended to 17β-estradiol, since the mechanism of ALT/AST elevations is unknown. In phase 2/3 trials, 18 subjects were taking estradiol as hormone replacement therapy. ALT/AST elevations in these subjects were similar to that observed in the overall study population [131].

Similarly, the Canadian and European product monographs for sofosbuvir/velpatasvir/voxilaprevir state that coadministration with ethinyl estradiol-containing products may increase the risk of ALT elevation, despite lack of any significant pharmacokinetic interaction noted [59,132]. The Canadian monograph recommends that ALT monitoring may be required, while the European Summary of Product Characteristics contraindicate concomitant use of sofosbuvir/velpatasvir/voxilaprevir with ethinyl estradiol-containing products including oral contraceptives and vaginal rings. In contrast, the US package insert states that there is no clinically significant interaction with ethinyl estradiol/norgestimate and does not include any mention of ALT elevations with coadministration. Again, it is unclear whether these precautions apply to 17β-estradiol use in GAHT. 17β-estradiol is a substrate of OATP1B1. DAAs which inhibit this transporter (glecaprevir, pibrentasvir, velpatasvir and voxilaprevir) could theoretically increase estradiol exposure, although this has not been studied and the clinical relevance is unclear.

A post-hoc analysis examined 1022 identified cis women with HCV genotypes 1 or 4 who received 12 weeks of elbasvir/grazoprevir therapy; participants were stratified according to whether they received oral contraceptives or hormone replacement therapy (HRT) during the study period. Of the 81 women taking contraceptives/HRT, 17 (21%) used estradiol for at least 7 days during DAA treatment. Efficacy and safety of elbasvir/grazoprevir were similar in those receiving contraceptives/HRT compared to those not on contraceptives/HRT [9,133]. These limited observations suggest that elbasvir/grazoprevir may be safely used with concomitant hormone therapy, including estradiol.

Given the importance of GAHT in the context of mental health and quality of life outcomes [20], GAHT should not be discontinued during HCV treatment if possible. Liver function test monitoring should be completed in trans women taking feminizing GAHT within 4 weeks of HCV treatment initiation with regimens that may influence ALT concentrations, including glecaprevir/pibrentasvir and sofosbuvir/velpatasvir/voxilaprevir. Clinicians should also monitor for patient-reported symptoms including fatigue, weakness, lack of appetite, nausea or vomiting, or jaundice, as these may indicate hepatic toxicity.

7. Conclusions

Antiretrovirals and DAAs may significantly interact with GAHT used in trans patients, with potential consequences including lack of GAHT efficacy or increased toxicity. Clinically significant pharmacokinetic interactions that may impact GAHT efficacy are most likely to occur via ARV-mediated induction or inhibition of CYP isoenzymes. Some DAAs may potentially increase estradiol concentrations via inhibition of OATP transporters, but the clinical significance is unclear. Pharmacodynamic interactions between GAHT and ART or HCV treatment may occur in trans patients with certain comorbidities, and clinicians should monitor these patients regularly for additive toxicities or adverse events influenced by ART or HCV therapies and consider alternative ARVs or DAAs if possible.

8. Expert opinion

Given the improved health and quality of life outcomes associated with GAHT [20], the high rate of HIV infection among trans women, and the risk of HIV-HCV co-infection in this population, it is critical for clinicians to be aware of unique medical needs of transgender individuals in order to provide affirming medical care to this underserved population. This includes understanding and managing potential drug-drug interactions between GAHT and ART and/or HCV therapies, since concerns regarding the impact of drug-drug interactions on GAHT efficacy and safety may serve as a barrier to optimal care for transgender adults [17].

While it is tempting to use data from clinical drug-drug interaction studies between ARVs or DAAs and hormonal contraceptives to estimate the direction of potential pharmacokinetic interactions with feminizing GAHT, the extent of these interactions likely cannot be predicted based on these data alone. This limitation is largely due to differences in the metabolic pathways of synthetic hormones used for contraception compared with those used for feminization. For example, EE and 17β-estradiol are both metabolized by CYP3A4, yet the extent of CYP3A4 hydroxylation, and the influence of oral versus non-oral estradiol administration, has not been systematically compared between these estrogens. Similarly, differential activity of secondary CYP or UGT isoenzymes has not been characterized, and the role of these isoenzymes in mediating clinically relevant drug-drug interactions involving EE compared with 17β-estradiol remains unclear. An important distinction between EE and estradiol metabolism is that estradiol is

a substrate of OATP1B1 and OAPT1B3, and thus is susceptible to interactions via inhibition of these transporters by ARVs and DAAs. Such interactions would not be identified by simply extrapolating drug-drug interaction data from studies with EE. Thus, it is important for clinicians to use caution when predicting clinically relevant GAHT drug-drug interactions based on synthetic hormone data.

The NNRTIs efavirenz, nevirapine, and etravirine may decrease estradiol via CYP3A4-mediated induction; monitoring for estradiol efficacy is recommended, with measurement of estradiol concentrations and dose adjustment as needed. Limited case report experience suggests that transdermal estradiol may mitigate this effect, but this strategy has not been evaluated in clinical studies and has not been consistently observed to avoid drug-drug interactions with other hormones that are given via non-oral routes of administration. In contrast, cobicistat-boosted regimens may be more likely to increase estradiol concentrations. The net effect of ritonavir on estradiol is unclear. Thus, monitoring for estradiol toxicity and efficacy is recommended when administering with boosted ARV regimens. Generally, no significant interactions are anticipated between unboosted INSTIs, or the NNRTIs doravirine and rilpivirine with GAHT. When possible, these agents may be preferable for trans individuals receiving GAHT to avoid drug-drug interactions.

GAHT drugs are not generally considered to cause drug-drug interactions, although emerging pharmacokinetic data suggest that NRTI concentrations, specifically tenofovir (administered as TDF) and emtricitabine, may be altered by feminizing GAHT in HIV-negative trans women. One pharmacokinetic study observed intracellular concentrations of active NRTI phosphorylated moieties that were higher in trans women compared with ranges reported in the literature among cis adults [73]. The magnitude of these findings are modest, and further studies are needed to understand the influence of GAHT on NRTI efficacy. No data are available with GAHT and tenofovir administered as TAF. No dose adjustments are currently recommended among trans adults taking NRTIs as either PrEP or as a backbone regimen in ART.

While DAAs including glecaprevir/pibrentasvir and sofobuvir/velpatasvir/voxilaprevir are contraindicated or to be used with caution with ethinyl estradiol due to risk of ALT elevation, it is unclear whether use of estradiol poses the same risk, given differences in pharmacology. In phase 2/3 trials, limited use of estradiol in combination with either glecaprevir/pibrentasvir or elbasvir/grazoprevir was well tolerated. Nevertheless, there is potential for glecaprevir/pibrentasvir, sofosbuvir/velpatasvir and voxilaprevir to increase estradiol exposures via inhibition of OATP1B1/3. As such, regular monitoring for adverse effects, including elevated transaminases, is recommended during coadministration.

The antiandrogens cyproterone, dutasteride, finasteride, the progestogens medroxyprogesterone and progesterone, and testosterone may be subject to CYP3A4-mediated interactions with ritonavir, cobicistat, and NNRTIs that induce CYP isoenzymes (efavirenz, etravirine, nevirapine). Some DAAs have weak CYP3A4-inhibiting effects, but these are not expected to have clinically relevant interactions with these GAHT agents. Monitoring for desired GAHT clinical effects and regular measurement of serum sex hormone concentrations is recommended. In trans women taking GAHT, spironolactone may have a more favorable safety profile compared with cyproterone, in addition to having a lower potential for clinically significant drug-drug interactions. Oral spironolactone may be preferred among trans women at risk for thromboembolic events.

Pharmacodynamic drug-drug interactions between GAHT and ART or DAA regimens are poorly characterized. Certain ARVs and DAAs have side effect profiles that may exacerbate co-occurring morbidities in trans persons, such as depression, cardiovascular disease, or hyperlipidemia, or have side effects such as renal toxicity or transaminitis with GAHT that require monitoring. Clinicians should be aware of these factors when initiating or modifying GAHT, ART, or HCV treatment. In patients living with HIV, unboosted INSTI-based regimens are recommended as first-line ART by U.S. DHHS based on their efficacy and favorable safety profiles compared with other ARVs. Certain INSTIs, including bictegravir and dolutegravir, may be associated with elevated rates of neuropsychiatric adverse events and ART-associated weight gain in trans individuals. Mental health status and total body weight should be monitored among trans adults who are initiating ART, regardless of GAHT use. Among patients taking tenofovir-containing ART, TAF may be preferred over TDF due to improved renal and bone safety. When calculating risk scores, it may be appropriate to use calculations and reference ranges that are based on a patient's affirmed gender rather than sex assigned at birth, taking into consideration factors such as age at GAHT initiation, duration of use, consistency/adherence, and dose(s) of GAHT, as well as history of gonadectomy [94,95,97]. Clinical studies are urgently needed to identify and characterize significant pharmacokinetic and pharmacodynamic interactions that may occur between GAHT, ARVs and DAAs. We highly recommend collaboration and communication between providers of gender-affirming care and experienced HIV/HCV clinicians to manage potential pharmacodynamic drug-drug interactions in trans patients.

SHORT REPORTS

Transgender Women Living with HIV Frequently Take Antiretroviral Therapy and/or Feminizing Hormone Therapy Differently Than Prescribed Due to Drug–Drug Interaction Concerns

Hannan M. Braun,[1,2] Jury Candelario,[3] Courtney L. Hanlon, MS,[4] Eddy R. Segura, MD, MPH,[2,5] Jesse L. Clark, MD, MSc,[2] Judith S. Currier, MD, MSc,[2] and Jordan E. Lake, MD, MSc[2,6]

Abstract

Purpose: Both hormone therapy (HT) and antiretroviral therapy (ART) can be lifesaving for transgender women (TW) living with HIV, but each has side effects and potential drug–drug interactions (DDI). We assessed how concerns about HT–ART interactions affect treatment adherence.
Methods: This study used a cross-sectional survey of TW ($n = 87$) in Los Angeles, CA.
Results: Fifty-four percent were living with HIV; 64% used HT. Only 49% of TW living with HIV discussed ART–HT DDI with their provider; 40% reported not taking ART (12%), HT (12%), or both (16%) as directed due to DDI concerns.
Conclusion: Imperfect HT/ART use and limited provider communication suggests a need for improved HT–ART integration.

Keywords: antiretroviral therapy, health disparities, HIV, medication adherence, transgender

Introduction

Feminizing hormone therapy (HT) is used to harmonize gender identity and secondary sex characteristics for transgender women (TW), and antiretroviral therapy (ART) is essential for individuals living with HIV; both therapies can be lifesaving.[1–3] Despite a 34-fold higher likelihood of having HIV among TW in the United States compared with the general population,[4] transgender people (approximately 0.4%–0.6% of the U.S. population[5,6]) have comparatively low healthcare utilization rates[7] and may seek gender-affirming therapies (including HT and body modification services) outside of traditional, supervised medical settings.[8,9] Both HT and ART have potential side effects, and drug–drug interactions (DDI) may exist between some ART medications (such as nonnucleoside reverse transcriptase inhibitors [NNRTI] and protease inhibitors [PIs]) and HT (particularly ethinyl estradiol),[10] making unsupervised or uncoordinated HT and ART use potentially risky for TW taking feminizing HT.

Limited data exist that address knowledge and consequences of ART and/or HT side effects and ART–HT DDIs among TW. Qualitative studies have identified fear among TW that ART limits the effect of hormones.[11] However, few studies have explored levels of adherence to either regimen resulting from these fears about interaction. Using survey data from a cross-sectional, community-based study, we assessed knowledge of and concern about HT and ART side effects and DDIs, including effects on treatment adherence, among TW living with HIV and TW not living with HIV in Los Angeles, California.

Methods

Participants

From March to July 2016, self-identified TW were recruited from APAIT, a community-based AIDS service organization

[1]School of Medicine, University of California, San Francisco, San Francisco, California.

serving diverse communities in Los Angeles, CA, for a cross-sectional, pilot project to determine differences in biomarkers of inflammation and cardiovascular risk among TW living with HIV, TW not living with HIV, and age- and race-matched control cisgender men living with HIV and not living with HIV. For this trial, eligibility criteria included being assigned male sex at birth and age ≥18 years (or 17 years with parental consent). The study sought to enroll at least 40 participants per arm (total $n = 160$, including a minimum of 80 TW). In our current analysis, we further restricted the sample to participants self-identifying as a TW.

Procedures

At the time of questionnaire administration, blood was collected for the parent study's assessment of cardiovascular risk, for which TW living with HIV were required to be on ART and have HIV-1 RNA <50 copies/mL. Eligible participants self-reported sociodemographics, medical history, healthcare access, and knowledge of ART and HT side effects and ART–HT DDIs. Participants living with HIV were asked if concern about ART–HT DDIs had prevented them from taking either/both therapies as prescribed.

Consent/permissions

The study was approved by the Institutional Review Board of the University of California, Los Angeles. Written informed consent was obtained from all study participants before performance of study procedures.

Data analysis

The main outcome for this analysis was self-reported history of HT or ART use different than prescribed due to concerns about ART–HT DDI (TW living with HIV only), which we constructed as a dichotomous variable. We calculated descriptive summaries of participant characteristics as well as self-reported beliefs and healthcare experiences. Significance was defined as $P < 0.05$. All analyses were exploratory using chi-square and *t*-test, without adjusting for multiple testing. Prevalence ratios were calculated using generalized linear models to estimate the associations of participant clinical or sociodemographic characteristics with our main outcome of imperfect use of HT and/or ART. All analyses were performed using Stata 14.0 (StataCorp LLC, College Station, TX).

Results

Eighty-seven TW were enrolled, 47 (54%) of whom were living with HIV and on ART. Participants were predominantly Hispanic (62%), black (17%), or multiracial (13%), with a mean age of 45 (Table 1). In our sample, TW living with HIV were older than TW not living with HIV (48 vs. 43 years, $P = 0.03$) and more likely to report substance use during the last 90 days (47% vs. 25%, $P = 0.04$). Median $CD4^+$ T lymphocyte count among TW living with HIV was 555 cells/μL. ART regimens included nucleoside reverse transcriptase inhibitors (98%, including 79% with tenofovir and 23% with abacavir), integrase inhibitors (40%), PIs (32%), and NNRTIs (28%).

Most TW (77%) had a regular healthcare provider, and 64% were currently using feminizing HT. Eighty-six percent of insured TW reported that their insurance covers HT fully or in part. Twenty-five percent of HT users (not living with HIV 13%, living with HIV 34%, $P = 0.07$) were accessing HT outside of the medical system and obtaining nonprescription HT from: the street (9%), a friend (4%), a pharmacy without a prescription (4%), multiple (7%), or other (2%) sources.* TW took HT in the form of pill only (40%), injection only (28%), patch only (2%), or multiple delivery routes (30%), and took estrogen (67%), progesterone (2%), antiandrogen (4%) or combination (26%) HT.† While most (78%) took their hormones regularly, those who did not commonly reported fears of side effects (31%), financial difficulties (23%), limited access to a prescribing clinician (8%), multiple (31%), or other challenges (8%)‡ as barriers to taking HT as directed.

Only 68% of TW (78% not living with HIV, 61% living with HIV, $P = 0.12$) discussed potential HT side effects with their provider, including the risks of blood clots (71%), heart attacks (69%), stroke (55%), or other side effects (24%). Fifty-seven percent of TW living with HIV reported concern for ART–HT interactions, and 40% cited this concern as a reason for not taking ART (12%), HT (12%), or both (16%) as directed, although only 49% reported discussing these concerns with their provider. Of note, taking ART differently than prescribed was not associated with significantly lower $CD4^+$ T lymphocyte counts (not as directed: 493 cells/μL vs. as directed: 563 cells/μL, $P = 0.45$) among this group with an undetectable plasma HIV-1 RNA.

In bivariate models, no clinical or sociodemographic factors were significantly associated with our main outcome of taking HT or ART differently than prescribed, although our outcome frequency was small ($n = 17$). We observed suggested associations between this outcome and recent (last 90 days) substance use (crude prevalence ratio [cPR] 1.92, 95% confidence interval [CI] 0.87–4.25, $P = 0.10$) or alcohol use (cPR 1.92, 95% CI 0.87–4.25, $P = 0.10$). We also observed a trend that current HT users were more likely to take HT and/or ART as directed (cPR 1.81, 95% CI 0.90–3.64, $P = 0.10$).

Discussion

In this cohort of 87 TW in Los Angeles, we noted high rates of concern about ART–HT DDIs and side effects, but insufficient communication on this topic with healthcare providers. We also found high rates of taking HT, ART, or both differently than prescribed because of these concerns. These results support previous research demonstrating TW's concern that adverse ART–HT DDIs delay the desired effects of hormones.[11] Our findings are concerning for numerous reasons: suboptimal ART adherence increases the risk of developing ART resistance and virologic failure.[12,13] Suboptimal adherence also increases HIV transmission risk to sexual partners during periods of uncontrolled viremia,[14–16] and possibly increases risk of transmission of drug-resistant virus.[17,18] While incompletely studied, decreased HT adherence or intermittent use may cause suboptimal feminization and/or increased risk of side effects or adverse outcomes of HT.[19]

*$P<0.05$ for transgender women living with HIV compared with transgender women not living with HIV.
[a]Participants were able to report therapy with both tenofovir and abacavir.
ART, antiretroviral therapy; DDI, drug–drug interactions; HT, hormone therapy; INSTI, integrase inhibitor; N/A, not applicable; NNRTI, non-nucleoside reverse transcriptase inhibitor; NRTI, nucleoside reverse transcriptase inhibitor; PI, protease inhibitor; PrEP, preexposure prophylaxis.

These data affirm the importance of generating evidence-based data on ART–HT DDIs, as well as educating patients and providers on perceived versus actual risks. These findings also extend to ART for preexposure prophylaxis (PrEP) to prevent HIV acquisition, as TW may have concerns about possible DDIs between PrEP and feminizing HT.[20]

In looking at the evidence for DDIs, published studies predominantly address HT–ART DDI between ART (typically NNRTI/PI-based regimens) and ethinyl estradiol, a synthetic estrogen used in contraception but not currently recommended for feminizing HT due to increased thrombotic risk.[21] A recent systematic review found that the most noteworthy interactions occurred for cisgender women using NNRTIs, and particularly efavirenz, although these outcomes were predominantly pharmacokinetic in nature and assessed interactions at doses used for contraception rather than feminizing HT.[22] No studies have specifically addressed interactions between ART and the estrogen regimens/doses used for feminizing HT. Thus, there are insufficient data to fully understand the risk of DDIs between ART and HT for TW.[23] However, even relatively minor or rare interactions warrant attention, as both HT and ART may be long-term or lifelong medications. In addition, TW living with

HIV, like nontransgender patients, have a baseline cardiovascular disease risk influenced by both traditional risk factors (smoking, obesity, etc.)[24,25] and HIV-specific risk factors (independent of ART),[26,27] so the additive risk of ART–HT DDIs is worth defining. Evidence-based guidance for feminizing HT for TW living with HIV or taking PrEP is needed.

Considering the recent findings that (1) TW may have suboptimal ART adherence,[28,29] and (2) higher HT adherence and access to other transgender-specific healthcare factors is associated with higher ART adherence,[30] opportunities exist to utilize this synergy to ensure greater participation in HIV care by TW. Given our results that current HT users may report higher rates of HT or ART adherence, our findings support previous data,[29,30] suggesting that gender-affirming healthcare, including clinical integration of HT and ART services, may improve engagement in HIV care for TW.

Care for TW can also be improved through active engagement by healthcare providers and both professional and community-based organizations. While more data are needed before providing specific clinical recommendations to providers on preferred HT and ART regimens/doses for TW living with HIV, professional organizations (such as the World Professional Association for Transgender Health) could help by issuing HIV-specific expert consensus statements. Clinicians serving transgender patients should be attentive to possible HT–ART DDI and address them similarly to other DDIs, if such concerns arise.

Several limitations to our pilot study exist. First, our small sample size, although common among studies of TW, limits generalizability to larger populations of TW. Replication of this study with participants of more varied ethnicities and ages may be necessary as our sample was predominantly Hispanic with a mean age of 45, possibly limiting generalizability to other groups. In addition, the study site was a community center that did not provide medical care. Therefore, we were unable to capture whether the participant's hormone therapy (when prescribed and not acquired from an illicit source) was provided within an informed consent framework, a model of HT provision that addresses the medical and social benefits and risks of HT, including potential side effects. The parent study, a community-based assessment, was not focused exclusively on TW living with HIV, and therefore did not address other topics that may influence ART adherence, such as stigma or discrimination. Finally, TW living with HIV were required to have undetectable plasma HIV-1 RNA, which limits our ability to examine adherence. However, our racially diverse sample of TW and the limited number of studies addressing transgender-specific issues in HIV care make these data an important contribution to the field.

Conclusion

Our data show significant concerns about ART–HT DDIs among TW, which impact adherence to both therapies and suggest a need for comprehensive care programs for TW living with HIV. Future research will address ART–HT DDIs and side effect profiles for TW, including cardiovascular disease risk, and investigate approaches to mitigate risk. An improved understanding of these interactions will likely improve engagement and retention in healthcare for TW and may increase clinician comfort discussing TW's concerns regarding ART–HT side effects and DDIs.

Acknowledgments

The authors thank the participants who contributed their time and experiences. December 16, 2021

Dear Ryan White HIV/AIDS Program Colleagues,

Ensuring that transgender people with HIV have access to care, treatment and support services that improve their health and decrease risk of morbidity and mortality related to HIV is a priority for the Health Resources Services Administration's (HRSA) HIV/AIDS Bureau (HAB). Of the more than half a million people served by the Ryan White HIV/AIDS Program (RWHAP) 2.1 percent, approximately 11,600, are transgender.[1] Providing gender-affirming care is an important strategy to effectively address the health and medical needs of transgender people with HIV. HRSA HAB strongly encourages RWHAP service providers to harness and mobilize the existing RWHAP infrastructure and services to support gender-affirming services within allowable RWHAP parameters.

Gender-affirming care and treatment services are described in the *HHS Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents Living with HIV* (Guidelines).[2] According to the Guidelines, gender affirmation describes processes whereby a person receives social recognition, value, and support for their gender identity and expression. Gender affirmation is often described across several dimensions, including: social (e.g., social support and acceptance, use of pronouns, names, or clothing that align with their gender identity); medical (e.g., use of hormones or surgery); legal (e.g., legal name change or changing gender markers on identity documents); and psychological (e.g., the degree of self-acceptance and comfort with their gender identity).

RWHAP funds may be used to support gender affirming care across various HRSA RWHAP core medical and support service categories as outlined in *Policy Clarification Notice #16-02 Ryan White HIV/AIDS Program Services: Eligible Individuals & Allowable Uses of Funds.*[3]

---

[2] Panel on Antiretroviral Guidelines for Adults and Adolescents. Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents with HIV. Department of Health and Human Services. Available at: https://clinicalinfo.hiv.gov/sites/default/files/guidelines/documents/AdultandAdolescentGL.pdf, pp. J61-J70.
[3] Policy Clarification Notice 16-02: Eligible Individuals & Allowable Uses of Funds Clarification Notice. Available at: https://hab.hrsa.gov/sites/default/files/hab/program-grants-management/ServiceCategoryPCN_16-02Final.pdf.

Many RWHAP AIDS Drug Assistance Programs (ADAPs) provide access to gender-affirming hormone therapy.[4] RWHAP ADAP funds, along with RWHAP funds allocated under the service category *Health Insurance Premium and Cost Sharing Assistance for Low-Income Individuals*, can be used to purchase and maintain private health insurance, Medicaid, and Medicare coverage, which can support a broader range of health needs for transgender people with HIV. In addition, RWHAP recipients and subrecipients may provide behavioral and mental health services to clients experiencing gender dysphoria and social and emotional stress related to transgender discrimination, stigma, and rejection. RWHAP funds may be used to provide housing, case management, and substance use disorder treatment services, which are fundamental in reducing health disparities and improving HIV-related outcomes among transgender people. RWHAP AIDS Education and Training Centers provide training and education to clinicians and healthcare staff on cultural humility, cultural sensitivity, and inclusive care for diverse populations. HRSA HAB funds activities that support patient-centered, trauma-informed, and inclusive environments of care for RWHAP recipients through training, technical assistance, and other initiatives[5] to reduce barriers to antiretroviral therapy adherence and maximize the likelihood of achieving viral suppression.

As an outpatient ambulatory healthcare program, surgeries and inpatient care are not allowable uses of RWHAP or Ending the HIV Epidemic in the U.S. (EHE) initiative funds. This general prohibition applies to surgeries conducted in inpatient and outpatient settings, even when performed "same-day" as an ambulatory procedure under general anesthesia.

Among transgender clients receiving RWHAP HIV medical care in 2020, 84.5 percent were virally suppressed, which is lower than the national RWHAP average (89.4 percent).[6] While viral suppression rates among transgender clients in our programs are higher than the national non-RHWAP average, we recognize that more efforts are needed to help achieve our goal of ending the HIV epidemic and those set forth in the National HIV/AIDS Strategy (2022-2025).[7] This is true especially of Black and Hispanic/Latino/a transgender women who are disproportionally impacted by HIV and other intersecting social and health challenges.

HRSA HAB will continue to monitor HIV clinical outcomes and ensure evidence informed, evidence based, and emerging interventions are shared to support recipients with providing gender-affirming services for transgender people with HIV. We appreciate your efforts to provide affirming, whole person care to transgender people with HIV.

HRSA
Health Resources & Services Administration
HIV/AIDS Bureau
5600 Fishers Lane
Rockville, MD 20857

December 20, 2024

Dear Ryan White HIV/AIDS Program Colleagues,

As many of you know, earlier this year the Health Resources and Services Administration's (HRSAs) HIV/AIDS Bureau (HAB) introduced **Ryan White Program 2030 (RWP 2030),** a renewed vision for the Ryan White HIV/AIDS Program (RWHAP). Building on 35 years of success and innovation, RWP 2030 integrates lessons learned from the RWHAP and the Ending the HIV Epidemic in the U.S. (EHE) initiative. This framework is designed to sustain high-quality care and treatment for people currently receiving services through the RWHAP **while expanding efforts to identify and engage individuals with HIV who are undiagnosed or out-of-care[1].**

Achieving this goal will require a comprehensive, collaborative approach that builds upon existing successes and resources while fostering innovation[2]. At its core, RWP 2030 reflects our shared commitment to improving health outcomes for people with HIV. This vision calls on the HIV community to establish and strengthen partnerships, prioritize community engagement, and utilize focused interventions to end the HIV epidemic.

Since 2010, viral suppression among people receiving HIV medical care through the RWHAP has increased significantly, from 69.5% to 90.6% in 2023. Thanks to advancements in treatment, HIV is now a manageable chronic condition for individuals who remain engaged in care, allowing them to live long, healthy lives while preventing transmission to others. Despite this progress, we recognize that approximately 40% of people with HIV in the U.S. are either undiagnosed or not receiving regular care, contributing to most new HIV infections. Addressing these gaps is essential to achieving our goal of ending the epidemic.

Through EHE, we have seen the power of targeted investments and innovative strategies. In 2022, EHE-funded providers served over 22,000 individuals who were new to care and re-engaged more than 19,000 individuals who were out of care. Remarkably, 79.2% of individuals new to care achieved viral suppression, underscoring the effectiveness of our collective efforts. These successes highlight the importance of combining strategic investments with community-driven planning to achieve high-impact outcomes.

Ryan White Program 2030 emphasizes the importance of sustaining care for those already engaged in the RWHAP, while expanding our reach to ensure timely diagnosis and sustained treatment for underserved communities. This will require collaboration across sectors, innovation in care delivery, and a commitment to addressing barriers to care. We must also engage individuals with lived experience and non-traditional partners to inform program planning[3] and care models that are responsive to the needs of diverse communities.

[1] Legal authority: §§ 2602(b)(4), 2617(b), 2664(a), and 2671(c) of the Public Health Service (PHS) Act.
[2] Legal authority: §§ 2603(b)(2)(B), 2620, 2654(c), and 2691 of the PHS Act.
[3] Legal authority: § 2681 of the PHS Act.

Ryan White HIV/AIDS Program recipients play a critical role in advancing the goals of RWP 2030 and are responsible for employing sound planning and decision-making processes to determine which HIV related services are prioritized and how much to fund them. As part of these responsibilities, RWHAP recipients must continue to base service priorities and resource allocation decisions on the size, demographics, and needs of people with or affected by HIV. RWP 2030 specifically entails a renewed focus on reaching those who are undiagnosed or out of care. This may necessitate a re-evaluation of existing resource allocations to ensure outreach, engagement, and support efforts are effectively scaled to meet the needs of these especially high-need populations while still addressing the needs of individuals who are currently receiving care through the RWHAP.

We encourage you to begin engaging your partners in discussions about this vision and its implications for your work. Over the next several months, HRSA HAB will work to develop additional guidance and tools to support your efforts in implementing RWP 2030. The RWHAP Best Practices Compilation contains effective innovative interventions and best practices on outreach, linkage to and engagement in care. TargetHIV also contains a number of trainings, resources, and reference guides to support recipients and subrecipients in providing care to people with HIV. HAB is also planning a series of listening sessions in 2025 to ensure that RWP 2030 is informed by diverse perspectives and to better understand the challenges and barriers to implementing this vision.

We are confident that, with your continued partnership, we can realize the goals of RWP 2030 and bring us closer to ending the HIV epidemic. If you have questions, please contact your HRSA HAB Project Officer.

Thank you for your unwavering dedication to improving the lives of people with HIV.

Sincerely,

/Laura W. Cheever/

Ryan White Program 2030: Engaging People with HIV in Care to End the HIV Epidemic

Updated: January 21, 2026

In 2024, the Health Resources and Services Administration's (HRSA's) HIV/AIDS Bureau (HAB) introduced **Ryan White Program 2030 (RWP 2030)**, a renewed vision for the Ryan White HIV/AIDS Program (RWHAP). RWP 2030 builds on the foundation of the RWHAP and innovative, low-barrier strategies employed in the Ending the HIV Epidemic in the U.S. (EHE) initiative. This framework is designed to sustain high-quality care and treatment for people currently receiving services through the RWHAP **while expanding efforts to identify and engage individuals with HIV who are undiagnosed or out-of-care**[i]**.**

Achieving this goal requires a comprehensive, collaborative approach that builds upon existing successes and resources while fostering innovation[ii]. At its core, RWP 2030 reflects the RWHAP's shared commitment to improving health outcomes for people with HIV. This vision calls on the HIV community to establish and strengthen partnerships, prioritize community engagement, and utilize focused interventions to end the HIV epidemic. This requires collaboration across sectors, innovation in care delivery, and a commitment to addressing barriers to care. The RWHAP must also engage individuals with lived experience and non-traditional partners to inform program planning[iii] and care models that are responsive to the needs of these communities.

Since 2010, viral suppression among people receiving HIV medical care through the RWHAP has increased significantly, from 69.5% to 91.4% in 2024. Thanks to advancements in treatment, HIV is now a manageable chronic condition for individuals who remain engaged in care, allowing them to live long, healthy lives while preventing HIV transmission to others. Preventing new HIV infections not only reduces the spread of the virus but also reduces long-term healthcare costs. Despite this progress, approximately 87% of new HIV transmissions are estimated to result from persons who do not know of their HIV status or are not engaged care[iv]. Addressing these gaps is essential to achieving the goal of ending the HIV epidemic.

The EHE initiative has demonstrated the power of targeted investments and innovative strategies. In 2023, EHE-funded providers served over 26,800 individuals who were new to care and re-engaged more than 17,300 individuals who were out of care. Remarkably, 81.4% of patients who were new to care and receiving HIV treatment reached viral suppression, underscoring the effectiveness of the RWHAP's collective efforts. These successes highlight the importance of combining strategic investments with community-driven planning to achieve high-impact outcomes.

Ryan White HIV/AIDS Program recipients play a critical role in advancing the goals of RWP 2030 and are responsible for employing sound planning and decision-making processes to determine which HIV-related services are prioritized, and how much to fund them. As part

of these responsibilities, RWHAP recipients must continue to base service priorities and resource allocation decisions on the size, demographics, and needs of people with or affected by HIV. RWP 2030 specifically entails a renewed focus on reaching those who are undiagnosed or out of care. This may necessitate a re-evaluation of existing resource allocations to ensure outreach, engagement, and support efforts are effectively scaled to meet the needs of people and communities disproportionately impacted by HIV while still addressing the needs of individuals who are currently receiving care through the RWHAP.

HRSA HAB encourages RWHAP recipients and HIV community members to engage subrecipients and partners in discussions about this vision and its implications for your work. HRSA HAB is working to develop additional guidance and tools to support your efforts in implementing RWP 2030.

Moving forward, the HIV community can leverage the infrastructure and expertise of the RWHAP, and the innovations and high impact activities learned from the EHE initiative, to accelerate reaching people with HIV who are out of care, ensuring that no one is left behind in our efforts to end the HIV epidemic.

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF MASSACHUSETTS

AMERICAN ACADEMY OF HIV MEDICINE; HIV MEDICINE ASSOCIATION, a division of the INFECTIOUS DISEASES SOCIETY OF AMERICA; INTERNATIONAL ASSOCIATION OF PROVIDERS OF AIDS CARE; JENNIFER K. BRODY, MD; and CHRISTOPHER B. FOX, NP, *Plaintiffs*, v. HEALTH RESOURCES AND SERVICES ADMINISTRATION; THOMAS J. ENGELS, in his official capacity as the Administrator of the Health Resources and Services Administration; U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES; and ROBERT F. KENNEDY, JR., in his official capacity as Secretary of the U.S. Department of Health and Human Services, *Defendants*.	Case No.

DECLARATION OF JOSÉ M. ZUNIGA, PRESIDENT AND CHIEF EXECUTIVE OFFICER OF THE INTERNATIONAL ASSOCIATION OF PROVIDERS OF AIDS CARE

I, José M. Zuniga, hereby state as follows:

1. I am over 18 years of age, of sound mind, and in all respects competent to testify.

2. I have personal knowledge of the facts set forth in this declaration and would testify competently to those facts if called to do so.

3. I am the President and Chief Executive Officer of the International Association of Providers of AIDS Care ("IAPAC"), which is an organizational plaintiff in this case bringing claims on behalf of its members and the transgender patients of its members.

4. I joined IAPAC in 1997 as Vice President and have served as its President and CEO since 2000. In 2020, I also became the President and CEO of the Fast-Track Cities Institute, a global network of urban providers and the world's largest urban health initiative, which unites more than 600 cities and municipalities worldwide to accelerate progress towards achieving health-related goals in relation to HIV. As IAPAC's President and CEO, I oversee the association's medical education and technical assistance initiatives. As part of this role, I lecture at various academic institutions, publish research, and write and edit books related to HIV/AIDS care. I also serve as an Editor Emeritus for the *Journal of the International Association of Providers of AIDS Care*, and I am a trustee of IAPAC. I formerly served as a member of the Joint United Nations Programme on HIV/AIDS Scientific and Technical Advisory Committee.

5. I submit this declaration in support of Plaintiffs' Motion for Preliminary Relief under 5 U.S.C. § 705 and for a Preliminary Injunction, which seeks to prevent Defendants from giving effect to certain conditions relating to transgender people and gender-affirming medical care set forth in Ryan White HIV/AIDS Program ("Ryan White Program") Notices of Funding Opportunity issued or forecasted to be issued in 2026 and the 2026 Updated HRSA General Terms and Conditions, issued on March 11, 2026.

6. In this declaration, I explain that transgender people are more likely than others to acquire HIV for many reasons, including social, economic, and legal exclusion, and that the Ryan White Program is a lifeline that ensures comprehensive primary care for people living with HIV. Using survey results, I show that providers are experiencing unwanted operational changes that

impact the most vulnerable populations, including transgender people, and that losing the ability to provide gender-affirming medical care will cause patients to discontinue HIV care. I conclude by explaining that the Challenged Conditions will cause long-term harm to clinic providers and their patients, such as loss of revenue and closure of clinics, poor health outcomes for transgender patients, and the further destabilization of the American HIV response.

I. Background on IAPAC

7. IAPAC is a 501(c)(3) nonprofit membership organization and the largest world-wide association of clinicians and allied health professionals working to end AIDS as a public health threat by 2030 with programming in over 150 countries.

8. IAPAC's mission is to expand access to and improve the quality of prevention, care, treatment, and support services provided to people affected by and living with HIV and its co-occurring conditions.

9. IAPAC's history spans decades. The Physicians Association for AIDS Care ("PAAC") was established in 1985 as the first organization to support physicians as they struggled to care for people who, given limited treatment options, were dying of AIDS-related complications.

10. PAAC was the precursor to IAPAC. In 1995, coinciding with the advent of antiretroviral therapy ("ART"), PAAC expanded its U.S.-centric geographic focus to one inclusive of all regions of the world. That same year, the association was renamed the International Association of Physicians in AIDS Care. The association was again re-named in 2012 to the International Association of Providers of AIDS Care to reflect the variety of clinicians and lay-providers engaged in the global battle against HIV/AIDS.

11. IAPAC has over 30,000 clinical provider and community health worker members worldwide, with more than 8,500 members in the United States. IAPAC performs traditional functions of professional medical associations, develops HIV care guidelines, and advances global initiatives to end the HIV epidemic. IAPAC also manages the Fast-Track Cities network.

12. IAPAC members represent a broad cross-section of clinicians across the country. Those members accept a mix of Medicaid, Ryan White funding, private insurance, and other sources to fund their HIV care. Survey research conducted by the Emergency HIV Clinical Response Task Force, of which IAPAC is a member, indicates that 67% of HIV medical providers rely on the Ryan White Program to provide comprehensive HIV care. A copy of the Emergency HIV Clinic Response Task Force's report, titled *HIV Response in U.S. Experiencing Renewed Strain*, published in April 2026 is attached hereto as **Exhibit A**.

13. Indeed, over 60% of IAPAC's members provide medical care to their patients with HIV with funding from the Ryan White Program, including through funding under all its parts as well as any supplementary funding. For their transgender patients, this often includes hormone therapy as treatment for their gender dysphoria (also known as "gender-affirming hormone therapy" or "gender-affirming medical care").

14. One of IAPAC's functions is providing clinicians and allied health professionals with education on scientific advancements and best practices in HIV medicine. IAPAC hosts conferences and workshops, publishes the *Journal of the International Association of Providers of AIDS Care*, and coordinates multidisciplinary online educational activities specific to key challenges in reaching hard-to-reach populations of people who are vulnerable to HIV.

15. Given the disproportionate impact of the HIV epidemic on LGBTI+ people, IAPAC has published several resources specific to the health of these populations in relation to HIV care.

For example, in 2021, IAPAC conducted a study that included assessments of fifty cities and municipalities from four geographic regions, as well as 275 key informant interviews with people involved in LGBTI+ health issues at the community level. The study's results are featured in "LGBTI+ Health Equity: A Global Report of 50 Fast-Track Cities," which reflects outcomes across multiple public health and social determinants of health indicators that affect the lives of LGBTI+ people across the Fast-Track Cities network. A copy of the report is attached hereto as **Exhibit B.** IAPAC also published a fact sheet on transgender people that is available on its website and was last reviewed in June 2025. A copy of IAPAC's transgender people fact sheet is attached hereto as **Exhibit C.**

II. HIV and Transgender People

16. The link between LGBTI+ health equity and our work at IAPAC is perhaps obvious given the longstanding and staggering disparities that LGBTI+ individuals[1] face with respect to HIV. And given my work in this field as well as my role at IAPAC, I am familiar with and must keep informed of the relation between LGBTI+ people and HIV.

17. The first cases of what came to be known as AIDS were detected in gay men in 1981. At the beginning, AIDS was perceived not as a national health problem but as a problem for "homosexuals" and people who inject drugs. As a 2011 report by the Institute of Medicine documents: "Because of the marginal status of these groups, societal response to the epidemic was slow. It was not until there was widespread awareness that AIDS was affecting the 'mainstream'

[1] In health research, including some of IAPAC's publications, we refer to sexual and gender minorities in lieu of using "LGBT" or "LGBTI+" people. Sexual minorities are individuals whose sexual attraction, behavior, and/or identity is something other than exclusively heterosexual. Gender minorities include individuals whose gender identity is something other than cisgender and may also include individuals whose gender expression rather than identity does not conform with established social norms. In this declaration, I use the terms "sexual and gender minorities" to be synonymous and encompassing of "LGBT" people. The acronym LGBTI+ is used as an umbrella term to describe sexual and gender minorities as well as intersex individuals.

population that the disease garnered significant attention. Indeed, it was Ryan White, an Indiana adolescent who acquired AIDS through treatment for hemophilia, who became the sympathetic face of AIDS to the nation."[2]

18. The response of the federal government to the epidemic was likewise slow. Throughout most of the 1980s, AIDS was seldom acknowledged by the federal government, and research and prevention efforts were hampered by the stigma associated with being gay. Moreover, virtually no attention was paid to infection rates in the transgender community until the mid-1990s, because transgender people were not understood to be separate from the category of gay men in federal research efforts. As a result, AIDS claimed the lives of a significant portion of the generations of LGBT people who came of age during and after the World War II era and dramatically altered the LGBT community in numerous ways.

19. While the cultural climate in the United States affecting people with HIV has positively improved since the early days of the AIDS epidemic, stigmatization continues to affect all LGBT people, including those living with HIV. Indeed, HIV continues to be a major public health concern among sexual and gender minority populations.

20. As our LGBTI+ Health Equity report documents, the risk of acquiring HIV among transgender and other gender minority individuals is thirteen times that of the cisgender population. While HIV prevalence data among the transgender community remains scarce, we know that transgender people are disproportionately affected by the HIV epidemic. According to the Centers for Disease Control and Prevention ("CDC"), transgender people make up 2% of new

[2] Inst. of Med., The Health of Lesbian, Gay, Bisexual, and Transgender People: Building a Foundation for Better Understanding 68 (2011).

HIV diagnoses in recent year-to-year data[3] despite comprising only about 1% of the United States population aged 13 and older.[4]

21. The existing data specific to transgender people demonstrate a heavy burden of HIV among transgender women, specifically transgender women who have sex with cisgender men. Transgender women are one of the groups most affected by HIV and are forty-nine times more likely to have HIV than the general population.

22. Disparities exist even within this population on intersectional aspects of their identity. For example, racial and ethnic disparities are stark among transgender women in the United States: 62% of Black/African-American transgender women and 35% of Latina/Hispanic transgender women have HIV, while only 17% of White transgender women have HIV. In other words, and as the LGBTI+ Health Equity report states, in the United States, Black transgender individuals are five times more likely to be living with HIV than transgender and nonbinary people in general.

23. CDC data also show that in the United States, HIV diagnoses among transgender people vary by region, with the highest number of new HIV diagnoses among transgender people occurring in the South.

24. There are many factors that put transgender people at heightened risk of HIV, including social, economic, and legal exclusion. As documented in our fact sheet, transgender people face stigma and discrimination, which contributes to higher levels of unemployment,

---

[3] Ctrs. for Disease Control and Prevention, *Fast Facts: HIV and Transgender People* (Mar. 28, 2024) https://tinyurl.com/4a38tazk [https://web.archive.org/web/20250103203335/https://www.cdc.gov/hiv/data-research/facts-stats/transgender-people.html]. A copy of the CDC Fact Sheet is attached hereto as **Exhibit D**.

[4] Williams Inst., Ucla Sch. Of L., *How Many Adults and Youth Identify as Transgender in The United States?* (Aug. 2025), https://tinyurl.com/3haevkt5 [https://perma.cc/M2BZ-9QXK].

poverty, homelessness, sex work, depression and other mental health issues, substance use, incarceration, and violence, all of which are linked to higher rates of HIV. Most transgender people have experienced some form of abuse or harassment because of their gender identity or presentation. This may negatively impact access to HIV testing, care, and/or treatment for HIV. Many patients of IAPAC members report co-occurring social conditions that exacerbate the risk of HIV, such as homelessness, sexual violence, and poverty.

25. In addition, many transgender people have had negative experiences with healthcare providers, which discourages them from seeking care. Finding providers who are knowledgeable about and sensitive toward transgender people can be challenging, but is critically important. Transgender people may not have access to HIV prevention information or adequate treatment when providers are not affirming of their identities. In fact, transgender people may delay seeking treatment due to transphobia and insensitivity among healthcare professionals.

26. Delays in treatment initiation lead to increased morbidity and mortality, and deny transgender patients the therapeutic and preventive benefits of achieving an undetectable viral load. The WHO has reported that a person living with HIV who achieves an undetectable viral load cannot sexually transmit HIV to a sexual partner.[5]

27. As the World Health Organization's *Consolidated Guidelines on HIV, Viral Hepatitis and STI Prevention, Diagnosis, Treatment and Care for Key Populations*, published in 2022, and which IAPAC's transgender people fact sheet references, states: "The high vulnerability and specific health needs of trans and gender diverse people necessitates a distinct and independent

[5] Ministry Of Pub. Health Of Thail., World Health Org. & Joint United Nations Programme On Hiv/Aids, People Living With Hiv With An Undetectable Viral Load Cannot Transmit Hiv Sexually (Feb. 21, 2020), https://tinyurl.com/2mr3ejfy [https://perma.cc/AY6V-S5V8].

status in the global HIV response."[6] This means that "[g]ender affirmation is often a priority intervention for the trans and gender diverse community."[7]

III. HIV Healthcare Disruptions Since 2025

28. Despite decades of progress in HIV prevention and treatment, the HIV response in the United States is experiencing renewed strain. Funding uncertainty, workforce attrition, policy shifts, and rising social and economic precarity are reshaping the delivery of HIV services at the clinic and community levels. In June 2025, in response to reports of HIV clinical and supportive service disruptions, five U.S.-based professional medical and nursing associations—the American Academy of HIV Medicine, Association of Nurses in AIDS Care, Gay and Lesbian Medical Association, HIV Medicine Association, and IAPAC—launched the Emergency HIV Clinical Response Task Force. We launched the task force because we were hearing reports of HIV clinical and supportive service disruptions in the United States caused by the Trump administration, despite decades of progress in HIV prevention and treatment. The Task Force administered two nationwide Emergency HIV Clinical Response Surveys in the summer and winter of 2025 to quantify the scope, nature, and equity dimensions of these disruptions as experienced by frontline HIV service providers across the United States. In April 2026, the Task Force published the results of the winter survey, titled *HIV Response in U.S. Experiencing Renewed Strain* (Exhibit A). Just under 400 clinical providers completed the survey across forty-seven states and Puerto Rico. Respondents included physicians, nurses, pharmacists, case managers, social workers, and community-based providers working across academic medical centers, Federally Qualified Health Centers, hospitals,

---

[6] World Health Org., Consolidated Guidelines on HIV, Viral Hepatitis & STI Prevention, Diagnosis, Treatment and Care for Key Populations 54 (2022), https://tinyurl.com/4jr928hy [https://perma.cc/9GNL-6CGG].

[7] *Id.*

private medical practices, and outreach settings. Moving forward, the Task Force will continue to field this survey quarterly until the need dissipates.

29. 68% of HIV care providers who responded to the surveys reported unwanted operational changes in their clinical settings from July to October 2025 due to changes in federal or state policies or funding cuts. Respondents reported medical service disruptions to patients caused by the closure of programs, reduction in ability to provide services, and adjustment of staffing, including staff layoffs. 61% of respondents reported at least one HIV service disruption in their clinic setting. These disruptions in medical service spanned the HIV care continuum, with the highest amount of disruption impacting gender-affirming medical care. These disruptions were largely caused by federal policy directives under the current administration.

30. These disruptions impacted the most vulnerable populations, with respondents identifying transgender people (40%) and immigrants (38%) as key populations most affected by population-level disruptions in HIV care. HIV care disruptions are particularly harmful for vulnerable patients who are less likely to receive adequate healthcare due to barriers to care, including housing instability, food insecurity, loss of health insurance, fear of immigration enforcement, loss of employment, and mistrust in healthcare systems.

31. Most respondents experiencing care disruption identified the predominant cause as insurance lapses or loss and reported that the most urgent resource needed to safeguard continuity of HIV services was funding, with specific emphasis on the Ryan White program. Several respondents gave detailed responses beyond the pre-written survey options, specifically noting "continued access to gender-affirming care" and "protection for gender-affirming care" as the most urgent resources or assistance needed to safeguard the continuity of HIV-related services. Additionally, multiple providers described losing transgender patients living with HIV because the

providers could no longer provide gender-affirming medical care due to institutional or state policies. One provider explained that "continued profiling of immigrants and transgender individuals is causing severe mental health issues and distress," leading to current and anticipated service disruptions. Another provider explained that a loss of Ryan White funding would be devastating, and that transgender patients who "perceive changes" have already stopped following up with care, even when those changes have not occurred." Yet another provider wrote, "had to take gender-affirming care off my provider info page on our website because HRSA told us we had to." These prohibitive policies are impacting transgender patients' funding for care, access to care, and mental health due to discrimination.

IV. Harms to IAPAC Members and their Transgender Patients

32. Given my experience in this field as well as my role in IAPAC, I am aware of the impacts that the restrictions on how HIV care providers may treat their transgender patients with HIV, including the use of Ryan White funding for gender-affirming medical care, may have on HIV care providers like IAPAC's members and their transgender patients.

33. Addressing disruptions in HIV care is imperative to safeguarding lives and decades of progress in the United States's HIV response. The Ryan White Program is vital to prevent these disruptions, as other sources of funding are not sufficient to cover patient needs.

34. Gender-affirming medical care is a vital pathway for transgender patients to receive HIV treatment. Consistent with the Ryan White Program's emphasis on ensuring comprehensive primary care and addressing people living with HIV's co-occurring conditions, we believe that ending the HIV epidemic requires that we meet people's whole health needs in the context of HIV prevention and treatment.

35. As noted, transgender people, and transgender women in particular, are vulnerable to HIV due to socioeconomic marginalization and discrimination in healthcare settings, and we know that transgender people are less likely to maintain regular contact with the healthcare system due to high costs and historic discrimination from providers. Research, like that presented at IAPAC's Continuum Conference and with which we are familiar, consistently shows that when transgender people feel supported and affirmed in their gender identity by health care providers, they are more likely to access HIV testing, engage with pre-exposure prophylaxis, adhere to ART, and achieve viral suppression.[8] Ryan White-funded clinics open the door for treatment for transgender patients who often do not access routine healthcare because clinicians can address patients' comprehensive health needs, including gender-affirming medical care, when administering HIV care.

36. It is my understanding that the current administration indicated that it is conditioning Ryan White funding on the non-promotion of gender ideology, which I understand the administration defined as acknowledging and respecting transgender patients' identities, and prohibiting the use of Ryan White funding for the provision of gender-affirming medical care, notwithstanding that this is an outpatient service for a co-occurring condition that many IAPAC members provide to their transgender patients with HIV.

37. IAPAC members are worried that they will lose their ability to provide gender-affirming medical care in the face of a restriction on gender-affirming medical care for the Ryan White Program. They report that hospital systems will likely end gender-affirming medical care programs rather than risk their funding. Members also fear legal exposure amid confusion about

---

[8] Martha O. de la Paz & Harry Barbee, Beyond Prevention: How Gender-Affirming Care Can Transform HIV Outcomes for Transgender and Gender-Diverse Populations, 115 AM. J. PUB. HEALTH 1613–14 (2025). A copy is attached as **Exhibit E**.

how they may address their transgender patients and what care they are permitted to provide to these patients. As such, this restriction would suddenly change the way providers engage in patient health literacy as well as create a barrier for HIV care and other critical services for transgender Ryan White patients.

38. Our members are concerned that transgender Ryan White patients are likely to discontinue HIV care if this restriction goes into effect. Many transgender patients distrust medical systems because of historic discrimination. Accordingly, trust between medical professionals and transgender patients is crucial for good health outcomes because it reduces healthcare avoidance—but the sudden inability to provide gender-affirming medical care will shatter that hard-earned trust in a way that cannot be repaired. As a result, patients will be less likely to continue any care, including HIV care, with their doctor. These patients will experience worse health outcomes without consistent HIV care, including an increase in viral load, immune system damage, and health complications. Moreover, an increase in viral load will allow for HIV transmission to others. Members worry that the nationwide gains made over the last few decades in decreasing HIV incidence will be reversed due to a key population largely losing access to care, which protects patient health and the broader health of the public.

39. Transgender patients who receive services with Ryan White Program funding would also experience immediate harm if their doctors are unable to provide their gender-affirming medical care with Ryan White funds or are prohibited from acknowledging or respecting their identities. Members worry that many transgender patients would lose access to gender-affirming medical care altogether because they simply could not afford it, or even—if alternative avenues of funding were available——would not come for visits for care unrelated to gender-affirming medical because their Ryan White-funded HIV care provider is prohibited from addressing them with the

right pronouns or in a manner that respects their identity. Most transgender patients in the Ryan White program who have healthcare coverage do so through Medicaid, which does not universally cover gender-affirming medical care.

40. The restriction would also undermine our members' ability to treat their patients by erasing data on transgender people living with or at risk of HIV. The Ryan White program generates significant amounts of data about its patients, which is helpful for our members' understanding of the HIV epidemic and patient needs. Without data on transgender patients, epidemiological data would become inaccurate, noncomprehensive, and create unnecessary HIV risks for both transgender and non-transgender populations. Providers and the communities they serve will be left in the dark about the scope of HIV outbreaks.

41. The restriction would also cause a drop in patients for providers, and as a result cause a loss of revenue for clinics. Members are anxious about the potential closure of clinics specializing in gender-affirming medical care, whether it be from funding loss, loss of revenue, or political pressure.

42. The downstream impacts of these restrictions will harm the ability of the United States to control the HIV epidemic. When any population is omitted from HIV care, it destabilizes the structures in place intended to prevent further cluster events and HIV outbreaks because health professionals lose key information needed to determine causes and solutions. Transgender patients, already vulnerable to HIV, will see worse health outcomes, while providers will have less capacity to address these issues.

V. Conclusion

43. In the United States and around the world, transgender people are disproportionately affected by HIV. With early testing and treatment, transgender people with HIV

can live longer, healthier lives and prevent the sexual transmission of HIV among those who achieve an undetectable viral load.

44. Based on IAPAC and our members' experience and research, providing HIV care and comprehensive care, including gender-affirming medical care, that affirms transgender patients and addresses their health needs holistically, is an essential component of HIV treatment for transgender patients.

45. Omitting this piece from comprehensive medical care is contrary to best practice, accepted standards of care, and the experiences of IAPAC's members. It will only cause irreparable harm to HIV care providers and the health of their transgender patients. If the restrictions challenged in this case are allowed to go into effect and be incorporated into the Ryan Program, IAPAC members are at imminent risk of losing critical funding that they need to fulfill their obligation as medical providers and meet the health needs of their patients, and the health and wellbeing of transgender people with HIV will be endangered.

46. As IAPAC's LGBTI+ Health Equity report notes, the bottom line is that we cannot adequately address HIV and other health conditions without including LGBT populations, and we cannot adequately serve this population unless we understand its diversity and complexity. To end the HIV epidemic, those of us working in the field of HIV care and in any other area relevant to LGBT health equity must work holistically to end the disparities key populations face, including the transgender community.

I declare under penalty of perjury that the foregoing is true and correct. Dated: June 8, 2026

HIV Response in U.S. EXPERIENCING RENEWED STRAIN

Emergency HIV Clinical Response Task Force
April 2026

KEY TAKEWAYS

- HIV service disruptions are occurring, especially for vulnerable populations. These disruptions affect clinical care, prevention and supportive services, and workforce capacity.
- Structural and social determinants of health – particularly unemployment, housing instability, food insecurity, and insurance loss – are emerging as drivers of disruption.
- Clinics are making operational adjustments to their services and staffing that may further limit access to HIV prevention, treatment, and care services.
- Vulnerable populations are falling out of care, notably transgender people, migrants and undocumented individuals, and people experiencing homelessness.
- Continuing to monitor service disruptions will be important as state AIDS Drug Assistance Programs (ADAPs) contract and the Medicaid expansion cuts take effect.

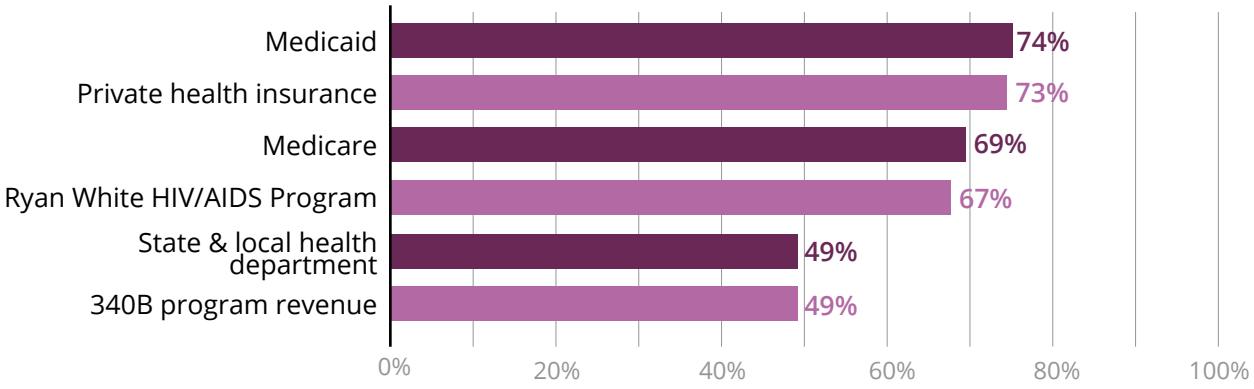
BACKGROUND

Despite decades of progress in HIV prevention and treatment, the HIV response in the United States is experiencing renewed strain. Funding uncertainty, workforce attrition, policy shifts, and rising social and economic precarity are reshaping the delivery of HIV services at the clinic and community levels. In response to reports of HIV clinical and supportive service disruptions, five U.S.-based professional medical and nursing associations – the American Academy of HIV Medicine, Association of Nurses in AIDS Care, Gay and Lesbian Medical Association, HIV Medicine Association, and International Association of Providers of AIDS Care – launched the Emergency HIV Clinical Response Task Force (Task Force) in June 2025.

The Task Force fielded an online Emergency HIV Clinical Response Survey in July 2025 to quantify the scope, nature, and equity dimensions of these disruptions as experienced by frontline HIV service providers across the U.S. A follow-up survey was fielded in November through December 2025 to map additional dimensions related to HIV service disruptions, including structural and social determinants of health, as well as operational austerity measures in the face of federal funding cuts.

METHODOLOGY

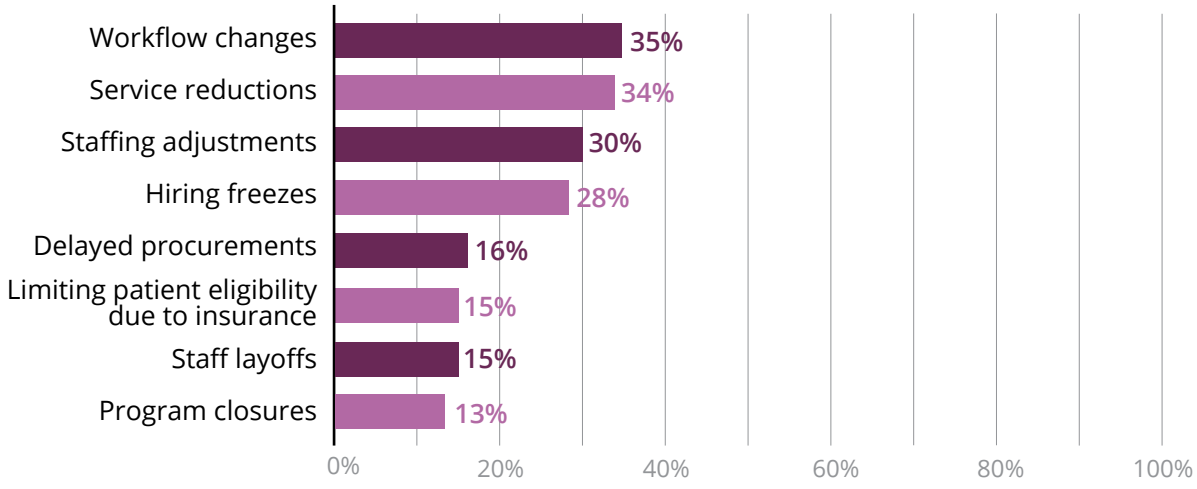
Between November 6, 2025, and December 11, 2025, a follow-up online Emergency HIV Clinical Response Survey was distributed to HIV service providers nationwide through the five members of the Emergency HIV Clinical Response Task Force. Analyses are based on 383 clinical provider respondents who completed the survey across 47 states and Puerto Rico. Respondents included physicians, nurses, pharmacists, case managers, social workers, and community-based providers working across academic medical centers, Federally Qualified Health Centers (FQHCs), hospitals, private practices, and outreach settings. Questions were intended to capture the breadth of disruptions and impacts experienced from July to October 2025.



RESPONDENT AND SITE PROFILES

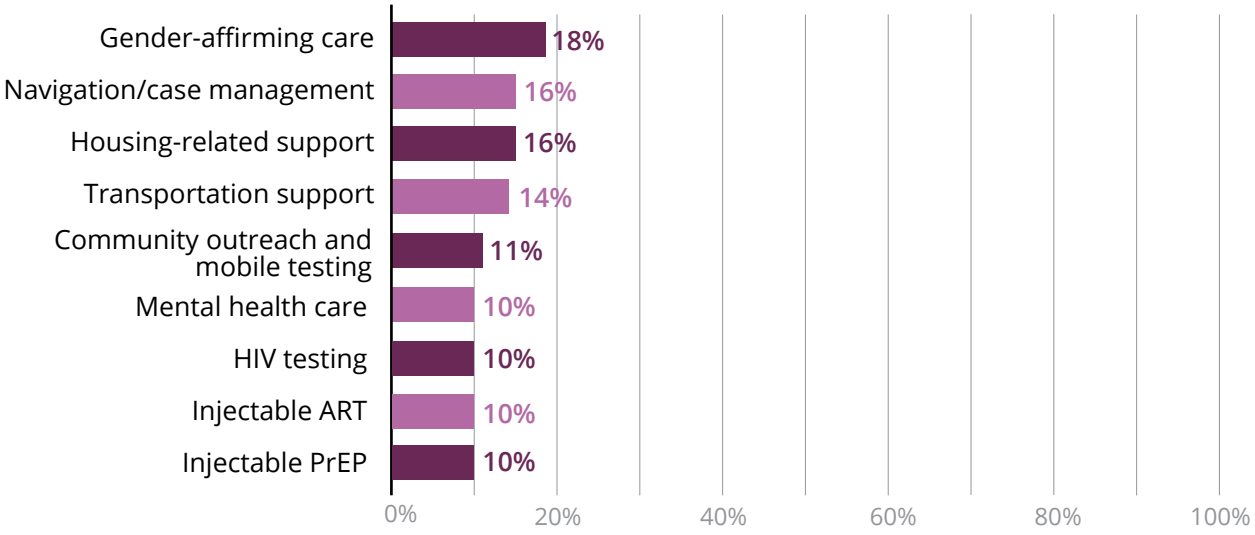
The perspectives captured reflect a cross-section of the HIV workforce and a diversity of clinical settings that deliver HIV care:

- Clinical roles dominated the sample, with physicians (30%), nurse practitioners (23%), and registered nurses (14%) comprising two-thirds of respondents.
- Over 65% of responses came from hospital-based clinics (33%) and community health centers and FQHCs (32%), underscoring impacts within core HIV care infrastructure.
- The South accounted for more than one-third of responses (36%), with responses from three other regions: Northeast (24%), West (23%), and Midwest (18%).



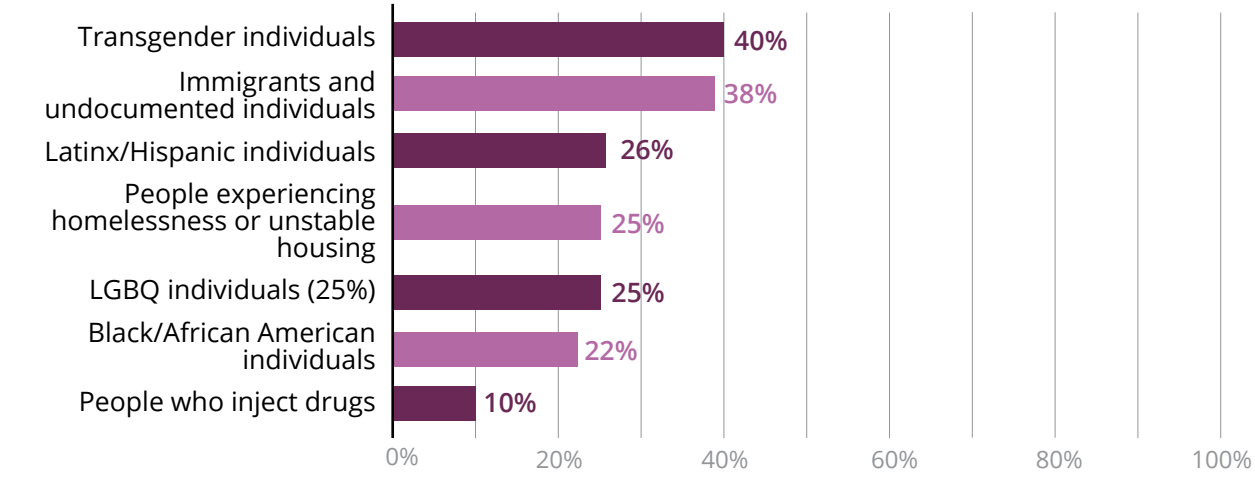
SOURCES OF FUNDING

Respondents reported a combination of funding sources for their clinical settings, including:



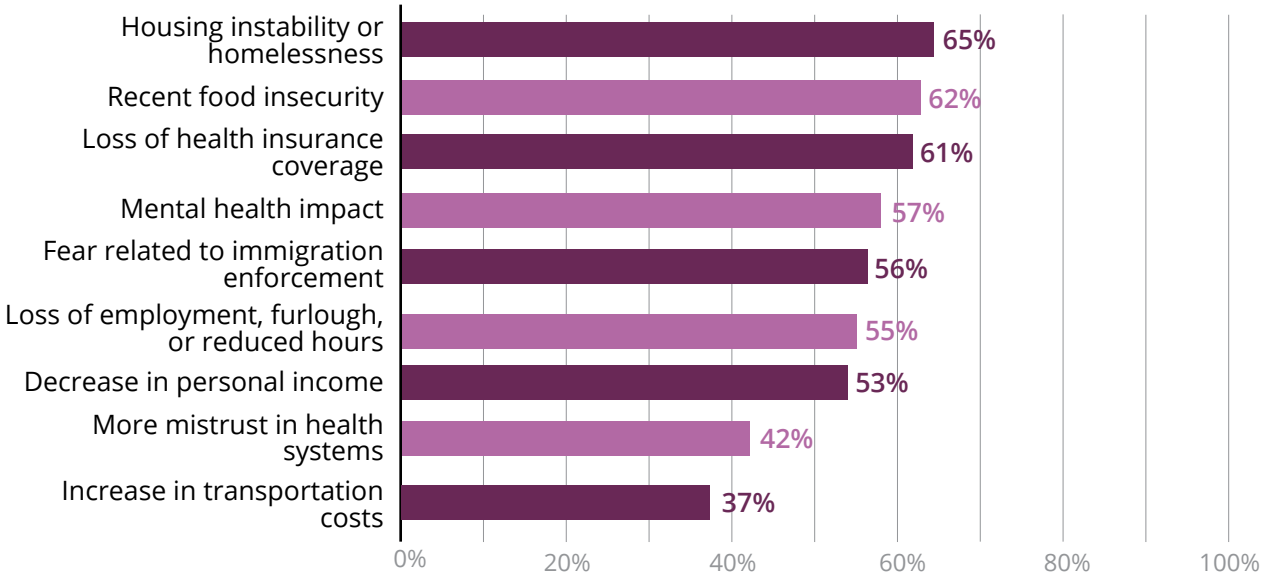
OPERATIONAL DISRUPTIONS

Sixty-eight percent of respondents reported one or more operational changes in their clinical settings due to changes in federal or state policies or funding cuts, including:



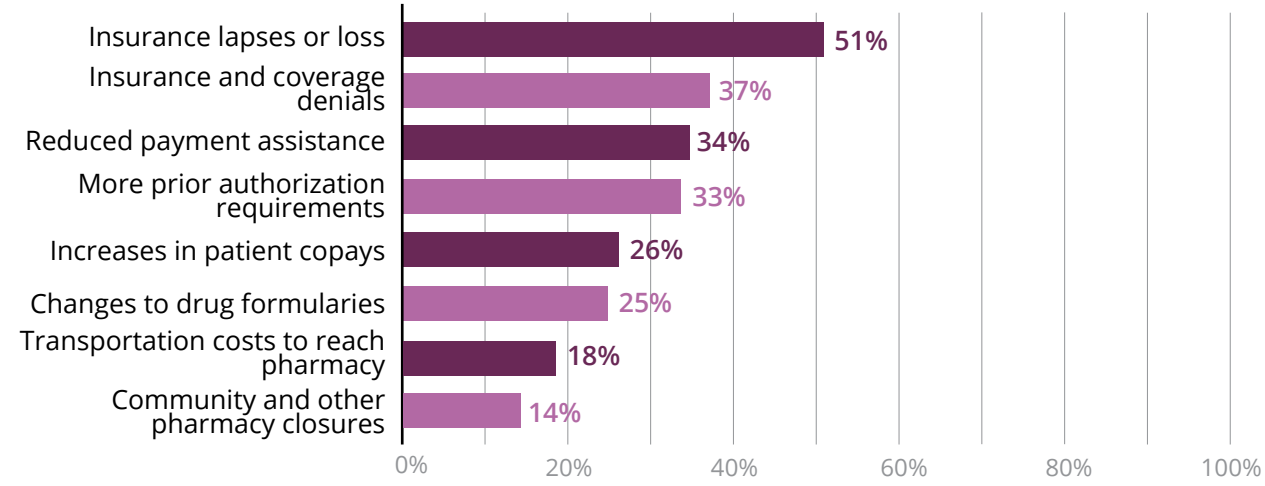
HIV AND OTHER HEALTH SERVICE DISRUPTIONS

Sixty-one percent of respondents reported at least one HIV service disruption in their clinical setting. Reported service disruptions spanned the HIV care continuum and beyond:



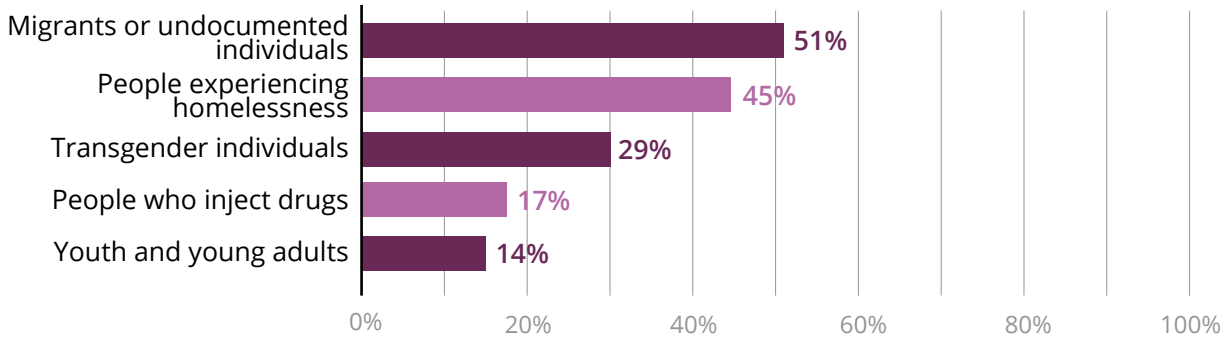
EQUITY IMPACTS: POPULATIONS MOST AFFECTED

Of the 69% of respondents who reported at least one population-level service disruption, the following key populations were cited as most affected:



PATIENT-REPORTED BARRIERS TO ENGAGEMENT IN CARE

Among the 92% of respondents who reported hearing from patients about specific barriers to remaining engaged in care, the following were the most cited:



MEDICATION ACCESS AND LOSS TO FOLLOW-UP

Of the 69% of respondents who reported their patients spoke with them about medication access, the following factors were most associated with medication access barriers:

Although 14% of respondents reported no significant population-specific effects on retention in HIV care, of the 86% of respondents who did report effects the following key populations were cited as the most affected:

INSIGHTS FROM OPEN-ENDED QUESTIONS

Forty-six percent of respondents provided additional insights through an open-ended survey question about the most urgent resources needed to safeguard continuity of HIV services:

- Funding concerns dominate the landscape, mentioned by 37% of respondents, with specific emphasis on Ryan White HIV/AIDS Program (20%) and 340B Drug Pricing Program (4%) sustainability.
- Health insurance coverage was reported as critical, with 27% of respondents citing Affordable Care Act/insurance concerns and 13% specifically mentioning Medicaid enrollment challenges.
- Social determinants of health, including housing (17%), transportation (13%), and food security (7%), were recognized as essential to maintaining HIV care continuity.

Forty-two percent of respondents answered a second open-ended question seeking insights into declines in clinic attendance by undocumented or migrant individuals observed in the respondents' clinical settings, with 83% of this subset of respondents citing fear of immigration enforcement and deportation as the primary contributing factor.

One survey response detailed a patient death directly attributed to this fear:

"Due to a fear of being detained by ICE, a patient with relapsed Hodgkin's lymphoma delayed care and then it became an emergency which resulted in his death."

CONCLUSION

The outcomes of the second Emergency HIV Clinical Response Survey document a clear warning signal that the Trump administration-led policy and funding actions taken over the last year are destabilizing the delivery of HIV services in the U.S.

Continued monitoring is critical in addition to locally-driven, novel, and nimble interventions to prevent disruptions in HIV testing, prevention, care, and treatment with a focus on key populations most affected by federal policy and budget shocks.

Addressing these disruptions is imperative to safeguarding lives and decades of progress in the U.S. HIV response.

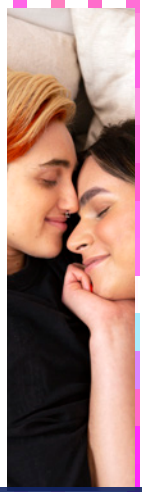
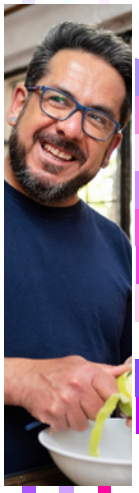
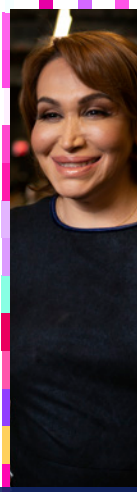
LGBTI+ HEALTH EQUITY



A GLOBAL REPORT OF **50 FAST-TRACK CITIES**



FAST-TRACK CITIES



IAPAC
INTERNATIONAL ASSOCIATION OF PROVIDERS OF AIDS CARE

This report is made possible through a grant from ViiV Healthcare.

About IAPAC

The International Association of Providers of AIDS Care (IAPAC) was founded in 1985 with a mission to improve access to and the quality of prevention, care, treatment, and support services delivered to people living with and affected by HIV and comorbid diseases, including tuberculosis and viral hepatitis (HBV and HCV). With more than 30,000 members globally and programming in over 150 countries, IAPAC is the largest association of clinicians and allied health professionals working to end the epidemics of HIV, TB, and viral hepatitis by 2030.

About Fast-Track Cities

The Fast-Track Cities initiative leverages data-driven, equity-based public health policy and implementation science to mobilize and support cities and municipalities worldwide in their efforts to achieve Sustainable Development Goal (SDG) 3.3 — ending the epidemics of HIV, tuberculosis (TB), and viral hepatitis (HBV and HCV) by 2030 — and SDG 11 — making cities and municipalities inclusive, safe, resilient, and sustainable. The initiative is a global partnership between cities and municipalities around the world and four core partners: the International Association of Providers of AIDS Care (IAPAC), the Joint United Nations Programme on HIV/AIDS (UNAIDS), the United Nations Human Settlements Programme (UN-Habitat), and the City of Paris. Launched on World AIDS Day 2014, the network has grown to include more than 350 cities and municipalities.

DR. JOSÉ M. ZUNIGA

PRESIDENT/CEO

International Association of Providers of AIDS Care (IAPAC)

Fast-Track Cities Institute (FTCI)

Introductory Letter

Last year — in the midst of COVID-19 (a global pandemic unlike anything we have seen in the last century) — the International Association of Providers of AIDS Care (IAPAC) began an ambitious plan to launch a global report on LGBTI+ health equity during Copenhagen 2021, a WorldPride celebration and human rights forum. The report, which we are launching today, is unique for its focus on cities, where half of the world's 7 billion citizens live, and because it allows us to compare LGBTI+ health equity issues globally. We selected 50 cities that are or soon will be part of the Fast-Track Cities network to serve as examples in a report aimed at informing current and future Fast-Track Cities as well as all of those working to end LGBTI+ health inequities.

The link between LGBTI+ health equity and our work at IAPAC is perhaps obvious given the longstanding and staggering disparities that LGBTI+ individuals face with respect to HIV. While HIV continues to be a critical issue in LGBTI+ health, we cannot allow that to be the only LGBTI+ health topic that is studied, discussed, funded, and actioned. Fundamentally, LGBTI+ health equity is about stigma, discrimination, and injustice, but also about resilience. The history of conditions facing LGBTI+ communities has led to myriad health inequities — including physical, mental, and behavioral — that are all interwoven.

Globally, 275 key informants from four geographic regions scored their local LGBTI+ quality of life an average score of 3.2 on a 1 to 5 scale — about halfway between "poor" and "excellent." No region came close to perfect on markers of LGBTI+ health equity, including access to care, quality of life, and nondiscrimination. Even cities with relatively good scores had room for improvement. And while cities that had better policies and more community visibility tended to score better among key informants, there were some surprises. For example, Tokyo scored slightly lower on LGBTI+ quality of life than did Kampala, where an anti-LGBTI+ political agenda has made headlines for years.

These results reveal two important insights. First, no one factor is determinative in LGBTI+ well-being, and many aspects of health equity (e.g., social determinants of health, quality care, nondiscrimination) must all be addressed to achieve better outcomes. Inclusive policies on paper will do little to change LGBTI+ health inequities if they are not correctly implemented and if cultural change does not occur concurrently. Moreover, the colliding COVID-19 and HIV pandemics have taught us that medical and scientific advancements can increase health inequities if entire populations are denied access to their benefits.

Second, LGBTI+ community leaders likely judge their city based on local factors, such as how LGBTI+ people are faring relative to non-LGBTI+ people locally and compared to other LGBTI+ people regionally — not in terms of global conditions. This helps explain how key informants in cities with vast differences in wealth, for example, often scored LGBTI+ socioeconomic problems as being roughly equal. The results should encourage those working in areas considered to be LGBTI+ inclusive that there is still much work to be done; the report should also bring pride to LGBTI+ advocates working in difficult conditions, knowing that their communities are more resilient than many people might think.

The bottom line is that we cannot adequately address HIV and other health conditions without including LGBTI+ populations, and we cannot adequately serve LGBTI+ populations unless we understand the diversity and complexity of these communities and their needs. Those of us working in the field of health and in any other topic area relevant to LGBTI+ health equity must recommit ourselves to working holistically to end the disparities these communities face. No one law, policy, or program will fix these challenges; rather, we must address the pervasive issues of stigma and inequality that comprise their core. Doing so begins with understanding what we know about disparities, and what we still need to learn, and in that respect, I hope this report will contribute to ending LGBTI+ health inequities.

In solidarity with LGBTI+ communities,

18 August 2021
Washington, DC

Executive Summary

BACKGROUND

Sexual and gender minority groups experience health disparities because of myriad overlapping social-ecological, cultural, and political factors. Lesbian, gay, bisexual, transgender, intersex, and other sexual and gender minority (LGBTI+) populations have higher incidence and prevalence of life-threatening physical conditions, mental health problems, chronic and infectious disease risk, violence and victimization, and discrimination; experience significant barriers to accessing health care, treatment, and retention in care; and face substantial threats to quality of life. Understanding and improving the health of LGBTI+ communities is critical to the goals of the Fast-Track Cities initiative because of the disproportionate burden of HIV among this population but also because of the interconnectedness between HIV and other health and social conditions facing them. The main objective of this project is to advance health equity among LGBTI+ individuals across current and prospective Fast-Track Cities by studying and comparing LGBTI+ health inequities. Fast-Track Cities are signatories of the *Paris Declaration on Fast-Track Cities* and thus members of the Fast-Track Cities network, and they have committed to ending AIDS as a public health threat by 2030.

METHODS

This study examined 50 current and prospective Fast-Track Cities, including 10 from Africa, 20 from the Americas, five from the Asia-Pacific region, and 15 from Europe. The study included two components. First, a key informant survey was conducted among individuals who study, work, or volunteer in LGBTI+ health equity related fields and who have knowledge of their local LGBTI+ community. Participants were recruited through virtual outreach and snowball sampling. The second component of the study were comprehensive assessments of publicly available data and policies. Four domains were developed for assessing health equity among LGBTI+ populations: health outcomes, socioeconomic factors, community trauma, and community resiliency. These domains were designed to assess health equity in broad terms that includes social determinants of health and underlying socioeconomic, political, and legal conditions that affect health equity.

RESULTS

Overall, 275 key informants rated quality of life for LGBTI+ people at 3.2 out of 5, about in the middle between a “poor” rating of one and an “excellent” rating of five. Only 15 key informants worldwide said that LGBTI+ quality of life in their city was “excellent.” The regional averages ranged from a low of 2.7 in the African cities to a high of 3.6 in the Asia-Pacific region cities, with the Americas and Europe falling in the middle with scores of 3.2 and 3.3, respectively. However, within each region there was wide variability; for example, in the Asia-Pacific region, Quezon City scored a 4.0 while Tokyo scored only 2.2.

Data assessments revealed many health disparities among LGBTI+ people, including with respect to HIV, sexually transmitted infections (STIs), mental health, substance use, and noncommunicable diseases. However, many cities lacked data beyond HIV among sexual minority men and transgender women, and some other conditions with respect to sexual minority men only. These results indicate a dire need for disaggregated data on LGBTI+ health, particularly at the local level, where interventions are implemented.

How Concerning are Issues Relating to Social Determinants of Health, on a 1-4 Scale?*

Housing access	3.2
Gender identity discrimination	3
Intersectional discrimination	3
Employment access	2.9
Sex worker treatment	2.9
Criminal justice for people of color	2.8
Sexual orientation discrimination	2.7
Police mistreatment	2.6
HIV status discrimination	2.4
Food access	2.4
Police targeting	2.3

* Scores on a scale of 1 (“not a problem”) to 4 (“serious problem”).

HIV-related services received by far the best rating when looking at access to care for LGBTI+ individuals, scoring a 3.8 on a 1 to 5 scale. Primary care was next, with a score of 3.1, followed by mental health care at 2.8, and gender-affirming care at 2.7. These trends were relatively consistent across the study's four regions and reaffirm the status of HIV care providers as leaders in LGBTI+ health equity, but also highlight the need for more focus on mental health and services for transgender individuals.

The vast majority of key informants found issues relating to social determinants of health — including socioeconomic opportunity, discrimination, and criminal justice involvement — to be at least somewhat problematic for their communities. Globally, housing access was rated as the most pressing challenge, with a score of a 3.2 on a 1 to 4 scale, in which a 1 indicated the issue was "not a problem," 2 indicated a "minor problem," 3 indicated a "moderate problem," and 4 indicated a "serious problem." Housing was followed by gender identity-based discrimination (3), discrimination against LGBTI+ people with multiple marginalized identities (3), employment access (2.9), and issues relating to sex work (2.9). In most cities, sexual orientation-based discrimination (2.7) and HIV discrimination (2.4) were found to be less problematic than gender identity discrimination (3), although there was some variation by city. Among socioeconomic issues, food access (2.4) was rated well below employment opportunities (2.9) and housing access (3.2), and among criminal justice issues, problems such as mistreatment by police (2.6) and the impact on LGBTI+ people of color (2.8) were rated higher than whether LGBTI+ people are being targeted or arrested by police due to anti-LGBTI+ bias (2.3).

While the severity of these social challenges varied between regions and individual cities, many of the trends were consistent. Most key informants found socioeconomic challenges to be problems for their community regardless of the overall wealth or poverty in their city. For example, the three cities in which the problem of housing access was most highly rated were San Francisco (where every key informant said it was a "serious problem"), Denver, and Dublin; these cities may be wealthy on a global scale, but the survey results demonstrate that inequities facing LGBTI+ people persist. Key informants rated the response by local institutions to these socioeconomic challenges to be at or below the midway point on a 1 to 5 scale; for example, the local response to LGBTI+ housing problems was rated just a 2.6.

Similarly, while LGBTI+ nondiscrimination laws varied widely, key informants considered discrimination against LGBTI+ people to be a problem in every city. Many key informants noted nondiscrimination policies as being a positive factor for those cities that had enacted them, and a prospectively positive factor for those who desired them, but concerns relating to underlying stigma and discrimination were universally reported. This helps explain how only 6% of key informants globally said that gender identity-based discrimination was "not a problem" in their city, despite the fact that more than 6% of them hailed from cities where nondiscrimination policies are in place.

In terms of sources of resilience, community-based organizations (CBOs) and informal social networks were the two most common sources named by key informants. When asked which type of entity best engaged with local LGBTI+ communities, CBOs scored highest at 3.9 globally compared to 3.1 healthcare providers, 3.0 for local government, and a 2.9 for the private sector. Suggestions for improving resilience included more and equitable access to funding for local CBOs; visible support from local political, community, and religious leaders; policies that recognize LGBTI+ identities and address discrimination; consistent, institutionalized, and authentic engagement with LGBTI+ communities; a stronger focus on subpopulations within the LGBTI+ population that face particularly strong challenges, such as transgender people and racial and ethnic minorities; and education of the public and those in the healthcare field to reduce LGBTI+ stigma, including within the context of improving health services.

RECOMMENDATIONS

To address both the health inequities documented in this research and the gaps in data that it revealed, action is needed at all levels of government and from external partners. While the focus of this report is on cities, urban and municipal leaders are most effective when they have the support — rather than opposition — of national and international actors. More detailed recommendations are included at the end of the report, but following is a summary of the overarching recommendations:

1. **PRIORITIZE** the elimination of inequities within LGBTI+ communities. These include those affecting racial and ethnic minorities, immigrants, low-income individuals, and people with disabilities, as well as needs specific to transgender and nonbinary people.
2. **ADDRESS** underlying socioeconomic factors. Issues such as access to housing, employment, and food were identified as LGBTI+ community challenges by the majority of key informants, even in resource-rich settings.
3. **IMPROVE** inclusive data collection. There is a dearth of disaggregated data to offer insights into LGBTI+ health, particularly outside of HIV and notably relevant to key populations beyond sexual minority men.
4. **ADDRESS** criminal justice disparities. Even in places where LGBTI+ identities are not formally criminalized, issues relating to police mistreatment, sex work laws, and criminalization of HIV exposure were identified as barriers to LGBTI+ health equity.
5. **ENSURE** LGBTI+ nondiscrimination. Many cities lacked even basic LGBTI+ legal protections, including nondiscrimination ordinances or laws, and even where these legal protections exist, many key informants reported the need for better education and awareness to address LGBTI+ stigma.
6. **ENGAGE** LGBTI+ communities. While most cities had some formal means in place of engaging with LGBTI+ communities, key informants indicated that more engagement was needed, and rated CBOs as better than other local actors in their efforts to sustain engagement.
7. **RECOGNIZE** gender minorities and their health needs. Healthcare services for transgender people were rated well below general LGBTI+ inclusive care, and key informants noted that discrimination based on gender identity was a major concern.
8. **IMPROVE** health systems. Key informants revealed a dire need for training and inclusion measures to improve the LGBTI+ experience in accessing and utilizing LGBTI+ inclusive health services.
9. **FOSTER** multisectoral collaboration. While this report is focused on cities, the LGBTI+ health challenges identified herein require collaboration between local, national, and international entities, including multisectoral representation. The Fast-Track Cities initiative itself offers evidence that such an approach is possible and effective.
10. **SUPPORT** HIV service providers as LGBTI+ care leaders. These providers scored better than others in health systems and can help lead the way in policy and practice.

CONCLUSION

THE LGBTI+ HEALTH INEQUITIES IDENTIFIED IN THIS REPORT ARE WIDE-RANGING AND PERVASIVE.

While many differences exist between local contexts, the underlying stigma, discrimination, and lack of visibility that causes these inequities are largely the same, as are the sources and effects of the LGBTI+ communities' resilience and the policies that could foster change. Ending health inequities must include addressing social determinants of health (e.g., housing, employment, public safety) that are intertwined with health conditions. Lasting and widespread progress must be achieved through a multisectoral and multilateral approach in which diverse actors — including city governments and local communities — are helping lead the way.

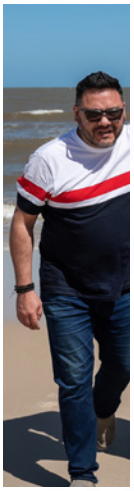
Background

LGBTI+ COMMUNITIES AND THEIR HEALTH

SUSTAINABLE DEVELOPMENT GOALS AND FAST-TRACK CITIES

To address LGBTI+ health equity in Fast-Track Cities, the issue must be framed within the context of the Sustainable Development Goals (SDGs) and the Fast-Track Cities initiative. The SDGs were launched in 2015 as part of the *2030 Agenda for Sustainable Development*.[1] In relation to LGBTI+ communities, SGD 3 calls for United Nations (UN) member-states to "[e]nsure healthy lives and promote well-being for all at all ages," and it includes subgoals that relate directly to areas where LGBTI+ populations experience disparities. These include with respect to efforts to end the HIV epidemic, ensure access to sexual and reproductive health services, and realize the right to universal healthcare. While SDG 3 is the goal within which health is explicitly addressed, all of the SDGs are relevant to health in that they address social determinants of health, or "the non-medical factors that influence health outcomes" and "the conditions in which people are born, grow, work, live, and age."[2] The SDGs that address inequality, resilience, and sustainability all relate to health in important ways. Moreover, SDGs 10 and 11 relate quite explicitly to LGBTI+ health in particular, calling for UN member-states to achieve gender equality and promote inclusive societies.

LGBTI+ HEALTH EQUITY DEFINITIONS AND CONCEPTS



The populations that make up LGBTI+ communities are diverse even within a single city or neighborhood. On a global scale, these communities are even more challenging to define and discuss in uniform terminology. In broad strokes, however, LGBTI+ communities can be described as those comprised of sexual and gender minorities, as well as intersex individuals and those with related identities.

Sexual minorities are individuals whose sexual attraction, behavior, and/or identity is something other than exclusively heterosexual. Some individuals who have sexual relationships that would be described as non-heterosexual — for example, a man who has sexual relations with men and women — may still identity as heterosexual, especially given the different cultural contexts in which sexual orientation is interpreted. While such an individual would not identify as being part of an LGBTI+ community, many of the health risks, stigma, and potential discrimination that they would encounter would be similar. Gay, lesbian, and bisexual are among the most common sexual minority identities, but there are many others, especially outside of the English language and the perspective of the global North.

Gender minorities include individuals whose gender identity is something other than cisgender and may also include individuals whose gender expression rather than identity does not conform with established social norms. Cisgender individuals are those whose sex assigned at birth is the sex or gender with which they identify. For example, someone who was identified as female at birth and who currently identifies as female is likely to identify as cisgender, even if that term is still largely unknown among people outside of the LGBTI+ community. Therefore, gender minorities are typically those whose gender is something other than the sex they are assigned at birth. For example, a person who was assigned female at birth but who actually identifies as male would be a transgender man, and a gender minority. This population also includes a growing number of people who identify as not being either male or female (e.g., genderqueer individuals, nonbinary individuals), those whose gender identity shifts over time (i.e., gender fluid individuals), and those who identify as having no gender at all (i.e., agender individuals). To understand the concept of gender minorities, it is important to understand the difference between sex, which is assigned at birth and is generally related to biological characteristics, and gender — a social construct built around societal and individual norms and individual senses of self.

Intersex individuals are those whose sex characteristics do not fall exclusively into those associated with males or females. These can include differences in chromosomes, primary sex characteristics (i.e., genitalia), secondary sex characteristics, and/or other factors. Most individuals who are intersex are nonetheless assigned male or female at birth, and many are exposed to treatment (criticized by advocates) that attempts to put them in conformity with the sex selected by their healthcare provider or parents, often without the knowledge or consent of the individual. Because intersex identities relate to sex rather than sexual orientation or gender, intersex individuals do not necessarily consider themselves part of sexual or gender minorities, respectively, unless they also happen to have a sexual orientation or gender identity that places them within those categories.

In this report, the acronym LGBTI+ is used as an umbrella term to describe this broad population. Some of the health inequities and needs facing members of this population are similar, yet many are different. Nonetheless, the underlying influences of stigma and discrimination that facilitate the health inequities facing this community are largely interrelated, as are many of the solutions, such as antidiscrimination laws, clinical and service provider trainings, and community outreach. Additionally, members of this population have often banded together to increase their political power and influence, an important practical step given the marginalization they have faced. Therefore, while more research that focuses with exactitude on subpopulations within this broader community is needed, it is also useful to explore the strengths and challenges of LGBTI+ communities as a whole — largely the approach taken by this report. This approach is also necessary in large-scale research (such as what is presented in this report) given the varying approaches taken in data collection — for example, defining sexual minorities by sexual behaviors versus attractions versus identities — which can produce subtle or major differences in the results that require a nuanced rather than direct comparison.

Finally, this report mostly discusses “equity” rather than “equality.” Equality means that two or more things are equal, whereas equity accounts for differing needs as well as concepts relating to justice. For example, providing the same sexual health outreach and services to all individuals might be equal, but it might not be equitable if certain populations have different risks or needs. Similarly, it is important to acknowledge that the differences in health outcomes between LGBTI+ people and others are not only unequal, but are also inequitable, in that they are the result of stigma, discrimination, and other unjust social conditions.

EXPLORING LGBTI+ HEALTH INEQUITIES

There are myriad LGBTI+ health inequities and issues that manifest in different ways across the life course. These are mostly explained, often nonexclusively, by two factors: inherent differences between LGBTI+ people and others, and social conditions that impact LGBTI+ health. For example, transgender individuals need certain forms of care (i.e., gender-affirming hormone therapy) that cisgender people generally do not; they also face difficulties accessing that care for socially constructed reasons (e.g., discrimination, lack of competent providers, underlying financial insecurity due to limited opportunity). Therefore, the unique needs and challenges regarding gender-affirming care reflects both different necessities and also issues related to social justice. The former are important to know, understand, and respond to, but cannot be changed; the latter can be changed through advancing positive policies and changing social conceptions. Higher rates of tobacco use, on the other hand, are an example of a problem affecting the LGBTI+ community not because of an inherent difference in health needs, but rather because of changeable factors in society, such as the targeting of the community by tobacco company advertising and marketing, as well as the minority stress that may cause LGBTI+ people to feel the need to smoke. This concept is critical in that it explains that LGBTI+ health disparities exist not because LGBTI+ people are inherently risky, unsafe, or unhealthy, but because they have different needs from the general population that are frequently not met, and because they face persistent, underlying LGBTI+ related stigma and discrimination.

Physical and Sexual Health

As has been noted, sexual health disparities among LGBTI+ populations — particularly disparities relating to HIV — are among the most widely documented. The Joint United Nations Programme on HIV/AIDS (UNAIDS) reports that the risk of acquiring HIV among transgender and other gender minority individuals is 13 times that of the cisgender population.[3] They also found sexual minority men to be at 26 times higher risk for acquiring HIV than other men, with this population comprising 23% of new HIV infections worldwide — a highly disproportionate number compared to their share of the population.[4] Risk behaviors for HIV acquisition are similar to those of other sexually transmitted infections (STIs) and HIV and certain STIs can also have synergistic relationships in which contracting one makes an individual more susceptible to contract another and/or experience negative health outcomes as a result.[5] This helps explain why LGBTI+ individuals also have a disproportionate burden of other syndemic conditions such as syphilis or comorbid conditions such as hepatitis C virus (HCV) infection.[6,7]

Beyond sexual health, there are various physical health conditions for which LGBTI+ populations may be at greater risk. Major noncommunicable disease factors include tobacco and alcohol use as well as insufficient exercise and poor diet.[8] These risk factors are likely more prevalent among LGBTI+ populations for the reasons described below regarding mental and behavioral health, as well as social determinants of health, and a lack of access to culturally competent care that would allow physical conditions to be quickly diagnosed and effectively treated.

Mental and Behavioral Health

The significant inequities that LGBTI+ people face with respect to mental and behavioral health can be understood through a minority stress framework, in which individual and structural discrimination, stigma, and bias are seen to cause negative mental health outcomes for the population.[9] At least some level of anti-LGBTI+ bias is found in nearly every society, with much of it being state-sponsored or at least not fully banned. For example, in a global survey of laws relating to sexual minorities, not a single country met every indicator of protections and social recognition for LGBTI+ people.[10] Thus, through the minority stress framework mental health inequities for the LGBTI+ population can be reasonably projected globally, even where research does not exist.

Additionally, there is a large body of literature to provide specific examples of minority stress and/or negative mental health outcomes in a variety of settings. A global review found that LGBTI+ people experienced higher levels of emotional distress, victimization, and other negative health factors, and also faced barriers to getting related care.[11] Another international systemic review found specifically that self-stigmatization among gender minorities (a factor of minority stress) was an important factor related to increased incidence of depression, anxiety, and suicidality among this population.[12] Stress within LGBTI+ circles was another factor associated with anxiety and less connectedness to the community among sexual minority women.[13]

Substance use, minority stress, and other mental health conditions are all interconnected among LGBTI+ populations, causing these issues to compound one another.[14] For example, one study found that sexual minority women were more likely to consume alcohol on days when they experienced instances of minority stress or discrimination.[15] In the United States, sexual minority adults were about 50% more likely to have past year tobacco use than were their heterosexual peers,[16] a disparity that arises out of LGBTI+ individuals using tobacco to cope with stress, as well as tobacco companies leveraging LGBTI+ social vulnerabilities to aggressively market their products to this population.[17]

Youth and Aging

Health issues can evolve in LGBTI+ people throughout their life cycle, with LGBTI+ youth and older adults facing particular challenges and needs. For example, among youth, bullying in schools is a major problem that denies educational opportunities and creates mental health and other challenges.[18] The UN Independent Expert on sexual orientation- and gender identity-based violence has called for a global ban on efforts to "convert" LGBTI+ people to cisgender and/or heterosexual identities,[19] a practice that disproportionately affects youth and that is legal in most jurisdictions.[20] One issue affecting transgender and nonbinary youth in particular is the need to access to gender-affirming care, which they are too often denied despite their vital importance in the lives of this population, according to experts.[21]

With respect to aging, LGBTI+ older adults face many challenges due to their lower levels of social support, including decreased likelihood of being partnered and having children, as well as lower levels of financial support, given a lifetime of compounded limits to their socioeconomic opportunities.[22] In places where LGBTI+ rights and social acceptance have been expanding rapidly in recent years, LGBTI+ older adults have not been able to benefit — in terms of their health, socioeconomic standing, internalized acceptance, and acceptance from their peers — to the degree that have younger individuals. This is further complicated by the increased needs faced by older adults with respect to health, housing, and social support.

Intersectionality

Intersectionality is the concept that people of color who are also members of another marginalized identity face unique forms of discrimination. For example, women of color do not just face racism and sexism, but rather encounter intersectional discrimination as women of color that is unique to their population and must be independently understood and addressed.[23] Kimberlé Crenshaw, who originated the concept of intersectionality, has since applied the concept to LGBTI+ people of color.[24] Thus, it is important to understand intersectionality not as just interconnected forms of identity, which are part of everyone's identities, but rather intersecting forms of oppression, a condition that applies only to people who confront multiple forms of marginalization. While this concept will look different across societies, the idea of intersectionality as a framework remains consistently useful and important. For example, issues of race and ethnicity are very different in Amsterdam, Kigali, and Mexico City (three of the Fast-Track Cities featured in this report), each of these societies has both internal dynamics and global contexts (i.e., colonialism) that make the concept of intersectionality important to understanding local LGBTI+ equity. In the United States, for instance, Black transgender and nonbinary individuals are five times more likely to be living with HIV than transgender and nonbinary people in general, and are also more likely to have attempted suicide, been sexually assaulted, or faced violence while incarcerated.[25]

Social Determinants of Health

In assessing the status of LGBTI+ health equity — and LGBTI+ equity in general — it is critical to consider the underlying social determinants of health that effect LGBTI+ communities. These social determinants are interrelated with LGBTI+ health issues. For example, lack of access to a safe and inclusive education early in the life could cause an LGBTI+ person to have reduced employment opportunities in the future, thus limiting access to adequate housing, nutritious food, and quality healthcare. Most countries do not have full legal protections against LGBTI+ discrimination in areas such as employment and housing,[26] and even in jurisdictions that do ban or protect against such discrimination, it still occurs.[27] Furthermore, equal access to one aspect of socioeconomic opportunity does not ensure equitable access; for example, a discrimination-free housing market that does not have supports for those who have been denied educational or employment opportunities may be equal, but not equitable.

Criminal Justice Systems

Criminal justice is another issue that has an impact on the health of LGBTI+ individuals, and it is closely intertwined with many social determinants of health. In addition to countries that actually criminalize LGBTI+ identities or behaviors, other criminal laws — such as those criminalizing the transmission of HIV or sex work — can have a disproportionate effect on LGBTI+ people. Moreover, LGBTI+ people are both disproportionately represented in criminal justice systems and can face violence and abuse once in such systems.[28] Involvement in the criminal justice system has significant health implications for LGBTI+ people, not only because it impacts other social determinants (by depriving individuals of employment, education, and stable housing, for example) but also because of the connection between criminal justice involvement and mental health[29] and conditions such as HIV, HCV, and TB.[30]

Healthcare Access

Many LGBTI+ health disparities can be caused or compounded by a lack of access to affordable, quality, and culturally competent or responsive care. In countries where LGBTI+ identities or behaviors are criminalized, "coming out" to one's healthcare provider can have deleterious effects, and in countries where the "promotion" of LGBTI+ identities or behaviors is illegal, providing care to these individuals can represent a criminal act. Furthermore, harmful medical practices such as conversion therapy are harmful in and of themselves, but also serve to discourage future healthcare use; these harmful practices are not banned in the vast majority of jurisdictions.[31] Another challenge for LGBTI+ healthcare access is a lack of culturally competent healthcare providers who are both able to respectfully interact with LGBTI+ individuals and who understand and respond to their unique health needs.

Urban Health

Finally, while much of this report applies to LGBTI+ health equity broadly, its specific focus is on 50 urban settings. Cities can provide both advantages and disadvantages to LGBTI+ health equity. For example, LGBTI+ resources of all types tend to be concentrated in urban areas, and also may be more accessible due to the presence of public transportation. There are also more healthcare and service providers from which to choose, increasing the chance that LGBTI+ people can confidentially find competent care. On the other hand, the social determinants of health that are particular to or exacerbated in urban areas — which are context-dependent but can include poverty, violence, poor environmental health, and other factors — impact LGBTI+ populations as they do all others. Additionally, because of the underlying socioeconomic vulnerability of LGBTI+ individuals, issues such as poor environmental health due to pollution, unsafe building conditions, and overcrowding might have a more significant impact on LGBTI+ people than non-LGBTI+ people. Therefore, while every city (and its contrasting non-urban surrounding environment) is different, urban health concerns such as these should be considered in assessing LGBTI+ health equity in cities.

Methods

Designing a Global LGBTI+ Health Report

Fifty cities were selected for inclusion in this study, representing four regions: Africa (10), the Americas (20), Asia-Pacific (5), and Europe (15). All but one of the selected cities (Tokyo) are signatories of the *Paris Declaration on Fast-Track Cities* and thus members of the network of more than 350 Fast-Track Cities that have committed to ending the epidemics of HIV, TB, and viral hepatitis by 2030.

Cities Included in the Study

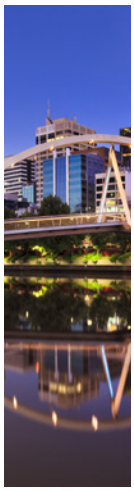
REGION	CITIES
AFRICA	Bamako, Durban (eThekwini), Kampala, Kigali, Lagos, Lusaka, Maputo, Nairobi County, Yaoundé, Windhoek
AMERICAS	Atlanta, Baton Rouge, Buenos Aires, Charleston, Chicago, Columbia, Dallas, Denver, District of Columbia, Kingston, Mexico City, Miami-Dade County, Montréal, New Orleans, New York City, Oakland, Phoenix, Rio de Janeiro, São Paulo, San Francisco
ASIA-PACIFIC	Bangkok, Melbourne, Quezon City, Taipei, Tokyo
EUROPE	Amsterdam, Athens, Berlin, Brussels, Copenhagen, Dublin, Glasgow, Kyiv, Lisbon, London, Madrid, Milan, Paris, Prague, Vienna

Four domains were developed for assessing health equity among LGBTI+ populations, based on a review of existing research on this topic: health outcomes (e.g., prevalence of HIV, mental health conditions, noncommunicable diseases), socioeconomic factors (e.g., employment, housing), community trauma (e.g., discrimination, criminal justice), and community resilience (e.g., civic engagement, resources). These domains were designed to assess health equity in broad terms that includes social determinants of health and underlying socioeconomic, political, and legal conditions that affect health equity. These domains formed the foundation of a two-pronged study whose protocol was granted an institutional review board waiver by Pearl IRB.

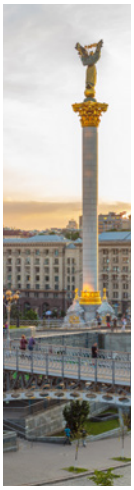
This study used two means of gathering data. The first method was an assessment conducted by study personnel regarding health equity across the four domains in each city. Data were collected for regional and global

analyses based on a series of indicators selected to cover a range of topics within each domain. Researchers sought city-specific, population-wide data with sexual orientation and gender identity disaggregated for each indicator. When such data were not available, researchers gathered alternative data, such as national data, data from smaller studies, or data that only included a subpopulation of the LGBTI+ community. Some indicators were based on factors beyond public health data. For example, several indicators relate to the criminalization of acts or identities related to LGBTI+ health.

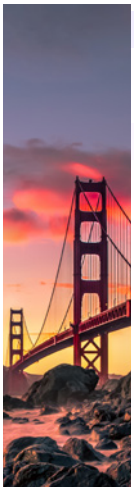
The second method of research was a key informant survey designed to gather the expert opinions of individuals who study, work, or volunteer in fields related to LGBTI+ health equity across the study's four regions. The survey was shared with local contacts in the cities selected for the study, who were asked to participate in the survey themselves if they qualified and/or to share the survey with colleagues, to allow for virtual snowball sampling. The survey was made available in English, French, Portuguese, and Spanish, and included both numerical and open response questions, including several questions across each of the four domains plus a question on overall quality of life for local LGBTI+ people. Some questions utilized a 1 to 5 scale, in which 1 was "poor" and 5 was "excellent," with regard to the availability of services or the performance of different local institutions. Other questions asked key informants to rate potential challenges (i.e., housing access) as being "not a problem," a "minor problem," a "moderate problem," or a "serious problem." City, regional, and global averages were created for the numerical responses and thematic analyses were conducted for open responses.



The following limitations exist with respect to the study:



- There are many gaps in data around LGBTI+ populations and differing cultural understandings and methods of assessing LGBTI+ identities. This makes comparability of data a challenge and thus requires a more nuanced analysis of the data.



- While the key informant survey was open to the public, IAPAC and Fast-Track Cities initiative contacts were encouraged to share the survey with others, thus participation was biased towards those who are connected to IAPAC and/or the Fast-Track Cities network. It is possible that the survey participants were more likely to work in HIV or related fields and were more likely to engage in collaboration with major institutions than the average LGBTI+ health activist or professional. This survey bias towards those who are better connected with major institutions and international collaboration may have been furthered by the limited number of languages in which the survey was available.

- Finally, the cities selected for this study, because they form a part of the Fast-Track Cities network, are perhaps more favorable towards LGBTI+ populations than the global average of cities, not to mention smaller municipalities and rural areas. Therefore, while this study presents findings that might be widely useful outside of the 50 selected cities and the Fast-Track Cities network in general, the results may understate the extent of LGBTI+ inequities in other urban, peri-urban, and nonurban areas.

Notwithstanding these limitations, this study was designed to help identify and fill gaps in the global LGBTI+ health literature — including the lack of consistent and comparable data across cities and regions — and to act as a catalyst for future research and action.

Results

Global, Regional, and City Analyses

This report is novel for its focus on LGBTI+ life in diverse cities but is also in the minority of LGBTI+ research due to its global focus. While the health and well-being of LGBTI+ communities look very different across contexts, this report found a great deal of similarity in the issues and the relative severity of health, policy, socioeconomic, and other challenges LGBTI+ people face.

This section of the report begins with a global overview of research findings and proceeds into regional analyses. Three cities from each region were also selected for individual analyses to provide more in-depth examples of the research findings.

GLOBAL OVERVIEW

In total, there were 275 survey respondents (or key informants) globally who were deemed eligible for inclusion, of whom the majority (51%) are associated with non-profit organizations, 21% with clinics or hospitals, 12% with government, 9% with academia, and the remainder with other settings.

Quality of Life and Care

The overall quality of life for LGBTI+ people was rated at 3.2 out of 5 (mode: 3; SD: 0.95), about in the middle between a "poor" rating of 1 and an "excellent" rating of 5. Only 15 of 275 key informants worldwide said that LGBTI+ quality of life in their city was "excellent," demonstrating significant room for improvement. While there was some correlation between the quality of life score and factors such as local LGBTI+ laws and socioeconomic conditions, there was still a surprising diversity in which cities scored poorly or well. For example, Tokyo and Kampala scored about evenly (2.2 and 2.3, respectively) at the bottom of a sample of cities, despite LGBTI+ people in Tokyo having a better legal landscape and an overall

Quality of Life on a 1-5 Scale in a Sample of 20 Cities *

* Scores on a scale of 1 ("poor") to 5 ("excellent").

stronger economy and health system. Similarly, New York City and Quezon City both achieved a relatively high score of a 4 out of 5, despite residents of Quezon City experiencing fewer legal protections and having a less established LGBTI+ community. These results likely reflect the fact that quality of life for LGBTI+ people is largely conceptualized on a local rather than a global basis. Key informants may think about their local LGBTI+ community's quality of life in terms of the overall quality of life among people in their city, and perhaps how their experiences of LGBTI+ life in their city compare to perceptions of LGBTI+ life elsewhere in their country. More than anything, the survey findings suggest that conventional wisdom about where LGBTI+ communities enjoy better or worse conditions stands to be questioned, and that this topic merits more research.

"Health, legal, and educational professionals are not trained in matters related to the LGBTI+ community... [There is a] lack of knowledge on the primary needs facing the community."

Key Informant, Maputo

With respect to healthcare access, the knowledge and cultural competency of clinical health providers was ranked slightly better (3.1 out of 5; mode: 3; SD: 1.01) than was that of mental health service providers (2.8 out of 5; mode: 2; SD: 1.08), although both rankings were concerning given the critical need for all health providers to address existing inequities. The availability and affordability of gender-affirming care for gender minorities was also rated poorly, with an average score of 2.7 out of 5 (mode: 3; SD: 1.16), suggesting that the healthcare needs of transgender and gender-nonconforming individuals should be a priority in addressing LGBTI+ health equity. According to the assessments, most cities in which access to gender-affirming care was guaranteed, and where other policies that facilitate access were in place (e.g., access to documents reflecting one's name and gender, access to gender-based facilities of one's choice) were in the Americas.[32] However, it bears noting that these policies reflect fairly new trends and, in the United States in particular, have been met with a backlash that has also spurred anti-transgender policies and legislation.[33]

The availability of low-cost, low-barrier HIV services for LGBTI+ people fared better than other areas of healthcare access, with an average score of 3.8 out of 5 (mode: 4; SD: 1.07). This relative strength is promising given that all cities included in the study are part of the Fast-Track Cities initiative and have thus committed to ending AIDS as a public health threat by 2030. This result is also important given the persistent HIV-related disparities facing LGBTI+ people in these 50 cities, as described below. Regarding HIV prevention services in particular, 29 key informants discussed access to pre-exposure prophylaxis (PrEP) in their qualitative responses, including 10 who raised concerns, including about availability and cost, lack of knowledgeable providers to prescribe PrEP, stigma within the healthcare system against those who use PrEP, and lack of awareness within the LGBTI+ community on the use of PrEP. Nine key informants, on the other hand, said that PrEP access has been improving and noted this as being a positive for their community. The remainder discussed their involvement with PrEP without making a negative or positive commentary regarding its availability. Beyond PrEP, there were various key informant comments regarding how LGBTI+ stigma and discrimination, as well as a lack of comprehensive sexual health education, were hindering HIV prevention measures, including the use of condoms and other safer sex methods.

Health Outcomes

Globally, HIV continues to be a major public health concern among LGBTI+ populations. There have been continued improvements in HIV prevention and treatment, yet sexual minority men — often referred to as men who have sex with men (MSM) in the HIV literature — remain one of the populations most affected by HIV across the globe. Data on HIV prevalence in assessments of the selected cities were relatively complete for sexual minority men, with city-specific estimates varying in great degree based on specific subgroups of sexual minority men and sampling methods. There was a general lack of HIV prevalence data available among the transgender community; however, these data were more readily available among transgender women comparted to transgender men who report having cisgender male sexual partners. Among the cities with HIV prevalence data reported for both MSM and transgender women (two groups that are sometimes wrongly conflated), transgender women universally experienced the greatest disparity. For example, in Rio de Janeiro, 54.0% of transgender women were living with HIV compared to 13.9% of MSM. Although effective testing and treatment of chlamydia, gonorrhea, and syphilis have been available for decades, eradication of these diseases remains an elusive objective for LGBTI+ populations globally. A similar pattern with respect to lifetime prevalence of bacterial STI emerged, with CT (up to 26.0%), GC (up to 18.3%), and syphilis (up to 37.9%) data available in the majority of cities among sexual minority men, but mostly absent for all other LGBTI+ populations.[34]

The prevalence of mental health problems among LGBTI+ populations is higher when compared to non-LGBTI+ populations, according to the assessments, although not to the level of serious pathology. Specifically, mental health problems such as depression, anxiety, and post-traumatic stress disorder (PTSD) were high across cities for this assessment. Although the majority of the cities had data on the prevalence of depression among sexual minority men, this was not the case for both anxiety and PTSD, and certainly not the case for other LGBTI+ populations. Furthermore, in general, availability of suicide data is scant among LGBTI+ populations, particularly outside of the Americas.

Data revealed alarmingly high rates of substance use among LGBTI+ populations when compared to demographically matched peers. Notably, in multiple cities, sexual minority men report higher rates of substance use (e.g., drug and alcohol use, smoking) compared with the general population, with extensive use of stimulants and other party drugs, including 3,4-methylenedioxymethamphetamine (commonly known as MDMA or ecstasy), γ-hydroxybutyric acid (commonly known as GHB), and ketamine. Alcohol use is also more common among sexual minority men in the 50 cities than among the general population. Similarly, across cities, lesbian and transgender women had higher rates of substance use compared with the general population. According to available literature, a major underlying reason for these disparities stems from the internalization of societal stigma as a result of growing up in non-affirming environments, leading to sexual and gender minority stress and suboptimal health outcomes in reaction to these adverse experiences.

* Scores on a scale of 1 ("not a problem") to 4 ("serious problem").

One issue contributing to mental health disparities among the population is the practice of conversion therapy, which is a term for harmful, non-evidence-based, and discredited practices that seek to "change" LGBTI+ people to have heterosexual and/or cisgender identities. Too often, LGBTI+ people receive such treatment in lieu of the evidence-based, affirming mental health support that they actually need. Most of the cities where this practice was banned were in the Americas.

"An over-emphasis on the success story of affluent white gay men distorts perceptions of LGBTI+ reality."

Key Informant, London

Data on other health indicators among LGBTI+ populations — including diabetes, obesity, and mortality rate — are even more scarce, with only a handful of cities having disaggregated results based on sexual orientation or gender identity. LGBTI+ populations did show a higher prevalence of disability than their non-LGBTI+ counterparts. On average, across cities, data show the prevalence of disability to be about 36% among lesbians, 36% among bisexual women, 26% among gay men, and 40% among bisexual men. None of the cities had disaggregated data on the prevalence of disability by gender identity.

Socioeconomic Factors

"Many are still expelled from their home or repress their sexuality or gender identity for fear of being expelled, which leads to several problems, especially in mental health."

Key Informant, São Paulo

In terms of socioeconomic factors, finding and maintaining housing was a major factor for LGBTI+ communities, with eight in 10 key informants (80%) saying that it was a serious or moderate challenge. A slightly smaller percentage (71%) said the same about finding and maintaining adequate employment. However, this trend was driven by results in the Americas and, to a lesser extent, Europe; in both of these regions, housing outranked employment as a concern, whereas in Africa and Asia-Pacific, that trend was reversed. A smaller percentage (50%) globally felt that access to sufficient and nutritious food was a serious or moderate challenge for LGBTI+ people. The ability of local governments, nonprofit organizations, the private sector, and other actors to respond to these challenges was rated highest with respect to food access (3.0 out of 5; mode: 3; SD: 1.16) and lowest with respect to housing (2.6 out of 5; mode: 2; SD: 1.05). This finding is concerning in that it indicates that the areas in which support is most badly needed, housing first and employment second, are also the areas in which the local response remains weakest.

With respect to the data assessments, there were no city-specific, population-based data on the indicators used herein — unemployment rate, homelessness rate, poverty rate, or food insecurity — that were disaggregated by sexual orientation and/or gender identity. However, national (or, in the United States, state-specific) rates on these topics for the selected cities were high, particularly with respect to poverty, where rates ranged from 9.1% (Colorado, USA)[35] to 55.5% (South Africa).[36] These high overall poverty rates, in and of themselves, are a public health concern, since a significant relationship between income inequality and HIV prevalence has been documented across many countries throughout the world.[37] Countries with greater inequality have higher HIV prevalence, particularly in sub-Saharan Africa but also to a lesser extent across Asia-Pacific, Europe, and the Americas.

Discrimination

Key informants identified discrimination against LGBTI+ people to be a major problem for their communities, and research supports that discrimination is a contributing factor to the health inequities LGBTI+ people face. Cities were mixed with respect to nondiscrimination laws pertaining to sexual orientation, gender identity, gender expression, and HIV status, as well as laws recognizing LGBTI+ related hate crimes. The majority of cities with LGBTI+ protections are in the Americas, Europe, and Asia-Pacific, whereas cities without protections were mostly among those selected from the Africa region, excluding Durban (eThekwini), South Africa. The African cities and, to a lesser extent, cities in Asia-Pacific were also less likely than those in the Americas and Europe to legally recognize same-sex relationships, an important if not primary legal step in combatting discrimination.

According to key informants, discrimination against LGBTI+ people with other marginalized identities (e.g., racial, ethnic minorities) was the most problematic form of discrimination facing their community. Thirty-five percent of key informants said discrimination was a "serious" problem, 39% said it was a "moderate" problem, 19% said it was a "minor" problem, and >7% said it was "not a problem" at all. "I think the main issue in Denver around this would be the intersections of LGBTI+ identity and race and gender," said one key informant who works in public health. "For white, cisgender LGBTI+ individuals, Denver is [a] 'safe' place to live and one without much discrimination compared to other parts of our country. I think for individuals of color, this is not the case. And I do know that non-white LGBTI+ [people] consistently express their own experiences of racism within the larger LGBTI+ communities."

"Migrants are particularly demonized under the current UK government," said a key informant in London. "There is a serious risk here around refugees and asylum seeker and their access to adequate health and care, including support to manage sexual health and chronic conditions."

Regarding the types of discrimination facing the LGBTI+ community, key informants cited gender identity-based discrimination as being more of a problem than discrimination based upon sexual orientation or HIV status. Only 6% of key informants said that gender identity-based discrimination was "not a problem" in their community, while one in three said it was a "serious" problem. Particularly in jurisdictions that have banned sexual orientation-based discrimination but not gender identity-based discrimination, this presents an urgent need for legal reform and other interventions. Sexual orientation-based discrimination was also found to be a concern among 90% of key informants, including 19% who found it to be a "serious" challenge. HIV-related discrimination was a concern for 91%, including 24% who said it was a "serious" concern in their local LGBTI+ community.

In open-ended responses, many key informants wrote that open discrimination against LGBTI+ people in healthcare settings or lack of inclusive care (e.g., intake forms not being sensitive to gender minorities, competent care not being available) had an impact on health. Other key informants discussed how stigma and minority stress take a toll on mental health, with one in Columbia, SC, USA, writing that LGBTI+ people are "not treated like humans, but almost as if they're contaminated by something. Consequently, this encourages them to skip out on needed routine medical [and] preventive care, which drives STI and infectious disease rates." Still other key informants described how discrimination has an impact on social determinants of health, especially housing and homelessness, which leads to ripple effects across various aspects of overall well-being.

How Big a Problem is Intersectional Discrimination on a 1 to 4 Scale?*

Criminal Justice

Key informants rated criminal justice issues slightly less in terms of their significance than were housing and employment issues. Eighty-five percent of key informants said that mistreatment or abuse of LGBTI+ people by law enforcement was a problem in their city, including 24% who said it was a "serious" problem, 31% a "moderate problem," and 30% a "minor" problem. A slightly smaller percentage (71%) said that targeting of LGBTI+ people in their city was a "serious," "moderate," or "minor" challenge, while slightly more than that percentage (77%) reported the same about criminalization of HIV exposure and/or nondisclosure of HIV status. Most cities for which this issue was raised are in countries with laws that criminalize transmission and non-disclosure of HIV status to sexual partners, and criminalization of HIV can still occur in places that do not have laws that specifically mention HIV; instead, laws against endangerment, physical or sexual assault, and even attempted homicide are often employed. In fact, more than half of the current cases worldwide criminalized HIV exposure and non-disclosure of HIV status to sexual partners using general criminal laws.[38,39]

"There is no gender recognition law in Thailand. Transgender people are not allowed to change their gender marker on their ID. They often face stigma and discrimination going to the hospital as their appearance will usually not match with their gender marker. They often get questioned with unnecessary and irrelevant questions. This creates massive discomfort for transgender people and it drives [them away from] health services."

Key Informant, Bangkok

Criminalization of sex work and/or mistreatment of sex workers was ranked as more of a concern than treatment of the LGBTI+ community itself, with 90% of key informants saying it was a problem, including 34% who said it was a "serious" problem. Although sex work is reportedly widespread in every city included in this report, more than 40 of 50 cities have laws governing sex work as illegal. This statistic is particularly concerning given that the legal environment, including policy, law enforcement, and the judicial system, is a significant structural determinant of HIV acquisition and transmission risk in the context of transactional sex and should remain at the center of the HIV prevention agenda. Moreover, LGBTI+ people are disproportionately represented in the field of sex work due, in part, to limited economic opportunities elsewhere, and can be the targets of arrest and mistreatment when sex work criminalization laws are enforced.

Critically, the majority of key informants (90%) said that there was a disparate impact among racial and ethnic minorities with respect to these criminal justice issues, including 30% who said it was a "serious" problem and 32% who said it was a "moderate" problem. Therefore, while not all criminal justice issues were rated as being as problematic as socioeconomic and discrimination issues, nine in 10 key informants felt that they were problematic with respect to impact on racial and ethnic minorities in particular. This problem was ranked highest in the Americas, followed by Africa, Europe, and Asia-Pacific. This ranking may relate to recent attention in the Americas, and especially the United States, regarding the disproportionate impact of criminal justice systems on people of color in general, which would apply in this case to LGBTI+ people of color. The relatively weak ranking of this issue in Europe is slightly surprising given many key informants noted problems facing LGBTI+ people from racial and ethnic minorities in their cities, especially migrants, though it could reflect relatively liberal criminal justice systems compared to those found in, for example, the United States.

Community Resilience

Community-based organizations, nonprofits, and informal social networks of other LGBTI+ people were most frequently named as major sources of community resilience in open responses from key informants. In terms of which sector did best at engaging in productive and respectful dialogue with the local LGBTI+ population, nonprofits scored best, with an average of 3.9 out of 5 (mode: 4; SD: .92). Healthcare providers, local government, and the private sector all scored lower and roughly equally, with averages of 3 (mode: 3; SD: 1.08), 3 (mean: 4; SD: 1.23), and 2.9 out of 5 (mode: 3; SD: 1.10), respectively. While nonprofits scored well, some key informants called on them to take more of a leadership role in influencing other actors and society at large. Nonprofit organizations "could influence change if they invest in evidence-based advocacy," said the executive director of an organization serving transgender women in Kampala. "Capacity building of healthcare providers about transgender women and the need to support them to access services would also influence change."

Many key informants also called for more funding for community-based organizations, health services, and social spaces, noting that good work was being done but that more support was needed. "Give us funding to work," stated the director of an organization providing health services to sex workers in Lagos. Strategies proposed by the key informants included lowering barriers to accessing grants, reducing bureaucracy, and diversifying which organizations receive grants.

Other common themes regarding how institutions can improve LGBTI+ resilience included engaging in meaningful and formal dialogue; supporting socioeconomic opportunity for LGBTI+ individuals; increasing LGBTI+ inclusive data collection to better identify needs and demonstrate inclusivity; visible displays of LGBTI+ support, such as LGBTI+ flags in public spaces and the participation of political leaders in LGBTI+ community celebrations; and supporting changes to laws to eliminate criminalization of LGBTI+ identities and eliminate LGBTI+ discrimination.

In terms of the assessments, evidence varied from city to city, pointing to a major need that local, national, and international actors could support. Although most heavily concentrated in cities in the Americas and Europe, many of the 50 cities globally had one or more LGBTI+ community spaces, as well as public funding for LGBTI+ community resources (e.g., tourism association, pride events). Similarly, many cities had spaces identified — either via known areas that are open to the public or hidden but known via word of mouth — where LGBTI+ populations could socialize. Furthermore, many cities had a local LGBTI+ office, liaison, public report, or public plan on advancing LGBTI+ equity, although little evidence was found of such supports in the African cities, with the notable exception of Durban (eThekwini).

How Concerning are Issues Relating to Social Determinants of Health on a 1-4 Scale? *

Housing access	3.2
Gender identity discrimination	3

Private Sector	2.9

* Scores on a 1 ("poor") to 5 ("excellent") scale.

Conclusion

The global analysis of the LGBTI+ health equity survey and assessment reveal that LGBTI+ communities face wide-ranging and widespread health inequity and that access to health and other critical services is particularly poor for gender minorities. Discrimination was a concern among an overwhelming number of key informants, but laws addressing discrimination remained absent or incomplete in a majority of jurisdictions. Communities facing multiple forms of marginalization, including communities of racial and ethnic LGBTI+ people, were found to face higher levels of discrimination and criminal justice involvement. And, despite greater public attention to civil and political issues such as same-sex marriage and discrimination laws, key informants noted that socioeconomic issues — which are key social determinants of health — were among their chief concerns. The opinions of these key informants, each one a local LGBTI+ stakeholder, helped to fill in the many gaps in data that the assessments revealed, including limited information on health disparities beyond HIV and STIs, and almost no large-scale data on socioeconomic conditions among LGBTI+ populations. Much of the data that did exist were focused on sexual minority men, including relating to HIV, STIs, and rates of depression, and occasionally data relating to HIV among transgender women.

Despite the many alarming results it presented, the research outcomes also highlighted the remarkable resilience of LGBTI+ communities. Even where formal programming or spaces for LGBTI+ people were limited, key informants noted the presence of informal spaces and social networks as a source of strength. HIV services stood out as a clear leader in health services for LGBTI+ people and nonprofit organizations led the way as being a source of collaboration and respectful dialogue with the community. The study also demonstrated that LGBTI+ advocates, communities, resources, and spaces exist throughout diverse cities, and that even in places with harsh anti-LGBTI+ laws and limited public resources to support LGBTI+ communities, these communities have found ways to support each other and survive.

Africa

2.7
QUALITY OF LIFE SCORE
REGIONAL

This study included 10 Fast-Track Cities in Africa: Bamako, Durban (eThekwini), Kampala, Kigali, Lagos, Lusaka, Maputo, Nairobi County, Yaoundé, and Windhoek. Three cities were selected from these to serve as examples with more detailed analyses, which follow this regional description; they are Durban (eThekwini), Kampala, and Maputo.

Among the lingering injustices of the colonial era in Africa are still-standing socioeconomic inequalities and anti-LGBTI+ legislation (particularly laws regarding same-sex male relations), both of which complicate progress for LGBTI+ communities. The continent also faces major inequities with respect to HIV that — while more widespread than elsewhere in the world — still disproportionately affect LGBTI+ people. Key informants in the 10 African cities also reported different priorities than those in the Americas and Europe, which often drive (financially, politically, and culturally) LGBTI+ movements elsewhere — a cautionary finding for those wishing to best support LGBTI+ health equity in Africa.

Quality of Life and Care

On average, key informants in Africa rated their local LGBTI+ quality of life at 2.7 (mode: 3; SD: .97), well below the global average of 3.2. Key informants also rated all health services worse than the global averages, with LGBTI+ affirming mental healthcare being rated worse of all, at only a 2.3 on a 1 to 5 scale (mode: 2; SD: 1.05) compared to a 3.2 score worldwide. Disturbingly, given the continent's disproportionate burden of the disease, HIV services were among those rated worse than the global average, at 3.3 out of 5 (mode: 3, SD: .98), compared to 3.8 across all cities.

"People (including healthcare providers) lack information about LGBTI+ [health]."

Key Informant, Kigali

Stigma was the most common barrier to health service access and utilization that was cited by the key informants, especially for transgender individuals. "The biggest challenge is the negative judgment," said an HIV project manager in Bamako, "however you translate it: stigmatization, rejection, discrimination."

Only one of the 10 African cities, Durban (eThekwini), had laws banning the practice of conversion therapy, or the nonscientific practice of attempting to change one's sexual orientation or gender identity. The persistence of such practices may contribute to the negative scores given to various types of care, and also contributes to mistrust of healthcare systems.[40]

69%

of key informants in Africa said access to **employment** was a "serious" problem for LGBTI+ people, compared to just 27% of key informants globally

Health Outcomes

Data regarding HIV prevalence was relatively complete among the African cities and demonstrated a clear need for HIV to remain a priority among LGBTI+ populations, as well as for LGBTI+ populations to remain a key group for city stakeholders coordinating HIV responses. With the exception of Yaoundé, the nine other African cities had some city-specific data available on population-wide HIV prevalence and all but Nairobi County, Lusaka, Windhoek, and Yaoundé had some city-specific data specifically on prevalence among sexual minority men. Bamako had the largest disparity between MSM and the general population, with 13.7% of sexual minority men living with HIV compared to 1.1% of the overall population, a 12.5 times higher prevalence.[41] Inequities in HIV burden were also found in Lagos (17.4%[42] versus 1.4%[43]), Durban (eThekwini) (48.2%[44] versus 27%[45] in Durban's province of KwaZulu-Natal), Kampala (12.2%[46] versus 6.9%[47]), Maputo (41.4% versus 10.4%)[48], and Kigali (10%[49] versus 4.3%[50]), when comparing sexual minority men to the overall population.

Regarding other aspects of sexual health, disaggregated data for sexual minority men exist in Kampala and Kigali with respect to chlamydia, gonorrhea, and syphilis, and with respect to chlamydia and gonorrhea in Lagos and Maputo. While prevalence of these conditions was generally lower than HIV, many of the rates were concerningly high. Kampala had relatively low rates of chlamydia and gonorrhea among sexual minority men than did the other cities, but a relatively high rate of syphilis at 10.3%.[51] The highest rates of chlamydia and gonorrhea among sexual minority men and transgender women were found in Lagos (18.3% and 25.8%, respectively)[52] and Kigali (9.1% and 8.8%, respectively).[53]

Data on mental health were relatively limited among the African cities. No city had population-based, SOGI-disaggregated data on anxiety, PTSD, or suicide, nor was any national SOGI-disaggregated data identified. Data existed in one city, Bamako, regarding depression among MSM, with a reported rate of 8%.[54] Additionally, there were national data applicable to Durban (eThekwini) (44% of MSM in South Africa).[55] These numbers suggest that depression and other mental health problems among sexual and gender minorities throughout cities in the African region could be quite high but requires additional epidemiological research to document the prevalence of mental health disorders and determine an appropriate response that is informed by both the data and the science.

Data on other indicators included in the study — obesity, smoking, drug use, and mortality — were even more limited, with only a few cities or national population-based data available that disaggregated results based on sexual orientation or gender identity. In Lagos, 15.4% of sexual minority men were reported to be current smokers. In terms of alcohol consumption, 34.1% of MSM in Lagos were current drinkers, and half of the current drinkers were described to have a drinking problem using the CAGE assessment for alcohol dependence.[56] In terms of alcohol consumption, 43.7% of MSM in Maputo were classified as problem drinkers using the AUDIT-C scale. Cannabis use in the 12 months preceding the survey was reported by 12% of MSM in Maputo; less than 3% of MSM used other drugs.[57]

Socioeconomic Factors

In terms of socioeconomic factors, perhaps not surprising given the longstanding socioeconomic injustices affecting African nations, key informants identified employment, housing, and food access for LGBTI+ individuals to be "serious" problems. For example, while globally, 27% of key informants said that LGBTI+ employment access was a "serious" concern, that number skyrocketed to 69% in Africa, where less than 3% said it was "not a problem."

With respect to the assessments, no city population-level had relevant data on the indicators used herein — unemployment rate, homelessness rate, poverty rate, or food insecurity — that were disaggregated by sexual orientation and/or gender identity. However, national rates for the selected cities on these topics were high, particularly for poverty, where rates ranged from 17.4% for Windhoek (Namibian national data) to 55.5% for Durban (eThekwini) (South African national data).[58] These high overall poverty rates, combined with the survey data on socioeconomic inequities facing LGBTI+ populations, support that the conclusion that this is a major issue in addressing LGBTI+ health equity in African cities, despite the lack of relevant LGBTI+ specific data.

Discrimination

Regarding discrimination, African key informants rated discrimination on the basis of gender identity, HIV status, and intersectional factors roughly the same as their global counterparts. However, key informants rated sexual orientation-based discrimination about 25% higher as a problem than did the average key informant worldwide. A majority (60%) said that sexual orientation-based discrimination was a "serious" problem, while less than 9% said it was "not a problem." Many key informants said that discrimination facing LGBTI+ people prevented access to services, hindered HIV responses, and caused significant mental health problems in their local communities.

Only one out of the 10 African cities selected — Durban (eThekwini) — has nondiscrimination laws pertaining to sexual orientation, gender identity, gender expression, and HIV status.[59] A similar pattern emerged with respect to the legality of same-sex relationships, with LGBTI+ rights in African cities ranging from having the same legal protections as non-LGBTI+ people (again, Durban (eThekwini)) to punishments that start with fines to life imprisonment (i.e., Lagos).[60] There are many reasons for this, but homophobic colonial laws, religious morality, and the idea that homosexuality is imported by the West are among the most influential. Among the African cities that were selected, only Durban (eThekwini) had regulations and policies that protect transgender individuals; the Alteration of Sex Description and Sex Status Act allows people to apply to have their sex status changed in the population archive, and consequently to receive identity documents and passports indicating their gender identity. The law necessitates the person to have undergone medical or surgical treatment, such as hormone replacement therapy, but gender affirmation surgery is not required.[61]

Criminal Justice

African key informants found the problems of police mistreatment, police targeting, and criminal treatment of sex workers to be more severe than the average across all 50 cities. About half rated all three of these issues as being "serious," with only a handful of key informants saying they were "not a problem." This corresponds with the findings of the assessments, which demonstrated that African LGBTI+ communities faced more penalizing laws and fewer protective laws than did communities in other regions. Criminalization of HIV issues and the disproportionate impact on people with multiple marginalized identities both ranked closer in line with global averages.

Most African cities have laws that criminalize transmission and non-disclosure of HIV status to sexual partners. Even when laws do not explicitly mention HIV in this context, some African cities, such as Durban (eThekwini), have used existing laws to charge individuals in cases such as this

"Discrimination by health care workers acts as a barrier to accessing health services."

Key Informant, Nairobi County

"Stigma and discrimination [make] people living with HIV default from accessing antiretroviral therapy services at health facilities."

Key Informant, Nairobi County

with attempted homicide;[62] in fact, more than half of the current cases worldwide criminalized transmission and non-disclosure of HIV status to sexual partners using general criminal laws.[63] Although sex work is widespread in African cities, each have laws governing sex work as illegal.

Community Resilience

Three trends emerged when key informants were asked about sources of resilience for their local communities: support from within the LGBTI+ community itself, including stemming from the resilience of individuals themselves; services from local organizations, including through support groups; and international donors, who funded many of these efforts (although organizational reliance on these sources caused some concerns about sustainability). When asked how local institutions can best support their community to grow its resilience, the most common requests were more collaboration with LGBTI+ individuals and organizations, public education about LGBTI+ identities, and advocacy to change negative laws and policies impacting the community.

"The main sources of resilience of this group are civil society organizations that have done their work in defense of human rights and have been the only institutions to work with these groups."

Key Informant, Maputo

"Even us at the frontline are feeling threatened and disempowered," said the director of a nonprofit in Durban (eThekwini). "Visible partnerships towards advancing lives and promoting rights" would provide a boost to the community, they said, as would "more meaningful dialogues or community activities than these last-minute tick boxes we have been having."

Key informants in Africa gave a lower score to how their local governments interact with LGBTI+ communities compared to the global averages, with an average score of 2.4 (mode: 2; SD: 1.19) compared to 3.0 worldwide. They ranked providers (3; mode: 3; SD: 1.15) and nonprofits (4; mode: 5; SD: 1.01) about equally to their global peers, and the private sector (2.7; mode: 2; SD: 1.19) just slightly behind the global average (2.9).

In terms of assessment factors used to gauge LGBTI+ community resilience, almost no evidence was found. This points to a major need that local, national, and international actors could support. In Durban (eThekwini), at least one LGBTI+ community space was identified, as was public funding for LGBTI+ community resources such as a tourism association and pride events.[64] Durban (eThekwini) also had other LGBTI+ spaces, and while all cities lacked any permanent social spaces (i.e., LGBTI+ bars), there have been places identified where gay men can socialize. Such spaces, community resources, and funding were not found in any of the other African cities included in the study. Furthermore, no cities had a local LGBTI+ office or liaison, or a public report or plan on advancing LGBTI+ equity.

Conclusion

The study's findings indicate a wide variety of challenges affecting LGBTI+ communities in African cities. Key informants in Africa scored their services and relationships with institutions as worse, and their challenges greater, than the global averages around most issues on which they were surveyed. The challenges facing these communities were reinforced by the findings of the assessments, which indicated fewer legal and political supports (as well as less visibility and data) than was available elsewhere in the world. Nevertheless, internal community strengths and support from nonprofits stood out as bright spots in reflections on community resilience, with nonprofits scoring slightly better in Africa than the global average, as a plurality gave nonprofit organizations a 5 out of 5 score on relationships with LGBTI+ people. Additionally, a comparison with other cities around the world demonstrates that while the challenges facing LGBTI+ people in Africa may be greater than those in some other parts of the world, the underlying issues — and solutions — also bear many similarities.

4.0
QUALITY OF LIFE SCORE
CITY

Select Cities

Durban (eThekwini)

Situated in South Africa, the city of Durban (eThekwini) faces national contexts that includes one of the highest poverty rates among the cities included in this study as well as a high overall rate of HIV. At the same time, because of national and local LGBTI+ inclusive measures, Durban (eThekwini) stood out among the 10 African cities as a clear leader on LGBTI+ health equity.

In Durban (eThekwini) alone, same-sex marriage was legal, conversion therapy was banned, and transgender people were able to change their gender markers on their identification documents — a key means by which to access health services and avoid LGBTI+ violence and stigma.

Durban (eThekwini) also stood out for its community supports, including having a community space for LGBTI+ people and some public funding of LGBTI+ events. Nevertheless, key informants said these resources were limited and urged institutions to increase their support, especially given the violence that LGBTI+ individuals must still confront. “Organizing Durban Pride in Durban is a nightmare,” said the director of a local LGBTI+ organization, who says support for the event has dwindled. Pride is meant “to create an awareness, build bridges, showcase talent, and promote Durban and eThekwini as a Safer City.”

Another key informant who works as a psychotherapist in the community encouraged local actors to “create safe spaces, more support groups, and encourage more family building amongst their respective communities in order to spread awareness... Just allow [LGBTI+ individuals] to live as normal people. If they don’t want to change to suit anyone, they shouldn’t be killed for it.”

2.3

QUALITY OF LIFE SCORE

CITY

Kampala

Kampala is one of the fastest growing cities in Africa and is situated in a country known throughout the world for its efforts to pass extreme anti-LGBTI+ legislation, the worst of which has so far been stymied. Sadly, but not surprisingly, key informants in Kampala gave their city one of the lowest quality of life scores (2.3; mean: 2; SD: .71) of the 50 cities included in the study.

Unlike the global trend, in Kampala, key informants rated sexual orientation-based discrimination as a greater problem than discrimination on the basis of gender identity, with all but one informant saying that sexual orientation-based discrimination was a "serious" problem. Still, many noted in their comments that the situation for transgender women in Kampala was particularly dire, indicating that perhaps homophobic attitudes driven by the higher visibility of that issue are also affecting transgender people, regardless of their sexual orientation.

"The existing laws and policies inhibit open provision of service [and] successful HIV treatment."

Key Informant, Kampala

Moreover, in Kampala, the mistreatment and targeting of LGBTI+ people by law enforcement were considered greater concerns than they were internationally. "Transgender people face the hardest hardships and queer sex workers, too, where they have been beaten up and jailed," said a local activist working with LGBTI+ women. Additionally, the director of a local HIV organization said, "In my city, it's still illegal to say you're an LGBTI+ member. This makes it hard to even advertise the organizations that provide [services]."

The biggest request from key informants was for more funding and support from local and international actors. The director of a local organization for people living with HIV said key to their success has been the "availability of caring non-state actors," specifically naming the US President's Emergency Plan for AIDS Relief (PEPFAR), the Global Fund to Fight AIDS, Tuberculosis and Malaria, and diplomatic missions from countries such as the United States and Sweden.

Most key informants also noted the need for legal reform and some placed this above all other concerns. "First," advised one key informant, "address the harsh policy."

3.0
QUALITY OF LIFE SCORE
CITY

Maputo

Key informants in Maputo rated their socioeconomic, criminal justice, and discrimination issues as being more problematic than the global averages. The most significant concern raised by key informants was lack of access to employment, followed by mistreatment by the police and discrimination facing people with multiple marginalized identities. These issues are likely caused in part and exacerbated by the city's lack of legal protections for LGBTI+ people as well as laws recognizing and affirming their identities.

"Poor access to employment and employability" were among the top concerns of one key informant, along with "poor access to education due to stigma and discrimination" facing the LGBTI+ community. Other key informants concurred that stigma was a "serious" concern. One key informant noted that psychological violence may seem like less of a concern than physical violence, "but if we go deeper, we can see that this violence affects most people and has been the reason that people in this community even hang themselves or have mental disorders."

Healthcare services were rated more closely to the global average, with HIV services faring particularly well, with an average score of 4 on a 1 to 5 scale. Additionally, key informants gave better ratings to how local government, providers, and the private sector interact with their local LGBTI+ community than did the average key informant worldwide. While these scores (all averaging 3.6 on a 1 to 5 scale) still left significant room for improvement, they represented a potentially relevant strength for the LGBTI+ community in Maputo compared to others.

One local LGBTI+ activist who gave above-average scores to how local institutions interact with the community called for more support: "Not monetary, but visibility: having the right to walk without being discriminated against or stoned just for carrying the LGBT flag... Many of us need that support."

"Generally, effeminate gay men and the transgender community face additional challenges by the way these groups freely express their sexuality and gender, which is contrary to heterosexual expressions."

Key Informant, Maputo

3.2
QUALITY OF LIFE SCORE
REGIONAL

The Americas

In the Americas, 20 cities participated in the study: Atlanta, Baton Rouge, Buenos Aires, Charleston, Chicago, Columbia, Dallas, Denver, District of Columbia, Kingston, Mexico City, Miami-Dade County, Montréal, New Orleans, New York City, Oakland, Phoenix, Rio de Janeiro, San Francisco, and São Paulo. Three of these cities — Kingston, New Orleans, and Mexico City — were selected to serve as examples with more detailed analyses, which appear after this regional description.

Together, these Fast-Track Cities span the entire Western hemisphere and represent a variety of cultures and political climates for LGBTI+ individuals. While the region has been making significant progress in recent years in recognizing same-sex marriages and banning certain forms of discrimination — and while many of these cities are known for their vibrant LGBTI+ communities — the results of this study show that there remain significant challenges.

Quality of Life and Care

Overall, key informants in the Americas gave their cities an average quality of life score that matched the global average: 3.2 on a 1-to-5 scale (mode: 3; SD: 0.95). Less than 6% gave their city a 5 out of 5, indicating that few believed that their city had no room for improvement.

Key informants from the Americas also rated access to LGBTI+ inclusive care roughly the same as did their global counterparts. As with the global trend, gender-affirming care (2.8 on a 1 to 5 scale; mode: 3; SD: 1.10) and mental health care (2.8; mode: 2; SD: 1.03) were rated lower than primary care (3.2; mode: 3; SD: 1.12) and HIV care (3.8; mode: 4; SD: 1.06), which was rated the best.

Even in cities known to be LGBTI+ friendly, many gave mediocre scores to the availability of inclusive and quality care. “In San Francisco, we are on the cutting edge of LGBTQ+ services, although there is always room for improvement,” said one local community advocate who specifically noted care for older adults as an area in which more attention was needed.

Many key informants pointed to nonprofit organizations and LGBTI+ leaders as driving LGBTI+ inclusive care. “Most of that work is being taken up by LGBTQI+ health providers, nonprofits, and advocates to push government and private sectors to be more inclusive and address LGBTQI+ disparities,” said a key informant in Chicago.

Health Outcomes

Compared to the other regions, data regarding HIV prevalence with respect to sexual and gender minority populations were the most complete among the cities in the Americas included in the study. Data were the most comprehensive among sexual minority men, with the highest HIV prevalence reported in Baton Rouge (44.7%),[65] followed by Miami-Dade County (42.8%) and New Orleans (36.9%).[66] Universally, across all cities in the Americans, extremely concerning racial and ethnic disparities exist for HIV prevalence data. In the United States, Black sexual minority men having the highest prevalence out of any racial group, followed closely by Latinx sexual minority men.[67] Similarly, across cities, transgender women represent a population that is most severely affected by HIV with an average estimated HIV prevalence of 42.2% across the cities in the Americas. Cities with the highest HIV prevalence among transgender women included Atlanta (58.4%), New York City (52.2%), New Orleans (44.6%), and San Francisco (41.2%). Among transgender women, similarities among racial and ethnic disparities exist for HIV prevalence data, with Black transgender women having the highest HIV prevalence out of any racial group.[68] The constant and unrelenting exposure to sexual and gender minority stigma compounded by the psychosocial challenges associated with social disadvantage and economic marginalization exacerbates disparities in HIV prevalence among these populations. Among sexual minority men and transgender women, this invalidates their sexual and gender identity and can lead to behaviors (e.g., substance use, sex work, healthcare avoidance) that potentiate HIV acquisition and transmission risk.

Disaggregated data for sexual minority men exist in nearly all of the selected cities with respect to chlamydia, gonorrhea, and syphilis. Overall, STI prevalence and incidence among sexual minority men — including primary and secondary syphilis and antimicrobial-resistant gonorrhea — is greater than that reported in sexual minority women and both heterosexual women (who have sex with men only) and men (who have sex with women only). There was a general lack of city-specific, population-level STI data available for transgender individuals. While the prevalence of these diseases is generally lower than HIV among sexual and gender minorities, many of the rates were still concerningly high. Furthermore, both chlamydia and gonorrhea differed in prevalence by anatomical site (e.g., urethral, rectal, pharyngeal) among sexual minority men. With respect to urethral chlamydia among sexual minority men, Miami-Dade County (5%) had the lowest prevalence and the highest was seen in San Francisco (5.9%); rectal chlamydia rates were much higher, ranging from 14.3% in Miami-Dade County to 18.4% in San Francisco.[69] As far as urethral gonorrhea rates among sexual minority men, Miami-Dade County (5.4%) had the lowest prevalence and the highest was seen in New York City (8.9%); rectal gonorrhea rates were much higher, ranging from 12.2% in Miami-Dade County to 14.8% in San Francisco. The prevalence of syphilis among sexual minority men ranged from 8.3% in Denver to 21.9% in San Francisco.[70]

Population-level data on the prevalence of specific mental health disorders among sexual and gender minorities was robust for the cities in the Americas, but there remains plenty of room for strengthening these data. Rates of depression and anxiety among all sexual and gender minority groups are consistently higher than those among the general adult population. Among MSM, rates of depression range from 47.3% (San Francisco) to 47.8% (New York City) across cities as compared to 5-12% among the general adult population.[71,72,73] For alcohol and drug use across cities in the Americas, on average 26.2% of sexual minority men reported drinking alcohol at least three days per week, and 10.6% were heavy drinkers (i.e., they consumed at least four drinks per day or consumed an amount equal to six drinks per occasion).[74] Furthermore, among sexual minority men, marijuana was the drug most likely to be used (average for New York City,

Chicago, San Francisco, and Denver, with negligible variation: 46.3%), followed by poppers (amyl nitrates) (36.6%); hallucinogens, including ecstasy (24%); cocaine (19.3%); amphetamines (12.9%); and injection drug use (10%).[75] Among the cities (New York City, San Francisco, Chicago) with population level data specific to transgender women, the average prevalence (differences by city are insignificant) of specific disorders was as follows: lifetime and current major depressive episode, 35.4% and 14.7%, respectively; suicidality, 20.2%; generalized anxiety disorder, 7.9%; and posttraumatic stress disorder, 9.8%. Among transgender women, the average prevalence (differences by city are insignificant) of alcohol dependence is 11.2% and substance use dependence is 15.2%.[76]

Socioeconomic Factors

On socioeconomic issues, key informants from the Americas reported more significant problems regarding LGBTI+ access to adequate housing and food than the global average. In the Americas, 55% said that housing access was a "serious" concern, compared to 42% who said the same globally. Regarding food access, 92% of key informants in the Americas felt that this was at least somewhat of a problem, compared to 76% globally who felt the same. Most of the key informants from the Americas came from the United States, a country with ample resources to address these concerns, and yet the response by institutional actors to address socioeconomic concerns facing the LGBTI+ community were ranked worse in the Americas than globally. Latin America is also known to face rising socioeconomic disparities generally. These factors — combined with limited antidiscrimination laws (described below) — likely explain why the Americas fared poorly on these key social determinants of health.

With respect to the assessments, there was scant city-specific, population-level data on unemployment rates, homelessness rates, poverty rates, or food insecurity that were disaggregated by sexual orientation and/or gender identity. In the United States, there were limited state-specific and country-level population data; on average LGBTI+ people collectively have a poverty rate of 21.6%, which is much higher than the rate for cisgender heterosexual people of 15.7%. It is important to note that among LGBTI+ people, transgender people have an especially high rate of poverty (29.4%).[77] A major contributor to the high rate of poverty among transgender individuals is their high (15%) unemployment rate — three times higher than the unemployment rate in the U.S. population at the time of the survey (5%). On average, lesbian (17.9%) and heterosexual (17.8%) cisgender women have higher poverty rates than gay (12.1%) and heterosexual (13.4%) cisgender men. But cisgender lesbian women do not have significantly different poverty rates than cisgender heterosexual women. Finally, bisexual cisgender women (29.4%) and men (19.5%) had higher poverty rates than heterosexual straight women and men, respectively.[78] As far as population-level data on recent homelessness in the US, 8% of transgender and 3% of cisgender sexual minorities experienced this versus 1% of cisgender heterosexuals.[79]

Discrimination

Key informants from the Americas rated discrimination relating to sexual orientation and HIV status about equally with respect to the global ratings. However, they rated the problems of discrimination on the basis of gender identity and intersectional discrimination facing LGBTI+ racial and ethnic minorities as more significant problems than the overall average of key informants surveyed.

In the United States, same-sex relations have been legal nationwide since 2003[80] and same-sex marriage has been legal in every state since 2015.[81] In the Brazilian cities of Rio de Janeiro and São Paulo, LGBTI+ rights are among the most advanced in Latin America, including the right for same-sex couples to marry since 2013.[82] Montréal, Mexico City, and Buenos Aires have also legalized same-sex relations and same-sex marriage since 2004,[83] 2009,[84] and 2010,[85] respectively.

Across all selected cities in the Americas, hate crime is recognized and punishable by law. In all selected United States cities, hate crimes based on sexual orientation or gender identity are punishable by federal law.[86] Universally, across the Americas, transgender people are allowed to access appropriate gender-based facilities and are able to change their gender marker on legal documents, although the requirements and therefore ease of doing so varies.[87,88,89]

Criminal Justice

The Americas saw sharp disparities compared to their global neighbors with respect to criminal justice issues. For example, key informants in the Americas scored the problem of LGBTI+ people being targeted for arrests about 13% higher than the global average and scored about 16% higher than the global average the disproportionate impact of the criminal justice system on LGBTI+ racial and ethnic. Indeed, 41% of key informants in the Americas said that the disproportionate impact on LGBTI+ people of color was a "serious" problem, compared to 30% who said so globally.

As noted, LGBTI+ identities and relationships were not criminalized in any of the cities from the Americas included in the study. With respect to the legality of transactional sex in the Americas, all selected cities have laws making the practice of exchanging sex for money illegal, except for Buenos Aires, Mexico City, Rio de Janeiro, and São Paulo; however, it is illegal to operate a brothel in these cities, and vagrancy laws are routinely used against sex workers soliciting clients on the street. In Montréal, offering sexual services is not illegal; however, purchasing and using sexual services is illegal.[90] With respect to the exposure and non-disclosure of HIV status to sexual partners, only Montréal,[91] Phoenix, District of Columbia, and Dallas have no criminalization laws, while Atlanta, Baton Rouge, Charleston, Chicago, Columbia, Miami-Dade County and New Orleans criminalize or control behaviors through HIV-specific statutes and regulations.[92]

Community Resilience

Key informants in the Americas rated LGBTI+ community engagement by local government and healthcare providers about the same as did their peers globally, but rated nonprofits and businesses more poorly than did key informants worldwide. Still, as in other parts of the world, nonprofit organizations were the clear leaders, scoring an average of 3.8 on a 1-to-5 scale compared to a 3.0 score for local government and providers, and a 2.8 score for businesses.

According to the assessments, factors thought to support LGBTI+ community resilience across the selected cities in the Americas were robust. All cities in the Americas are appointed with LGBTI+ community spaces and community resources (e.g., tourism association, pride event) and have allocated funding for LGBTI+ specific service organizations. Similarly, in existence for all selected cities in this region, are publications on LGBTI+ scientific research, or reports or plans on advancing LGBTI+ health equity.[93-109]

Conclusion

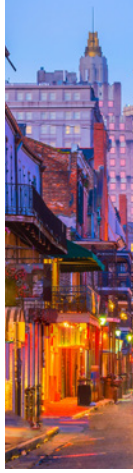
Overall, there were no areas in which key informants from the Americas provided average ratings that were better than the global average, and in several areas (e.g., housing, criminal justice, racial impact) they rated their local conditions worse. Therefore, despite the progress that has been made on LGBTI+ issues in the Americas in recent decades, the participants from these cities reported worse overall conditions than did their colleagues around the globe. Many of these challenges seem related to factors connecting LGBTI+ identities to other social justice issues, namely poverty and racism.

2.7
QUALITY OF LIFE SCORE
CITY

Select Cities

Kingston

"I would say nonprofit organizations in Jamaica are leading the way in providing services to LGBT+ people, such as free HIV/STI testing, HIV care/treatment, offering PrEP (especially [to those in] serodiscordant relationships), and psychosocial support for those that need it."



Key Informant, Kingston

Key informants in Kingston rated the quality of life for their LGBTI+ population at 2.7 on a 1 to 5 scale, well below the 3.2 global average. They also rated access to various types of care below global averages, although the difference was particularly stark with respect to mental health care (2.3 locally versus 2.8 globally) and gender-affirming care (2.3 locally versus 2.7 globally).

Every key informant noted that nonprofit organizations were doing the most to address inequities, while others needed to do more. LGBTI+ health "is mostly being addressed by nonprofit organizations and some clinical and service providers," said one key informant, "so these services [are] not adequate in relation to access and the quality of service." While the local government scored low on its interactions with the LGBTI+ community (1.5 on a 1 to 5 scale), the data assessment promisingly found numerous formal engagement mechanisms on LGBTI+ issues (such as an advisory group and inclusion in public reports), indicating that the basic infrastructure was in place for the government to work on these relationships.

Sexual orientation and gender identity-based discrimination were both rated equally in Kingston, with all but one key informant saying these were both "serious" problems. Notably, key informants pointed to widespread stigma and discrimination in different facets of life as impacting mental health, socioeconomic opportunity, and the willingness of LGBTI+ people to seek care.

One key informant called for more education "for the general population [and] especially healthcare workers for them to understand [the] LGBTI+ community, their gender identity/sexual orientation, etc. The community needs support — whether psychosocial or financial — to be sustainable in society."

3.3
QUALITY OF LIFE SCORE
CITY

New Orleans

Overall, key informants in New Orleans gave their city a quality of life score for LGBTI+ people (3.3) roughly equal to the global average (3.2). However, with respect to healthcare access, key informants rated the city considerable worse on access to HIV services (3.3 compared to 3.8 globally) and gender-affirming care (2.3 versus 2.7).

Across the board, key informants scored socioeconomic challenges in New Orleans as being more severe than the global average, although the difference was particularly striking with respect to access to sufficient and nutritious food. While only 13% of global key informants said food access for LGBTI+ people is a "serious" problem, 58% of key informants in New Orleans reported this challenge as being "serious," a stark reality for a city in one of the world's wealthiest nations.

Similarly, key informants rated their LGBTI+ community as having much more significant criminal justice issues than the global average. Eighty-three percent of key informants said that criminal justice disparities among LGBTI+ people of color is a "serious" challenge, compared to just 30% of key informants globally.

"There are areas of our city that are very accepting and LGBTI+ friendly and some LGBTI+ persons in New Orleans have robust support systems of family and friends," said one key informant, "but this is not universal."

Many key informants noted the importance of community organizations as a source of resiliency but said that more was needed. "Local governments, healthcare providers, nonprofit organizations, and the private sector should seek out the advocates that are making efforts and trying to get something done," said one key informant. Another recommended, in what was a common theme, "actually providing funding and resources to the organizations that can do this well" and "avoiding concentrating too much funding or resources in any particular organization."

"Housing discrimination and employment discrimination are pretty rampant... We have a lot of hard-working people that can never get their head fully above water."

Key Informant, New Orleans

3.2

QUALITY OF LIFE SCORE

CITY

Mexico City

"Mexico City defines itself as being LGBTI+ friendly, but in fact, it is far from being so."

Key Informant, Mexico City

"Those with low education background face a lot of challenges to get easy access to health facilities due to the complexity of bureaucratic processes... There are few options for the transgender community."

Key Informant, Mexico City

Overall, key informants in Mexico City gave LGBTI+ conditions in their community lower marks than did key informants globally. On access to care, they gave their city worse scores on the availability of primary LGBTI+ inclusive care (2.8 versus 3.1 globally, on a 1 to 5 scale), mental health care (2.7 versus 2.8 globally), and HIV care (3.3 versus 3.8 globally). However, they rated access to gender-affirming care as marginally better (2.8 versus 2.7 globally). The differences in scores were mostly minor deviations from the global averages, with the exception of HIV care, which is concerning given the high burden of HIV among LGBTI+ people.

On socioeconomic issues, key informants rated both employment and housing access as bigger problems than did their peers worldwide. The exception was on food access, for which one-third said it was "not a problem" compared to one-quarter of key informants globally, while no key informants in Mexico City said it was a "serious" problem compared to 13% who did so globally.

Discrimination on the basis of sexual orientation was rated as slightly more problematic in Mexico City than globally, and intersectional discrimination was rated equally. However, discrimination on the basis of gender identity and regarding HIV status was rated as more of a problem. Most criminal justice issues were also rated as more problematic in Mexico City than globally, with the exception of issues relating to sex work, which (while still deemed a problem by most key informants) were rated as less of a problem than they were worldwide.

One key informant reported "arbitrary cases of detention of people who get found 'cruising,'" or looking for other LGBTI+ people publicly. Another noted "greater police violence" facing the LGBTI+ community, including those who engage in sex work, compared to the general population.

When asked about resilience in the local community, key informants noted nonprofit organizations, bars, and informal social spaces as key areas of support, but they said more support was needed from the government. One key informant, who named bars and other venues as the current center of LGBTI+ community, called for "implementation of permanent campaigns [and] creation of community centers and kitchens that give priority attention to LGBTI+ people."

Asia-Pacific

3.6
QUALITY OF LIFE SCORE
REGIONAL

Five cities from the Asia-Pacific region were included in this study: Bangkok; Melbourne; Quezon City; Taipei; and Tokyo. Three of these — Bangkok, Melbourne, and Quezon City — were selected as examples for individual analyses, which follow this regional description.

While the number of cities in this region was smaller than that for the other regions, it is reflective of the fact that the Fast-Track Cities network in the region is relatively small, although expanding (i.e., Tokyo is a prospective Fast-Track City). The expansion of the Fast-Track Cities network in the region is important because Asia has experienced a surge in HIV rates, particularly among sexual minority men and transgender individuals, over the past several years.

Quality of Life and Care

Key informants in Asia-Pacific rated the quality of life for LGBTI+ individuals at a considerably higher rate than the global average, giving their cities a score of 3.6 on a 1 to 5 scale (mode: 4; SD: 0.91) compared to the worldwide average of 3.2. Tokyo received the lowest score of the cities included in the study, with an average rating of 2.2, while Quezon City received the highest score, with a rating of 4.0.

Access to all types of care were similarly rated better in Asia-Pacific than they were globally, though they followed the same trends as were observed worldwide, in which access to HIV-related care was rated best (4.2 on a 1 to 5 scale; mode: 5; SD: 0.99), followed by culturally competent primary care (3.6; mode: 4; SD: 0.91). Lowest-scoring types of care were gender-affirming care (3.1; mode: 3; SD: 1.30) and mental health care (3.3; mode: 4; SD: 1.20).

"LGBTI+ health disparities are addressed mainly by non-profit organizations working for LGBTI+ people," said a key informant in Tokyo who rated healthcare access there to be fairly poor. "Women, transgender people, racial and ethnic minorities, and people with disabilities" all face additional barriers to accessing care.

Health Outcomes

Data on HIV prevalence with respect to sexual and gender minority populations is the most detailed among the selected cities in Asia. Disaggregated data were complete among sexual minority men with the highest HIV prevalence reported in Bangkok (19.5%)[110] followed by Quezon City (8.8%),[111] Melbourne (4.9%),[112] Taipei (4.3%),[113] and Tokyo (3%).[114] Similarly, transgender women in Asia also are at considerable risk for HIV, with the highest estimated HIV prevalence seen in Bangkok (12%-13.5%).[115,116] In Melbourne, the limited data show an approximate HIV prevalence among transgender women of 4.5% and 2.5% among transgender men.[117] These groups experience higher rates of HIV in their communities due to varying social, demographic, and economic factors, including victimization, stigma, discrimination, and harassment, all of which leads to further socioeconomic marginalization and exacerbates disparities in HIV among these populations. The HIV rates experienced by LGBTI+ people, particularly sexual minority men and gender minority individuals, are concerning as HIV rates in the region have trended upward over the past decade.[118]

Despite effective treatments, lack of access to culturally competent and stigma-free health care for sexual and gender minorities in the cities in the Asia-Pacific region leads to higher STI rates. In addition, the high prevalence of STIs is facilitated by a sex industry fueled by tourism and

local consumption. Among the selected cities that had disaggregated data on the prevalence of chlamydia and gonorrhea among sexual minority men, the lowest rate was seen in Quezon City (0.7% and 3.5%, respectively)[119] and the highest in Bangkok, with chlamydia prevalence at 16% and urethral, rectal, and oropharyngeal gonorrhea, 34.7%, 29%, and 27.9%, respectively.[120] Syphilis infection among sexual minority men in the selected cities in Asia was also relatively elevated with the highest prevalence seen in Bangkok (24.4%)[121] and the lowest in Taipei (2.2%)[122] followed by Quezon City (2.1%).[123] Across selected cities in the Asia-Pacific region, there is a general lack of city-specific, population-level STI data for both transgender women and men. However, data from Bangkok show that a high prevalence of syphilis (3.2%), chlamydia (22.9%), and gonorrhea (14.3%) among transgender women.[124]

"It is difficult to be open as LGBTI+ and... live a normal, socially-acceptable life if sexual orientation is not disclosed."

Key Informant, Tokyo

Across the globe, substantial evidence has shown that sexual and gender minorities experience overall poorer mental health outcomes compared to their heterosexual counterparts or the general adult population. Although the governments within the selected cities in Asia have increased legislation and provided more accessible mental health services recently, there remains a general taboo and stigma around mental health, particularly within families and the community in which people live. Hence, people often do not seek treatment for fear of being ostracized; instead, they turn to either traditional family care alternatives or religious alternatives that maintain a sense of pride within one's immediate family. Overall, there was a lack of disaggregated data at the population level across cities. Rates of depression and anxiety among sexual and gender minority groups remain significantly higher due to a combination of discrimination, victimization, and internationalization of stigma, among other factors. Concerningly, transgender women in Bangkok have an estimated 58.2% prevalence of depression,[125] and in Melbourne, depression rates range from 21.3% among intersex individuals[126] to 57.2% among transgender women and men.[127] In terms of suicidality, among gay and bisexual men in Taipei, 31% reported experiencing suicide ideation or attempting suicide, including 14.6% who reported having attempted suicide at some point in their lifetime.[128] In Melbourne, 30.3% of LGBTI+ individuals reported a suicide attempt at some point in their lives, including 5.2% who reported this within the past year.[129]

Comparisons on drug and alcohol use were challenging because not every city had disaggregated data among sexual and gender minority groups at the population level and the way data were measured and reported varied in terms of quantity, frequency, and severity of use versus substance use disorder. Data that were available at the population level showed that 79.1% of transgender women and 75.1% of transgender men in Bangkok reported alcohol use in the past 12 months.[130] In terms of meeting diagnostic criteria for alcohol use disorder, the highest was seen in Quezon City with a prevalence of 24.7% among sexual minority men.[131] Data on alcohol consumption in Melbourne grouped sexual minorities, including lesbian, gay and bisexual individuals, indicating that 22% reported drinking that exceeds lifetime risk guidelines and 38% reported drinking that exceeds single-occasion risk guidelines.[132] Regarding other substance use, among transgender individuals in Bangkok, marijuana prevalence was the highest (12% compared to 5.5% among cisgender counterparts), followed by kratom (9%), amphetamine pills (3.0%), and crystal methamphetamine (2%).[133] Moreover, the prevalence of any substance use in Melbourne among lesbian, gay and bisexual individuals is 40%.[134]

Tobacco use is also highly prevalent among gender minorities in Bangkok, with 67% of transgender women and 56.9% of transgender men having smoked tobacco in the past 12 months;[135] in Melbourne, 16% of sexual minority individuals reported daily smoking.[136] Sexual minority women in Quezon City have a 24.3% prevalence of smoking, whereas among sexual minority men, there is a 71.3% prevalence of smoking.[137] Finally, in Melbourne, research shows that 39% of LGBTI+ individuals identify as having some form of a disability or chronic health condition.[138]

Socioeconomic Factors

Key informants in these cities rated socioeconomic concerns of employment, housing, and food access below the global averages. Access to employment was the biggest socioeconomic concern, of which only 8% said it was not a concern at all, but only 14% said it was a "serious" concern, with a majority of the latter being from Bangkok. The remaining 78% of key informants rated employment as a minor or moderate concern. Access to food was the lowest of these concerns, with 61% saying that was "not at all a problem" for their local LGBTI+ population; again, Bangkok was the city in which this which concern levels for this issue were highest. Overall, key informants in the Asia-Pacific region gave better ratings to the local response to these socioeconomic challenges than did key informants globally.

With respect to the assessments, there was a general lack of disaggregated population-level data among sexual and gender minorities with respect to the prevalence of unemployment, homelessness, poverty, and food insecurity. There exists little city-specific, but some country-level, population data on the prevalence of poverty among LGBTI+ individuals collectively, ranging from 9.9% in Bangkok to 12.6% in Melbourne and 16.6% in the Philippines. Regarding disaggregated population-level data on food insecurity, among LGBTI+ individuals, the prevalence of undernourishment ranged from 9.3% in Bangkok to 14.5% in the Philippines.[139]

"Many LGBTI+ people don't come out to others. Some LGBTI+ people are not accepted by their family. LGBTI+ teenagers don't get enough support in schools. Some LGBTI+ people are [unable] to find jobs."

Key Informant, Taipei

Discrimination

Overall, key informants in the Asia-Pacific region gave better scores on the problem of various types of discrimination than did the average key informant globally. However, unlike the global trend, HIV-based discrimination outranked intersectional discrimination as a concern in Asia-Pacific and roughly tied gender identity-based discrimination as a problem. Sixty-four percent of key informants said HIV-related discrimination was a "moderate" or "serious" problem, compared to 61% who said the same about gender identity-based discrimination, with fewer feeling the same about sexual orientation-based or intersectional discrimination. The relative strength of HIV discrimination as a concern should draw note as HIV advocates seek to address stigma as part of the global strategy to end the HIV pandemic.

In terms of the legal landscape explored in the assessments, neither same-sex marriage nor any other recognition of same-sex relationships are available in Bangkok, Quezon City, or Tokyo, while same-sex marriage is legal in Taipei and Melbourne.[140] Same-sex marriage has been legal in Taipei since 2019,[141] and Taipei enacts legal protection against discrimination based on sexual orientation and gender identity in education,[142] as well as protections against discrimination based on sexual orientation at work.[143,144] Bangkok enacted broad anti-discrimination laws covering sexual orientation and gender identity and as of 2019; a civil partnership is being discussed by the Thai government which, if passed, would grant same-sex couples several rights of marriage, including property and inheritance rights.[145] Additionally, Melbourne has enacted legal protections to support the LGBTI+ community from discrimination.[146] In 2003, Quezon City approved an ordinance banning discrimination against sexual minorities[147] and the Tokyo Metropolitan Government has passed legislation banning discrimination based on sexual orientation and gender identity in workspaces.[148] Universally, across the selected cities of the Asia-Pacific region, transgender people are allowed to access appropriate gender-based organizations and are able to change their gender marker on legal documents; however, some key informants made comments to the contrary, indicating ongoing challenges facing transgender people in navigating legal systems.

Criminal Justice

As with problems related to socioeconomics and discrimination, key informants in the Asia-Pacific cities rated as less serious issues relating to criminal justice, when compared to global averages. As was the case globally, the legality of sex work and treatment of sex workers is the criminal justice issue rated most severely. Fifty percent of key informants said that this issue represented a "serious" or "moderate" problem for the LGBTI+ community in their city, while 31% said it was

a “minor” problem and 19% said it was “not a problem.” The next highest-rated problem was the treatment of racial and ethnic LGBTI+ minorities by the criminal justice system, followed by mistreatment of LGBTI+ people by police, the criminalization of HIV, and finally, the targeting of LGBTI+ people by law enforcement, which most said was “not a problem.”

The assessments found that same-sex relations and identities were legal throughout the cities selected for the study in Asia-Pacific. Bangkok, Melbourne, Quezon City, and Tokyo all criminalize and attempt to modulate behaviors through HIV specific statutes and regulations which penalize people who choose to not to disclose their HIV status and hold others liable for transmitting HIV to their sexual partners.[149] Regarding the legality of transactional sex in the selected cities, all have laws prohibiting the practice of exchanging sex for money.[150] However, in Bangkok and Quezon City, sex work is somewhat tolerated among the society with minimal law enforcement and legal action against sex workers.[151] Furthermore, in Tokyo, the definition of “prostitution” is “intercourse with an unspecified person in exchange for payment,” and therefore fails to account for the sale of other sexual services which have become widespread and are considered legal.[152]

Community Resilience

In written comments, key informants presented as common sources of resilience the work being done by nonprofit organizations and the social networks of LGBTI+ people themselves, including families of choice. Other key informants mentioned LGBTI+ community events, greater visibility in recent years in the media, and support from friendly business and government leaders as sources of resilience.

In terms of supporting community resilience, all four sectors included in the survey — local government, providers, nonprofits and the private sector — fared better across the six Asia-Pacific cities than they did globally. However, while nonprofits still received the best marks, local government and the private sector more significantly outperformed the global averages. Nonprofits received a 4.1 score on a 1 to 5 scale (mode: 4; SD: 1.00) compared to a 3.9 globally; the private sector received a 3.5 (mode: 3; SD: 1.08) compared to 2.9 globally; and local government received a 3.4 (mode: 4; SD: 1.25) compared to 3 globally. In a change from the global trend, providers — who came in second worldwide in terms of how well they engage with the local LGBTI+ communities — came in last in the Asia-Pacific region, with a 3.3 score (mode: 4; SD: 1.16), although they were only modestly behind local government and the private sector.

Factors thought to support LGBTI+ resilience were found in all the selected cities in the Asia-Pacific region, including community spaces and resources (e.g., tourism association, pride events). Additionally, in all cities, public funding has been allocated for LGBTI+ specific service organizations. Similarly, LGBTI+ scientific research was available for all selected cities in this region, including reports or plans on advancing health equity in the local and wider community.

Conclusion

The cities in the Asia-Pacific region that were included in this study demonstrated a variety of strengths relative to the average city globally, including higher ratings for healthcare services and public engagement, and lower levels of concern around socioeconomic, discrimination, and criminal justice-related problems. Concerns regarding HIV-related discrimination rated relatively highly as community concerns, and providers scored relatively poorly in terms of their relationships with LGBTI+ communities. In addition, of all the problems included in the survey, only two — food access and targeting of LGBTI+ individuals by police — were rated as “not a problem” by a majority of key informants, indicating that a wide variety of challenges still exist for these communities.

Additionally, data assessments showed HIV disparities facing LGBTI+ individuals in the Asia-Pacific region that were of increasing concern, as well as other health inequities where data were available, such as with respect to substance use and mental health. Legal protections and policies recognizing LGBTI+ identities and relationships were also limited.

3.4
QUALITY OF LIFE SCORE
CITY

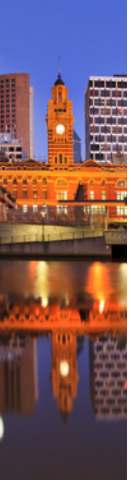
Select Cities

Bangkok

Overall, key informants in Bangkok gave their city a higher quality of life score than the global average, 3.4 on a 1 to 5 scale compared to 3.2 globally. However, on three out of four types of care, they rated their city well below the global averages; this was especially true regarding mental health care, in which a majority of key informants gave the lowest available score of 1, and the average was just 1.7, compared to a 2.8 worldwide.

However, with respect to gender-affirming care, key informants gave Bangkok a better score than the global average: 3.1 versus 2.7 globally. "Gender-affirming surgery is readily available in Bangkok," a physician and researcher said. "In fact, more transgender women undergo surgery in Bangkok than in any other city in the world. However, the procedure is not covered by insurance [and] gender-affirming hormone treatment is less available."

"Transgender health services are not included in any national health plan or coverage," said another key informant, who gave a low score to gender-affirming care access. "This left transgender people a massive barrier to access to proper healthcare."



While key informants in Bangkok scored housing and food access as much less of problems than they were rated for LGBTI+ people globally, they rated employment access as a more serious problem than their global peers, with all key informants saying this was either a "serious" or "moderate" problem. "Transgender people still face massive stigma and discrimination on employment, which leaves them with very limited employment options," said one key informant. "For these reasons, many of them are forced to engage in sex work." Indeed, both discrimination on the basis of gender identity and the treatment of sex workers were rated as much more problematic in Bangkok than they were worldwide.

Given the wide variety of challenges facing Bangkok's LGBTI+ community, but its nonetheless above average quality of life score, community resilience is likely key. Even more so than with the global trends, nonprofits were rated quite well in how they support local LGBTI+ individuals compared to other actors, and most key informants named community organizations and the community itself as sources of strength.

"There are few LGBTI+ specific services available in Thailand. Due to stigmatization and the fear of discrimination, most LGBTI+ people do not reveal their sexual orientation or behavior when accessing health services and therefore do not receive appropriate care or counselling when accessing HIV/STI screening and prevention services."

Key Informant, Bangkok

3.8

QUALITY OF LIFE SCORE

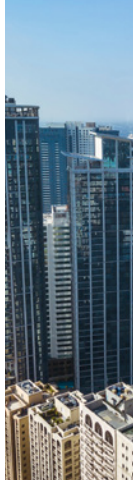
CITY

Melbourne

Key informants in Melbourne rated their city above average in terms of quality of life for LGBTI+ people, with a 3.8 on a 1 to 5 scale, compared to 3.2 worldwide. Similarly, they rated access to LGBTI+ inclusive primary care, mental health care, and HIV services better than the global averages. With respect to gender-affirming care, the city was rated slightly below the global average, with a 2.6 average and no informant scoring said care above a three.

Across the board on socioeconomic and criminal justice issues, key informants in Melbourne rated these as being lesser problems than did key informants worldwide. The one exception was on the problem of a disproportionate impact of the criminal justice system on LGBTI+ people of color, where Melbourne key informants scored their city the same as the global average.

Melbourne also scored better in relation to discrimination on the basis of sexual orientation and HIV status, as well as intersectional discrimination, although the city received the same "moderate" problem average score as did the rest of the world on the issue of gender identity-based discrimination.



Key informants in Melbourne gave strong marks to how local actors engage with LGBTI+ individuals, and the local government in particular scored much better than the global average, receiving a 4.2 on a 1 to 5 scale, compared to 3.0 globally. Additionally, unlike global responses, Melbourne's key informants singled out LGBTI+ community events (e.g., pride events, fundraisers, festivals) as a major source of resilience, while calling for increased institutional participation in such activities.

The situation for LGBTI+ people "has improved enormously over the last 20 years with consistent state government support, increasing policy initiatives," said a clinician and researcher. "We are the envy of all other states in Australia."

"There seems to be a strong and committed focus on LGBTI+ health and wellbeing in our state government that is reflected in high levels of consultation with LGBTI+ communities and the distribution of some funding to address critical issues. The nonprofits seem to be addressing the impacts of intersectionality within our LGBTI+ communities and are starting to focus on the issues impacting a broader cross section of the community beyond the traditional gay white male focus."

Key Informant, Melbourne

4.0
QUALITY OF LIFE SCORE
CITY

Quezon City

Overall, key informants in Quezon City rated LGBTI+ quality of life in their city at 4 on a 1 to 5 scale, better than the global 3.2 average. They also rated access to care above the global averages, and followed the same trend as did ratings worldwide, in which HIV care was rated best, followed by primary care, with gender-affirming care and mental health care lagging.

While services were better rated in Quezon City than elsewhere, and many of the challenges facing LGBTI+ people were rated as less problematic, most key informants noted the persistent stigma and discrimination facing the community. "Although it has lessened, discrimination and lack of information regarding LGBTI+ and everything about it still serve as the major problem in the city," said one key informant.

Some key informants noted that the challenges facing the LGBTI+ community are particularly pronounced in the poorest sections of the city, where opportunity in general is lower, access to services is more limited, and knowledge about LGBTI+ individuals is low.

In terms of building resilience, some key informants praised the work being done by nonprofit organizations and the city government, while others suggested initiatives be more grassroots-oriented and participatory. "In order for a policy to be effective, it should be participatory," said one key informant. "In other words, let the LGBTI+ people create the policy they need and make sure that it is implemented down to the smallest community."

"The LGBTI+ community has been working hard... to prove to others that they are also capable of doing the same things as everyone else, or even more."

Key Informant, Quezon City

3.3
QUALITY OF LIFE SCORE
REGIONAL

Europe

This study included 15 cities from across Europe: Amsterdam, Athens, Berlin, Brussels, Copenhagen, Dublin, Glasgow, Kyiv, Lisbon, London, Madrid, Milan, Paris, Prague, and Vienna. Three of these cities — Athens, Kyiv, and London — were selected to serve as examples with individual analyses following this regional description.

Even among the majority of these cities that are part of the European Union, the cities face a variety of legal and policy landscapes that underpin LGBTI+ issues, as well as diverse LGBTI+ community histories and cultural backdrops that inform LGBTI+ health equity in each.

Quality of Life and Care

Overall, key informants in Europe gave their cities an average quality of life score of 3.3 (mode: 4; SD: 0.85) on a 1 to 5 scale, just slightly above the global average of 3.2. A plurality of key informants (40%) gave their city a score of 4.

Regarding quality of care, key informants scored each facet of care roughly the same as their global counterparts. As was the trend globally, HIV care scored best, with a 3.8 on a 1 to 5 scale (mode: 4; SD: 1.04) followed by general care with a score of a 3 (mode: 3; SD: 1.03), mental health care with a score of 2.8 (mode: 2; SD: 1.01), and finally gender-affirming care with a score of 2.6 (mode: 2; SD: 1.13).

Many key informants noted the work of nonprofits as being key to addressing health inequities, and many noted the need for additional resources to build on what services do exist. “LGBTI+ health concerns are largely addressed through symbolic gestures (speeches, pamphlet launches), and rarely through commitment of substantial resources,” said an anthropologist and sexuality expert in Dublin. “Specialist clinics have been at capacity for years.”

Health Outcomes

Data on HIV prevalence with respect to sexual and gender minority populations is the most detailed assessment area among the selected cities in Europe. Disaggregated data were complete among sexual minority men, with the highest HIV prevalence in Amsterdam (19.9%), followed by Berlin (19.7%), Lisbon (17.6%), Copenhagen (17.1%), Paris (16.3%), Kyiv (15.3%), London (14.6%), Brussels (14.5%), Athens (14.2%), Madrid (14%), Milan (12.3%), Prague (10.9%), Vienna (10.1%), Dublin (8.4%), and Glasgow (4.4%).[153] Although much of Europe has access to cutting-edge HIV treatment options and preventative strategies, sexual and gender minorities experience higher rates of HIV despite comprising a small percentage of Europe's population. As noted in HIV prevention literature in European cities, discrimination on the basis of sexual orientation or gender identity including for employment, public accommodations, housing, or healthcare can lead to mental health problems, such as anxiety and depression, which can then contribute to behaviors that place individuals at risk for HIV acquisition. The potential real-life consequences of bias, victimization, and discrimination with respect to social, cultural, demographic, and economic factors modulate the spread of HIV and exacerbate disparities in HIV prevalence and treatment among these populations. Furthermore, social determinants related to discrimination and oppression, including institutional discrimination in healthcare access and treatment, as well as a shortage of healthcare providers who are culturally competent and knowledgeable in LGBTI+ health modulates higher rates of STDs among sexual and gender minority populations in the majority of the selected cities in Europe.

Chlamydia infection among sexual minority men is relatively high compared to heterosexual counterparts or the general adult population with the highest prevalence rate reported in London (29.6%), followed by Athens (26%), Paris (11.7%), Amsterdam (10%), Glasgow (7.1%), Copenhagen (6.4%), Berlin (3.8%), Madrid (3.7%), Vienna (3.5%), Lisbon (2.9%), Kyiv (1.9%), Milan (1.5%), and Prague (1.2%). Disaggregated data among the selected cities in Europe reveal the highest Gonorrhea prevalence in London (44.3%), followed by Athens (18.3%), Amsterdam (11.8%), Paris (10.8%), Glasgow (8.0%), Lisbon (7.8%), Brussels (6.8%), Copenhagen (6.9%), Madrid (6.1%), Berlin (4.3%), Vienna (4%), Prague (2.4%), Milan (2.3%), and Kyiv (1.9%). The highest syphilis prevalence was reported in Athens (37.9%), followed by Paris (13%), Milan (9.1%), London (8.54%), Berlin (8.1%), Prague (5.6%), Madrid (5.4%), Lisbon (5.3%), Brussels (7.3%), Copenhagen (3.1%), Glasgow (3.1%), Vienna (3%), Kyiv (2.4%), and Amsterdam (2.3%).[154]

Across the cities in Europe, evidence revealed that sexual and gender minorities experience higher rates of mental health issues when compared to the general population. Disaggregated data regarding anxiety are the most complete among sexual minority men, with the highest anxiety prevalence Dublin (41.7%), Kyiv (12.1%), London (10.7%), Athens (9.1%), Prague (9%), Copenhagen (7%), Lisbon (6.9%), Paris and Brussels (6.5%), Madrid (5.9%), Berlin and Amsterdam (5.1%), and Vienna (3.6%).[155] Strikingly, the prevalence of anxiety is 60% among lesbian, gay and bisexual individuals in Glasgow and 72% and 47% among transgender women and men in Glasgow and Milan, respectively.[156,157] Data regarding depression rates that were available at the population level reveal, on average, 46.8% of sexual and gender minorities in Dublin reported some level of depression.[158] Additionally, the prevalence of depression is 49% among sexual minority individuals and 72% among transgender people in Glasgow,[159] 52% among LGBTI+ individuals in London,[160] and 63.1% among transgender individuals in Milan.[161] With respect to suicide prevalence, 21.4% of all LGBTI+ participants in Dublin had ever seriously attempted suicide,[162] whereas 46% of transgender individuals and 31% of sexual minority individuals in London attempted suicide.[163] Finally, the highest prevalence of attempted suicide (51.7%) was seen among transgender individuals in Milan.[164]

There is an overall general lack of disaggregated population-level data among sexual and gender minorities with respect to diabetes and obesity. Glasgow registered on the high end of diabetes prevalence, which was at 2% among sexual minority individuals there,[165] while London had the highest prevalence of being overweight or obese, which was true of 44% of sexual minority men.[166]

"Despite efforts to combat discrimination and stigma, there are still a number of obstacles in accessing certain services (i.e., housing). In this sense, the Lisbon City Council created a plan that seeks to provide specific responses to the LGBTI+ community and to fight transphobia and homophobia, integrating vulnerable populations such as migrants, refugees, [and] people who use drugs."

Key Informant, Lisbon

"These disparities are largely overlooked. No data are being collected on citizen's sexual orientation or gender identity [and] community surveys are largely missing in this area. The city has so far not addressed these disparities because they have so far not developed an interest and a sense of care for citizens who are not heterosexuals."

Key Informant, Prague

Comparisons regarding alcohol and drug use across the selected cities in Europe were challenging because not every city has disaggregated data among sexual and gender minorities and the data that was measured and reported varies in terms of quantity, frequency, and severity of use versus a diagnosis of substance use disorder. Data that were available at the population level reveal that 35.4% of sexual minority men in Dublin report current smoking[167] and in Copenhagen, one in five LGBTI+ individuals smoke daily and one in four bisexual women smoke cannabis.[168] In Glasgow and London, 15% of LGBTI+ individuals report smoking every day,[169,170] whereas 43.1% of sexual minority men in Paris report using cigarettes or e-cigarettes daily.[171] Furthermore, 54.5% and 35% of sexual minority men in Paris[172] and Dublin,[173] respectively, have a prevalence of any current illicit substance use. Importantly, in terms of active use, 11% and 13% of LGBTI+ individuals aged 18 to 24 in Glasgow[174] and London,[175] respectively, report using drugs at least once a month. In terms of meeting diagnostic criteria for potential alcohol dependency, the highest was seen in Kyiv with a prevalence of 30.6% among sexual minority men, followed by Berlin (22.1%), Vienna (21.8%), Lisbon (14.8%), Madrid (14.9%), Prague (14.4%), Amsterdam (13.5%), Milan (10.8%), and Athens (10.1%).[176] In Copenhagen, 16.0% of gay men exceed the high-risk limit (21 units of alcohol per week) and 17% of transgender individuals drink more than 17.5 units per week.[177] Among LGBTI+ individuals in London[178] and Glasgow,[179] 16% and 14% reported daily drinking, respectively. Among sexual minority men in Dublin, 58% reported binge-drinking in the last twelve months,[180] whereas 46.7% of sexual minority men in Paris reported alcohol use (five or more drinks in one sitting).[181]

Finally, no population level data on the prevalence of disability was available with disaggregation by sexual or gender minority status.

Socioeconomic Factors

On two socioeconomic questions — access to employment and housing — European key informants were almost exactly in line with key informants globally. Four percent said that employment access was "not a problem" (compared to 5% worldwide), 28% said it was a "minor" problem (25% worldwide), 43% said it was a "moderate" problem (43% worldwide), and 26% said it was a "major" problem (27% worldwide). A similar trend held for access to housing, which was considered more of a challenge, with 38% finding it to be a serious problem (compared to 42% worldwide).

However, the European cities did perform better than the global average when it came to access to sufficient and nutritious food for LGBTI+ individuals. Here, a third of key informants (33%) said it was "not a problem" (compared to 24% globally) while only 4% said it was a "serious" problem (compared to 13% globally), with the rest rating it a "moderate" or "minor" problem.

With respect to the data assessments, there is a lack of disaggregated population-level data among sexual and gender minorities relating to the prevalence of homelessness and food insecurity. There exists some city-specific and country-level, population data on the prevalence of unemployment with the highest rates in Greece (15.9%)[182] followed by Italy (10.7%),[183] Madrid (10.3%),[184] Portugal (6.9%),[185] London (6.5%),[186] Ireland (5.8%),[187] Belgium (5.6%),[188] Copenhagen (5.3%),[189] Scotland (4.3%),[190] Germany and Netherlands (3.8%),[191] and Czech Republic (3.4%).[192] As far as disaggregated country-level population-level data on poverty rates, the highest rates exist in Greece (31.8%)[193] followed by Spain (20.7%), Italy (20.1%), Portugal (17.2%), Switzerland (16%), Belgium and Germany (15.8%), France (13.6%), Austria (13.3%), Ireland (13.1%), Denmark (12.5%), and Czech Republic (10.1%).[194]

Discrimination

Key informants for the European cities scored sexual orientation and gender identity-based discrimination as being slightly less of a problem in their communities than the global average. HIV-related discrimination scored equally problematic, while discrimination against people with multiple forms of marginalization (i.e., LGBTI+ racial and ethnic minorities) scored as a bigger problem than it did worldwide.

On sexual orientation-based discrimination, while 87% of key informants said that it was a problem, only 12% said that it was a "serious" problem, compared to 19% globally who said the same. Regarding gender identity-based discrimination, a larger 92% share felt that it was a problem, and a more significant 29% said it was a "serious" problem — but, again, this was better than the 33% who said it was a "serious" problem globally.

Intersectional discrimination was noted as a serious problem by 36% of key informants in Europe, almost identical to the 35% who said so globally. This is in keeping with the fact that 66% of key informants specifically named migrants, refugees, and/or asylees as individuals facing particular hardships when asked if any groups within the LGBTI+ population face inequities.

The assessments found that discrimination on the basis of sexual orientation and, to a lesser extent, gender identity was banned in most of the selected cities in Europe. For example, only Milan does not have a regional or national ban on gender identity-based discrimination in employment settings. Across all selected cities in Europe, same-sex relations are legal and, in most cities, recognized. However, same-sex marriage is still not available in four of the cities included from Europe: Athens, Kyiv, Milan, and Prague.[195] Across all selected cities in Europe, hate crimes are recognized and punishable by law. Universally, across the European Union, transgender people are allowed to access appropriate gender-based facilities and are able to change their gender marker on legal documents.

Criminal Justice

Key informants in Europe scored criminal justice issues as being less of a problem for LGBTI+ individuals than did the average key informant worldwide, specifically in the areas of mistreatment or targeting by police, criminalization of sex work and treatment of sex workers, and a disproportionate impact on racial and ethnic minorities. However, the European cities did not score better than the global average on criminal justice issues relating to HIV status and disclosure, instead rating that problem equally with their global peers.

While key informants rated criminal justice issues as slightly less problematic in Europe than elsewhere in the world, most still believed they were at least a "minor" a problem for their community. Seventy-five percent said that mistreatment by the police was a "minor," "moderate," or "serious" problem; 56% said that targeting of LGBTI+ people for arrests was a problem; 94% said criminalization of sex work and/or treatment of sex workers was a problem; 78% said that criminalization of HIV exposure and/or nondisclosure of status was a problem; and 81% said a disproportionate impact on LGBTI+ racial and ethnic minorities was a problem. This was consistent with the global trend in which issues relating to sex workers were deemed the most problematic.

66%

of key informants in Europe volunteered **"migrants," "asylees," or "refugees"** when asked if any LGBTI+ subgroups face particular hardship

AND

96%

said that **intersectional discrimination** was a problem in their city

Regarding the assessments, LGBTI+ identities and relationships are not criminalized in any of the European cities included in the report. With respect to the transmission and non-disclosure of HIV status to sexual partners, all European countries criminalize or control behaviors through HIV-specific statutes and regulations; however, in Amsterdam, only intentional HIV exposure or transmission are criminalized, making it one of the most advanced cities in the world when it comes to laws seeking to criminalize transmission and non-disclosure of HIV status to sexual partners. With respect to the legality of transactional sex in Europe, nine of the selected cities have laws making the practice of exchanging sex for money illegal, while Amsterdam, Athens, Berlin, Copenhagen, Brussels, and Vienna do not. However, in most of the latter group of cities, there are regulations in place surrounding activities such as operating brothels, receiving money from or facilitating exchanges of sex and money between other parties, and soliciting money in exchange for sex. In Dublin and Paris, it is illegal to pay for sex, but not to be a sex worker (the client commits a crime, but not the sex worker).

"Copenhagen isn't a paradise for LGBT+ people just because we offer LGBT+ people extensive rights; the culture needs to change."

Key Informant, Copenhagen

Community Resilience

As with other parts of the world, key informants in Europe were most likely to name community organizations and the community's internal strength as the two main source of resilience. Key informants in Europe were, however, more likely than those elsewhere to name local LGBTI+ bars, cafes, and social establishments as a source of community strength.

European key informants gave their cities slightly better scores than the global averages in terms of how local governments, nonprofit organizations, and the private sector engage with their community, while giving the same score to providers as did key informants worldwide. Still, the scores showed much room for improvement. As with the global trend, nonprofit organizations received the best score for their community engagement, with a 4.1 on a 1 to 5 scale (mode: 4; SD: 0.78). Local governments scored a 3.1 (mode: 4; SD: 1.19), as did providers (mode: 4; SD: 1.05), while the private sector was only slightly behind with a 3 (mode: 3; SD: 1.01).

In all of the selected cities of Europe, assessment factors thought to enhance and support LGBTI+ resilience are available, including community spaces and resources (e.g., tourism association, pride events) and allocated funding for LGBTI+ specific service organizations. In an effort to overcome intersecting dynamics of discrimination, societal harassment, and stigma, community-building models of social work practice help alleviate feelings of alienation and oppression by creating a family-like community based on empathy and relatability which promotes perseverance and adaptability in the face of adversities. Among the selected cities of Europe, Kyiv is the only city that does not have an LGBTI+ office or liaison and does not offer or promote publications on sexual and gender minority scientific research, which includes reports or plans on advancing health equity in the local and wider LGBTI+ community.[196-204]

Conclusion

Overall, Europe performed better than the global average in many areas of the assessment (e.g., having positive policies in place, having available community resources), as well as in the key informant surveys (e.g., discrimination, criminal justice, food access, relationships with local institutions). However, the key informants in European cities gave their local LGBTI+ quality of life only a slightly better score than the global average, with a 3.3 on a 1 to 5 scale compared to a 3.2 globally. Additionally, LGBTI+ inclusive health services were not rated much better than the global average. These results suggest that while LGBTI+ people in European Fast-Track Cities enjoy better policies, more visibility, and greater inclusion than the average LGBTI+ person worldwide, there is still much room for improvement, particularly with respect to health services. Additionally, the assessment results reveal missing data on LGBTI+ issues in Europe, despite the communities' relatively high visibility and political support.

2.8
QUALITY OF LIFE SCORE
CITY

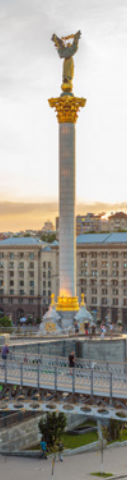
Select Cities

Athens

Key informants from Athens reported a quality-of-life score of 2.8 on a 1-to-5 scale — well below the global average of 3.2. Access to quality, inclusive types of care were also ranked more poorly than international averages, with access to gender-affirming care rated just 2.2 out of 5.

In a reverse of the global trend, key informants in Athens rated access to employment as an even bigger challenge than access to housing. Ninety-one percent of key informants said access to employment was a serious or moderate challenge, compared to 81% who said the same of housing.

Key informants in Athens were far more likely than their global counterparts to name all types of discrimination (based on sexual orientation, gender identity, HIV status, and intersectional factors) as being a "serious" problem for their community. While LGBTI+ Athenians enjoy strong nondiscrimination protections, a lack of other legal recognitions — such as same-sex marriage and adoption, as well as easier policies to change gender identity documents — may prevent the underlying stigma facing LGBTI+ people to be addressed.



"There is not gender-affirming care in my city and also no planning in doing so in the future. There is no education about healthy sex practices not only for the LGBTI+ people but also for cisgender/ heterosexual people. Most of the progress that has been made is due to the work of non-profit organizations but there is still a long way ahead."

Key Informant, Athens

"Same-sex marriage is not legalized (apart from civil unions). Adoption by same sex couples is still a taboo issue. Homophobia and transphobia are rampant in Greek society and often enforced by the Orthodox Church and right-wing politicians."

Key Informant, Athens

2.7

QUALITY OF LIFE SCORE

CITY

Kyiv

"In general, the basic human rights remain a non-achieved dream for LGBTI+ [people]: equality in marriage and child adoption; be yourself in public openly; to take your partner's hand, kiss, hug without fear of attack."

Key Informant, Kyiv

Kyiv was in the minority of European cities with respect to several legal and policy factors, including in that it does not yet have legal recognition of same-sex couples. There was also no evidence found when completing the city's assessment of a formal LGBTI+ advisory group or a public LGBTI+ equity report.

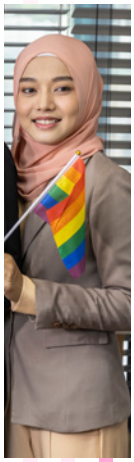
A small sample of key informants in Kyiv reported that progress had been made but was incomplete. "The situation has been changing for the better in recent years," said one key informant working in public health. "LGBTI+ representatives hold public events, the local authorities allow and protect them. Doctors and society as a whole have become tolerant of LGBTI+ people, although it should be noted that there are problems... I would like more participation of local governments in support of the LGBTI+ movement." Intolerance, violence, and stigma, especially from certain political and cultural groups, were also identified as challenges by key informants.

Additionally, HIV remains a major issue for LGBTI+ people in Kyiv, with 15.3% of sexual minority men self-reporting that they are living with HIV; the same survey also found that 12.6% of sexual minority men in the city had recently experienced severe anxiety or depression.[205,206] However, Kyiv has made progress on HIV issues since joining the Fast-Track Cities initiative: between 2015 and 2019, the number of people living with HIV who were on ART jumped from less than 50% to over 80%, and the percentage of those individuals who were virally suppressed reached 96% in 2018.[207,208]

3.4
QUALITY OF LIFE SCORE
CITY

London

London's key informants gave their city a higher LGBTI+ equality of life score than the global average, with a 3.4 on a 1 to 5 scale, compared to 3.2 worldwide. They also gave above-average marks on primary, mental health, and HIV related care; for example, every key informant gave their city a four or five score on the availability of affordable, quality HIV services. On the other hand, key informants rated their city's availability of gender-affirming care at slightly below the global average, with a majority of key informants giving such care a score of a two.



Key informants in London identified problems facing LGBTI+ racial and ethnic minorities. Disparate impact on this particular population by the criminal justice system was considered the most problematic of criminal justice issues on which they were surveyed, and intersectional discrimination was rated the most problematic form of discrimination, with all key informants saying it was a "moderate" or "serious" challenge. In contrast, just one key informant said that discrimination facing sexual minorities in general was a "moderate" or "serious" problem in the city.

Local government, providers, and nonprofits all scored above the global average for their work on engaging the community, while the private sector scored slightly worse than the global average. The assessment conducted for London also found a wide array of public supports thought to build community resilience, and the city has a favorable policy landscape, including nondiscrimination protections and same-sex marriage.

Still, several key informants called for engagement with a wider and more diverse segment of the LGBTI+ population. "Representation is not enough," said one key informant. "It needs to be supported by an evidenced, long-term commitment to challenging issues of poverty that have the biggest impact on all aspects of health and wellbeing."

"Regrettably, LGBTQIA+ health is overly pathologized — looking for things to 'fix' rather than taking a more holistic approach to overall health and wellbeing. However, considering the austere environment to funding and resource allocation, this is not surprising."

Key Informant, London

"Disruptions in education, employment, and housing are common issues, particularly for transgender people and migrants."

Key Informant, London

Recommendations

Overcoming LGBTI+ Health Equity Barriers

Based on the findings of this report, the following recommendations are being issued to advance LGBTI+ health equity in Fast-Track Cities and beyond. The overarching and cross-cutting recommendations include principles that are broadly applicable to a variety of actors who impact LGBTI+ health equity. These are followed by specific recommendations for local governments, providers and health systems, community-based organizations, national governments, and international actors.

OVERARCHING & CROSS-CUTTING

1. **PRIORITIZE THE ELIMINATION OF INEQUITIES WITHIN LGBTI+ COMMUNITIES.** The results of this report demonstrate that, while each local context is different, inequities are present *within* LGBTI+ communities around the world. These inequities affect racial and ethnic minorities, gender minorities, women, and other groups. LGBTI+ health equity cannot be addressed without identifying, engaging with, and prioritizing these disparately impacted subpopulations.

2. **ADDRESS UNDERLYING SOCIOECONOMIC FACTORS.** While data on social determinants of health rarely included disaggregated data on LGBTI+ populations, key informants shared many concerns with respect to access to employment, housing, and food. These issues are all key to achieving health equity and can be addressed through nondiscrimination laws, which were lacking or incomplete in most cities, as well as socioeconomic development policies and programs designed for LGBTI+ populations, such as enhancing inclusive labor policies and educational environments and providing LGBTI+ specific employment opportunities and academic scholarships.

3. **IMPROVE INCLUSIVE DATA COLLECTION.** Even in cities that were relatively highly resourced and LGBTI+ inclusive, data regarding LGBTI+ health equity were lacking, especially outside of the topic of HIV (such as with respect to noncommunicable diseases). Additionally, data on social determinants of health were lacking in most places. Surveillance systems and research must include sexual orientation and gender identity questions to fully define and understand the needs of these populations. For surveillance systems to effectively do so, LGBTI+ individuals must feel safe and comfortable in self-identifying as LGBTI+.

4. **ADDRESS CRIMINAL JUSTICE DISPARITIES.** While only a few cities were in countries that outright discriminate against LGBTI+ people through laws criminalizing same-sex relationships, many criminalized sex work and/or HIV exposure, which likely have a disparate impact on LGBTI+ populations. Additionally, key informants indicated an overall discriminatory impact of criminal justice systems, especially for LGBTI+ racial and ethnic minorities. Both criminal law and the practices of the criminal justice system must be reformed to protect and strengthen LGBTI+ civil rights and to ensure that LGBTI+ people can safely live their lives, enjoy socioeconomic opportunities, and access health services.

5. **ENSURE NONDISCRIMINATION.** Data assessments revealed that few jurisdictions had comprehensive nondiscrimination protections in place that guaranteed equitable access

to health services and insurance benefits, especially for transgender individuals, as well as to socioeconomic opportunities such as employment and housing. Furthermore, key informants indicated that access to these services and opportunities was limited and that discrimination was common. Nondiscrimination laws with proper enforcement are the first step on the path to full social inclusion.

6. **ENGAGE COMMUNITIES AT ALL LEVELS.** Key informants indicated that while nonprofits did relatively well at engaging with local LGBTI+ communities, far more work was needed with respect to healthcare providers, government entities, and the private sector. Assessments revealed that many local governments in Europe and the Americas had local LGBTI+ advisory groups and some funding for LGBTI+ organizations or events, but fewer cities had formal LGBTI+ liaisons, offices, or public reports on advancing equity. LGBTI+ communities in Africa and, to a lesser extent, Asia-Pacific were particularly in need of such formal support and engagement. While local responses to housing, food, and employment issues all left much room for improvement according to key informants, responses to the issue of housing were particularly rated as low, suggesting this could be an important area to increase engagement.

7. **RECOGNIZE GENDER MINORITIES AND THEIR HEALTH NEEDS.** Gender minorities in many cities lacked even a basic recognition of their gender identity, with many not having access to identity documents that reflect their name and gender or being able to access gender-based facilities that correspond with their identities. Transgender people also did not have equal access under the law to gender-affirming care in many jurisdictions, and actual access in practice was a need indicated across regions by key informants. This basic legal recognition and access to gender-affirming care is essential for meeting all other health equity goals among gender minority populations.

8. **IMPROVE HEALTH SYSTEMS.** Access to culturally competent care was noted as a significant need among key informants, with mental health and gender-affirming care options said to be particularly lacking. Cultural competency education should be encouraged or mandated to improve health systems' basic ability to respond to LGBTI+ health needs. Without such improvements, health systems themselves will be a barrier to rather than a partner in ending LGBTI+ health inequities.

9. **FOSTER MULTILATERAL COLLABORATION.** Advancing LGBTI+ health equity in cities around the world will require innovative collaboration between local, national, and international actors, including governments, nonprofits, and the private sector. The Fast-Track Cities network is an example of city multilateralism, in which cities augment traditional health diplomacy and engage with other cities as well as national and international actors to advance shared goals. This dynamic is especially important given the shared dependence between national governments (which set relevant laws, issue funding, and collect data) and local governments (which are more closely connected to communities and lead public health responses).

10. **SUPPORT HIV SERVICE PROVIDERS AS LGBTI+ CARE LEADERS.** Globally, access to low-cost, low-barrier HIV services was rated higher than other types of healthcare services. Those working in the field of HIV can help foster connections to other types of care, build trusted networks, and train other providers on engaging with LGBTI+ communities.

CITY AND MUNICIPAL GOVERNMENTS

Cities and municipal governments around the world have been leaders in advancing LGBTI+ equity and must continue to lead the way. In addition to offering the overarching recommendations above, this report is making the following recommendations specifically to city and municipal governments:

1. **ENACT LOCAL NONDISCRIMINATION ORDINANCES OR POLICIES.** While national nondiscrimination laws or constitutional provisions often offer the strongest protection for LGBTI+ individuals, local ordinances or policies could fill in many of the gaps identified in this report. Such actions, even if relatively limited, can also send a symbolic message of inclusion, make local LGBTI+ communities feel seen, and open a larger dialogue.

2. **ESTABLISH FORMAL COLLABORATIONS WITH LOCAL STAKEHOLDERS.** Many cities in Europe and the Americas, and a few cities in Asia-Pacific and Africa, have established formal collaborations with local stakeholders, such as LGBTI+ advisory groups, liaisons, or public plans, as well as funding for LGBTI+ organizations and events. This type of collaboration is an of what cities can often do better than countries, given their proximity and close ties to local populations. This is also an area in which local governments can generally act unilaterally, without the need for national policy changes or support.

3. **SUPPORT AND IMPLEMENT LGBTI+ SPECIFIC RESEARCH.** This report revealed a dearth of data that can be disaggregated based on sexual orientation and gender identity. While much of the relevant data is collected primarily at the regional or national levels, local governments gather data or support research that could be invaluable in informing local LGBTI+ health needs; this includes advancing comprehension of current health inequities and learning how to better implement policy and funding solutions. While this type of research can be challenging — especially when data collection follows national guidance or templates — increasing data whenever possible is a worthwhile step in the right direction. Local governments should avoid seeing the relative newness and scarcity of sexual orientation and gender identity questions as a reason for inaction.

4. **PROMOTE COMPREHENSIVE LGBTI+ CULTURAL COMPETENCY TRAINING.** Local governments can provide LGBTI+ cultural competency trainings to their staffs, as well as offer (and in some cases require) such training of local contractors and grantees. Regardless of how advanced LGBTI+ rights are in a given jurisdiction, training is important because it helps bring about the cultural change that is equally as important as legal change. Training of public-facing staff and contractors helps ensure that interactions with LGBTI+ individuals are respectful and inclusive, while training of staff such as administrators and managers can ensure that LGBTI+ populations are properly considered when policy and funding decisions are made.

5. **ADVOCATE FOR NATIONAL AND GLOBAL CHANGE.** The Fast-Track Cities initiative has proven that city governments can successfully engage in multilateralism and advance health goals through advocacy with national governments as well as through engaging with other cities and international actors. While cities may not always have the direct authority to act on all of the overarching recommendations noted above, they can be powerful forces in advancing change at home and abroad. This can be accomplished through direct advocacy as well as by serving as an incubator for change and providing an example of positive policies and strategies that can be more broadly applied.

PROVIDERS AND HEALTH SYSTEMS

Providers and health systems have an important role to play in addressing LGBTI+ health equity, both through the services that they provide to patients and the role they can play in advocating for systemic change. Following are recommendations for providers and health systems to take to strengthen local LGBTI+ health equity:

1. **IMPLEMENT NONDISCRIMINATION POLICIES.** Even in settings that do not have local or national nondiscrimination laws applying to LGBTI+ individuals, providers and actors within health systems can often add these to their practices. This type of policy — as well as other actions, such as LGBTI+ inclusive messaging and imagery in medical offices — sends the message that it is a safe and welcoming place for LGBTI+ populations. Where outward support of LGBTI+ patients is not legally permissible, general nondiscrimination and inclusion policies could be effective.

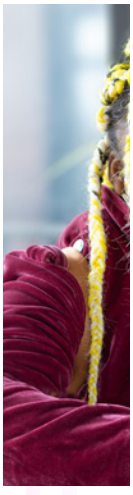
2. **CONDUCT LGBTI+ HEALTH EQUITY TRAINING.** Key informants indicated a dearth of LGBTI+ competent healthcare providers, particularly in the areas of mental health and gender-affirming care. Healthcare providers have an ethical responsibility to educate themselves about the needs of vulnerable populations. While systemic changes, such as the inclusion of LGBTI+ issues in health education curricula and licensing requirements, are needed, systems and providers can also take individual action, including through free or low-cost resources available online.

3. **COLLECT SOGI DATA.** The data assessments for this report demonstrated major gaps in knowledge on LGBTI+ health issues, particularly at the local level. Healthcare settings collect a wide range of data that could be invaluable to better understand and address LGBTI+ health equity, were it possible to disaggregate such data based on sexual orientation and gender identity. Collecting such data (when the local context is one in which it is safe to do so) also sends a welcoming and inclusive message to LGBTI+ patients and can serve as a catalyst for healthcare staff to learn more about LGBTI+ communities and their needs.

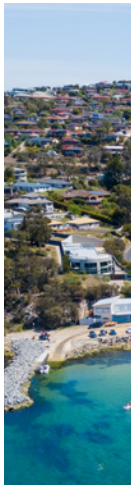
4. **CREATE A LOCAL REFERRAL NETWORK.** Social determinants of health for LGBTI+ people are equally important to healthcare access in addressing inequities. Providers and health systems can play a crucial role in helping to connect LGBTI+ patients to culturally competent legal, housing, employment, food, and other services. These referral networks also ensure the reverse — that LGBTI+ individuals seeking services from community resources are connected to LGBTI+ inclusive care. Participation in community events and developing medical-legal partnerships are other methods of developing connections to LGBTI+ serving organizations.

5. **ADVOCATE FOR CHANGE.** Policymakers should and often do take seriously the expert opinion of local healthcare entities and professionals. Individual providers can take action at the local level by advocating with decision-making bodies (i.e., submitting oral or written testimony at relevant proceedings), communicating with the public (i.e., writing an opinion piece on relevant policies), or advocating for change within their own clinic or hospital. Healthcare organizations can play a similar role, especially as many already engage regularly with local decision-makers. The healthcare sector can help bring a science-driven, evidence-based perspective to LGBTI+ issues that are often clouded by stigma and are over politicized.

COMMUNITY-BASED ORGANIZATIONS



Community-based organizations are key to the resilience of local LGBTI+ populations and must continue to expand their work on behalf of these communities in the pursuit of health equity. Following are recommendations for an enhanced role for community-based organizations to promote LGBTI+ health equity:



1. **LEAD THE WAY ON LGBTI+ ENGAGEMENT.** Key informants indicated that community-based organizations outperformed local government, providers, and the private sector in respectfully engaging local LGBTI+ communities. Community-based organizations should continue to play this vital role and use their strong connections to LGBTI+ individuals to lift up their voices and concerns among other stakeholders.

2. **PRIORITIZE LGBTI+ PEOPLE WITH MULTIPLE FORMS OF MARGINALIZATION.** This report indicates higher levels of unmet needs among subpopulations such as gender minorities and LGBTI+ racial and ethnic minorities. Given the critical role that community-based organizations play in supporting LGBTI+ communities, it is critical that they prioritize these disparately impacted groups, who historically have been left behind by many mainstream LGBTI+ serving organizations. Building connections with organizations that serve these populations could be a successful and mutually beneficial strategy.

3. **BUILD MULTISECTORAL PARTNERSHIPS.** As trusted gatekeepers among LGBTI+ populations, community-based organizations can serve a powerful role in connecting LGBTI+ people to other services. This report demonstrates that LGBTI+ health equity requires increased attention to issues such as housing, employment, criminal justice, and more, in addition to traditional health services. Local organizations can build LGBTI+ inclusive referral networks to help LGBTI+ people connect with the wide scope of services they may need in order to advance their wellbeing.

4. **EMPOWER COMMUNITIES TO ACT.** Community-based organizations can play a vital role in helping local LGBTI+ people advance justice, both within the LGBTI+ population (i.e., working to address racism or transphobia within the LGBTI+ community itself) and externally in their city, country, and beyond (i.e., providing community members with advocacy tools).

NATIONAL GOVERNMENTS

While this report focuses on LGBTI+ health equity in Fast-Track Cities, national governments play a critical and at times determinative role in addressing LGBTI+ health equity issues. Following are recommendations for the role that national governments can play in supporting cities and municipalities to achieve LGBTI+ health equity:

1. **ADOPT NATIONAL NONDISCRIMINATION LAWS.** The strongest protections against LGBTI+ discrimination — be it in healthcare access, employment, housing, or other areas — are generally national. Cities often have limited power to ban LGBTI+ discrimination and ensure inclusion through local ordinances and policies, placing the responsibility on national governments to ensure these critical measures come into effect. National governments should, at a minimum, not prohibit local governments from enacting their own nondiscrimination measures.

2. **IMPLEMENT INCLUSIVE DATA COLLECTION STANDARDS.** Even when data are being collected at subnational levels, said collection is often done in connection with national rules, standards, and guidelines. National governments should ensure that their own data collection is inclusive of sexual orientation and gender identity measures, and should also promote standardized, inclusive data collection by local governments, nongovernmental entities, and other relevant stakeholders.

3. **FUND LOCAL LGBTI+ SERVICES.** A great deal of funding for local health and other essential services is derived from national governments. Funding should be prioritized for organizations that explicitly serve local LGBTI+ populations and especially priority subpopulations (e.g., gender minorities, LGBTI+ racial and ethnic minorities). National governments can also require grantees to adhere to LGBTI+ nondiscrimination and inclusion policies.

4. **ENGAGE IN LGBTI+ HEALTH EQUITY DIPLOMACY.** National governments can use relationships with public and private entities to advance LGBTI+ health equity on the world stage. This engagement should be conducted in partnership with cities, which are often leaders in LGBTI+ issues, by supporting city multinationalism on issues relating to LGBTI+ health.

INTERNATIONAL ACTORS

International actors — including intergovernmental organizations, donors, and private entities — can all play a supportive role in advancing LGBTI+ health equity. Following are recommendations for the ways in which international actors can collaborate with cities to advance LGBTI+ health equity:

1. **SUPPORT RESEARCH AND PROGRAMMING RELATING TO LGBTI+ EQUITY.** Particularly when governmental entities fail to support LGBTI+ equity, either due to opposition to LGBTI+ rights or because of resource constraints, international actors have a responsibility to consider LGBTI+ populations in their work. International actors can help cities to better understand their local LGBTI+ communities and can support services for these individuals. Similar to the role of national governments, international entities can fund city-specific work to advance LGBTI+ equity and encourage or require nondiscrimination and inclusion among local partners and grantees.

2. **ADDRESS LGBTI+ HEALTH HOLISTICALLY.** International actors should avoid contributing to siloed responses that narrowly address LGBTI+ health issues. This report makes clear that social determinants of health, including socioeconomic opportunity, are critical to addressing LGBTI+ health and other inequities. Significant social change is needed to reject aspects of the status quo that have imbedded stigma and inequality into health and other systems.

3. **BUILD COLLABORATIVE NETWORKS.** The Fast-Track Cities initiative is an example of international nonprofits and intergovernmental organizations uniting with local partners to engage in innovative collaboration with respect to HIV. A similar model can be used to build novel partnerships to address LGBTI+ issues. Local actors could use such networks to access global support and solidarity, which is especially useful when local or national political climates hamper efforts to advance LGBTI+ health equity.

4. **LISTEN LOCALLY.** LGBTI+ communities are diverse, and as this report demonstrates, so are their strengths and needs. The issues facing one community or region should not be interpreted as representing the priorities of all LGBTI+ communities. All institutions working to effect change globally would benefit from letting people on the ground take the lead on LGBTI+ issues, including those related to health.

Conclusion

An Urgent Call to Action

This study demonstrates a dire need to improve the health and wellbeing of LGBTI+ people around the world — from cities in which LGBTI+ communities are visible and enjoy strong political support, to cities in which LGBTI+ identities are ignored or even punished. Data assessments of the 50 cities that were selected for this study reveal both significant disparities where data does exist, as well as many areas in which population-wide data are severely lacking. A survey of 275 key informants across the 50 cities further demonstrated that access to health and socioeconomic resources is limited, even in affluent cities, and that stigma and discrimination is relentlessly pervasive. Furthermore, both the assessments and the key informant surveys showed that meaningful engagement with LGBTI+ communities was limited, especially outside of community-based organizations.

There was a high degree of variability on the severity of challenges and the quality of services and institutional relationships relevant to LGBTI+ health, both across and within regions. The cities in the Asia-Pacific region scored best overall; the cities selected from Africa scored worst, on average; and the cities from the Americas and Europe fell in between. Within each region, cities with better policies on LGBTI+ issues tended to score better. Nonetheless, there was overall a great deal of consistency in how different challenges were ranked. For example, gender identity-related discrimination was rated as a more significant problem than sexual orientation-related discrimination nearly universally, and gender-affirming care was similarly rated as less available than general LGBTI+ inclusive care. Additionally, while the severity of the problems varied, most key informants said that access to housing and employment was a challenge for their local LGBTI+ population regardless of the overall socioeconomic strength of their city. In sum, the results of the study showed that LGBTI+ issues do indeed vary locally, but also that LGBTI+ populations around the world — even in “LGBTI+ friendly” cities with vast resources — face myriad challenges with respect to equity.

The recommendations made in this report call for broad changes to local and national laws and policies, improved data collection, increased LGBTI+ health training, and more robust community engagement. However, underlying these recommendations is a need for social transformation that holistically addresses topics such as equity and stigma, and that sees topics such as socioeconomic opportunity and criminal justice as being integral to improved health and well-being. Moreover, these recommendations cannot be meaningfully accomplished and, in fact, could serve to exacerbate inequities — if the most marginalized subpopulations within LGBTI+ communities are not prioritized. These populations include transgender and other gender minority individuals, racial and ethnic minorities, and people who face multiple forms of marginalization and social isolation.

Most of all, if health equity is to be achieved, stakeholders must leverage the profound resilience that LGBTI+ communities from around the world have consistently demonstrated. Despite the health inequities they face on a day-to-day basis, LGBTI+ people are not victims. They are community activists, essential workers, healthcare providers, artists, scientists, family members, neighbors, and much more. Undoubtedly, LGBTI+ people are the most powerful resource in undoing the inequalities that they themselves face. But that aspiration can be realized much sooner, and many lives can be saved, if more of the myriad actors with the power to change systems join in the march towards equity.

Survey outreach and translation was assisted by Bertrand Audoin, MBA (IAPAC, Paris, France); Justin Hill (IAPAC, Chicago, IL, USA); Gonçalo Lobo (IAPAC, Lisbon, Portugal); Yolanda Manuel, MD, MPH (IAPAC, Maputo, Mozambique); Imane Sidibé, MSc (IAPAC, Bamako, Mali); and Jessica Tiah-Mullen (IAPAC, Canberra, Australia). Editorial support was provided by Sindhu Ravishankar, MPhil (IAPAC, Washington, DC, USA) and Jienna Foster (Consultant, Geneva, Switzerland). Administrative support was provided by Zak Binshaieg, MA, and Payton Oliver-Smith (both IAPAC, Washington, DC, USA). Graphic design support was provided by DOSSU Design + Consulting LLC.

The authors wish to thank the Fast-Track Cities network, whose support with respect to disseminating the key informant survey was critical to the successful launch of this report. The authors also express their gratitude to the 275 key informants whose perspectives from their respective cities provided a snapshot of the current LGBTI+ health equity landscape and informed this report's recommendations.

Transgender People

WHAT DOES ASSIGNED FEMALE AT BIRTH MEAN?

Assigned female at birth (AFAB) is a term that is used for people who have external sex traits that are identified at birth as female. It is used as a way to refer to the sex on one's birth certificate or to discuss medical issues that primarily face AFAB people without making assumptions about current sex, body, or gender identity. AFAB people are typically raised with the assumption that they will identify as women, however AFAB people can be any gender and can have any gender presentation. The term AFAB is an umbrella term to describe the following people:

- Cisgender women (AFAB and identify as women)
- Transgender men (AFAB and identify as men)
- Non-binary and genderqueer people (AFAB and identify as something other than women)

Growing research on transgender men (transmen) and non-binary/genderqueer AFAB people shows increased HIV risk and burden, although not much is known about these transgender populations. Read more about HIV among cisgender women and girls.

WHAT DOES ASSIGNED MALE AT BIRTH MEAN?

Assigned male at birth (AMAB) is a term that is used for people who have external sex traits that are identified at birth as male. It is used as a way to refer to the sex on one's birth certificate or to discuss medical issues that primarily face AMAB people without making assumptions about current sex, body, or gender identity. AMAB people are typically raised with the assumption that they will identify as men, however AMAB people can be any gender and can have any gender presentation. The term AMAB is an umbrella term to describe the following people:

- Cisgender men (AMAB and identify as men)
- Transgender women (AMAB and identify as women)
- Non-binary and genderqueer people (AMAB and identify as something other than men)

Most of the information below refers to transgender women because there is a glaring lack of research and knowledge about vulnerability to HIV among all other transgender people. Read more about HIV among cisgender men who have sex with men (MSM).

ADDITIONAL TERMINOLOGY

Transgender: A person whose gender identity is different from their sex assigned at birth.

Cisgender: A person whose sex assigned at birth is the same as their gender identity.

Gender expression: A person's outward presentation of their gender (for example, how they act or dress).

Gender identity: A person's internal understanding of their own gender.

HOW SERIOUS IS HIV FOR TRANSGENDER PEOPLE?

There are an estimated 25 million transgender people living around the world. The existing data specific to transgender people demonstrate a heavy burden of HIV among transgender women, specifically transgender women who have sex with cisgender men. Transgender women are one of the groups most affected by HIV and are 49 times more likely to have HIV than the general population. Globally, it is estimated that around 19% of transgender women have HIV. HIV among transgender women sex workers is estimated to be 27%, compared with 15% among transgender women who did not engage in sex work.

In the U.S., nearly 1 million people identify as transgender. According to the Centers for Disease Control and Prevention (CDC), transgender people made up 2% of new HIV diagnoses in 2018 and 2,351 transgender people were diagnosed with HIV from 2009-2014. Of these, 84% were transgender women, 15% were transgender men, and 1% had another gender identity. Black/African American transgender women and young transgender women had the highest rates. About 42% of transgender women in the U.S. have HIV. Racial and ethnic disparities are quite stark among transgender women in the U.S.:

- 62% of Black/African American transgender women have HIV
- 35% of Latina/Hispanic transgender women have HIV
- 17% of White transgender women have HIV

WHY ARE TRANSGENDER PEOPLE PARTICULARLY AT RISK FOR HIV?

There are many factors that put transgender people at heightened risk of HIV. The following factors contribute to the global burden of HIV among transgender people:

Social, economic, and legal exclusion: Across the world transgender and gender-nonconforming people face stigma and discrimination, which contributes to higher levels of unemployment, poverty, homelessness, sex work, depression and other mental health issues, substance use, incarceration, and violence, all of which are linked to higher rates of HIV. Most transgender people have experienced some form of abuse or harassment because of their gender identity or presentation. This may negatively impact accessing HIV testing, care, and/or getting treatment for HIV.

Overlapping social, cultural, legal, and economic factors contribute to pushing transgender people to society's margins. Transgender people are more likely to drop out of school, be rejected from family and friends, and face workplace discrimination, limiting educational and economic opportunities. They can encounter problems accessing basic goods and services and even public spaces. These challenges are exacerbated by a lack of legal recognition of their gender and the absence of anti-discrimination laws that explicitly include them.

Data from the recently released *Trans Legal Mapping Report* showed the following about transgender people around the world:

- 13 countries have explicit laws specifically criminalizing transgender people, mostly using cross-dressing laws, punishing them with prison, corporal punishment and, where anti-gay laws are also used against trans people, even death

- 37 countries have de facto laws laws criminalizing transgender people (de facto refers to something that exists in practice but is not necessarily ordered by law or officially established)
- 47 countries prohibit transgender people from changing their gender legally

Racism and discrimination increase HIV risk-related behaviors and lead to health disparities in HIV, particularly among transgender women of color. Intersections of race, gender, and age contribute to disparities in HIV testing, prevention, treatment, and viral suppression. Issues associated with racism and discrimination—including limited access to health care, employment, and housing—can increase the risk for HIV and affect the health and well-being of transgender people.

In addition, many transgender people have had negative experiences with healthcare providers, which discourages them from seeking care. Finding providers who are knowledgeable about and sensitive toward transgender and gender-nonconforming people can be challenging. Transgender people may not have access to HIV prevention information that uses appropriate language to describe their body parts and how they have sex, and few HIV services are tailored to this population.

Sex work: Social exclusion, economic vulnerability, and lack of employment opportunities means that sex work is often the only form of income available to transgender people. The proportion of transgender people who engage in survival sex work is estimated to be up to 90% in India, 84% in Malaysia, 81% in Indonesia, 47% in El Salvador, and 36% in Cambodia.

Data suggests that HIV prevalence is up to 9 times higher for transgender sex workers compared to cisgender sex workers. Knowledge and reported use of condoms is generally low among transgender sex workers. In Asia and the Pacific, only 50% of transgender sex workers are aware of HIV and HIV testing, and only 50% report using condoms consistently with clients and casual partners. Sex workers may get paid more for unprotected sex and often feel pressured to not use condoms, which makes them highly vulnerable to HIV. Read more about HIV among sex workers.

High-risk sex: There are high rates of unprotected anal sex among transgender women. Receptive anal intercourse carries the highest risk because the lining of the rectum is very thin and can be damaged very easily during sexual activity. This makes it easier for HIV to enter the body. Stigma and discrimination, leading to low self-esteem and disempowerment, can make it harder for transgender women to insist on condom use. In many settings, condom use is often controlled by the insertive sexual partner, so many transgender women who have sex with cisgender men may feel unable to negotiate condom use. Gender affirming hormonal therapy (GAHT), which many transgender women use, can lead to erectile dysfunction, increasing the likelihood of taking the receptive role during sex.

There are other factors that make transgender people more likely to engage in high-risk sex. Some transgender people who want to affirm their gender identity through sex, or who fear rejection from sexual partners, can be more likely to agree to unprotected sex. The stress of social isolation may also lead to a much higher rate of drug and alcohol use among transgender people that can affect their judgement and make them less likely to use condoms.

For the above reasons, many transgender people do not use condoms or take medicines to prevent or treat HIV consistently. These medicines include pre-exposure prophylaxis (PrEP) to prevent HIV transmission and antiretroviral therapy (ART) to treat HIV infection.

Injecting hormones. Many transgender people self-administer injectable hormones as part of GAHT. Without counseling on safe injecting practices, people going through this process may be very vulnerable to HIV transmission because of the risk of sharing needles with others.

WHAT DO WE KNOW ABOUT HIV AMONG TRANSGENDER MEN?

The transgender community is diverse and not enough research has been conducted with transgender people in general. In particular, very little is known about transgender men and their vulnerability to HIV. This is partly because transgender men are assumed to have sex primarily with other AFAB people and therefore be at low risk for HIV.

To date, research related to HIV among transgender people has almost exclusively focused on transgender women. However, there is evidence that there is a significant subgroup of transgender men that engage in unprotected sex with AMAB people, including some transgender men who engage in sex work. If cisgender men and transgender women are a priority for HIV prevention and sexual health care, transgender men should be as well.

Generally, HIV prevalence among transgender women is higher than transgender men. Few studies have been done on HIV prevalence among transgender men and gender non-conforming AFAB people, but there is reason to believe that these communities are more vulnerable to HIV than the general population.

Several studies show that a majority of transgender men report not using condoms consistently during receptive anal and/or frontal (vaginal) sex with AMAB partners, low rates of HIV testing, and low perception of risk.

HIV testing is the gateway to care for people who have HIV and to prevention services for people who don't have HIV. In the U.S., 96% of transgender women have ever been tested for HIV compared with 82% of transgender men.

Few HIV prevention interventions have been developed that address the unique needs of transgender men and specific eligibility criteria for PrEP have not been devised. Nonetheless, a review of U.S. data by the CDC showed that 15% of the 2,351 transgender people diagnosed with HIV in a five-year period were transgender men. A 2017 survey of more than 800 transgender men who have sex with AMAB people found that a majority engaged in behavior that could put them at risk for HIV, and most had heard of PrEP but only 22% were using it.

Many researchers have concluded that studies looking at HIV among transgender people should investigate behavioral risk as well as gender identity and that transgender men need to be included in HIV prevention efforts.

PREVENTING HIV INFECTION AMONG TRANSGENDER PEOPLE

It is evident that prevention strategies are failing to reach this group due to high HIV prevalence in communities around the world. When transgender people are targeted by HIV prevention campaigns they can be extremely effective. It is important that a combination of prevention programs are available.

Encourage less risky sexual behaviors

Unprotected receptive anal/vaginal sex (bottoming) is the riskiest type of sex for getting HIV. Unprotected insertive anal sex (topping) is less risky for getting HIV but very risk for passing HIV to others. In general, there is little to no risk of getting or transmitting HIV from oral sex. Read more about safer sex guidelines.

Limit the number of sex partners. The more partners you have, the more likely you are to have a partner with poorly controlled HIV or to have a partner with an STI. Both factors can increase the risk of HIV transmission.

Use condoms correctly every time you have sex. Read more about how to use condoms correctly and consistently.

HIV counseling and testing

Effective ways to encourage HIV testing among transgender people are to provide home-based testing and community-based testing. Community-based testing is carried out at local pop-up clinics or mobile vans in areas where transgender people feel comfortable. This removes the need to test in clinics where they may experience discrimination and mistreatment. Home-based testing has the benefit of the person being able to avoid identification by healthcare workers. The privacy of conducting an HIV test alone at home makes this an appealing option for many transgender people.

HIV self-testing should be made more widely available to help increase testing and earlier diagnosis. Transgender people should be educated about the use of self-testing kits to heighten their confidence in using them as an alternative to testing at regular healthcare settings.

Whether you test HIV positive or HIV negative, you can take action to protect your health and prevent HIV transmission. The CDC recommends that everyone between the ages of 13-64 get tested for HIV at least once as part of routine health care. People with certain risk factors should get tested at least once a year or more frequently. Find an HIV testing site near you.

Pre-exposure prophylaxis (PrEP)

PrEP is the daily use of antiretroviral medications (ARVs) to reduce the risk of HIV infection among HIV-negative people. PrEP can be combined with other prevention methods, such as condoms, to reduce the risk of HIV even further.

The first approved medication for PrEP, Truvada, has been tested in a few hundred transgender women and shown to be highly effective at preventing HIV when used consistently. Some studies have found that the drugs in Truvada do not reach as high a level in the vagina as they do in the rectum, so transgender men and other AFAB people who have vaginal/frontal sex should be especially careful to take PrEP consistently.

A large study of Descovy, the second PrEP option approved for some people, did not include AFAB people, and the Food and Drug Administration (FDA) declined to approve it for people who have vaginal/frontal sex until more research is done.

Many transgender people are concerned that the medications used for PrEP may interact with GAHT. But in studies so far, the drugs in Truvada have not been found to interfere with hormones.

Post-exposure prophylaxis (PEP)

PEP is the use of ARVs to prevent HIV infection as soon as possible after potential exposure to HIV. It must be taken within 72 hours of possible exposure. It must also be coupled with counseling about the importance of finishing the treatment course. PEP is not the right choice for people who may be exposed to HIV frequently. If a person is at ongoing risk for HIV, such as through repeated exposures to HIV, they should talk to a healthcare provider about taking PrEP.

ANTIRETROVIRAL THERAPY (ART) AMONG TRANSGENDER PEOPLE

Generally, data on transgender people's access to HIV treatment is scarce. One study of people with HIV in the U.S. found that only 59% of transgender participants, compared to 82% of cisgender people, were accessing ART.

As with access to HIV prevention information, transgender people may delay seeking treatment due to transphobia and insensitivity among healthcare professionals. Depression and isolation are often associated with poor adherence to HIV treatment. A lack of supportive relationships can affect important aspects of living healthily with HIV, such as remembering to take medication. One study found that transgender people with HIV were less likely to report adherence to treatment of above 90% compared to cisgender people. The study found that many transgender people found it difficult to take regular medication alongside other treatments such as hormone therapy.

In the U.S., transgender women have about the same viral suppression rates and transgender men have higher viral suppression rates compared to all people with HIV.

	Received some care	Retained in care	Achieved viral suppression
Transgender Women with HIV	84%	66%	65%
Transgender Men with HIV	87%	61%	72%
All people with HIV	76%	58%	65%

Source: https://www.cdc.gov/hiv/group/gender/transgender/viral-suppression.html

Taking HIV medicine every day can make the viral load undetectable. People who get and keep an undetectable viral load (or remain virally suppressed) can stay healthy for many years and have effectively no risk of transmitting HIV to their sex partners.

WHO has produced comprehensive guidance on HIV services for transgender people and recommends that adherence can be increased significantly by addressing HIV stigma and discrimination.

THE BOTTOM LINE

In the U.S. and around the world, transgender people are disproportionately affected by HIV. With early testing and treatment, transgender people with HIV can live longer, healthier lives.

There is a critical lack of data and limited funding for, and research about, transgender people and what drives

their vulnerability to HIV. This is particularly true for transgender men and non-binary/genderqueer transgender people.

Transgender people at high risk for HIV should get tested for HIV at least once a year, and in some cases more frequently. This is especially true for transgender people who have multiple sex partners, who are engaged in sex work, who inject drugs, or who share needles for gender affirming hormonal injections. If they test positive for HIV, they can take steps to reduce the risk of infecting their partners and ensure their own health.

The best way to prevent infection is by using condoms, taking PrEP if HIV-negative, and taking strong ART if HIV-positive. Transgender people who use intravenous drugs or inject hormones should not share injection equipment and supplies.

The most commonly used HIV medications do not interfere with hormones and vice versa. However, it is important to tell your healthcare provider about all the medications you are taking, including hormone therapy.

Fast Facts: HIV and Transgender People

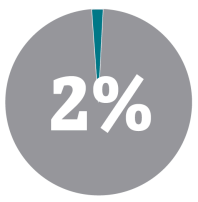
MARCH 28, 2024

For Everyone

Per a court order, HHS is required to restore this website to its version as of 12:00 AM on January 29, 2025. Information on this page may be modified and/or removed in the future subject to the terms of the court's order and implemented consistent with applicable law. Any information on this page promoting gender ideology is extremely inaccurate and disconnected from truth. The Trump Administration rejects gender ideology due to the harms and divisiveness it causes. This page does not reflect reality and therefore the Administration and this Department reject it.

AT A GLANCE

Nearly 1 million people (.3%) identify as transgender in the United States (US), and transgender people made up 2% (671) of new HIV diagnoses in the US and dependent areas in 2019. Get the latest data on HIV among transgender people.



Fast facts

HIV affects some groups more than others. Social and structural issues—such as HIV stigma, homophobia, discrimination, poverty, and limited access to high-quality health care—influence health outcomes and continue to drive inequities.

HIV Diagnoses

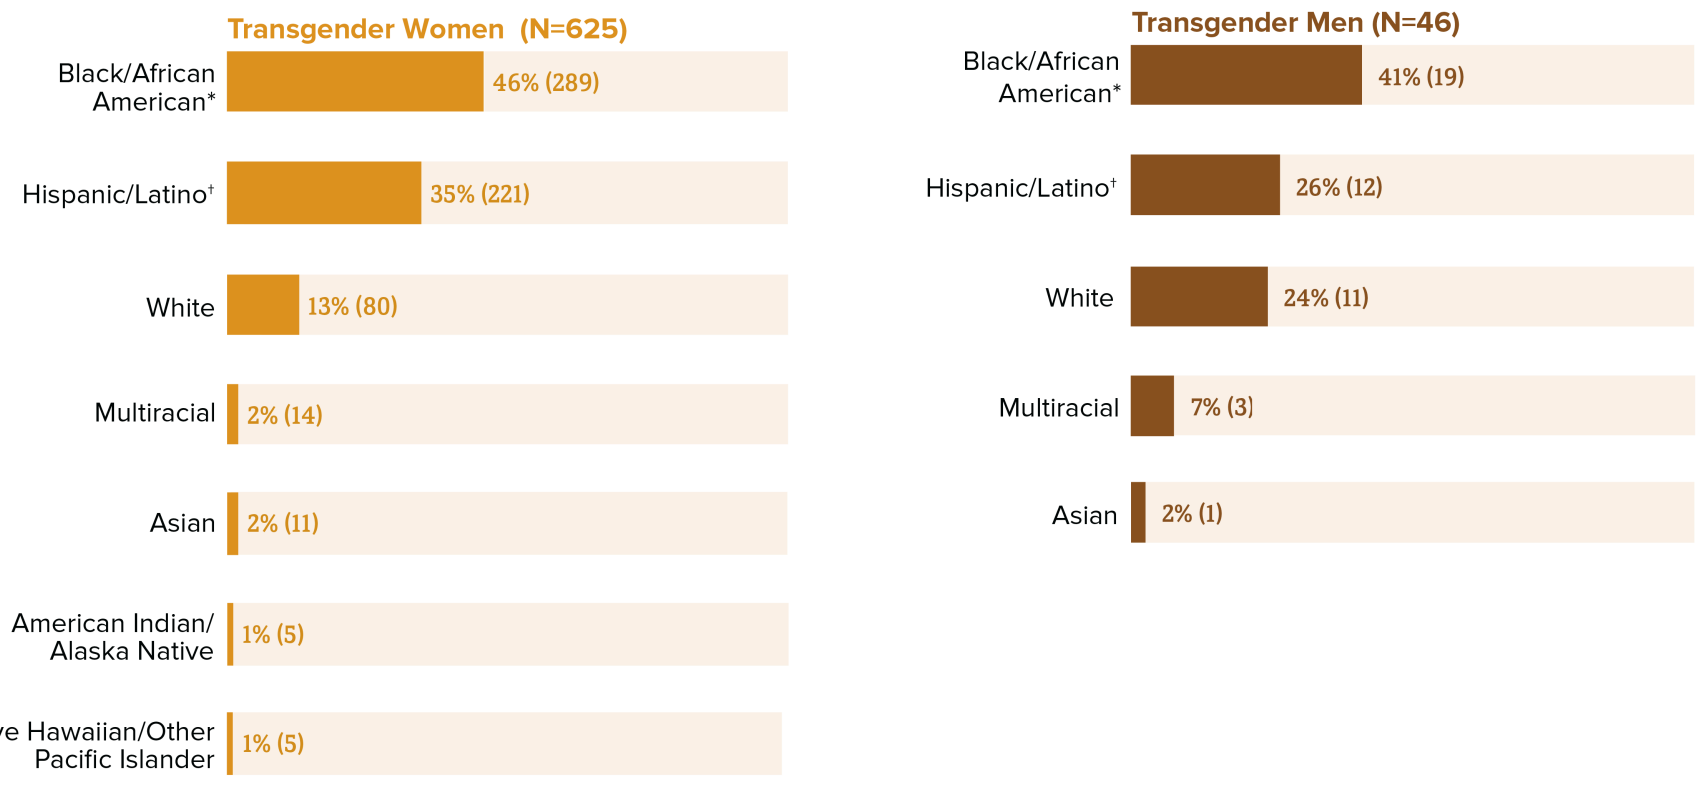
HIV diagnoses refers to the number of people who received an HIV diagnosis during a given year.

HIV diagnoses among transgender people in the US and dependent areas, 2019

Of the **36,801 new HIV diagnoses** in the US and dependent areas in 2019, 2% (671) were among transgender people.

Ending the HIV Epidemic

Overall Goal: Decrease the number of new HIV diagnoses to 9,588 by 2025 and 3,000 by 2030.



Learn more about HIV diagnoses among transgender people.

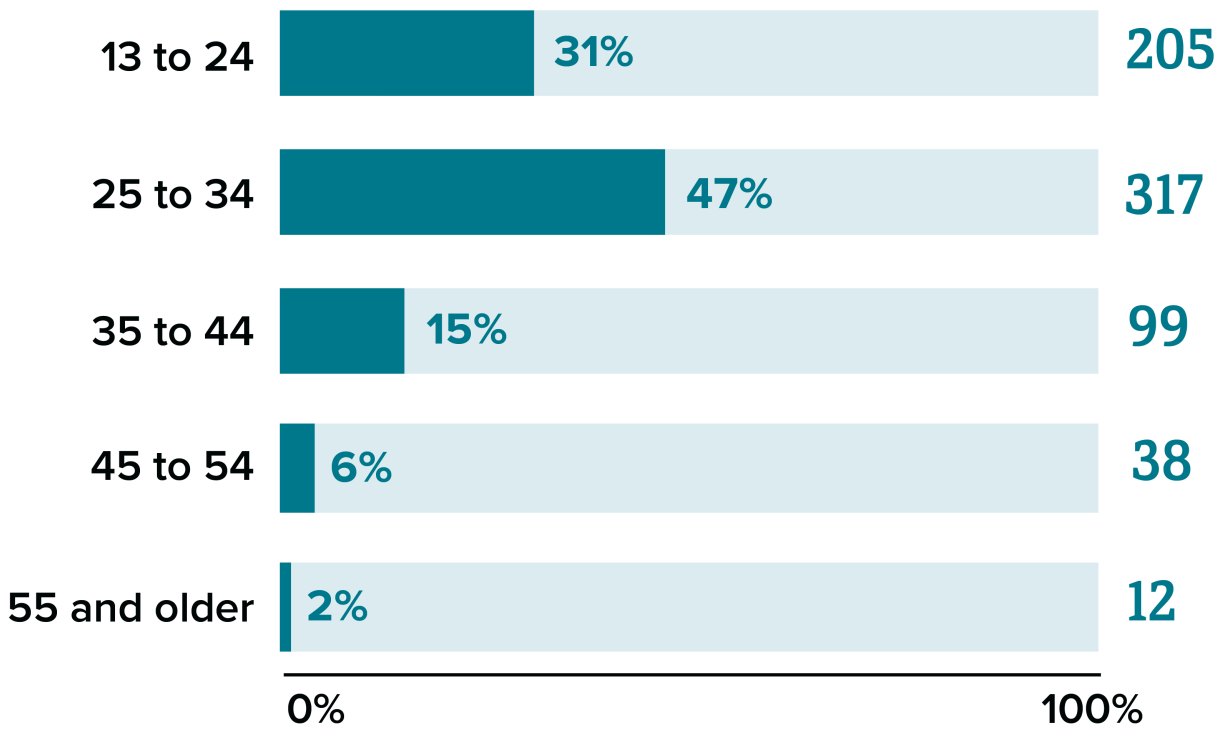
Source: CDC. Diagnoses of HIV infection in the United States and dependent areas, 2019. *HIV Surveillance Report* 2021;32.

HIV diagnoses among transgender people by race/ethnicity in the US and dependent areas, 2019

Most new HIV diagnoses among transgender people were among Black/African American people.

Learn more about HIV diagnoses among transgender people by race and ethnicity.

**Black* refers to people having origins in any of the Black racial groups of Africa. *African American* is a term often used for people of African descent with ancestry in North America.

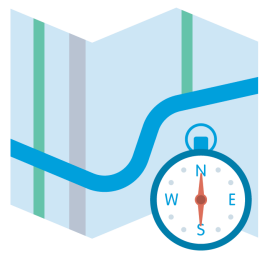


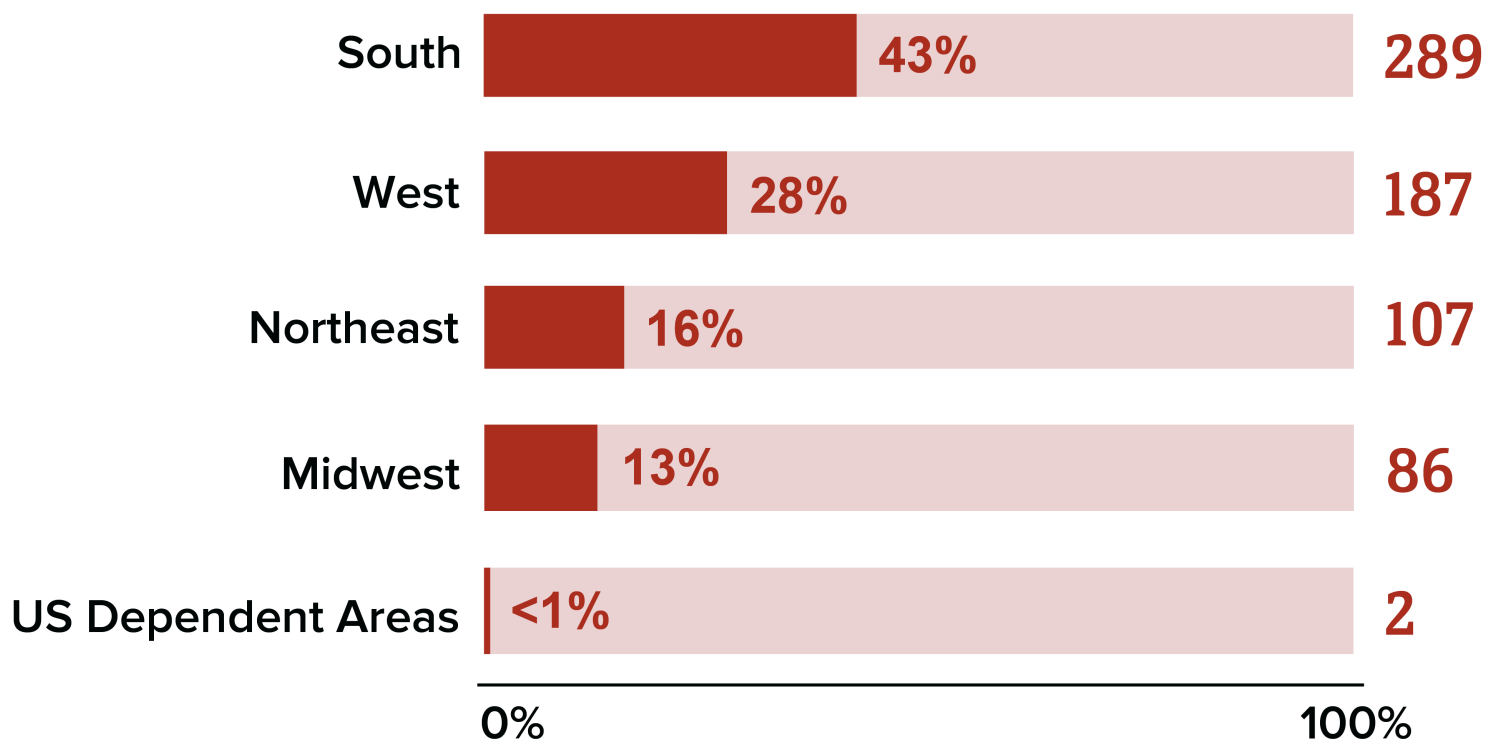
† Hispanic/Latino people can be of any race.

Source: CDC. Diagnoses of HIV infection in the United States and dependent areas, 2019. *HIV Surveillance Report* 2021;32.

HIV diagnoses among transgender people by age in the US and dependent areas, 2019

Among transgender people, most new HIV diagnoses were among people age 25 to 34.





Learn more about HIV diagnoses among transgender people by age.

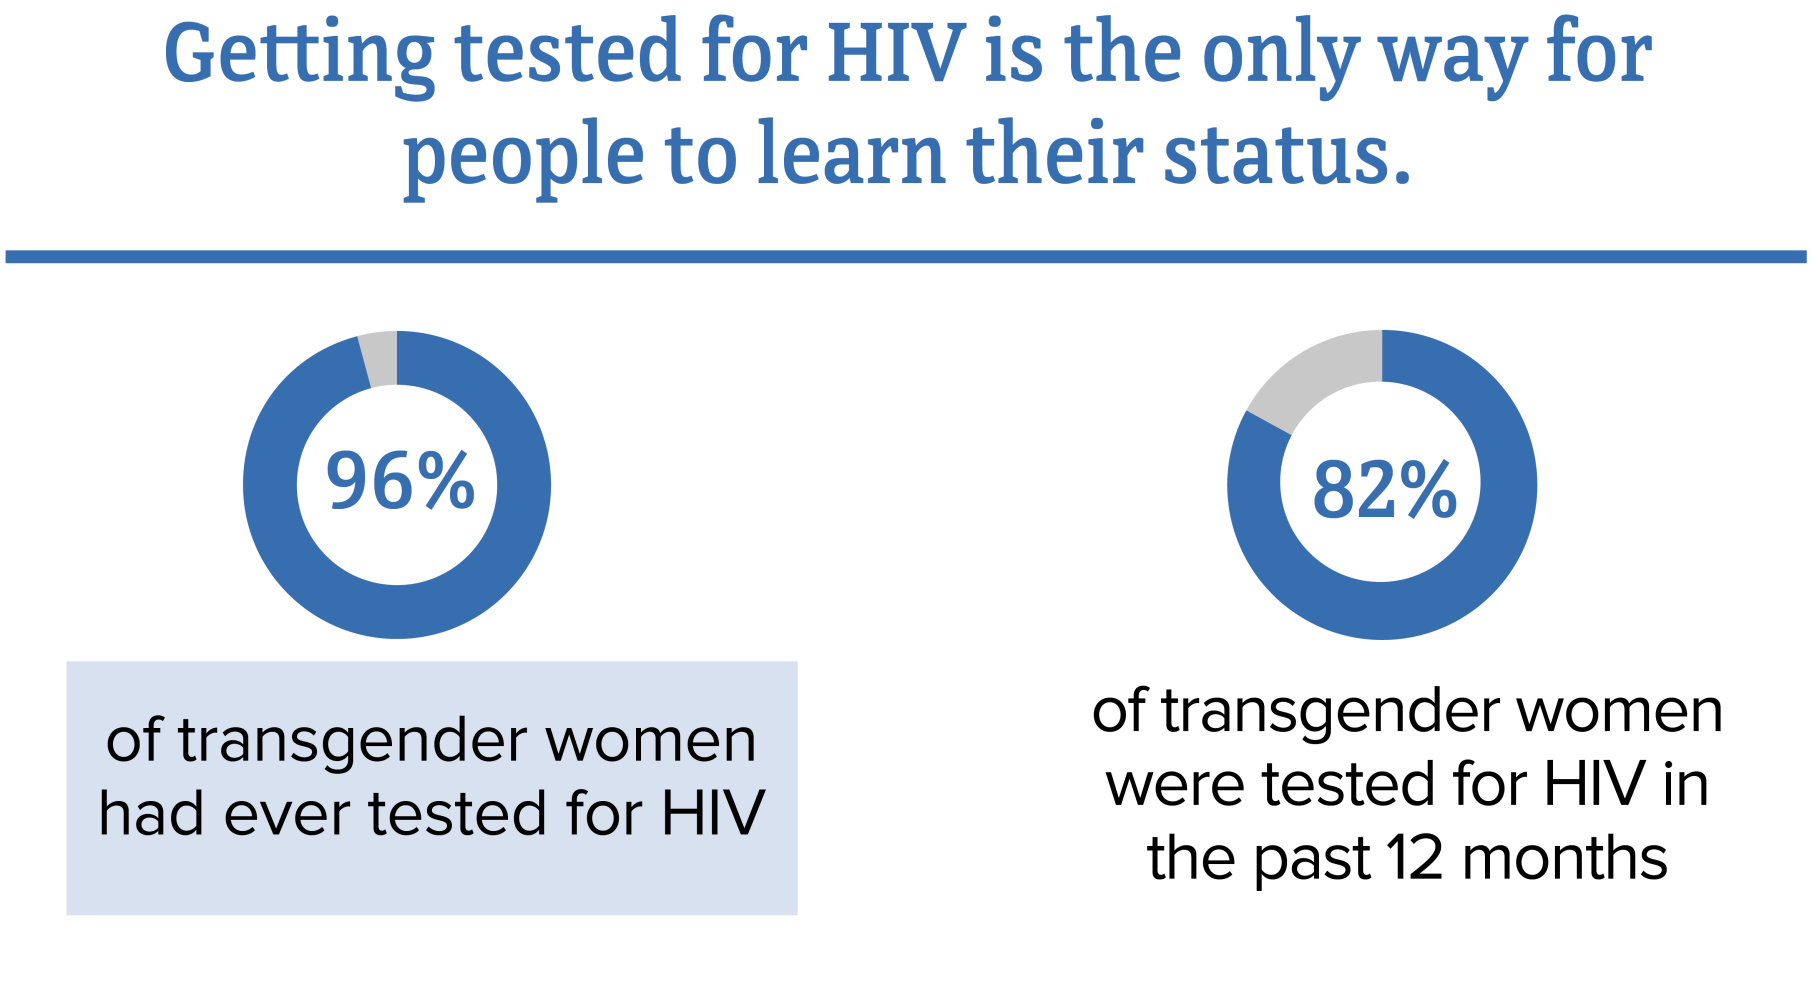
Trends by Age

Learn more about trends in HIV diagnoses among transgender people.



*Changes in subpopulations with fewer HIV diagnoses can lead to a large percentage increase or decrease.

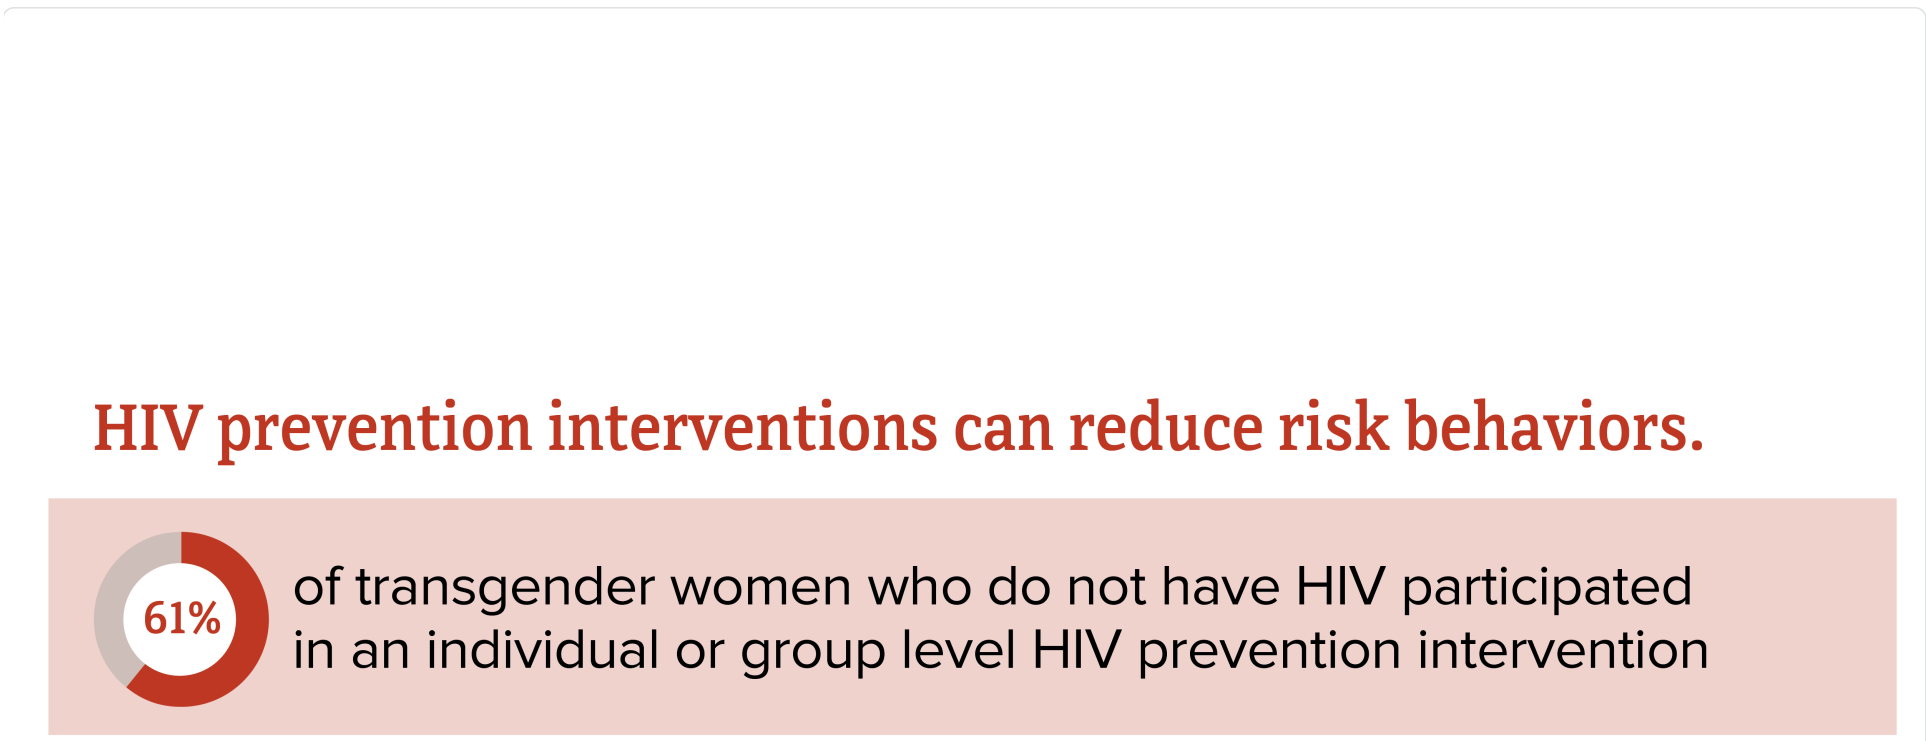
Source: CDC. Diagnoses of HIV infection in the United States and dependent areas, 2019. *HIV Surveillance Report* 2021;32.

HIV testing

HIV testing is the gateway to care for people who have HIV and to prevention services for people who don't have HIV. CDC recommends that everyone between the ages of 13 and 64 get tested for HIV at least once as part of routine health care. People with certain risk factors should get tested at least once a year. A recent study found that transgender women have high rates of recent and lifetime HIV testing.

HIV testing among transgender women in 7 US cities, 2019–2020*

Learn more about HIV testing among transgender women.



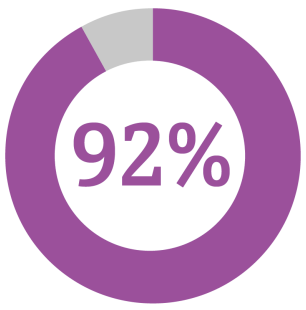
*Among people aged 18 and older.

Source: CDC. HIV infection, risk, prevention, and testing behaviors among transgender women–National HIV Behavioral Surveillance–7 U.S. Cities, 2019-2020. *HIV Surveillance Special Report* 2021.

HIV prevention

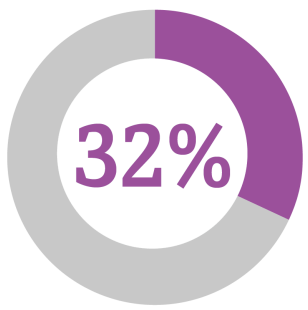
There are many HIV prevention strategies available, including condoms; pre-exposure prophylaxis (PrEP); post-exposure prophylaxis (PEP); as well as interventions focused on risk reduction; adherence to HIV medicine; linkage to, retention in, and re-engagement in care; structural approaches; and engagement in PrEP care. Additionally, for people with HIV, treatment provides substantial benefits for personal health and reduces HIV transmission to others. This is sometimes called HIV treatment as prevention.

HIV prevention interventions among transgender women in 7 US cities, 2019–2020*



Learn more about HIV prevention interventions among transgender women.

*Among people aged 18 and older.



Source: CDC. HIV infection, risk, prevention, and testing behaviors among transgender women–National HIV Behavioral Surveillance–7 U.S. Cities, 2019-2020. *HIV Surveillance Special Report* 2021.

PrEP awareness and use among transgender women in 7 US cities, 2019–2020*

PrEP is highly effective for preventing HIV from sex or injection drug use.

of transgender women without HIV were aware of PrEP

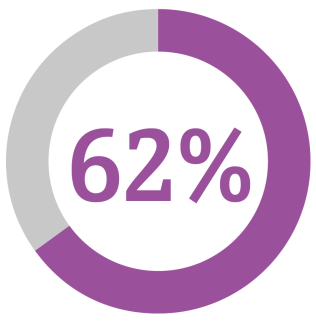
of transgender women without HIV used PrEP

Learn more about PrEP awareness and use among transgender women.

*Among people aged 18 and older.

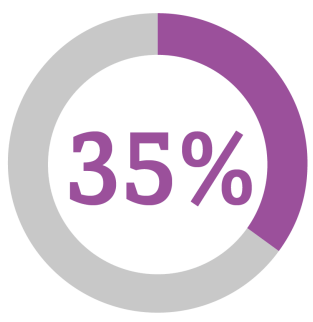
Source: CDC. HIV infection, risk, prevention, and testing behaviors among transgender women–National HIV Behavioral Surveillance–7 U.S. Cities, 2019-2020. *HIV Surveillance Special Report* 2021.

HIV prevalence

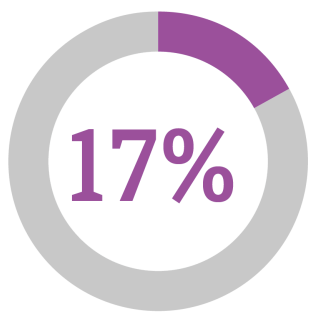


HIV prevalence is the number of people with HIV at a given time regardless of the time of infection.

HIV prevalence among transgender women in 7 US cities, 2019–2020*



Racial and ethnic disparities exist among transgender women with HIV.



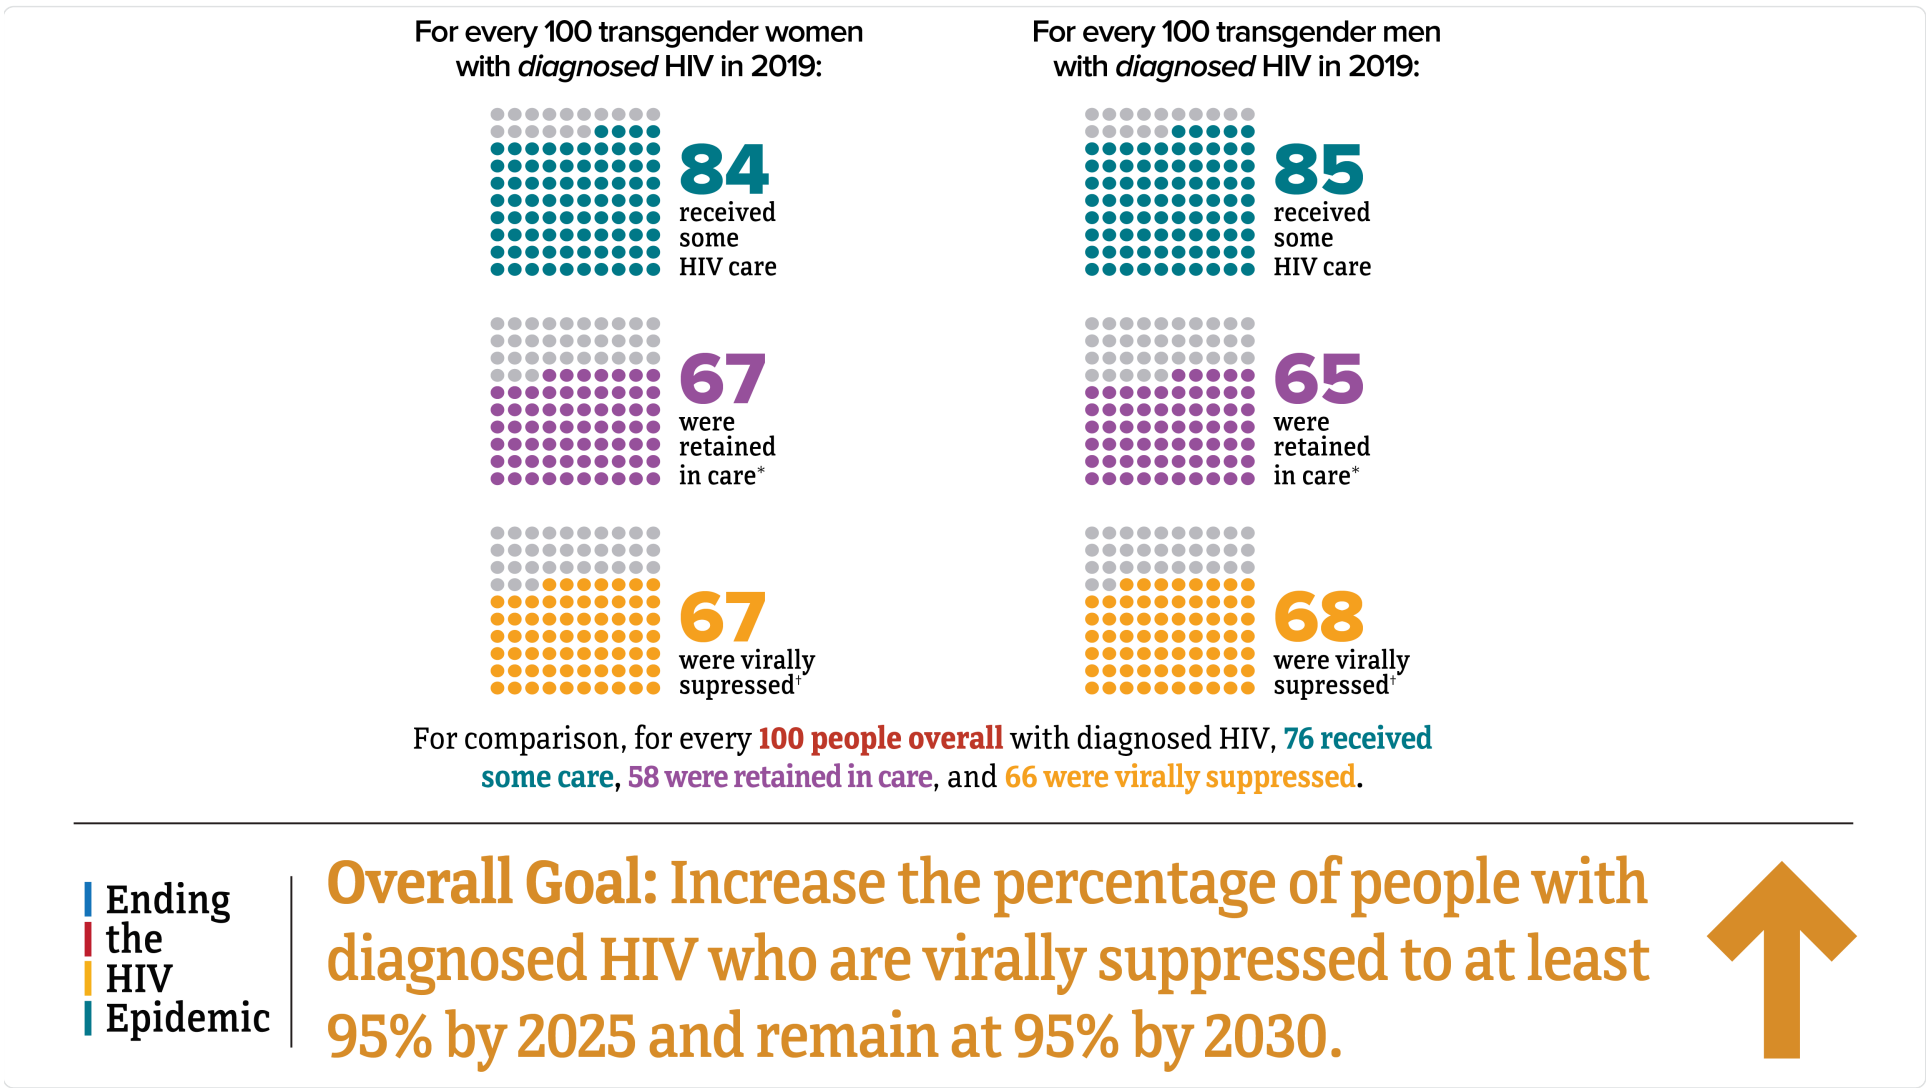
Among transgender women interviewed, 42% had HIV.

of Black/African American transgender women had HIV

of Hispanic/Latina transgender women had HIV

of White transgender women had HIV

Learn more about HIV prevalence among transgender women.



*Among people aged 18 and older.

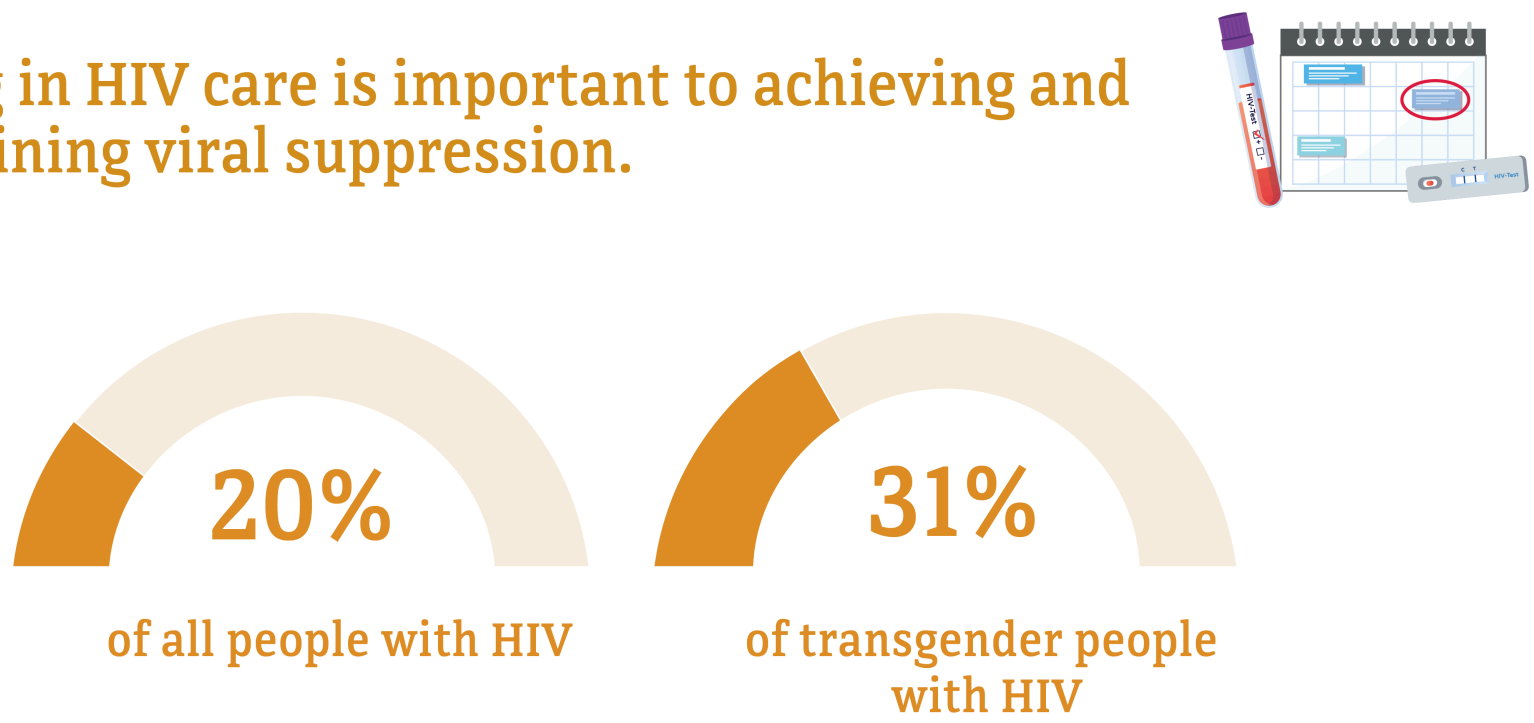
Viral suppression and barriers to care

Viral suppression refers to the percentage of people with diagnosed HIV who have less than 200 copies of HIV per milliliter of blood.

Transgender people with diagnosed HIV in 44 states and the District of Columbia, 2019

Learn more about HIV care and viral suppression among transgender people with diagnosed HIV.



*Had 2 viral load or CD4 tests at least 3 months apart in a year.

† Had less than 200 copies of HIV per milliliter of blood on most recent viral load test.

Source: CDC. Monitoring selected national HIV prevention and care objectives by using HIV surveillance data—United States and 6 Dependent Areas, 2019. *HIV Surveillance Special Report* 2021; 26(2).

Many people with HIV experience challenges with achieving and maintaining viral suppression over time. Some of these challenges include missing HIV medical appointments, needing but not receiving other important health care services, or missing doses of HIV treatment.

Missed HIV medical care appointments among transgender people with diagnosed HIV in the US, 2020*

Glossary

Acute hepatitis C (HCV): a recently acquired HCV infection that meets certain clinical criteria (discrete onset of symptoms such as nausea or malaise plus either jaundice or elevated serum alanine aminotransferase (ALT) levels (tenfold increase).

Adolescents: individuals between the ages of 10 and 19 years old are generally considered adolescents. Adolescence is the developmental transition to adulthood accompanied by hormonal, physical and psychological developments in the period from puberty to adulthood. Adolescents are not a homogenous group; physical and emotional maturation comes with age, but its progress varies among individuals of the same age. Also, different social and cultural factors can affect their health, their ability to make important personal decisions and their ability to access services. This document primarily uses the term "adolescents". Adolescents may also belong to one or more key population groups. Other terms covering overlapping age groups include **youth** – this term refers to individuals between the ages of 15 and 24, and **young people** – this term refers to those between the ages of 10 and 24.

Antiretroviral therapy (ART): refers to using a combination of antiretroviral (ARV) drugs for treating HIV infection.

Antiretroviral (ARV) drugs: refer to the medicines used to treat HIV.

Chemsex: for the purpose of these guidelines, is defined as when individuals engage in sexual activity, while taking primarily stimulant drugs, typically involving multiple participants and over a prolonged time.

Children: according to Article 1 of the Convention on the Rights of the Child, "A child means every human being below the age of eighteen years unless, under the law applicable to the child, majority is attained earlier".

Chronic hepatitis B (HBV) infection: persistence of HBsAg for at least six months. The persistence of HBsAg in two specimens at least six months apart is frequently used in clinical practice to confirm chronic hepatitis B infection.

Chronic hepatitis C infection (HCV): defined by HCV antibody positivity and HCV RNA positivity with a duration of infection longer than six months.

Cirrhosis: an advanced stage of liver disease characterized by extensive hepatic fibrosis, nodularity of the liver, alteration of liver architecture and disrupted hepatic circulation.

Community-led organizations: groups and networks are those that are led by and for the constituencies they serve. They are self-determining and autonomous entities where the majority of governance, leadership, staff, spokespeople, membership and volunteers reflect and represent the experiences, perspectives and voices of their constituencies, and which have transparent mechanisms of accountability to their constituencies.

Community-led responses: can be understood as the actions and strategies undertaken by these groups to improve the health and human rights of their constituencies. These responses are informed and implemented by and for communities themselves and the organizations, groups and networks that represent them.

Community-led responses are determined by and respond to the needs and aspirations of their constituents, and include a range of activities, such as advocacy, campaigning and holding decision-makers to account; monitoring of policies, practices, and service delivery; participatory research; education and information-sharing; service delivery; capacity-building; and funding of community-led organizations, groups and networks.

Decentralization: the process of delegating or transferring significant authority and resources from the central ministry of health to other institutions or to field offices of the ministry at other levels of the health system (such as provincial, regional, district, subdistrict, primary health care post and community).

Differentiated service delivery: an approach that simplifies and adapts services to better serve the needs of people living with HIV, viral hepatitis or Sexually transmitted infections (STIs), and to optimize the available resources in health systems.

HCV self-testing (HCVST): a process in which an individual collects their own specimen (blood or oral fluid), performs a rapid diagnostic test for the presence of HCV antibodies, and then interprets the result, often in a private setting, either alone or with someone they trust.

HCV sustained virological response (SVR): undetectable HCV RNA in the blood at a defined time point after the end of treatment, usually at 12 or 24 weeks (SVR12 or SVR24).

Human immunodeficiency virus (HIV): There are two types of HIV: HIV-1 and HIV-2. The vast majority of HIV infections globally are HIV-1.

HIV self-testing: a process in which a person collects their own specimen (oral fluid or blood), performs a test and interprets the result, often in a private setting, either alone or with someone they trust.

Integrated service delivery: integrated health services are health services that are managed and delivered in a way that ensures that people receive a continuum of health promotion, disease prevention, diagnosis, treatment, disease management, rehabilitation and palliative care services at the different levels and sites of care within the health system and according to their needs throughout the life-course.

Key populations: defined groups who, due to specific higher-risk behaviours, are at increased risk of HIV, viral hepatitis or STIs irrespective of the epidemic type or local context. Also, they often have legal and social issues related to their behaviours that increase their vulnerability to HIV. These guidelines focus on five key populations: 1) men who have sex with men; 2) people who inject drugs; 3) people in prisons and other closed settings; 4) sex workers; and 5) trans and gender diverse people. People in prisons and other closed settings are also included in these guidelines because of the often high levels of incarceration of the other groups, and the increased risk behaviours and lack of HIV, viral hepatitis and STI services in these settings. The key populations are important to the dynamics of HIV, viral hepatitis and STI transmission. They also are essential partners in an effective response to the epidemic.

Lay provider: any person who performs functions related to health care delivery and has been trained to deliver specific services, but has not received a formal professional or paraprofessional certificate or tertiary degree.

Men who have sex with men: refers to all men who engage in sexual relations with other men. The words “men” and “sex” are interpreted differently in diverse cultures and societies and by the individuals involved. Therefore, the term encompasses the large variety of settings and contexts in which male-to-male sex takes place, regardless of multiple motivations for engaging in sex, self-determined sexual and gender identities, and various identifications with any particular community or social group.

Nucleic acid amplification test (NAAT): a molecular technology, for example, polymerase chain reaction (PCR) or nucleic acid sequence-based amplification (NASBA) that can detect very small quantities of viral nucleic acid (RNA or DNA), either qualitatively or quantitatively.

Ongoing risk exposure for HCV: includes engagement in activities that increase the risk of HCV transmission: e.g., exposure to HCV infectious blood or body fluids that contain blood, including injection drug use and male-to-male sexual contact.

Partner services: (sometimes referred to as disclosure, contact tracing, index testing or assisted partner notification): a voluntary process whereby a trained provider asks people diagnosed with HIV about their sexual partners and/or drug injecting partners, and then, if the HIV-positive client agrees, offers the partner voluntary HIV testing services (HTS). Partner services are provided using provider-assisted referral or patient referral approaches.

People-centred care: care that is focused and organized around the health needs and expectations of people and communities rather than diseases.

People in prisons and other closed settings: there are many different terms used to denote places of detention that hold people who are awaiting trial, those who have been convicted, or people who are subject to other conditions of security. Similarly, different terms are used for those who are detained. In this guidance document, the term "prisons and other closed settings" refers to all places of detention within a country, and the terms "prisoners" and "detainees" refer to all those detained in criminal justice and prison facilities, including adult and juvenile males, females, trans and gender diverse individuals, during the investigation of a crime, while awaiting trial, after conviction, before sentencing and after sentencing. This term does not formally include people detained for reasons relating to immigration or refugee status, those detained without charge, and those sentenced to compulsory treatment and to rehabilitation centres. Nonetheless, most of the considerations in these guidelines apply to these people as well.

People who inject drugs: refers to people who inject psychoactive substances for non-medical purposes. These drugs include, but are not limited to, opioids, amphetamine-type stimulants, cocaine and hypno-sedatives, including new psychoactive substances.[1] Injection may be through intravenous, intramuscular, subcutaneous or other injectable routes. People who self-inject medicines for medical purposes – referred to as "therapeutic injection" – are not included in this definition. While these guidelines focus on people who inject drugs because of their specific risk of HIV and HCV transmission due to the sharing of blood-contaminated injection equipment, much of this guidance is also relevant for people who use substances through other routes of administration such as snorting, smoking and ingestion.

People who use drugs: include people who use psychoactive substances through any route of administration, including injection, oral, inhalation, transmucosal (sublingual, rectal, intranasal) or transdermal. Often this definition does not include the use of widely used substances such as alcoholic and caffeine-containing beverages and foods.

Point-of-care testing: is conducted at the site at which clinical care is being provided, with the results being returned to the person being tested or caregiver on the same day as sample collection and testing, to enable clinical decisions to be made in a timely manner.

Pre-exposure prophylaxis (PrEP): is the use of ARV drugs by people who do not have HIV, to prevent the acquisition of HIV before exposure.

Post-exposure prophylaxis (PEP): is the use of ARV drugs by people who do not have HIV, to prevent the acquisition of HIV after exposure.

Recent hepatitis C infection: evidenced by:

- positive HCV RNA or antigen test in an individual that returned a negative antibody, RNA or antigen result within the preceding year (including instances where this represents re-infection);
- positive HCV RNA or antigen test AND a current negative HCV antibody test; and
- positive antibody, RNA or antigen test AND, within the preceding year, clinical symptoms of acute hepatitis.

[1] The United Nations Office on Drugs and Crime (UNODC) uses the term "new psychoactive substances" which are defined as "substances of abuse, either in a pure form or a preparation, that are not controlled by the 1961 Single Convention on Narcotic Drugs or the 1971 Convention on Psychotropic Substances, but which may pose a public health threat". For more information visit the UNODC Early Warning Advisory on New Psychoactive Substances 2022 [Available from: https://www.unodc.org/LSS/Page/NPS].

Sex workers: include female, male, trans and gender diverse adults (18 years of age and above) who receive money or goods in exchange for sexual services, either regularly or occasionally. Sex work is consensual sex between adults, can take many forms, and varies between and within countries and communities. Sex work also varies in the degree to which it is more or less "formal" or organized. As defined in the Convention on the Rights of the Child (CRC), children and adolescents under the age of 18 who exchange sex for money, goods or favours are "sexually exploited" and not defined as sex workers.

Social network-based HIV testing: is an extension of partner services. A trained provider asks people with HIV, or those who are HIV-negative but at ongoing risk of HIV, to encourage and invite individuals in their sexual, drug-injecting or social networks to participate in voluntary HIV testing services. A social network refers to a group of individuals linked by a common set of relationships and includes sexual and drug-injecting partners, as well as social contacts.

Substantial risk (of HIV infection): HIV acquisition risk varies considerably within populations and geographical locations. Population-level HIV incidence is an important determinant of individual-level risk of HIV acquisition. However, when considering who could benefit from PrEP, it is important to consider the characteristics and behaviours of individuals and their partners that could lead to HIV exposure. Even in locations with a low overall HIV incidence, there may be individuals at substantial risk who could benefit from PrEP services. Individuals requesting PrEP should be given priority when offering PrEP since requesting PrEP indicates that there is likely to be a risk of acquiring HIV. When PrEP use is risk-informed (taken during periods of risk of HIV acquisition), PrEP can be cost-effective. Cost-effectiveness will vary across countries, populations, and PrEP products. However, cost–effectiveness should not be the only consideration when implementing PrEP programmes, since remaining HIV-negative and having control over HIV risk has intangible value to people and communities.

Task sharing: the rational redistribution of tasks between cadres of health care workers with longer training and other cadres with shorter training, such as lay providers.

Trans and gender diverse people: an umbrella term for those whose gender identity, roles and expression does not conform to the norms and expectations traditionally associated with the sex assigned to them at birth; it includes people who are transsexual, transgender, or otherwise gender nonconforming or gender incongruent. Trans and gender diverse people may self-identify as transgender, female, male, transwoman or transman, transsexual or one of many other gender nonconforming identities. They may express their genders in a variety of masculine, feminine and/or androgynous ways. The high vulnerability and specific health needs of trans and gender diverse people necessitate a distinct and independent status in the global HIV response.

Unprotected sex: refers to sex which does not involve evidence-based prevention interventions. These include condoms plus lubricants, which are protective against HIV, viral hepatitis and STIs and HIV pre-exposure prophylaxis. Successful ART with viral suppression prevents HIV transmission to sexual partners.

Executive summary

Purpose

The *Consolidated guidelines on HIV, viral hepatitis and STI prevention, diagnosis, treatment and care for key populations* outlines a public health response to HIV, viral hepatitis and sexually transmitted infections (STIs) for five key populations (men who have sex with men, trans and gender diverse people, sex workers, people who inject drugs and people in prisons and other closed settings). The guidelines present and discuss new recommendations and consolidate a range of recommendations and guidance from current World Health Organization (WHO) guidelines.

These guidelines focus on the above five groups, originally defined as "key" in the HIV response across the three infectious disease areas. This is for the following reasons.

- The structural barriers which limit the five key populations' access to HIV services also limit their access to viral hepatitis and STI services.
- HIV risk behaviours such as condomless sex and unsafe injecting, which are in general more common in key populations, are also among those that increase the risk of acquiring viral hepatitis and STIs.
- Many of the interventions recommended for HIV prevention also have an impact on transmission of viral hepatitis and STIs.

Particularly for key populations, social, legal, structural and other contextual factors both increase vulnerability to HIV, viral hepatitis and STIs and obstruct access to health and other essential services. These guidelines highlight the critical importance of addressing structural barriers in all settings as a priority.

Guidelines principles

These guidelines are developed with the following principles:

- human rights;
- gender equality;
- equity and inclusion;
- medical ethics;
- universal health coverage;
- evidence-based public health;
- key population community-led response.

Guidelines development methodology

This publication is an update to the 2016 *Consolidated guidelines on HIV prevention, diagnosis, treatment and care for key populations*. These guidelines include relevant existing recommendations, updated recommendations and new recommendations, good practice statements and other guidance.

For the development of new recommendations, WHO developed population, intervention, comparator, outcome (PICO) questions, and external researchers, supported by the WHO team, conducted the systematic reviews of the evidence to answer these questions.

WHO also commissioned four global networks of key populations (men who have sex with men, sex workers, trans and gender diverse people, and people who inject drugs) to undertake new qualitative research on values and preferences among their networks. The results formed part of the evidence synthesis.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 17 of 145

The evidence was synthesised and incorporated into an evidence-to-decision framework to help inform the discussions at a virtual Guideline Development Group meeting that occurred over six days between 30 August and 8 September 2021, chaired by two members of the Guideline Development Group, and all conflicts of interest were managed. The methodologist facilitated the Guideline Development Group's judgements, assisted by the chairs, on the potential benefits and harms of the intervention, stakeholder values and preferences, acceptability, feasibility, resource use and considerations of human rights and equity. Taken together and using the Grading of Recommendations Assessment, Development and Evaluation (GRADE) methodology, these judgements contributed to determining the strength and direction of the recommendation. All recommendations were made through consensus.

In these updated guidelines, guidance is provided to national programme managers, donors and advocates on how to prioritize different packages of health interventions to have the greatest impact on HIV, viral hepatitis and STIs, and to ensure universal coverage to address other health issues for key populations.

Each of the interventions listed, included in these guidelines based on initial scoping, was classified for each key population as follows.

1. **Essential for impact: enabling interventions**

   This includes all interventions recommended to address structural barriers to health services' access for key populations.

2. **Essential for impact: health interventions**

   This includes health sector interventions that have a demonstrated direct impact on HIV, viral hepatitis and STIs in key populations.

3. **Essential for broader health**

   This includes health sector interventions to which access for key populations should be ensured, but which do not have direct impact on HIV, viral hepatitis or STIs.

4. **Supportive**

   This includes other interventions which support the delivery of health sector interventions, such as creating demand, providing information and education.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 18 of 145

Summary of essential health and enabling recommendations

Essential for impact: enabling interventions

Removing punitive laws, policies and practices

Reducing stigma and discrimination

Community empowerment

Addressing violence

Essential for impact: health interventions

Prevention of HIV, viral hepatitis and STIs

Harm reduction (needle and syringe programmes (NSPs), opioid agonist maintenance therapy (OAMT) and naloxone for overdose management)

Condoms and lubricant

Pre-exposure prophylaxis (PrEP) for HIV

Post-exposure prophylaxis (PEP) for HIV and STIs

Prevention of vertical transmission of HIV, syphilis and HBV

Hepatitis B vaccination

Addressing chemsex

Diagnosis

HIV testing services

STI testing

Hepatitis B and C testing

Treatment

HIV treatment

Screening, diagnosis, treatment and prevention of HIV-associated tuberculosis (TB)

STI treatment

Hepatitis B and hepatitis C treatment

Essential for broader health: health interventions

Anal health

Conception and pregnancy care

Contraception

Gender-affirming care

Mental health

Prevention, assessment and treatment of cervical cancer

Safe abortion

Screening and treatment for hazardous and harmful alcohol and other substance use

TB screening and prevention

CHAPTER 1

Introduction

Key populations for HIV, viral hepatitis and STIs

The original (2014) and updated (2016) versions of the World Health Organization (WHO) *Consolidated guidelines on HIV prevention, diagnosis, treatment and care for key populations (3)* focused on HIV prevention, diagnosis, treatment and care for five key populations: men who have sex with men, sex workers, people in prisons and other closed settings, people who inject drugs, and trans and gender diverse people. However, members of these populations are also disproportionally affected by viral hepatitis and sexually transmitted infections (STIs), and there is increasing acknowledgement of the importance of addressing all three infectious disease areas in an integrated, community-led, and person-centred manner. Further, the risk behaviours and vulnerabilities of key populations and their networks determine the dynamics of HIV, viral hepatitis and STI epidemics, creating syndemics (defined as two or more infections interacting synergistically, contributing to excess burden of disease in a population), and meaning that preventing, diagnosing and treating HIV, viral hepatitis and STIs in key populations is central to the elimination of these infectious diseases as public health threats.

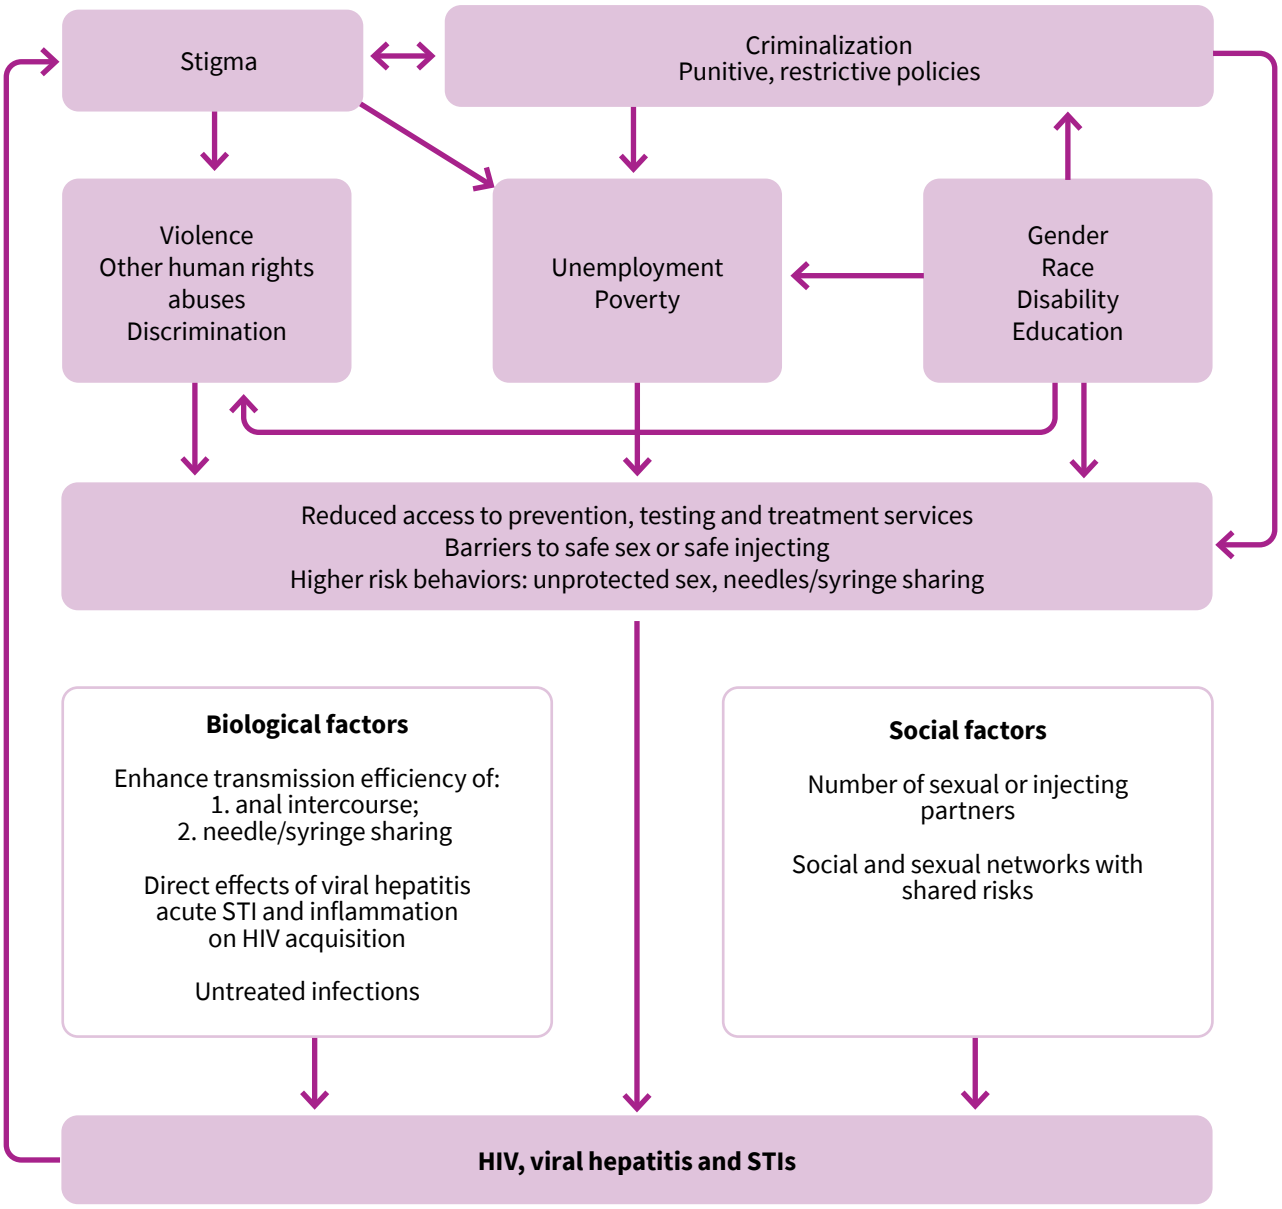
While strategies for viral hepatitis and STIs include additional priority populations (such as health care workers for hepatitis B virus (HBV) and pregnant women for syphilis and HBV) *(4, 5)*, and other populations vulnerable to HIV, in these guidelines we will focus on the above five groups, originally defined as "key" in the HIV response across the three infectious disease areas. This is for the following reasons.

- The structural barriers which limit the five key populations' access to HIV services also limit their access to viral hepatitis and STI services.
- HIV risk behaviours, such as condomless sex and unsafe injecting, which in general are more common in key populations, are also among those at increased risk of acquiring viral hepatitis and STIs.
- Many of the interventions recommended for HIV prevention also have an impact on transmission of viral hepatitis and STIs.

It is important to note that people can be members of more than one key population group, have more than one risk behaviour, and some people may engage in risk behaviours without identifying as members of a particular group; for example, men who have sex with other men but do not identify as gay. People who inject drugs often stop using drugs, sex workers stop sex working and people move in and out of prison; therefore, it is important to recognize the complexities and changes in people's lives.

In most countries, inadequate coverage and poor quality of services for key populations continue to undermine responses to HIV, viral hepatitis and STIs. All countries should prioritize reaching these key populations and supporting key population communities to lead the response and provide equitable, accessible and acceptable services to these groups.

Structural barriers



Particularly for key populations, social, legal, structural and other contextual factors both increase vulnerability to HIV, viral hepatitis and STIs, and obstruct access to health and other essential services. In many settings, one or more aspects of key population members' behaviour, work or gender expression are criminalized , and members are subject to punitive legislation and policing practices. Stigma and discrimination from/by the general population and health care workers and law enforcement officials are perpetuated by criminalization, which also means legal or policy change is more difficult to achieve. Stigma and discrimination in health care settings are common experiences among key populations and create significant barriers to achieving universal health coverage. Stigma and discrimination are related to unemployment as well as violence and human rights abuse. Violence and other human rights abuses are exacerbated by criminalization, making key population members less likely to report abuses and increasing vulnerability to such abuses.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 22 of 145

In combination, these reduce access to HIV, STI, viral hepatitis and other health services; can lead to poorer uptake and inconsistent use of prevention methods such as condoms, pre-exposure prophylaxis (PrEP) and post exposure prophylaxis (PEP) for HIV, and sterile needles/syringes; and to delayed diagnosis and poorer linkage and retention in treatment programmes (see Fig. 1).

Importantly, the complex intersections between the structural barriers which affect key populations and their gender, disability, education, race, religion and socioeconomic status cannot be ignored. For example, cisgender women and trans and gender diverse people experience extremely high rates of violence, racial minorities are over-represented in many prison settings, and all these factors increase stigma and discrimination.

Fig. 1. Factors contributing to HIV, STIs and viral hepatitis in key populations

HIV, viral hepatitis and STIs in key populations: dynamics and syndemics

There is a clear epidemiological rationale for HIV, viral hepatitis and STI programmes to focus on key population groups. This is related to each disease separately and also through biological and social interaction as syndemics.

As noted above, all five key populations are disproportionately affected by HIV, and in almost every setting have a higher prevalence and incidence than people outside of these groups. HIV epidemic models, which look beyond what are termed "static" modes of transmission (namely, looking at ongoing transmission over time, among networks of people rather than just incidence at one time point), show that preventing new infections and reducing viral load among key populations living with HIV has greater impact on ongoing transmission and population incidence and prevalence than focusing on lower-risk networks of people outside key population groups *(7–9)*. This means that all countries – those with high HIV burden across all populations as well as those with largely key population epidemics – must prioritize and address key population health needs for an effective, accelerated response.

HBV and hepatitis C virus (HCV) infections account for a significant global disease burden and high mortality from liver cancer and cirrhosis. HBV and HCV infections occur in all WHO regions; the HCV burden is particularly high in the Eastern Mediterranean and European regions, and the HBV burden in the African and Western Pacific regions. HCV burden has been documented as being high in people who inject drugs *(10)*, people in prisons *(11)* and men who have sex with men, particularly in men who have sex with men living with HIV *(12)*. Modelling shows that preventing, screening and treating HCV infection in key populations is needed to reach hepatitis C elimination goals *(13–16)*. Increased HBV prevalence and burden has been documented in all key populations *(17–20)*. Key populations also have higher rates of hepatitis D virus infection – which is a super-infection to HBV when compared to the larger population *(21)*. Outbreaks of hepatitis A are common among men who have sex with men *(22)*.

Sexually transmitted infections are spread predominantly by sexual contact (namely, vaginal, anal and oral sex), and have a profound impact on sexual and reproductive health worldwide. Some STIs are also responsible for severe adverse birth outcomes such as fetal and neonatal death and congenital anomalies. STIs are defined by multiple neglected pandemics that cause a significant global disease and economic burden. In 2020, more than 1 million curable STIs were estimated to be acquired every day worldwide, primarily caused by *Chlamydia trachomatis, Neisseria gonorrhoeae, Treponema pallidum* (syphilis) and *Trichomonas vaginalis*. Before the introduction of human papillomavirus (HPV) vaccines, over one in seven women were estimated to have prevalent HPV infection at any point in time *(23, 24)*. High-risk HPV types lead to cervical cancer cases and cervical cancer-related deaths and are important risk factors for anal cancer. In 2016, WHO also estimated that almost 500 million adults are currently living with herpes simplex virus (HSV) infection that causes genital herpes *(25)*.

Population groups that are at higher risk of STIs include sex workers and their clients, men who have sex with men, trans and gender diverse people in almost all settings *(26–31)*. There is increasing evidence of higher risk of STIs among people who inject drugs as well *(32)*. Adding to the burden of STI-related morbidity and mortality, emerging resistance to widely available antibiotics poses a risk of untreatable gonococcal infection. While this is not new, the rapid increase in resistance to some of the remaining effective therapies is leaving fewer options for treatment *(33)*.

Multiple epidemics and other adverse health outcomes may interact and mutually reinforce one another, increasing the risk and consequences of infection. These syndemic conditions generally develop in the context of social disadvantage and inequality, and are more commonly experienced by marginalized groups, such as key populations.

Coinfections of HIV and HBV and HCV can increase morbidity and mortality. For example, coinfection with HIV and viral hepatitis increases risk from accelerated liver disease and consequently cirrhosis, liver failure and hepatocellular carcinoma. In addition, coinfected individuals may have altered

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 24 of 145

immunological responses and are at increased risk of antiretroviral therapy (ART)-related hepatotoxicity *(34, 35)*. Hepatitis C and HIV are highly prevalent among people who inject drugs, and disproportionately affect men who have sex with men and people in prisons and closed settings *(10–12, 36, 37)*.

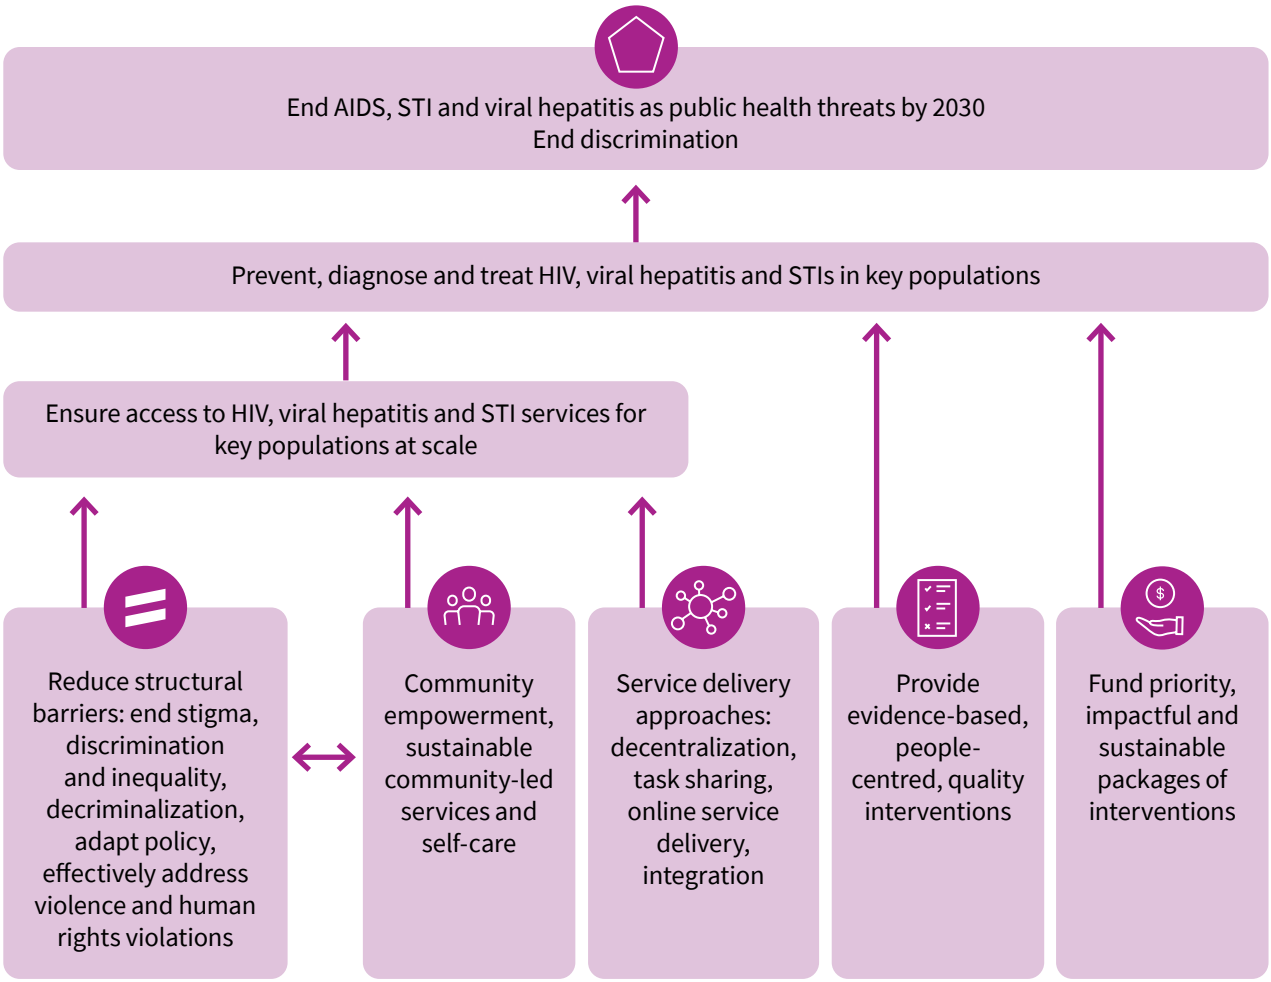
HIV infection is more likely to occur if another STI is present and vice versa, creating synergies and syndemics which are often overlooked. For example, STIs increase infectiousness of people living with HIV who are not on treatment by increasing the viral concentration in the genital tract, and by increasing the potential for HIV transmission *(38, 39)*. Genital herpes *(40, 41)* and syphilis *(42)* almost triple the risk of HIV acquisition; while women living with HIV are at high-risk of infection with HPV and are approximately six times more likely to develop cervical cancer *(43, 44)*.

Responding to HIV, viral hepatitis and STIs in key populations

Sustainable Development Goal (SDG) 3 and related target 3.3 are: "By 2030, end the epidemics of AIDS, tuberculosis, malaria and neglected tropical diseases and combat hepatitis, water-borne diseases and other communicable diseases" *(45)*. Given disease dynamics and syndemics as described above, this can only be achieved by prioritizing the prevention, diagnosis and treatment of these infections in key populations. Figure 2 describes a theory of change for meeting these global targets by 2030 and is detailed in the text below.

To prevent, diagnose and treat infections, key populations need equitable access to services at an adequate scale to have impact. The Joint United Nations Programme on HIV/AIDS (UNAIDS) set HIV coverage targets for 2025 as part of its global strategy to end AIDS *(45)*, which applies to all populations: 95% use combination prevention; 95% of people living with HIV know their HIV status; 95% of people living with HIV who know their status initiate treatment; 95% of people on HIV treatment are virally suppressed and 95% of women access HIV and sexual and reproductive health services. Global targets for viral hepatitis include 90% of people living with HCV or HBV diagnosed and 80% treated (HBV) or cured (HCV) by 2030. For STIs targets are that by 2030 >90% of priority populations are screened for gonorrhoea or syphilis and >95% treated if positive. Few countries reach this proportion of key populations with services, contributing to ongoing epidemics.

Access to services for key populations to have an impact on HIV, viral hepatitis and STIs can only be improved if structural barriers are removed, such as stigma and discrimination, criminalization, restrictive policies and violence, and if other human rights abuses and enabling environments exist (please see Chapter 4 on enabling interventions for references). Women who belong to key populations, as well as women who are partners of key population members, experience alarmingly high risks of acquiring HIV and are less likely to access services. The UNAIDS Global Strategy to end AIDS *(45)* includes 2025 targets related to structural barriers: less than 10% of countries have punitive laws and policies that deny or limit access to services, less than 10% of people experience stigma and discrimination and less than 10% experience gender inequality and violence. Relatedly, community empowerment is needed to both increase access and coverage and to support necessary structural changes.



Putting key populations at the centre of health systems – by organizing services around people's needs rather than around diseases, and by promoting integrated patient-centred approaches and linkages with primary health care services – is key to ending these epidemics. Different service delivery approaches, including task shifting to key population peers as health workers, decentralizing provision of services to key population community-led programmes, providing services online and service integration are also needed to increase access to and availability of HIV, viral hepatitis and STI services for key populations *(46)*.

Prevention, diagnosis and treatment of STI, viral hepatitis and HIV can only be achieved if people are provided with correct and evidence-based interventions with consideration for their individual health needs through providing person-centred care. This requires understanding of what works to prevent, diagnose and treat these conditions.

Finally, several effective interventions which prevent and treat HIV, STI and viral hepatitis in key populations are cost effective and cost saving *(47–50)*, but without adequate funding their impact cannot be realized. Funding needs to be sustainable, predictable and focused on supporting communities.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 25 of 145

Fig. 2. Theory of change: addressing HIV, viral hepatitis and STIs in key populations

Scope of these guidelines

These guidelines outline a public health response to HIV, viral hepatitis and STIs for five key populations. They present and discuss new recommendations and consolidate a range of recommendations and guidance from current WHO guidelines.

They summarize the components of a package of interventions for each key population and consider implementation issues, challenges and opportunities. The guidelines also provide guidance to countries on how to prioritize packages of interventions to have greatest impact.

Goals and objectives

High incidence and prevalence of HIV; viral hepatitis and STIs in key populations; dynamics of the epidemics; and persistent discriminatory barriers, inequalities and human rights abuses compel national programmes and implementers to prioritize the provision of evidence-based health and enabling interventions to these populations to meet the Global Health Sector Goals for the three groups of infections.

The objectives of these updated key population guidelines are as follows:

1. To develop new recommendations through quality assessment of evidence;
2. To consolidate the most recent guidance and recommendations related to HIV, viral hepatitis and STI prevention, diagnosis, treatment and care applicable to key populations;
3. To promote a set of evidence-based enabling interventions relevant for all key populations; and
4. To outline priority HIV, STI and viral hepatitis health-service packages that are impactful, beneficial and acceptable for different key populations.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 26 of 145

Audience

These guidelines are addressed primarily to national HIV, viral hepatitis and STI programme managers and other decision-makers within ministries of health and those responsible for health policies, programmes and services in prisons. They also endorse the Global AIDS Strategy target that 80% of service delivery for HIV prevention programmes, 30% of testing and treatment services and 60% of programme support achievement of societal enablers for key populations and women are delivered by community key population-led and women-led organizations, and to expand this to include viral hepatitis and STIs. In addition, the guidelines will be relevant for managers and policy-makers at national and sub-national levels responsible for services for tuberculosis (TB), sexual and reproductive health, needle and syringe programmes (NSPs), opioid agonist maintenance therapy (OAMT), drug dependence, adolescent health, and mental health; community-led civil society organizations and implementing programmes; judiciary, law enforcement and senior prison management; advocates and development and funding agencies.

Guidelines' principles

These guidelines are developed with the following principles:

Human rights

The framework for the development of these guidelines is based on human rights principles reflected in a number of international agreements *(51, 52)*. Namely, the right to:

- the highest attainable standard of physical and mental health for all, without discrimination;
- accessible, acceptable, available and quality health facilities, goods and services, including medicines for the treatment of HIV, viral hepatitis and STIs on an equal basis without discrimination – including, but not limited to – on the basis of sex, gender, health status, disability, nationality, sexual orientation, gender identity, race, ethnicity, age and marital status;
- access to justice and the right to a fair trial;
- freedom from arbitrary arrest and detention;
- freedom from torture and cruel, inhuman and degrading treatment;
- privacy, bodily autonomy, security of the person and to be free from violence; and
- enjoy the same standards of health care in prisons and other closed settings that are available in the community.

The above are grounded in underlying core principles of human rights; namely, accountability, equality and non-discrimination and participation of all concerned stakeholders.

Gender equality

The promotion of gender equality is central to the achievement of HIV, viral hepatitis and STI prevention, diagnosis and treatment goals. This means recognizing and taking into account how unequal power in intimate relationships, harmful gender norms and lack of access to resources and control over them affects access to, and experiences with, health services.

Equity and inclusion

Recognizing and addressing the social determinants of health and promoting equity and inclusion is central to achieving health for all.

Medical ethics

Health care providers and institutions must serve people from key populations based on the principles of medical ethics regardless of personal philosophy, politics, religion, moral theory or opinion *(53)*. Particularly relevant are those related to the provider-patient/client relationships:

- patient or client autonomy;
- confidentiality;
- informed consent;
- voluntary involvement in health services.

Also relevant are codes of conduct and etiquette which require professionalism, quality, high standards and dedication to "providing competent medical service in full professional and moral independence, with compassion and respect for human dignity" *(53)*.

Universal health coverage

Universal health coverage (UHC) means that all individuals and communities receive the health services they need without suffering financial hardship. It includes the full spectrum of essential health services, from health promotion to prevention, treatment, ongoing recovery and palliative care across the life course.

Achieving UHC requires multiple approaches: primary health care and life course approaches are critical. A primary health care approach focuses on organizing and strengthening health systems so that people can access services for their health and wellbeing based on their needs and preferences, at the earliest and in their everyday environments. Applying a life course approach optimizes people's health by addressing their needs and maximizing opportunities across all phases of life.

Within the UHC framework, this guideline employs the principal of progressive universalism, where those who are most vulnerable are prioritized and reached first *(54)*.

Evidence-based public health

These guidelines only includes recommendations and good practice statements that are based on an impartial synthesis of evidence and guided by an independent group of experts, the Guideline Development Group.

Key population community-led response

This guideline upholds the principle of the greater involvement of people living with HIV (the GIPA principle) *(55)*, applies it to key populations, and commits to support the meaningful engagement of key populations in the response to HIV, viral hepatitis and STIs.

How to use these guidelines

This guideline consolidates WHO recommendations related to the prevention, diagnosis and treatment of HIV, viral hepatitis and STIs for key populations. The majority of these recommendations are described in full in other WHO guideline documents, including many which were first described in the 2014/2016 consolidated key populations guidelines *(3)*. For simplicity, in most cases the background, evidence and decision-making process related to each recommendation are not included in this guideline; rather the source document which includes this information is referenced. Certain recommendations were newly developed or updated in 2021/2022 as part of this guideline process; these are marked with a star and details of evidence and decision-making are provided in Chapter 9: Additional information on the development of new recommendations. All relevant recommendations are presented in Chapter 4: The recommended package of interventions. Chapter 5 presents prioritized packages by key population.

This guideline also includes chapters on service delivery, enabling interventions, considerations for young key populations and decision-making, planning and monitoring the response. Web Annexes A–D provide full details of the supporting evidence for the new and updated recommendations.

CHAPTER 2

Methods

Overview

The WHO Department of the Global HIV, Hepatitis and STIs Programmes led the development of these consolidated key populations guidelines, following the WHO procedures and reporting standards laid out in the *WHO handbook for guideline development*, second edition, 2014 *(56)*. The recommendations in the guidelines are based on the GRADE (Grading of Recommendations Assessment, Development and Evaluation) approach to reviewing evidence and formulating recommendations.

These guidelines are an update of the *Consolidated guidelines on HIV prevention, diagnosis, treatment and care for key populations*, which were initially published in 2014 and updated in 2016 *(3)*. Importantly, these updated guidelines now combine existing WHO recommendations, new recommendations and guidance published by WHO related to viral hepatitis and STI prevention, in addition to HIV diagnosis, treatment and care for key populations.

Contributors to the guidelines

These guidelines were developed by technical staff of the WHO Department of the Global HIV, Hepatitis and STIs Programmes. The development process involved the formation of five main groups to guide and implement the process. Their specific roles are described in the next subsection. The members of all these groups and other contributors are listed in the Acknowledgements.

WHO Guideline Steering Group. The Testing, Prevention and Population Unit within the Global HIV, Hepatitis and STIs Programmes led this group and served as the WHO secretariat. Participants included WHO staff from other units within these programmes , as well as from the following WHO departments: Mental Health and Substance Use, and Sexual and Reproductive Health and Tuberculosis. This group also included WHO technical staff from two WHO Regional Offices (AFR and EUR).

Guideline Development Group. This group consisted of 25 members, with a balanced representation of geographic regions, gender and backgrounds, including academia and research, programme implementation and policy, and community organizations and networks. The global networks of people who use drugs, female, male and trans and gender diverse sex workers, gay men and other men who have sex with men and trans and gender diverse people were all represented on the Guideline Development Group. There is no global network of people in prisons and there were no prisoner representatives on the Guideline Development Group because participation was not feasible. The group members were selected in coordination with the Steering Group and WHO country and regional offices. This group was responsible for the formulation of the new and updated WHO recommendations. A full compilation and summary of the declarations of interest for Guideline Development Group members is available in Web Annex A.

External Review Group. This group was selected to ensure geographic and gender balance. It comprised 20 peer reviewers from academia, policy and research, programme implementation, UN agencies and community organizations and networks, including key population networks and civil society organizations and NGOs working in prisons.

External guideline contributors, guided by methodologist. Seven systematic reviews were conducted by three separate independent teams of experts, guided by one guideline methodologist, and with input from members of the WHO Steering Group and responsible technical officers. Qualitative research related to key populations' values and preferences was conducted by the global networks of people who inject drugs, sex workers, men who have sex with men and trans and gender diverse people. Additional evidence on feasibility, values and preferences and cost-effectiveness were also compiled and summarized by the systematic review teams. The Guideline Development Group, along with WHO technical officers, worked closely with the guideline methodologists to appraise the evidence using the GRADE methodology.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 30 of 145

External partners and observers. Representatives of the United States Agency for International Development (USAID), Centers of Disease Control and Prevention (CDC), Global Fund, Bill & Melinda Gates Foundation, Joint United Nations Programme on HIV/AIDS (UNAIDS), United Nations Development Programme (UNDP), United Nations International Children's Emergency Fund (UNICEF), United Nations Population Fund (UNFPA), United Nations Office on Drugs and Crime (UNODC), World Hepatitis Alliance (WHA), Clinton Health Access Initiative (CHAI) and World Professional Association of Transgender Health (WPATH) attended the Guideline Development Group meeting as observers. All representatives and organizations are potential donors and implementers of the proposed guideline, with a long history of collaboration with WHO's Global HIV, Hepatitis and STIs Programmes.

Competing interests

All external contributors to the development of guidelines, including members of the guideline development groups and the external review groups, completed a WHO declaration of interest form. Every effort is made to ensure that any potential influence of conflicts of interest is minimized. Individual participation was reviewed with regard to the interests declared. All declaration of interest forms are on electronic file at the WHO Department of Global HIV, Hepatitis and STIs Programmes, and will be maintained for 10 years.

To assess competing interests of the Guideline Development Group, the WHO responsible technical officers reviewed declarations of interest forms, curricula vitae and performed Google searches. The proposed membership list was posted for public review and comment 14 days prior to the guideline meeting before finalization. A management plan for each declared conflict was agreed on and recorded at the time of the meetings. One potential conflict related to receipt of funds that was considered significant in relation to one topic area was identified. The WHO team decided that this member would participate partially, excusing themselves from participating in decision-making discussions and formulation of a recommendation related to hepatitis C treatment (see Web Annex A).

Defining the scope of the guidelines

This publication is an update of the 2016 *Consolidated guidelines on HIV prevention, diagnosis, treatment and care for key populations*. In line with principles of Universal Health Care (UHC), a person-centred care and the rationale for increased public health impact, we identified areas for improvements to the former guidelines:

1) including and consolidating relevant recommendations related to viral hepatitis and STIs for key populations;

2) providing guidance to countries on prioritized packages of health interventions for each key population group; and

3) highlighting the central importance of critical enablers in ensuring UHC for key populations.

For initial scoping for the updated guidelines, WHO technical officers reviewed all the health intervention recommendations included in the 2014/2016 guidelines with the following objectives: 1) identify ways in which the guideline could be clearer, and easier to read and implement; 2) identify recommendations that required updating; and 3) identify where new recommendations were needed. Technical officers from HHS/TPP rated all of the 146 recommendations from the 2014/2016 key populations guidelines using the following actions:

Remove: It has been superseded and is no longer relevant. Review of the evidence is not necessary, and the recommendation is deleted ("remove (not relevant)") OR it should be removed from recommendations box because it is a "consideration" and can be highlighted in the narrative or in a separate section on structural interventions ("remove (move to narrative or structural)").

Validate: The recommendation is clearly established, and it is unlikely anyone would disagree with the recommendation. A review of the evidence and decision-making process is not necessary; the recommendation should be retained unchanged.

Edit: There is no change in the evidence or in the intention of the recommendation, but the precise wording needs editing to improve clarity.

Update: New evidence synthesis is required, and the topic and new evidence synthesis need to be reviewed by the Guideline Development Group with a full evidence-to-decision procedure, **or** there has been an update of the recommendations since 2016 conducted by another team or department in WHO.

New: A new topic, subgroup or intervention needs to be covered. A new evidence synthesis is required and the Guideline Development Group needs to perform a full evidence-to-decision procedure.

Following this exercise, a community and expert consultation was organized. The objectives of the consultation were: 1) to give an update on the consolidated key populations guidelines process and future timelines; 2) to discuss changes to the guidelines format and structure; 3) to gain feedback on proposed recommendations to be updated and new areas for future recommendations; and 4) to improve community engagement and transparency. Participants in the consultation included members of the key population community, young people and adolescents, donors, technical partners, implementers, representatives of national programmes and UN partners. The consultation also included a post-meeting survey. Overall, participants agreed with the proposed structure of the guidelines, with separate packages per key population, inclusion of STIs and viral hepatitis and the inclusion of prioritized packages of health interventions.

Values and preferences of key population members

WHO commissioned a qualitative study of key populations' values and preferences related to the new and updated recommendations being considered by the Guideline Development Group, as well as their general health priorities, service delivery preferences and experience of structural barriers. Unfortunately, it was not possible to include people in prisons in this study, given a lack of networks of people in prisons and logistical issues.

Global Action for Trans Equality (GATE), International Network of People who Use Drugs (INPUD), Global Action for Gay Men's Health and Rights (MPACT) and Global Network of Sex Work Projects (NSWP), following ERC approval of the protocol, conducted a total of 61 individual semi-structured interviews (SSIs) and 32 multi-country focus group discussions (FGDs). The global key population networks selected participants through their regional and country-based networks to participate in SSIs and FGDs, with attention given to balancing representation by region, gender, age and HIV status. All SSIs and FGDs were conducted virtually over secure communication platforms. Interviews were conducted in English, French, Spanish or Russian, as appropriate. Three interviews were additionally conducted by NSWP consultants in Thai, Hindi and Nepali, using community interpreters.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 32 of 145

Data were collected by community experts engaged by the global key population networks as consultants. Participant responses were documented, electronically recorded and, where possible, participant responses were transcribed verbatim with respect to the safety and anonymity of personal data. Responses were then collated and coded using an inductive, thematic analysis approach based on an analytical framework developed by the key population networks. Data summaries from each of the key population studies were prepared by one principal investigator from each network, inputted into a joint draft, and analysed to create a consolidated key population report (see Web Annex B for the full report).

Developing prioritized packages

In this updated guideline, guidance is provided to national programme managers, donors and advocates on how to prioritize different packages of health interventions to have the greatest impact on HIV, viral hepatitis and STIs, and to ensure universal coverage to address other health issues for key populations.

Each of the interventions listed and included in this guideline, based on initial scoping, was classified for each key population as:

1. **Essential for impact: enabling interventions**

   This includes all interventions recommended to address structural barriers to health services access for key populations.

2. **Essential for impact: health interventions**

   This includes health sector interventions which have a demonstrated direct impact on HIV, viral hepatitis and STIs in key populations.

3. **Essential for broader health**

   This includes health sector interventions to which access for key populations should be ensured, but which do not have direct impact on HIV, viral hepatitis or STIs.

4. **Supportive**

   This includes other interventions which support the delivery of health sector interventions, such as creating demand, providing information and education.

Plans for dissemination and updating

These guidelines will be updated in full or in part, based on regular scoping exercises of available evidence and experience from country implementation that will guide and trigger the need for new guidance. As the evidence base or user needs change, consideration will be given to producing technical updates on specific subjects.

The guidelines will be disseminated electronically on the WHO Global HIV, hepatitis and STIs Programmes' website and made available as a print publication on demand. Dissemination will be supported by publication of selected systematic reviews and evidence in peer-reviewed journals, as well as policy briefs, web and mobile phone-based apps.

CHAPTER 3

Critical enablers

Introduction

HIV, viral hepatitis and STI epidemics, particularly among key populations, continue to be fuelled by laws and policies criminalizing sex work; drug use or possession; diverse forms of gender expression and sexuality; stigma and discrimination; gender discrimination; violence; lack of community empowerment and other violations of human rights. These sociostructural factors limit access to health services, constrain how these services are delivered and diminish their effectiveness.

"Critical enablers[2]", as used in this guideline, means strategies, activities and approaches that aim to improve the accessibility, acceptability, uptake, equitable coverage, effectiveness and efficiency of HIV, viral hepatitis and STI services. Enablers operate at many levels – individual, community, institutional, societal and national, regional and global. They are crucial to developing strategies and implementing comprehensive HIV, viral hepatitis and STI programmes and services for key populations in all epidemic contexts.

The health sector has an important role to play, but successful implementation of critical enablers requires collaboration across different sectors, such as health, justice, housing, education, welfare and labour. It also requires multiple partners from government, civil society, religious institutions and the private sector. Full and meaningful involvement of key population-led organizations is crucial.

Special considerations for adolescents and young people

The barriers and critical enablers outlined in this chapter apply to both adults and adolescents in key populations. For adolescents from key populations, these factors may be further exacerbated by their rapid physical and mental development and complex psychosocial, familial, and social, educational and economic vulnerabilities. Also, adolescents from key populations experience sociostructural barriers to services, notably policy and legal barriers related to age of consent. Children of key populations can experience stigma and discrimination, and hence face the same difficulties in access to services. Health care providers may be prosecuted for providing services to adolescents without parental/guardian consent, further reducing access to services.

Key populations' experience, values and preferences related to structural barriers and critical enablers

Qualitative research conducted by the global key population-led networks for the development of this guideline (for a detailed report, please see Web Annex B) found that all key populations reported criminalization, stigma and discrimination as persistent barriers to accessing health services and remaining in treatment, as well as being driving factors in perpetuating vulnerability, human rights abuses and poor health outcomes. Participants from the trans and gender diverse people's network additionally emphasized structural barriers to legal gender recognition.

The criminalization of drug use or possession, sex work, same-sex relations and gender expression deter members of key populations from accessing services due to fears of legal repercussions. It was also noted how criminalization perpetuates the exclusion of key population-led and rights-based health programming from funding mechanisms and state health responses. Participants in the qualitative study additionally noted that law enforcement using the possession of condoms and injecting equipment as so-called evidence of sex work and drug use or possession further hinders the use of evidence-based prevention services and commodities.

[2] These are referred to as societal enablers in the *Global AIDS Strategy 2021–2026 (45).*

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 36 of 145

Stigma and discrimination, exacerbated by criminalization, also remain a salient barrier to accessing services and remaining in treatment for key populations. Participants across key population groups emphasized the pervasive problem of provider-based stigma and discrimination, including judgemental attitudes, breaches of confidentiality, denial of treatment, violence and abuse – even in contexts where legal protections exist.

To improve key populations' access to, and retention in, HIV, STI and viral hepatitis services, and to promote their health and human rights in general, participants stressed the need for legal and policy reform, community-led responses, community empowerment and capacity-building, and anti-violence initiatives.

Community empowerment was emphasized across all key population-led networks participating in the qualitative research project. Participants discussed the importance of key population-led responses, including peer outreach and other peer-based services, awareness-raising, advocacy, drop-in-centres, capacity-building and resource mobilization to ensure sustainable, community-led programming. These initiatives were seen both as a means to improve access to services, as well as an essential measure for addressing structural barriers undermining key populations' health and human rights.

In addition, participants noted the importance of sensitizing health care staff, law enforcement, NGO workers and the broader community. Key population-led sensitization training was perceived as an effective intervention to decrease stigma and discrimination and improve the acceptability of health services. Participants also recommended anti-violence interventions as enabling interventions.

Participants felt that because violence can be common (largely due to the effects of criminalization that require systemic solutions), violence prevention interventions need to be incorporated in an ongoing way into an overall wellness approach that views health as much more than "simply a set of interventions". In this context, they stressed the need for services to think more about what might bring people in and empower them to think about and address their health.

Lastly, all key population-led networks noted the critical role that funding plays in community-led initiatives, indicating an ongoing need to prioritize funding for key population-led programming, given the serious lack of funding for community and key population-led initiatives, and highlighting the importance of achieving the Global AIDS Strategy targets; namely, 80% service delivery for HIV prevention programmes for key populations, delivered by key populations; 30% testing and treatment services, delivered by community-led organizations; and 60% programme support achievement societal enablers, to be delivered by community-led organizations.

Essential interventions for impact: critical enablers

This chapter outlines a range of structural barriers that compromise access to health services for key populations, and then identifies critical enablers to overcome these barriers. This chapter includes a number of good-practice recommendations that are based on those made in the 2014/2016 WHO consolidated key population guidelines *(3)* with updated references, where available. While these barriers and enablers are interrelated, we attempt to discuss each individually.

Legal and policy barriers and enablers

Key population members are entitled to the full protection of their human rights, as specified in international human rights instruments. Human rights include, but are not limited to, the right to equal enjoyment of rights and non-discrimination; security of person and privacy; recognition and equality before the law; fair trial of law; the highest attainable standard of mental and physical health; education; employment and just and favourable conditions of employment; freedom of movement; peaceful assembly and association; freedom from arbitrary arrest and detention, and from cruel and inhumane treatment; and protection from violence. States have an obligation to ensure that the above rights are enjoyed without discrimination on the basis of race, nationality, sex, age, religion, sexuality, gender identity, health status, disability, marital status or other status *(57–60)*.

Most countries have laws, regulations or policies that are barriers to effective HIV, viral hepatitis, STI and other health services for key populations, including criminalization of sex work, drug use and possession, gender identity or expression, and sexual relations between people of the same sex. A number of countries criminalize gender identity in a de facto manner, by criminalizing cross-dressing or impersonation of the opposite sex. For trans and gender diverse people, the lack of legal gender recognition is a key barrier to access, and retention of, health services, in addition to the full enjoyment of other rights, such as freedom of mobility, housing, education and employment. This further isolates trans people and increases their vulnerabilities. In many settings, adolescents under 18 years of age are classified legally as minors and, therefore, must have consent from a legal responsible adult for medical care. Other barriers are related to restrictive or punitive policies and practices, such as criminalizing the possession of needles/syringes, which restricts the ability of programmes to operate NSPs, and using possession of condoms as evidence of sex work and as a basis for arrest *(61)*. Other harmful practices include forced anal examinations, which are used to investigate or punish alleged same-sex behaviour between consenting men or transgender women *(62)*.

These legal barriers have measurable, detrimental effects on the health of members of key populations, shown by modelling and other research *(63–74)*. For example, a systematic review found associations between exposure to arrest and HIV infection in people who inject drugs *(64)*; in countries in sub-Saharan Africa, the odds of living with HIV were found to be 7.2 times higher for sex workers in countries that criminalize sex work compared to countries that partially legalize sex work *(68)*; repressive policing of sex workers was associated with increased risk of HIV or other STIs (odds ratio of 1.87); and sex workers exposed to repressive policing were three times more likely to be physically or sexually assaulted *(75)*. The criminalization of the clients of sex workers has also been repeatedly shown to negatively affect sex workers' safety and health, including reducing condom access and use, and increasing the rates of violence *(68, 76)*. Studies show the negative effect of criminalization of same-sex practices on HIV prevalence and access to prevention, diagnosis and treatment services *(77, 78)*.

For trans and gender diverse people, the legal recognition of preferred gender and name may be important to reduce stigma, discrimination and ignorance about gender variance. Such recognition by health services can support better access, uptake and provision of HIV services *(79)*. Additionally, it is likely to improve trans and gender diverse people's health and wellbeing *(80)*. However, legal recognition must be accompanied by training, sensitization, education and enforcement.

Legal reforms, such as decriminalizing drug use or possession, sex work and same sex relationships; legal recognition of trans or gender diverse status; lowering the age of consent for accessing health services; and considering exceptions to a standard age of consent policy (such as mature minors) are critical enablers that can change a hostile environment for key populations to a supportive environment. Without protective policies and decriminalization of drug use or possession, and of diverse forms of gender identity and sexuality and sex work, barriers to essential health services will remain; many people from key populations may fear that seeking health care will expose them to adverse legal consequences. Specific consideration should be given to such legal reforms as part of any revision of policies or programmes for key populations.

Laws and policies that criminalize and punish key populations also constrain people from obtaining justice and legal services. Policies and procedures are needed to ensure that individuals from key populations can report rights violations such as discrimination, gender-based violence and other crimes, issues with policing, violations of informed consent, violations of medical confidentiality and denial of health care services. Reporting options, beyond going to the police, will encourage reporting of human rights violations. For example, persons from key populations can be trained as paralegals, and key population-led organizations and other organizations that work with key populations can serve as a third-party reporter of complaints *(61, 81)*.

Law enforcement has a statutory duty and obligation to ensure key populations enjoy equal protection under the law, and that the human rights of key populations are not violated. Law enforcement agents should receive continual training in ways to support – or at least not to impede – key populations' access to essential health services, including not surveilling or arresting people accessing OAMT, NSPs and drug dependence treatment clinics; avoiding confiscation of drug treatment medication, and not using possession of sterile needles or condoms to justify arrest. Systems to promote good policing practices and to provide safe avenues for reporting human rights violations will help ensure that police are protecting both the public health and the human rights of all persons *(61)*.

Overarching recommendations related to enabling interventions to address legal and policy barriers are listed below. Please see the recommended interventions chapter for full details.

Overarching good practice and guidance statements: removing punitive laws, policies and practices	
Existing good practice statement (adapted)[3]	Countries should work toward decriminalization of drug use/injecting, drug possession, sex work, same-sex activity and nonconforming gender identities, and toward elimination of the unjust application of civil law and regulations against people who use/inject drugs, sex workers, men who have sex with men and trans and gender diverse people *(3, 45, 79, 82–85)*.
Existing guidance statement	Laws, legal policies and practices should be reviewed and, where necessary, revised by policy-makers and government leaders, with meaningful engagement of stakeholders from key population groups, to allow and support increased access to services for key populations *(3, 79, 83, 84)*.

Stigma and discrimination

Stigma is a difference that is pejoratively labelled, stereotyped or named. Stigma can lead to discrimination; namely, unfair and unjust action towards an individual or group on the basis of real or perceived status or attributes, a medical condition, socioeconomic status, employment, drug use, gender, race, sexual identity, age or other perceived differences or characteristics, with the purpose or effect of impairing or nullifying the recognition, enjoyment or exercise – on an equal basis with others – of all human rights and fundamental freedoms *(61)*.

People from key populations are often particularly subjected to stigma, discrimination and negative attitudes related to their behaviour, sexual orientation, gender identity or engagement in sex work – and doubly so if also living with HIV, viral hepatitis or STIs. Many key populations also face intersecting forms of discrimination on the basis of their age, sex, race or ethnicity, physical or mental health status, disability, nationality, asylum or migration status, or criminal record. This is the basis for discrimination, which is common in many health facilities and law enforcement services. It may seem to be tacitly endorsed by the lack of national laws and policies that protect key populations against discrimination, and by the implementation of punitive and restrictive policies.

Within the health sector, stigma and discrimination can take many forms at the individual and systems levels. The lack of training and educational programmes to inform health workers of the needs, health issues and rights-based strategies and interventions for key populations contributes to marginalization. It leaves providers ill-equipped to address health needs and perpetuates stigmatizing and discriminating practices, even to the point of refusing services. Health care

[3] In the 2014 *Consolidated Guidelines for HIV prevention, diagnosis, treatment and care*, the wording of this good practice statement was: Countries should work toward decriminalization of behaviours such as drug use/injecting, sex work, same-sex activity and nonconforming gender identities, and toward elimination of the unjust application of civil law and regulations against people who use/inject drugs, sex workers, men who have sex with men and trans and gender diverse people.

workers may be biased against certain people, but may also experience discrimination themselves when working with key populations *(86)*.

The effects of stigma and discrimination against key populations can manifest in delayed testing and missed diagnoses, poor retention in treatment programmes and poor treatment outcomes, concealment of health status and, in general, poor uptake of health services *(61, 87–102)*.

There are many interventions designed to reduce stigma and discrimination in health care settings, with some randomized controlled trials and observational studies showing positive effects *(92, 103–114)*. However, given the heterogenous nature of the interventions and outcomes measured, meta-analyses are often not possible, and systematic reviews do not clearly indicate which are the most effective interventions when it comes to reducing stigma and discrimination in health care settings *(86, 115–117)*. Instead, it is useful to consider a range of interventions that can address different aspects of stigma and discrimination as listed below *(61, 115)*.

Intervention approach	Description
Information based	Providing information about health and health-related stigma
Skills building	Conducting sensitization or other skills-building activities for health care workers, law enforcement officers and others
Counselling and support	Supportive services for members of key population groups
Contact with key populations	Facilitating interactions between key population members and health care workers, law enforcement officers and others
Structural	Institute anti-stigma and anti-discrimination policies and codes of conduct with monitoring, oversight and opportunities for key population members to report discrimination, including redress and accountability mechanisms
Biomedical	Ensuring UHC and professional, non-discriminatory provision of care, including HIV, viral hepatitis and STI services for key populations

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 40 of 145

Enabling interventions to address barriers related to stigma and discrimination are listed below:

Overarching good practice and guidance statements: stigma and discrimination	
Existing good practice statement	Countries should work towards implementing and enforcing anti-discrimination and protective laws, derived from human rights standards, to eliminate stigma, discrimination and violence against people from key populations *(3)*.
Existing good practice statement	Policy-makers, parliamentarians and other public health leaders should work together with civil society organizations in their efforts to monitor stigma, confront discrimination against key populations and change punitive legal and social norms *(3, 79, 81, 83–85, 118, 119)*.
Existing guidance statement	Health services should be made available, accessible and acceptable to people from key populations, based on the principles of medical ethics, avoidance of stigma, non-discrimination and the right to health *(3, 79, 81, 83–85, 118–120)*.

Community empowerment

Key populations often have little or no control over HIV, STI and viral hepatitis risk factors driven by the legal, political and social and programmatic environment, and the context of their lives. These constraints can hinder people's control over their health and wellbeing, as well as increasing their risk of HIV, viral hepatitis and STIs. This lack of control is exacerbated if people are unaware of available health services, of their legal and human rights, specifically their right to health, and what to do if these rights are violated. Few young people from key populations receive adequate information and education centred on their sexual lives. Instead, they receive negative, critical, conflicting or confusing messages about gender, drug use, unintended pregnancy and STIs, including HIV *(121)*.

Empowerment is the process by which people with little power work together to increase control over events that determine their lives and health. Community empowerment means increasing key population communities' control over their health by addressing the structural constraints to health, human rights and wellbeing; making social, economic and behavioural changes; and improving access to health services. Community empowerment can take many forms, such as fostering key population-led groups and key population-led programmes and service delivery; meaningful participation of people from key populations in designing and operating services; peer education or navigation; task shifting to key population peers; self-care; implementation of legal literacy and service programmes; and ensuring civil space in which key populations can function without fear of reprisals.

Evidence, mainly among sex workers, shows that community empowerment has a measurable impact on key populations' health *(122–134)*, including reductions in STI incidence *(127)*, HIV incidence *(128, 134)*, high-risk sex *(131)* and increased uptake of family planning *(132)*.

Figure 3 shows a framework for fostering key population services included in key population networks' developed implementation tools *(135–138)*.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 41 of 145

Fig. 3. Framework for community empowerment

It is important to foster and support services, facilities and research led by organizations of people from key populations. Key population-led organizations, collectives and networks can play key roles in training staff of health services, law enforcement and social service agencies; facilitating interaction with the communities of key populations; and developing, implementing, monitoring and managing services. Key population communities can build understanding of, and alliances with, other neglected, at-risk groups, such as youth networks, persons with disabilities, adolescent girls and young women. They have special strengths in providing and leading community-based and outreach services.

Meaningful participation can mean not only having a voice in decision-making, but also contributing to service delivery and monitoring and evaluation (M&E). Community-led monitoring, an accountability mechanism led by key populations and other affected communities, which involves trained peer monitors and structured reporting mechanisms, is particularly important *(139)*.

WHO has several relevant recommendations related to roles for key population peers in service delivery, which can be found in the service delivery chapter.

The meaningful participation of key populations in programming is critical to ensure the appropriateness and acceptability of services to the intended clientele. It is also important for building trusting relationships between the community and service providers, who may be accustomed to establishing the parameters by which services are provided, and prescribing how relationships or partnerships are to be conducted, a norm that needs to be shifted to allow for community empowerment and service access.

Meaningful participation means that key populations: 1) choose whether to participate; 2) choose how they are represented, and by whom; 3) choose how they are engaged in the process; and 4) have an equal voice in how partnerships are managed.

Enabling interventions to improve community empowerment are listed below.

Overarching good practice and guidance statements: community empowerment[4]	
Existing guidance statement	Key population-led groups and organizations should be made essential partners and leaders in designing, planning, implementing and evaluating health services *(3)*.
Existing good practice statement	Programmes should implement a package of interventions to enhance community empowerment among key populations *(3, 79, 84, 85)*.

Violence

Violence against people from key populations is a common occurrence and can take various forms – physical, sexual or psychological, and can be perpetrated by different people, including intimate partners, clients, family members, strangers, service providers, law enforcement officers and others in positions of power *(140–147)*. Violence can be fuelled by the imbalance in the power dynamics of gender – by prejudice and discrimination against persons perceived to depart from conventional gender and sexuality norms and identities. Other characteristics such as age, disability or race can increase vulnerability to violence. Also, multiple structural factors influence vulnerability to violence, including discriminatory or harsh laws, and policing practices and cultural and social norms that legitimize stigma and discrimination.

Experience of violence has been shown to negatively impact on key populations' health, including increasing drug-related harms *(142, 148–152)*, reduced uptake of sexual and reproductive health services *(141)*, inconsistent condom use *(141, 147, 149, 153)*, depression and other mental health issues *(143, 154)*, and increased HCV infection risk *(155, 156)*, as well as having a direct impact on HIV and STI acquisition *(157)*. A modelling study estimated that reduced sexual violence against sex workers could reduce new HIV infections by 25% among sex workers and their clients *(158)*. Women, especially young women from key populations, including women who use drugs, female sex workers, people in prisons and transgender women, experience particularly high rates of physical, sexual and psychological abuse *(159)*.

The health sector has an important role to play in addressing violence by providing comprehensive health services, including: for sexual and reproductive health; providing referrals to other support services; gathering evidence through data and research; fostering prevention policies in other sectors; and advocating for violence to be recognized as a public health problem and for resource allocation *(160)*.

Those who experience sexual violence need timely access to post-rape care, including emergency contraception, safe abortion, post-exposure prophylaxis for HIV and other STIs, hepatitis B immunization and psychosocial care and support, as well as referrals to legal services *(161)*. HIV, viral hepatitis and STI prevention, diagnosis and treatment for key populations should include either on site or through strong referral and linkage, clinical and psychosocial care and support

[4] Please note, in the WHO guideline: *Prevention and treatment of HIV and other sexually transmitted infections for sex workers in low and middle-income countries: recommendations for a public health approach*, WHO recommended a package of interventions to enhance community empowerment among sex workers. This was a strong recommendation with very low quality of evidence. In 2014, all WHO recommendations related to key populations were consolidated and a new good practice statement developed to expand this recommendation to all key population groups, as included in the table above.

for survivors of violence, in line with WHO guidelines for responding to sexual violence *(161-162)*. Survivors may need treatment for physical injuries and longer-term mental health care. Health services also can document medico-legal evidence, which can assist survivors' access to justice. Supportive services also include hotlines, staffed by trained peer and other counsellors, to offer psychosocial support, as well as crisis response interventions, with multidisciplinary teams that link survivors to various services and safe spaces, without restrictions based on ongoing drug use *(84)*.

Efforts to address violence against people from key populations must involve other sectors along with the health sector. Together, they must create an enabling environment to promote physical, sexual and emotional wellbeing and safety. Critical enablers include mechanisms for documenting and monitoring violence, training people from key populations and other stakeholders to understand human rights, and for fostering the accountability of law enforcement officials to prevent and respond to violence and infringements of human rights *(162, 164)*. Evidence shows the effectiveness of participatory programmes that engage multiple stakeholders as well as community mobilization interventions *(165)*. Law enforcement practices can increase the risk of violence faced by key populations. Indeed, law enforcement officers themselves can be perpetrators. Work with law officers can involve training on the human rights of key populations, as well as promoting accountability for rights-based law enforcement *(162)*. Efforts to prevent violence can be promoted by advocacy for law and policy reforms that protect the rights and safety of key populations; increasing awareness of reporting mechanisms and disciplinary action; conducting sensitization workshops for people with pivotal roles (for example, government officials, law enforcement officers, prison staff, media, health care workers and religious leaders); the creation of safe spaces; and by creating early warning and rapid response mechanisms with the involvement of key population community members, health workers and law enforcement officials. Integrating community representatives into these efforts also helps to create channels of communication among key populations, civic officials and law enforcement officers *(162)*.

It also is important to monitor and document incidents of violence, both as evidence for advocacy and to inform programme design. Documenting the levels of violence faced by key populations is often the first step in creating awareness.

Enabling interventions to address violence against key populations are listed below.

Overarching good practice statements: violence	
Existing good practice statement	Violence against people from key populations should be prevented and addressed in partnership with key population-led organizations. All violence against people from key population groups should be monitored and reported, and redress mechanisms should be established to provide justice *(3, 79, 84, 85, 162)*.

CHAPTER 4

The recommended package of interventions

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 45 of 145

Introduction

This guideline consolidates WHO recommendations related to the prevention, diagnosis and treatment of HIV, viral hepatitis and STIs for key populations. The majority of these recommendations are described in full in other WHO guideline documents, including many that were first described in the 2014/2016 consolidated key populations guidelines *(3)*. For simplicity, in most cases the background, evidence and decision-making process related to each recommendation are not included in this guideline; rather the source document, which includes this information, is referenced. Certain recommendations were newly developed or updated in 2021/2022 as part of this guideline process; these are marked with a star, and details of evidence and decision-making are provided in the additional information chapter.

The interventions listed here have been categorized as follows:

1. **Essential for impact: enabling interventions**

   This includes all interventions recommended to reduce structural barriers to health services access for key populations.

2. **Essential for impact: health interventions**

   This includes health sector interventions that have a demonstrated direct impact on HIV, viral hepatitis and STIs in key populations.

3. **Essential for broader health**

   This includes health sector interventions to which access for key populations should be ensured, but do not have direct impact on HIV, viral hepatitis or STIs.

4. **Supportive**

   This includes health sector interventions which support the delivery of other interventions, such as creating demand, and providing information and education.

The tables below include recommendations which have been made through the GRADE process (see methods for details), good practice statements and summaries and links to relevant documents. The GRADE recommendations include the strength of the recommendation and certainty of the evidence as agreed by relevant Guideline Development Groups.

Packages of recommended interventions are provided for each key population group in Chapter 5.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 46 of 145

Recommended package

Note that these interventions are not in order of priority.

Also please note that this package includes a mix of existing and new recommendations, good practice statements and guidance statements. These can be classified as follows:

★ **New GRADE recommendation** – a recommendation which was newly developed as part of this guideline's development process, using the GRADE methodology as described in the methods section;

Existing GRADE recommendation – a recommendation which was developed as part of an already published WHO guideline;

★ **New good practice statement** – a good practice statement newly developed by the guideline development group as part of this guideline's development process, as described in the methods section;

Existing good practice statement – a good practice statement which was developed as part of an already published WHO guideline;

Existing guidance statements – overarching statements which summarize groups of existing recommendations and approaches;

WHO position – from position papers of the WHO Strategic Advisory Group of Experts (SAGE) on immunization; and

Adapted – for some of the recommendations and good practice statements, small changes to the wording have been made without substantial change.

Essential for impact: enabling interventions

Overarching good practice statements: removing punitive laws, policies and practices

Existing guidance statement	Laws, legal policies and practices should be reviewed and, where necessary, revised by policy-makers and government leaders, with meaningful engagement of stakeholders from key population groups to allow and support increased access to services for key populations *(3, 79, 83, 84)*.
Existing good practice statement (adapted)[5]	Countries should work toward decriminalization of behaviours such as drug use/injecting, sex work, same-sex activity and nonconforming gender identities, and toward elimination of the unjust application of civil law and regulations against people who use/inject drugs, sex workers, men who have sex with men and trans and gender diverse people *(3, 79, 82–85)*.

[5] In the 2014 *Consolidated guidelines for HIV prevention, diagnosis, treatment and care for key populations*, the wording of this good practice statement was: Countries should work toward decriminalization of behaviours such as drug use/injecting, sex work, same-sex activity and nonconforming gender identities, and toward elimination of the unjust application of civil law and regulations against people who use/inject drugs, sex workers, men who have sex with men and trans and gender diverse people.

Essential for impact: enabling interventions

Other good practice statements: removing punitive laws, policies and practices	
Existing good practice statement (adapted)[6]	Where criminalization continues, countries should work toward developing non-custodial alternatives to incarceration of people who use drugs, trans and gender diverse people, sex workers and people who engage in same-sex activity *(3, 82, 85)*.
Existing good practice statement (adapted)[7]	Countries should ban compulsory treatment[8] for key populations *(3, 82, 83, 85, 166)*.
Existing good practice statement	Countries should work toward developing policies and laws that decriminalize the use of sterile needles and syringes (and that permit NSPs) and that legalize OAMT for people who are opioid dependent *(3)*.
Existing good practice statement	The police practice of using possession of condoms as evidence of sex work and grounds for arrest should be eliminated *(3, 84)*.
Existing good practice statement	Countries should work towards legal recognition for trans and gender diverse people *(3, 79)*.
Existing good practice statement	Countries are encouraged to examine their current consent policies and consider revising them to reduce age-related barriers to HIV, STI and viral hepatitis services, and to empower providers to act in the best interests of adolescents *(3, 120)*.
Overarching good practice and guidance statements: stigma and discrimination	
Existing good practice statement	Countries should work towards implementing and enforcing anti-discrimination and protective laws, derived from human rights standards, to eliminate stigma, discrimination and violence against people from key populations *(3)*.
Existing good practice statement	Policy-makers, parliamentarians and other public health leaders should work together with civil society organizations, including key population-led organizations, in their efforts to monitor stigma, confront discrimination against key populations and change punitive legal and social norms *(3, 79, 81, 83–85, 118, 119)*.
Existing guidance statement	Health services should be made available, accessible and acceptable to people from key populations, based on the principles of medical ethics, avoidance of stigma, non-discrimination and the right to health *(3, 79, 81, 83–85, 118–120)*.

[6] In the 2014 *Consolidated guidelines for HIV prevention, diagnosis, treatment and care for key populations*, the wording of this good practice statement was: Countries should work toward developing non-custodial alternatives to incarceration of drug users, sex workers and people who engage in same-sex activity.

[7] In the 2014 *Consolidated guidelines for HIV prevention, diagnosis, treatment and care for key populations*, the wording of this good practice statement was: Countries should ban compulsory treatment for people who use and/or inject drugs.

[8] Compulsory, or involuntary, treatment includes treatment for drug dependence, so-called conversion therapy or rehabilitation of sex workers, which is against human rights and medical ethics principals of consent, freedom from arbitrary arrest, access to quality health, freedom from torture and cruel, inhumane and degrading treatment.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 48 of 145

Essential for impact: enabling interventions

Other good practice statements: stigma and discrimination

Existing good practice statement	Health care workers should receive appropriate recurrent training and sensitization to ensure that they have the skills and understanding to provide services for adults and adolescents from key populations, based on all persons' right to health, confidentiality and non-discrimination *(3)*.
Existing good practice statement	Services should be safe spaces that increase protection from the effects of stigma and discrimination, where adolescents can freely express their concerns, and where providers demonstrate patience, understanding, acceptance, non-judgement and knowledge about the choices and services available to the adolescent *(120)*.

Overarching guidance statement: community empowerment

Existing guidance statement	Key population-led groups and organizations should be made essential partners and leaders in designing, planning, implementing and evaluating health services *(3)*.

Other good practice statements: community empowerment

Existing good practice statement	Programmes should implement a package of interventions to enhance community empowerment among key populations *(3, 79, 84, 85)*.
Existing good practice statement	Programmes should be put in place to provide legal literacy and legal services for and by key populations, so that they know their rights and applicable laws and can receive support from the justice system when aggrieved *(3, 79, 84, 85)*.

Overarching good practice statement: addressing violence

Existing good practice statement	Violence against people from key populations should be prevented and addressed in partnership with key population-led organizations. All violence against people from key population groups should be monitored and reported, and redress mechanisms should be established to provide justice *(3, 79, 84, 85, 162)*.

Other good practice statements: addressing violence

Existing good practice statement	Health and other support services should be provided to all persons from key populations who experience violence. In particular, persons experiencing sexual violence should have timely access to comprehensive post-rape care in accordance with WHO guidelines *(3, 162)*.
Existing good practice statement	Law enforcement officials and health and social care providers need to be trained to recognize and uphold the human rights of key populations, and to be held accountable if they violate these rights, including perpetration of violence *(3, 79, 84, 85, 162)*.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 49 of 145

Essential for impact: health interventions

Prevention of STIs, HIV and viral hepatitis

Harm reduction (NSPs, OAMT and naloxone for overdose management)

Existing GRADE recommendation	All individuals from key populations who inject drugs should have access to sterile injecting equipment through NSPs *(strong recommendation, low certainty of evidence) (3, 83, 167)*.
Existing GRADE recommendation	It is suggested that NSPs also provide low dead-space syringes (LDSSs), along with information about their preventive advantage over conventional syringes *(this recommendation is conditional on local acceptability and resource availability) (168)*.
Existing GRADE recommendation	All people from key populations who are dependent on opioids should be offered OAMT[9] in keeping with WHO guidance (*strong recommendation, low certainty of evidence) (3, 83, 169)*, including those in prison and other closed settings *(170)*. Important considerations related to OAMT, including recommended doses, use in pregnancy and drug interactions are included in: Guidelines for the psychosocially assisted pharmacological treatment of opioid dependence Guidelines for the identification and management of substance use and substance use disorders in pregnancy
Existing GRADE recommendation	People likely to witness an opioid overdose should have access to naloxone and be instructed in its use for emergency management of suspected opioid overdose *(strong recommendation, very low certainty of evidence) (27)*.
	More details of community distribution of naloxone for overdose management can be found in the WHO guideline Community management of opioid overdose.

Condoms and lubricant

Existing GRADE recommendation	The correct and consistent use of insertive and receptive condoms with adequate supply of condom compatible lubricants is recommended to prevent sexual transmission of HIV, viral hepatitis and STIs through anal or vaginal sex[10] *(strong recommendation, moderate certainty of evidence) (3)*.

[9] Methadone or buprenorphine.

[10] Both HCV and HBV can be transmitted sexually, although sexual transmission of HCV is rare as it requires blood contact.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 50 of 145

Essential for impact: health interventions

Prevention of STIs, HIV and viral hepatitis (cont.)

Pre-exposure prophylaxis (PrEP) for HIV

Existing GRADE recommendation	Oral PrEP (containing tenofovir disproxyl fumarate) should be offered as an additional prevention choice for people at substantial risk of HIV infection as part of combination HIV prevention approaches *(strong recommendation, high certainty of evidence) (171).*
Existing GRADE recommendation	The dapivirine vaginal ring may be offered as an additional prevention choice for cisgender women at substantial risk of HIV infection as part of combination prevention approaches *(conditional recommendation, moderate certainty of evidence) (171).*
★ **New GRADE recommendation**	Long-acting injectable cabotegravir may be offered as an additional prevention choice for people at substantial risk of HIV infection, as part of combination prevention approaches *(conditional recommendation, moderate certainty of evidence) (172) .*

For detailed guidance on PrEP please see Consolidated guidelines on HIV prevention, testing, treatment, service delivery and monitoring: recommendations for a public health approach.

For implementation guidance, please see *Differentiated and simplified pre-exposure prophylaxis for HIV prevention: Update to WHO implementation guidance.*

Post-exposure prophylaxis (PEP) for HIV and STIs

Existing guidance statement	PEP should be available to all eligible people from key populations on a voluntary basis after possible exposure to HIV *(3).*
Existing guidance statement	For women who have been raped, a package of PEP, emergency contraception and presumptive treatment of STIs is recommended *(173).*

For detailed guidance on HIV PEP regimens, please see Consolidated guidelines on HIV prevention, testing, treatment, service delivery and monitoring: recommendations for a public health approach.

For detailed guidance on PEP for adults who have been sexually abused, please see WHO guidelines Responding to intimate partner violence and sexual violence against women.

For detailed guidance on PEP for children and adolescents who have been sexually abused, please see WHO guidelines Responding to children and adolescents who have been sexually abused.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 51 of 145

Essential for impact: health interventions

Prevention of STIs, HIV and viral hepatitis (cont.)

Prevention of vertical transmission of HIV, syphilis and HBV

Existing GRADE recommendation (adapted)[11]	HIV, syphilis and hepatitis B surface antigen (HBsAg)* tests should be offered at least once and as early as possible in pregnancy, ideally at the first antenatal care (ANC) visit *(syphilis: strong recommendation, moderate quality of evidence; HBsAg*: strong recommendation, low certainty of evidence) (174, 175).* * Particularly in settings with a ≥2% HBsAg seroprevalence in the general population. Recommended time points for HIV retesting for pregnant and postpartum key populations: early in pregnancy (first ANC visit); late in pregnancy (third trimester ANC visit); one additional postpartum retest (14 weeks, six months or nine months postpartum) *(175)*. Please see also STI testing below; chlamydia and gonorrhoea screening is recommended for all key populations, including those who are pregnant.
Existing guidance statement	Dual HIV/syphilis rapid diagnostic tests (RDTs) can be the first test in HIV testing strategies and algorithms in ANC *(176)*. HBsAG testing should be considered in addition when dual testing is performed.
Existing good practice statement (adapted)[12]	ART should be initiated urgently among all pregnant and breast and chest feeding people living with HIV, even if they are identified late in pregnancy or postpartum, because the most effective way to prevent HIV vertical transmission is to reduce maternal viral load *(171)*.
Existing GRADE recommendation (adapted)[13]	For early syphilis in pregnancy, the WHO STI guideline suggests using benzathine penicillin G 2.4 million units once intramuscularly over procaine penicillin 1.2 million units intramuscularly once daily for 10 days *(conditional recommendation, very low certainty of evidence) (177)*.
Existing GRADE recommendation (adapted)[14]	WHO recommends that those who test positive for HBV infection (HBsAg positive) with an HBV DNA ≥ 5.3 log10 IU/mL (≥ 200,000 IU/mL) during pregnancy receive tenofovir prophylaxis from the 28th week of pregnancy until at least birth, to prevent vertical transmission of HBV. This is in addition to three-dose hepatitis B vaccination in all infants, including timely birth dose *(conditional recommendation, moderate certainty of evidence) (178)*.
Existing GRADE recommendation (adapted)[15]	WHO recommends that in settings in which antenatal HBV DNA testing is not available, hepatitis B e antigen (HBeAg) testing can be used as an alternative to HBV DNA testing to determine eligibility for tenofovir prophylaxis to prevent vertical transmission of HBV2 *(conditional recommendation, moderate certainty of evidence) (178).* Please see also: WHO technical brief: preventing HIV during pregnancy and breastfeeding in the context of PrEP.

[11] Recommendations related to prevention of vertical transmission of HIV, syphilis and HBV have been reworded to be more gender inclusive.
[12] Ibid.
[13] Ibid.
[14] Recommendations related to prevention of vertical transmission of HIV, syphilis and HBV have been reworded to be more gender inclusive.
[15] Ibid.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 52 of 145

Essential for impact: health interventions

Prevention of STIs, HIV and viral hepatitis (cont.)

Hepatitis B vaccination

Existing WHO position	WHO recommends hepatitis B vaccination of persons at high risk of HBV infection.[16] Please find further details in WHO position paper: Hepatitis B vaccines: – July 2017
Existing GRADE recommendation	It is suggested to offer people who inject drugs the rapid hepatitis B vaccination regimen[17] *(conditional recommendation, very low certainty of evidence) (168).*

Addressing chemsex

★ **New good practice statement**	Addressing chemsex*, especially for key populations and their sexual partners, requires a comprehensive, non-judgemental and person-centred approach. This can include integrated sexual and reproductive health, mental health, access to sterile needles and syringes and OAMT services, with linkages to other evidence-based prevention, diagnostic and treatment interventions. *Chemsex, for the purpose of these guidelines, is defined as when individuals engage in sexual activity, while taking primarily stimulant drugs, typically involving multiple participants and over a prolonged period. Further details on evidence, decision-making, implementations, considerations and research gaps related to this new recommendation can be found in Chapter 9.

Diagnosis

HIV testing services

Existing guidance statement	In high and low HIV-burden settings, HIV testing should be offered to all key populations and their partners in all services as an efficient and effective way to identify people with HIV *(175).*
Existing guidance statement	It is recommended to offer retesting at least annually to all people from key populations. Depending on individual risk behaviours, more frequent voluntary retesting can be offered *(175).* Mathematical modelling among key populations in Viet Nam shows that retesting for key populations is cost effective. Bi-annual testing for key populations may be considered in similar settings, and should prioritize those at higher risk *(179).*

[16] Including key populations, persons with chronic liver disease, including those with hepatitis C, persons with HIV infection, and sexual contacts of persons with chronic HBV infection, as well as health care workers and others who may be exposed to blood, blood products or other potentially infectious body fluids.

[17] While this recommendation includes only people who inject drugs, this approach may be appropriate for all key populations receiving HBV vaccination.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 53 of 145

Essential for impact: health interventions

Diagnosis (cont.)

HIV testing services (cont.)

Existing GRADE recommendation	Community-based HIV testing services for key populations linked to prevention, treatment and care services are recommended, in addition to routine, facility-based HIV testing services in all settings (*strong recommendation, low certainty of evidence*) *(175)*.
Existing GRADE recommendation	Lay providers who are trained can, using rapid diagnostic tests, independently conduct safe and effective HIV testing services *(strong recommendation, moderate certainty of evidence) (175)*.
Existing GRADE recommendation	HIV self-testing should be offered as an approach to HIV testing services (*strong recommendation, moderate certainty of evidence*) *(175)*. *Please note that self-testing means an individual performing a test on themselves in private or under observation of a professional if they so desire. It should be voluntary and cannot be forced or coerced by anyone. Importantly, people who have self-tested should not be forced to disclose the results of that test to anyone, and should only do so on a voluntary basis.*
Existing GRADE recommendation	Social network-based approaches can be offered as an approach to HIV testing key populations as part of a comprehensive package of care and prevention *(conditional recommendation, very low certainty of evidence) (175)*.
Existing GRADE recommendation	Provider-assisted referral should be offered for all people with HIV as part of a voluntary comprehensive package of testing and care (including key populations) *(strong recommendation, moderate certainty of evidence) (175).* *Please note that particularly for sex workers, the risks associated with disclosing an HIV diagnosis to either clients or regular partners must be carefully considered and should always be voluntary. People who are experiencing intimate partner or other violence need assessment, support, documentation, treatment of any injuries and referral to appropriate services (162).*
Existing guidance statement	Dual HIV/syphilis RDTs may be considered for use among key populations and can increase access to both HIV and syphilis testing services *(181)*. Further testing to confirm syphilis diagnosis or offer of treatment depends on local epidemiology, past treatment history, available resources and confirmatory testing capacity, and national protocols. Mathematical modelling among key populations in Viet Nam shows that using dual HIV/syphilis RDT is cost-saving compared to separate HIV and syphilis tests at current coverage *(179)*.
	For detailed guidance on HIV testing, please see Consolidated guidelines on HIV testing services.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 54 of 145

Essential for impact: health interventions

Diagnosis (cont.)

STI testing

Existing guidance statement	Screening and diagnosing STIs for key populations is a crucial part of a comprehensive response to HIV and STIs *(3)*.
Existing GRADE recommendation	Offering periodic testing for asymptomatic urethral and rectal *N. gonorrhoeae* and *C. trachomatis* infections using nucleic acid amplification tests (NAAT) is suggested over not offering such testing for men who have sex with men and trans and gender diverse people *(conditional recommendation, low certainty of evidence) (79)*.
Existing GRADE recommendation	Offering periodic serological testing for asymptomatic syphilis infection to men who have sex with men and trans and gender diverse people is strongly recommended over not offering such screening *(strong recommendation, moderate certainty of evidence) (79)*.
Existing GRADE recommendation	WHO suggests offering periodic screening for asymptomatic sexually transmitted infections* to sex workers *(conditional recommendation, low certainty of evidence) (84)*. *Chlamydia, gonorrhoea and syphilis
Existing GRADE recommendation	Self-collection of samples for *Neisseria gonorrhoeae* and *Chlamydia trachomatis* should be made available as an additional approach to deliver STI testing services *(strong recommendation, moderate certainty of evidence) (182)*.
Existing GRADE recommendation	For people with symptoms of: 1) urethral discharge from the penis or 2) anorectal discharge and report receptive anal sex, management is recommended to be based on the results of quality-assured molecular assays. However, in settings with limited or no molecular tests or laboratory capacity, WHO recommends syndromic treatment to ensure treatment on the same day of the visit *(strong recommendation, moderate certainty of evidence) (183)*.
Existing GRADE recommendation	For people who present with genital ulcers (including anorectal ulcers), WHO recommends treatment based on quality-assured molecular assays of the ulcer. However, in settings with limited or no molecular tests or laboratory capacity, WHO recommends syndromic treatment to ensure treatment on the same day of the visit *(strong recommendation, moderate certainty of evidence) (183)*.
	For detailed guidance screening and diagnosis of different STIs please see: Guidelines for the management of symptomatic sexually transmitted infections WHO guidelines for the treatment of *Neisseria gonorrhoeae* WHO guidelines for the treatment of *Treponema pallidum* (syphilis) WHO guideline on syphilis screening and treatment for pregnant women WHO guidelines for the treatment of *Chlamydia trachomatis* WHO guidelines for the treatment of genital herpes simplex virus

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 55 of 145

Essential for impact: health interventions

Diagnosis (cont.)

Hepatitis C testing

Existing GRADE recommendation	In all settings (and regardless of whether delivered through facility- or community-based or self-testing testing), it is recommended that serological testing for HCV antibody (anti-HCV) be offered, with linkage to prevention, confirmatory diagnosis, care and treatment services, to the following individuals *(184)*: • adults and adolescents from populations most affected by HCV infection (i.e., who are either part of a population with high HCV seroprevalence or who have a history of exposure and/or high-risk behaviours for HCV infection)[18]; and • adults, adolescents and children with a clinical suspicion of chronic viral hepatitis C (i.e., symptoms, signs, laboratory markers). *(strong recommendation, low certainty of evidence).* For detailed guidance on HCV testing: how to test, how to confirm viraemic HCV infection and which assays to use, please see Guidelines on hepatitis B and C testing.
★ **New GRADE recommendation**	People at ongoing risk and a history of treatment-induced or spontaneous clearance of HCV infection may be offered 3–6-monthly testing for presence of HCV viremia (*conditional recommendation, very low certainty of evidence*). Remarks: • Testing should be voluntary and not be used to further stigmatize any populations at ongoing risk. • Testing should be offered alongside primary prevention services that are evidence-based and reduce transmission risks, and in combination with appropriate treatment access and linkage. • To detect presence of viremic infection, the use of quantitative or qualitative nucleic acid testing (NAT) for detection of HCV RNA, or alternatively an assay to detect HCV core antigen, can be performed. Further details on evidence, decision-making, implementation considerations and research gaps related to this new recommendation can be found in Chapter 9.
Existing GRADE recommendation	HCV self-testing should be offered as an additional approach to HCV testing services (*strong recommendation, moderate certainty of evidence) (185)*.

[18] Includes those who are either part of a population with higher seroprevalence (e.g., some mobile/migrant populations from high/intermediate endemic countries, and certain indigenous populations), or who have a history of exposure or high-risk behaviours for HCV infection (e.g., people who inject drugs, people in prisons and other closed settings, men who have sex with men and sex workers, and HIV-infected persons, children of mothers with chronic HCV infection, especially if HIV-coinfected).

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 56 of 145

Essential for impact: health interventions

Diagnosis (cont.)

Hepatitis B testing

Existing GRADE recommendation

In all settings (and regardless of whether delivered through facility- or community-based testing), it is recommended that HBsAg serological testing and linkage to prevention, care and treatment services be offered to the following individuals *(184)*:

- adults and adolescents from populations most affected by HBV infection (i.e., who are either part of a population with high HBV seroprevalence or who have a history of exposure and/or high-risk behaviours for HBV infection);
- adults, adolescents and children with a clinical suspicion of chronic viral hepatitis (i.e., symptoms, signs, laboratory markers);
- all pregnant women (at least once and as early as possible, ideally at the first ANC visit); and
- sexual partners, children and other family members, and close household contacts of those with HBV infection.

(strong recommendation, low certainty of evidence)

For detailed guidance on HBV testing and diagnosis, please see Guidelines on hepatitis B and C testing.

Treatment

HIV treatment

Existing GRADE recommendation

ART should be initiated in all adults living with HIV, regardless of WHO clinical stage and at any CD4 cell count (*strong recommendation, moderate certainty of evidence*) *(171)*.

For detailed guidance on HIV treatment, please see Consolidated guidelines on HIV prevention, testing, treatment, service delivery and monitoring: recommendations for a public health approach.

Please also see the service delivery chapter for details of differentiated service delivery for ART.

★

New guidance statement

Successful ART with viral suppression prevents HIV transmission to sexual partners: there is no transmission when viral load is undetectable or suppressed (less than or equal to 1000 copies/ML) *(186–188)*.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 57 of 145

Essential for impact: health interventions

Treatment (cont.)

HIV-associated TB

Existing GRADE recommendation	People living with HIV should be systematically screened for TB disease at each visit to a health facility *(strong recommendation, very low certainty of evidence) (189)*.
Existing GRADE recommendation	ART should be started as soon as possible within two weeks of initiating TB treatment, regardless of CD4 cell count, among people living with HIV* *(strong recommendation, low-moderate certainty of evidence for adults and adolescents, very low certainty of evidence for children).* *Except when signs and symptoms of meningitis are present
Existing GRADE recommendation	WHO recommends ART for all people with HIV and drug-resistant TB, requiring second-line anti-TB drugs irrespective of CD4 cell count, as early as possible (within the first eight weeks) following initiation of anti-TB treatment *(strong recommendation, very low certainty of evidence) (190, 191)*.
Existing GRADE recommendation	Adults and adolescents living with HIV who are unlikely to have active TB should receive TB preventive treatment as part of a comprehensive package of HIV care. Treatment should also be given to those receiving ART, to pregnant women and to those who have previously been treated for TB, irrespective of the degree of immunosuppression, and even if TB infection testing is unavailable *(strong recommendation, high certainty evidence) (192)*.
Existing GRADE recommendation	Routine co-trimoxazole prophylaxis should be given to all people living with HIV with active TB disease regardless of CD4 cell count *(strong recommendation, high certainty of evidence) (190)*.
	For detailed guidance on TB/HIV, please see Consolidated guidelines on HIV prevention, testing, treatment, service delivery and monitoring: recommendations for a public health approach. WHO guidelines on TB can be accessed here.

STI treatment

	STIs disproportionately affect key populations and should be diagnosed and treated in a timely manner following WHO guidelines. For detailed guidance on treating different STIs please see: Guidelines for the management of symptomatic sexually transmitted infections WHO guidelines for the treatment of *Neisseria gonorrhoeae* WHO guidelines for the treatment of *Treponema pallidum* (syphilis) WHO guideline on syphilis screening and treatment for pregnant women WHO guidelines for the treatment of *Chlamydia trachomatis* WHO guidelines for the treatment of genital herpes simplex virus

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 58 of 145

Essential for impact: health interventions

Treatment (cont.)

HCV treatment	
Existing GRADE recommendation	WHO recommends offering treatment to all individuals diagnosed with HCV infection who are 12 years of age or older, irrespective of disease stage *(strong recommendation, moderate certainty of evidence) (193).*
Existing GRADE recommendation	WHO recommends the use of pan-genotypic direct-acting antiviral (DAA) regimens for treatment of all adults, adolescents and children aged 3 years and above with chronic hepatitis C virus infection, regardless of stage of disease. Adults (18 years and above): *(strong recommendation, moderate certainty of evidence).* Adolescents (12–17 years): *(strong recommendation; moderate-low certainty of evidence).* For detailed guidance on HCV treatment, please see: Guidelines for the care and treatment of persons diagnosed with chronic hepatitis C virus infection and, Updated recommendations on treatment of adolescents and children with chronic HCV infection and HCV simplified service delivery and HCV diagnostics
★ **New GRADE recommendation**	Pan-genotypic DAA-HCV treatment should be offered without delay to people with recently acquired HCV infection and ongoing risk *(strong recommendation, very low certainty of evidence).* Remarks: • Individuals with recently acquired infection must have the option to make an informed choice about starting treatment immediately or delaying treatment initiation. • Treatment for recently acquired infection should be offered alongside additional, evidence-based interventions to reduce HCV risk and primary prevention services. Further details on evidence, decision-making, implementation considerations and research gaps related to this new recommendation can be found in the Chapter 9.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 59 of 145

Essential for impact: health interventions

Treatment (cont.)

HBV treatment

Existing GRADE recommendation	As a priority, all adults, adolescents and children with chronic hepatitis B and clinical evidence of compensated or decompensated cirrhosis (or cirrhosis based on APRI score >2 in adults) should be treated, regardless of ALT levels, HBeAg status or HBV DNA levels *(194)* *(strong recommendation, moderate certainty of evidence).*
Existing GRADE recommendation	Treatment is recommended for adults with chronic hepatitis B who do not have clinical evidence of cirrhosis (or based on APRI score ≤2 in adults), but are aged more than 30 years (in particular), and have persistently abnormal ALT levels and evidence of high-level HBV replication (HBV DNA >20 000 IU/mL), regardless of HBeAg status *(194)* *(strong recommendation, moderate certainty of evidence).*
Existing GRADE recommendation	Where HBV DNA is not available: Treatment may be considered based on persistently abnormal ALT levels alone, regardless of HBeAg status *(194) (conditional recommendation, low certainty of evidence).* For detailed guidance on HBV treatment, please see Guidelines for the prevention, care and treatment of persons with chronic hepatitis B infection.

Essential for broader health: health interventions

Anal health

★ **New guidance statement**	WHO does not have specific recommendations about anal health or anal cancer, but people infected with HIV are at least 20 times more likely to be diagnosed with anal cancer than uninfected people *(195)*. Like cancer of the cervix, anal cancer is associated with human papillomavirus (HPV) and HPV is vaccine-preventable for all people.[19] Cytological screening can be performed for anal cancer and its precursors, known as anal high-grade squamous intraepithelial lesions, particularly for men who have sex with men, trans and gender diverse people and other people who are more likely to engage in anal sex.

Conception and pregnancy care

Existing guidance statement (adapted)[20]	It is important that all members of key population groups have the same support and access to services related to conception and pregnancy care as pregnant people who are not members of key population groups, as indicated by WHO guidelines *(3)*.
	WHO has various guidelines on conception and pregnancy. Please see the WHO maternal health webpage. For specific recommendations related to pregnancy and HIV, please see Consolidated guideline on sexual and reproductive health and rights of women living with HIV.

[19] Achieving high HPV vaccination coverage in girls (>80%) reduces the risk of HPV infection for boys. Vaccination of secondary target populations, e.g., females aged ≥15 years or males, is recommended only if this is feasible, affordable, cost-effective, and does not divert resources from vaccination of the primary target population or from effective cervical cancer screening programmes *(196)*.

[20] This guidance statement has been reworded to be more gender inclusive.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 60 of 145

Essential for broader health: health interventions

Contraception

	WHO does not have an overarching recommendation related to contraception for key populations, but publishes medical eligibility criteria for contraceptive use (MEC), which provides guidance on the safety of various contraceptive methods for use in the context of specific health conditions and characteristics *(197)*.
Existing guidance statement	All hormonal contraceptive methods and intrauterine devices (IUDs) now fall into Category 1 of the MEC for women at high risk of HIV. Thus, women at high risk of HIV can use all methods of contraception without restriction.
	For detailed guidance on contraception, please see: Medical eligibility criteria for contraceptive use Selected practice recommendations for contraceptive use Contraceptive eligibility for women at high risk of HIV Please see also the service delivery chapter for details of integrating HIV, family planning and STI services.

Gender-affirming care[21]

Existing guidance statement	Trans and gender diverse individuals who self-administer gender-affirming hormones require access to evidence-based information, quality products and sterile injection equipment *(182)*. The principles of gender equality and human rights in the delivery of quality gender-affirming hormones are critical to expanding access to this important intervention and reducing discrimination based on gender identity *(182)*.

Mental health

Existing guidance statement	Routine screening and management for mental health issues (particularly depression and psychosocial stress) should be provided for people from key populations in keeping with the principles of consent, confidentiality and evidence-based quality *(3)*.
	WHO does not have overarching recommendations related to preventing or treating mental health issues for key populations. Instead, specific mental health issues and recommendations and a practical guide on addressing mental health issues in non-specialized health settings is provided by the mental health gap action programme (MhGAP): MhGAP Evidence Resource Centre MhGAP intervention guide

[21] WHO guidelines on health services for trans and gender diverse people are under development at the time of writing. They should be available in 2023.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 61 of 145

Essential for broader health: health interventions

Prevention, assessment and treatment of cervical cancer

Existing WHO position	WHO recommends that all countries proceed with nationwide introduction of HPV vaccination. For the prevention of cervical cancer, the WHO-recommended primary target population for HPV vaccination is girls aged 9–14 years, prior to becoming sexually active. Vaccination strategies should initially prioritize high coverage in this priority population *(196)*.
Existing GRADE recommendation	HPV self-sampling should be made available as an additional approach to sampling in cervical cancer screening services for individuals aged 30–60 years *(strong recommendation, moderate certainty of evidence) (182)*.
Existing guidance statement	All people with a female reproductive system are at risk for cervical cancer. Recommendations for cervical cancer prevention, screening and treatment can be found in the WHO guideline for screening and treatment of cervical pre-cancer lesions for cervical cancer prevention, which includes 16 new and updated recommendations and good practice statements for women living with HIV *(198, 199)*. For detailed guidance on cervical cancer prevention, screening and treatment, please see: WHO guideline for screening and treatment of cervical pre-cancer lesions for cervical cancer prevention New WHO recommendations on screening and treatment to prevent cervical cancer among women living with HIV

Safe abortion

Existing guidance statement	Abortion laws and services should protect the health and human rights of all women, including those from key populations *(3)*.
Existing GRADE recommendation	WHO recommends the full decriminalization of abortion; recommends against laws and other regulations that restrict abortion by grounds; recommends that abortion be available on the request of the woman, girl or other pregnant person; and recommends against laws and other regulations that prohibit abortion based on gestational age limits (*strong recommendations*) *(200)*. For detailed guidance on safe abortion, please see Abortion care guideline.

Screening and treatment for hazardous and harmful alcohol and other substance use

Existing GRADE recommendation (adapted)[22]	All key populations with hazardous and harmful alcohol or other substance use should have access to evidence-based interventions, including brief psychosocial interventions involving assessment, specific feedback and advice *(conditional recommendation, very low certainty of evidence) (3, 201, 202)*.
	For details on recommended, evidence-based interventions for the screening and treatment of hazardous and harmful drug and alcohol use please see: MhGAP Evidence Resource Centre MhGAP intervention guide The Alcohol, Smoking and Substance Involvement Screening Test (ASSIST) International standards for the treatment of drug use disorders

[22] The original wording of the recommendation was: All key populations with harmful alcohol or other substance use should have access to evidence-based interventions, including brief psychosocial interventions involving assessment, specific feedback and advice.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 62 of 145

Essential for broader health: health interventions

TB prevention, screening, diagnosis and treatment

Existing GRADE recommendation	Systematic screening for TB disease should be conducted in prisons and penitentiary institutions *(strong recommendation, very low certainty of evidence) (189)*.
Existing GRADE recommendation	Systematic screening for TB disease may be conducted among subpopulations with structural risk factors for TB. These include urban poor communities, homeless communities, communities in remote or isolated areas, indigenous populations, migrants, refugees, internally displaced persons and other vulnerable or marginalized groups with limited access to health care *(conditional recommendation, very low certainty of evidence) (189).*
Existing GRADE recommendation	Systematic TB infection testing and treatment may be considered for people in prisons, health workers, immigrants from countries with a high TB burden, homeless people and people who use drugs *(conditional recommendation, low to very low certainty in the estimates of effect) (192).*

TB prevention, screening, diagnosis and treatment

Existing GRADE recommendation	In settings where the TB prevalence in the general population is 100/100 000 population or higher, systematic screening for TB disease may be conducted among people with a risk factor for TB* who are either seeking health care or who are already in care (*conditional recommendation, very low certainty of evidence*) *(189).* *Substance use disorders and alcohol use disorders are considered risk factors. Additional guidance on TB prevention, screening, diagnosis and treatment is available: Consolidated guidelines on tuberculosis Module 1: Prevention: Tuberculosis preventive treatment Consolidated guidelines on tuberculosis Module 2: Screening – Systematic screening for tuberculosis disease Consolidated guidelines on tuberculosis Module 3: Diagnosis – Rapid diagnostics for tuberculosis detection Consolidated guidelines on tuberculosis Module 4: Treatment – Drug-resistant tuberculosis treatment

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 63 of 145

Supportive interventions

Behavioural interventions, counselling, demand creation, information and education can all support the interventions listed above. In the development of this guideline, we did not find evidence for the effectiveness of counselling behavioural interventions that aim to change risk behaviours (see below).

While we did not review evidence related to other types of behavioural or supportive interventions, and there is limited WHO guidance on these interventions, they may be helpful depending on the context and population. These include:

- information and education which support key populations to understand their health, health risks, available services and legal rights;
- interventions which aim to increase demand (demand creation) for evidence-based HIV, viral hepatitis and STI services;
- supportive counselling which does not aim to change behaviours; and
- counselling for mental health issues.

In general, the structural barriers which are described in the previous chapter make changing behaviours and improving uptake and retention in services for key populations difficult, and these should be addressed as a priority.

Behavioural interventions

★

New good practice statement

When planning and implementing a response for HIV, viral hepatitis and STIs, policy-makers and providers should be aware that counselling behavioural interventions that aim to change behaviours to reduce risks associated with these infections for key populations have not been shown to have an effect on HIV, viral hepatitis and STI incidence nor on risk behaviour such as condom use and needle sharing. Counselling and information-sharing, not aimed at changing behaviours, can be a key component of engagement with key populations, and when provided it should be in a non-judgmental manner, alongside other prevention interventions and with involvement of peers.

Remarks:

- Addressing structural and social barriers is critical to create environments which permit supportive and impactful counselling.
- Counselling interventions which promote abstinence from drug use, rehabilitation or cessation of sex work or drug use, or a so-called cure for homosexuality or gender incongruence (for example, so-called conversion therapy)* are not recommended, and create barriers to key population service access.

* Compulsory, or involuntary, treatment for drug dependence, so-called conversion therapy or rehabilitation of sex workers is against human rights and medical ethics principals of consent, freedom from arbitrary arrest, access to quality health, freedom from torture and cruel, inhuman and degrading treatment.

Further details on evidence, decision-making, implementation considerations and research gaps related to this new practice statement can be found in Chapter 9.

CHAPTER 5

Packages by key population

Introduction

This chapter presents the above-recommended interventions as packages per key population. It should be noted that there is much cross over between key populations; for example, sex workers who inject drugs and men who have sex with men who sell sex, and for those people, additional interventions to the ones presented below may be needed. Person-centred care means assessing each person's health needs and providing evidence-based interventions in an integrated and accessible way. The tables of packages below are provided as guidance only.

Sex workers

Background

Sex workers include female, male, trans and gender diverse adults (18 years of age and above) who receive money or goods in exchange for sexual services, either regularly or occasionally. Sex work is consensual sex between adults, can take many forms, and varies between and within countries and communities. Sex work also varies in the degree to which it is more or less "formal", or organized *(3, 84)*. Increasingly, sex workers are meeting and staying in contact with their clients online.

As defined in the Convention on the Rights of the Child (CRC), children and adolescents under the age of 18 who exchange sex for money, goods or favours are "sexually exploited" and not defined as sex workers *(203, 204)*. (Please see Chapter 7 on young key populations.)

Sex workers in many places are highly vulnerable to HIV and STIs due to multiple factors, including large numbers of sex partners, unsafe working conditions, barriers to the negotiation of consistent condom use, and intersecting social determinants of poor health. These include lack of social protection and housing, food insecurity, reduced education opportunities and disability. Moreover, sex workers often have reduced control over these factors due to structural barriers that increase their risk of unprotected sex and reduce access to health services (please see the chapter on critical enablers). In particular, sex workers may be harassed by law enforcement officers, including the practice of officers confiscating and using condoms and mobile phones as evidence of sex work; be subjected to violence from law enforcement officers, clients and intimate partners; and experience stigma and discrimination in health and other settings. As a result, sex workers are disproportionately affected by HIV and STIs. For the most recent data related to HIV, syphilis and sex workers, please access UNAIDS Key Populations Atlas.

The recommended package of interventions for sex workers includes enabling interventions that should be implemented as a priority, including the decriminalization of sex work (namely, removing all offences that criminalize sex workers, clients and third parties). Addressing these barriers would not only ensure sex workers' human rights, but also have an impact on HIV, STIs and viral hepatitis in all settings where sex work is criminalized and sex workers experience stigma, discrimination and violence *(68, 75)*. Other essential interventions are health interventions related to HIV and STI prevention, testing and treatment.

The majority of participants in the key populations values and preferences qualitative research (for the detailed report, please see Web Annex B) were opposed to the periodic presumptive treatment (PPT) of STIs, citing both health and ethical concerns. Participants noted an array of potential health risks associated with prolonged antibiotic use, including antibiotic resistance, kidney damage, depression and impacts on vaginal health. Additionally, participants expressed concerns surrounding the ethical implications of PPT and its role in perpetuating stigma and vulnerability. Others attested to the role of PPT in reinforcing stereotypes of sex workers as vectors of disease. Rather than offering sex workers PPT for STIs, participants stressed the need for increased access to STI testing and evidence-based prevention methods. For these reasons, the recommendation to provide PPT for STIs for sex workers is not included in these guidelines. If sex workers wish to prevent STI acquisition through PPT, this should always be voluntary, in full understanding of the potential complications, only in settings where aetiological diagnosis is not possible, and in consultation with health care providers.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 66 of 145

WHO recommends expanding access to aetiological diagnosis of STIs for sex workers as a priority, as well as suggesting offering periodic screening for asymptomatic STIs to sex workers. Offering voluntary periodic screening for HIV and the other main curable STIs, such as syphilis, gonorrhoea and clamydia, is particularly relevant for sex workers, due to the severe consequences of STIs, including infertility. In cases of pregnancy, untreated STIs can also lead to severe adverse pregnancy outcomes, such as prematurity, neonatal death, low-birth weight and congenital anomalies. WHO has specific recommendations for the treatment of the main STIs, suppressive therapy for genital herpes, and for the management of syndromes when the aetiology cannot be investigated for the most appropriate treatment *(183)*.

While evidence of increased prevalence of HCV and HBV in men who have sex with men is clear *(12)*, concerns about viral hepatitis in female and trans and gender diverse sex workers are new and emerging, and there is little data available to understand global prevalence of HBV and HCV among these populations. For female and trans and gender diverse sex workers who are living with HIV, there may be an increased risk of HCV and HBV *(205)*, although evidence is scarce, and additional small studies have shown increased risk for mono-infections *(18)*. However, HCV prevalence is high in people who inject drugs *(206)* and in people in prisons *(207)*, and there is considerable intersection between female and trans and gender diverse sex workers and these other key populations, indicating a need to ensure access to viral hepatitis prevention, testing and treatment for these groups. For this reason, viral hepatitis prevention, testing and treatment are included in the package of essential health interventions for all sex workers.

Other health issues are of particular concern to sex workers, including: those related to sexual and reproductive health (safe abortion, contraception, conception and antenatal care); those related to cervical and anal cancer prevention; and those related to screening and treatment for mental health issues, and for hazardous or harmful alcohol and substance use. In particular, the results of qualitative research undertaken by four global networks of key populations showed that addressing mental health was a priority for key populations. While global data on TB among sex workers is not available, sex workers who live and work in cramped conditions may be at increased risk of TB. These are essential interventions to address broader health beyond HIV, STIs and viral hepatitis, and access for key populations should be ensured.

The package of essential interventions for sex workers does not include those that are specifically related to HIV and viral hepatitis prevention for people who inject drugs (namely, NSPs, OAMT and naloxone for overdose management), or to gender-affirming care for trans and gender diverse people. However, for sex workers who inject drugs or who are trans and gender diverse, these are relevant interventions that should be made available, as outlined in the specific packages for these key populations.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 67 of 145

Recommended package for sex workers

These interventions are not in order of priority.

Essential for impact: enabling interventions
Removing punitive laws, policies and practices
Reducing stigma and discrimination
Community empowerment
Addressing violence
Essential for impact: health interventions
Prevention of HIV, viral hepatitis and STIs
Condoms and lubricant
Pre-exposure prophylaxis for HIV
Post-exposure prophylaxis for HIV and STIs
Prevention of vertical transmission of HIV, syphilis and HBV
Hepatitis B vaccination
Addressing chemsex
Diagnosis
HIV testing
STI testing
Hepatitis B and C testing
Treatment
HIV treatment
Screening, diagnosis, treatment and prevention of HIV associated TB
STI treatment
HBV and HCV treatment
Essential for broader health: health interventions
Anal health
Conception and pregnancy care
Contraception
Mental health
Prevention, assessment and treatment of cervical cancer
Safe abortion
Screening and treatment for hazardous and harmful alcohol and other substance use

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 68 of 145

People who inject drugs

Background

People who inject drugs refers to people who inject psychoactive substances for non-medical purposes. These drugs include, but are not limited to, opioids, amphetamine-type stimulants, cocaine and hypno-sedatives including new psychoactive substances.[23] Injection may be through intravenous, intramuscular, subcutaneous or other injectable routes. People who self-inject medicines for medical purposes – referred to as "therapeutic injection" – are not included in this definition. While these guidelines focus on people who inject drugs because of their specific risk of HIV and HCV transmission, due to the sharing of blood-contaminated injection equipment, much of this guidance is also relevant for people who use substances through other routes of administration, such as snorting, smoking and ingestion *(3)*.

In many countries drug use or possession is criminalized, and in almost every country it is considered immoral and significant stigma and discrimination is experienced by people who use drugs (please see the critical enablers chapter). At the time of writing there is extremely low coverage of the evidence-based package of NSPs and OAMT *(208)*. As a direct result, people who inject drugs are disproportionately affected by HIV and viral hepatitis. For most recent data related to HIV, viral hepatitis and people who inject drugs, please access UNAIDS Key Populations Atlas, the World Drug Report and the Global state of harm reduction.

For impact on HIV and viral hepatitis, structural barriers for people who inject drugs need to be addressed, including decriminalizing drug use and possession for personal use, ending forced detention in compulsory drug treatment centres, addressing violence, stigma and discrimination, and empowering communities of people who use drugs. People who use drugs in particular face additional barriers to accessing health services where cessation of drug use is a condition for eligibility. Women who inject drugs may be more stigmatized than their male counterparts, and many sell sex to pay for both their and their partner's drugs. Fear of losing custody of their children may make mothers who inject drugs less likely to access reproductive and other health services (*209*). They may experience more police harassment and violence than men who inject drugs. The impact of these barriers on HIV and viral hepatitis acquisition is clear *(64, 73, 210)*, and for this reason the enabling interventions listed in the table below are considered essential for impact for people who inject drugs.

Harm reduction is one of the key elements of a public health promotion framework (or response) that has been proven highly effective in reducing and mitigating the harms of injecting drug use for individuals and communities. WHO defines harm reduction as a comprehensive package of evidence-based interventions, based on public health and human rights, including NSPs, OAMT and naloxone for overdose management. Harm reduction also refers to policies and strategies that aim to prevent major public and individual health harms, including HIV, viral hepatitis and overdose, without necessarily stopping drug use.

High prevalence and incidence of HIV and viral hepatitis B and C in people who inject drugs call for countries to prioritize the provision of HIV and viral hepatitis prevention (particularly NSPs, OAMT and naloxone for overdose management), testing and treatment interventions.

Pre-exposure prophylaxis (PrEP) is an evidence-based HIV prevention intervention. Although there is strong evidence that PrEP is highly protective for sexual HIV transmission, evidence is more limited for the prevention of parenteral HIV transmission. PrEP services for people who inject drugs and their sexual partners can provide benefits both in the prevention of sexual transmission, and likely in the prevention of HIV, acquired through unsafe injection practices. PrEP services should

[23] UNODC uses the term "new psychoactive substances" which are defined as "substances of abuse, either in a pure form or a preparation, that are not controlled by the 1961 Single Convention on Narcotic Drugs or the 1971 Convention on Psychotropic Substances, but which may pose a public health threat" *(2)*.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 69 of 145

not replace NSPs. NSPs have the greatest impact in preventing the transmission of HIV and other bloodborne infections, including HCV associated with injecting drug use.

More research is needed on the values and preferences of people who inject drugs on PrEP as part of comprehensive HIV prevention approaches, and on how to best deliver PrEP services for this population to improve uptake and effective use (including through comprehensive and integrated community-based delivery models).

While global estimates of STIs among people who inject drugs are not known, people who inject and use drugs may be at increased risk of STIs, particularly those engaging in chemsex or those using stimulants. Values and preferences research showed a strong preference for STI services among women who inject drugs. For this reason, people who inject drugs should have access to STI testing, diagnosis and treatment.

People who inject drugs are at increased risk of TB, irrespective of their HIV status, and TB is a leading cause of HIV-related mortality among people who inject drugs *(211, 212)*. For this reason, TB prevention, screening, diagnosis and treatment are included in the package of interventions essential for broader health of people who inject drugs. Other common health issues related to unsafely injecting drugs include nerve and vein damage, abscesses and skin infections.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 70 of 145

Recommended package for people who inject drugs

These interventions are not in order of priority.

Essential for impact: enabling interventions
Removing punitive laws, policies and practices
Reducing stigma and discrimination
Community empowerment
Addressing violence
Essential for impact: health interventions
Prevention of HIV, viral hepatitis and STIs
Harm reduction (NSPs, OAMT and naloxone for overdose management)
Condoms and lubricant
Pre-exposure prophylaxis for HIV[24]
Post-exposure prophylaxis for HIV and STIs
Prevention of vertical transmission of HIV, syphilis and HBV
Hepatitis B vaccination
Addressing chemsex
Diagnosis
HIV testing
STI testing
Hepatitis B and C testing
Treatment
HIV treatment
Screening, diagnosis, treatment and prevention of HIV associated TB
STI treatment
HBV and HCV treatment
Essential for broader health: health interventions
Conception and pregnancy care
Contraception
Mental health
Prevention, assessment and treatment of cervical cancer
Safe abortion
Screening and treatment for hazardous and harmful alcohol and other substance use
TB prevention, screening, diagnosis and treatment

[24] Please note, results of qualitative research found that people who inject drugs prioritize access to harm reduction (NSPs, OAMT and naloxone for overdose management) over PrEP.

Men who have sex with men

Background

Men who have sex with men refers to all men who engage in sexual relations with other men. The words **men** and **sex** can be interpreted differently in diverse cultures and societies and by the individuals involved. Therefore, the term encompasses the large variety of settings and contexts in which male-to-male sex takes place, regardless of multiple motivations for engaging in sex, self-determined sexual and gender identities, and various identifications with any particular community or social group.

Men who have sex with men are disproportionately affected by HIV, hepatitis C *(12)*, hepatitis B *(213)* and STIs *(28, 31, 214)*. Hepatitis A outbreaks among men who have sex with men are common *(215–219)* and could be prevented with vaccination. This heightened risk is in part due to greater efficiency of transmission of the three disease groups through unprotected anal sex and syndemic features, such as increased risk of HIV acquisition in those with STIs *(221)*, or increased risk of HCV acquisition in men who have sex with men who live with HIV *(12)*.

Some men who have sex with men may also engage in chemsex – defined as when individuals engage in sexual activity while taking primarily stimulant drugs, typically involving multiple participants and over a prolonged time, which increases risk to all three infectious disease groups when there is no access to, and use of, prevention, diagnosis and treatment services.

Persistent structural barriers, such as criminalization of male-to-male consensual sex, stigma, discrimination and violence against men who have sex with men, reduces access to prevention, testing and treatment services, contributing to increased risk of infection (please see the critical enablers chapter).

The essential package of interventions for men who have sex with men includes enabling interventions to address structural barriers as a priority, including the decriminalization of same-sex intimacy. Essential health interventions for impact on HIV, STIs and viral hepatitis include prevention, such as PrEP, diagnosis and treatment for the three disease groups. Men who have sex with men who inject drugs also need access to harm reduction interventions (NSPs, OAMT and naloxone for overdose management).

Those interventions essential for broader health, and to which access for men who have sex with men should be ensured, include screening and treating mental health, and hazardous or harmful alcohol and drug use. Additionally, given the disproportionate rates of anal cancers among men who have sex with men, screening and treatment for anal cancer should be considered for men who have sex with men.

For most recent data related to HIV, syphilis and men who have sex with men, please access UNAIDS Key Populations Atlas.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 72 of 145

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 73 of 145

Trans and gender diverse people

Background

Trans and gender diverse people is an umbrella term for those whose gender identity, roles and expression does not conform to the norms and expectations traditionally associated with the sex assigned to them at birth; it includes people who are transsexual, transgender or otherwise gender nonconforming or gender incongruent. Trans and gender diverse people may self-identify as transgender, female, male, transwoman or transman, trans-sexual or one of many other gender nonconforming identities. They may express their genders in a variety of masculine, feminine and/or androgynous ways. The high vulnerability and specific health needs of trans and gender diverse people necessitates a distinct and independent status in the global HIV response *(3, 222)*.

Trans and gender diverse people experience structural barriers such as criminalization, stigma and discrimination, as do all key populations, but experience very high rates of sexual and physical violence *(223–226)*. High levels of stigma and discrimination against trans and gender diverse people in health care settings have been widely reported *(100)*. Violence and stigma and discrimination increase vulnerability to substance use disorders, eating disorders, depression, suicide attempts, HIV and other sexually transmitted infections, among others, and compromise trans and gender diverse people's access and utilization of health services *(101, 102, 222)*. Depression, for example, has been reported to affect more than half of the trans and gender diverse population in certain settings *(222)*, and their quality of life has been shown to be significantly poorer than that of the general population prior to receiving hormonal treatment, when desired *(227)*. Additionally, there are specific barriers caused by the lack of legal recognition of other gender identities and expressions, which hinder access to health and other services, and limit entry into both public and private health insurance schemes. In particular, gender-sensitive care for trans and gender diverse people is often not available, with health care providers untrained regarding the specific needs of trans and gender diverse people *(228)*.

Trans and gender diverse people are disproportionately affected by HIV and STIs *(30, 229)*. While data are limited, studies have also shown high prevalence of viral hepatitis B and C in trans and gender diverse people *(20)*. For the most recent data related to HIV, syphilis and trans and gender diverse people, please access UNAIDS Key Populations Atlas.

Gender-affirming care can include any of the following: hormone therapy; upper (for example, face, chest, breast) surgery; and/or lower (for example, vaginoplasty, phalloplasty, metoidioplasty, etc.) surgery. Gender affirmation is often a priority intervention for the trans and gender diverse community, but access is often hindered by poor availability, high cost and exclusion of gender-affirming interventions from national health service packages. Administration of industrial-grade silicone or other illicit subcutaneous injections, as well as non-medical-grade fillers, are reported to be common, especially in low- and middle-income countries (LMICs) *(231, 232)*. These interventions can cause body disfigurement, skin damage, allergic reactions, thrombosis, pulmonary silicone embolism and severe autoimmune and connective tissue disorders, among others *(233)*. Likewise, the use of unsafe and unregulated hormones was reported to be very common among trans and gender diverse people *(234)*.

It is important that hormones administered for gender affirmation remain within appropriate physiological levels to avoid negative health consequences, and trans and gender diverse people who self-administer hormones need access to evidence-based information, products and sterile injection equipment *(182, 235)*. Moreover, other non-medical body modification strategies are often used by both youth and adult trans and gender diverse people, including genital tucking and chest binding; little research has described either the prevalence or health risks and benefits of these methods of gender affirmation *(235)*.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 74 of 145

The recommended package of interventions for trans and gender diverse people includes enabling interventions that should be implemented as a priority to address barriers, in particular, recognizing gender diversity in laws, policies and practices.

The health intervention package reflects the complex and varied needs of trans and gender diverse people. Trans and gender diverse people need access to the entire range of HIV, viral hepatitis and STI prevention, testing and treatment interventions for greatest impact. These interventions include access to prevention of vertical transmission of HIV, HBV and syphilis for pregnant trans and gender diverse people; and include harm reduction (NSPs, OAMT and naloxone for overdose management) for trans and gender diverse people injecting drugs, including the injection of hormones and other products, such as silicon gel, for gender affirmation. Interventions for broader health include sexual and reproductive health interventions; screening for and treating hazardous or harmful drug and alcohol use and mental health issues; and preventing, assessing and treating cervical and anal cancers. Access to safe and evidence-based gender-affirming care should be seen as central to trans and gender diverse people's broader health, as well as an important entry point for HIV, STI and viral hepatitis health services, and other health services in general.

The international classification of diseases (ICD–11) has redefined gender identity-related health as gender incongruence, and has reclassified gender incongruence as a condition related to sexual health rather than a mental and behavioural disorder *(236)*. This reflects evidence that trans and gender diverse identities are not conditions of mental ill health and classifying them as such can cause enormous stigma. Inclusion of gender incongruence in the ICD should ensure trans and gender diverse people's access to gender-affirming health care, as well as adequate health insurance coverage for such services.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 75 of 145

Recommended package for trans and gender diverse people

These interventions are not in order of priority.

Essential for impact: enabling interventions
Removing punitive laws, policies and practices
Reducing stigma and discrimination
Community empowerment
Addressing violence
Essential for impact: health interventions
Prevention of HIV, viral hepatitis and STIs
Condoms and lubricant
Pre-exposure prophylaxis for HIV
Post-exposure prophylaxis for HIV and STIs
Prevention of vertical transmission of HIV, syphilis and HBV
Hepatitis B vaccination
Addressing chemsex
Diagnosis
HIV testing
STI testing
Hepatitis B and C testing
Treatment
HIV treatment
Screening, diagnosis, treatment and prevention of HIV associated TB
STI treatment
HBV and HCV treatment
Essential for broader health: health interventions
Anal health
Conception and pregnancy care
Contraception
Gender-affirming care
Mental health
Prevention, assessment and treatment of cervical cancer
Safe abortion
Screening and treatment for hazardous and harmful alcohol and other substance use

People in prisons and other closed settings

Background

There are many different terms used to denote places of detention, which hold people who are awaiting trial, who have been convicted or who are subject to other conditions of security. Similarly, different terms are used for those who are detained. In this guidance document, the term "prisons and other closed settings" refers to all places of detention within a country, and the terms "prisoners" and "detainees" refer to all those detained in criminal justice and prison facilities; included are adult and juvenile males, and females and trans and gender diverse people, who are detained during the investigation of a crime, while awaiting trial, after conviction, before sentencing and after sentencing. This term does not formally include people detained for reasons relating to immigration or refugee status, those detained without charge, and those sentenced to compulsory treatment and to rehabilitation centres, including people who use drugs and sex workers. Nonetheless, most of the considerations in these guidelines may apply to these populations as well *(3)*. Prison staff are also affected by HIV, viral hepatitis, STIs and other health issues, and may lack access to health services, particularly if they live in prison compounds without health services *(237)*.

People in prison are disproportionately affected by HIV *(212)*, hepatitis B and C *(207, 238)* and TB *(11, 212)*. This is, in part, due to the crossover between other key populations, particularly considering the criminalization of behaviours such as drug use, drug possession and sex work, and their overrepresentation in prison populations. Besides this, there is the transmission of HIV and viral hepatitis within prison through unprotected sex, sexual violence, sharing injection equipment, tattooing or parent-to-child transmission. HIV and hepatitis prevention interventions are often unavailable in prisons, although the risks persist *(239)*. There is a frequent intersection with people in prisons and those who are poor, have little education, and come from socioeconomically deprived sectors of the population, and in many prisons there is an overrepresentation of racial minorities. In particular, the prevalence of substance use and dependence in prison populations is much higher than in the community, particularly for women *(240–242)*.

People in prisons also have high exposure to TB, including multi-drug resistant TB, because of factors including overcrowding, poor ventilation and poor infection control practices. Assuring equitable access to TB services for all people in prisons, regardless of HIV status, is critical for reducing increased burden of HIV-associated TB among people in prisons. Contributing to poor health of people in prisons are: limited access to health care, with delays in diagnosis (due to insufficient laboratory capacity and diagnostic tools); inadequate treatment; frequent transfer of people in prisons between prisons, without continuity of treatment; and poor nutrition. Additionally, after release from prison there is often little support for ongoing health and social care.

For most recent data related to HIV and people in prisons and other closed settings, please access UNAIDS Key Populations Atlas.

The right to equivalent health services for people in prisons (namely, equivalent to that available outside of prisons) is enshrined in several internationally recognized documents *(243)*, and respect for these should be reflected in prison policies and practices. Violence in prisons is common and often clandestine because of the fear of reprisal when it is reported, therefore it is easily overlooked or underestimated *(244)*. Structural barriers within prisons, in particular regarding violence, where it is also important to develop measures for safe reporting and protection of victims, need to be urgently addressed, and are essential and priority interventions for impact.

People in prisons are adolescents, adults, male, female, trans and gender diverse and have urgent, varied and complex health needs. For impact on HIV, viral hepatitis and STIs, the package of interventions which prevent, diagnose and treat these diseases is essential, and should be provided within prisons and other closed settings, with continuity during inter- and intra-prison transfers and after release. This package should include condoms and lubricant and harm reduction

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 77 of 145

interventions (NSPs, OAMT and naloxone for overdose management), given that drug use is prevalent in prisons.

People in prisons have broader health needs, and the package of interventions includes mental health and hazardous or harmful drug and alcohol use screening and treatment; sexual and reproductive health interventions; and prevention, screening and treatment of cervical and anal cancers. Importantly, TB prevention, screening and treatment should be implemented in all prisons and closed settings.

UNODC recommends a package of 15 interventions for HIV prevention, diagnosis and treatment for people in prisons *(245)*. These guidelines address multiple disease areas and present a different package, although almost all the 15 UNODC recommended interventions are included here.[25]

[25] Interventions included in the UNODC package which are not included here are: Prevention of transmission through medical and dental services and Protecting staff from occupational hazards.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 78 of 145

CHAPTER 6

Service delivery

Background

Based on the principal of the human right to health, health services for key populations (as for all populations) should be:

Available – There needs to be sufficient number of functioning health care facilities, goods and services that can, in coordination, provide a package of interventions as described in these guidelines for all key populations.

Accessible – Health facilities, goods and services must be accessible to all key populations. This means they should be physically accessible, affordable and non-discriminatory.

Acceptable – Health services must respect medical ethics, be culturally and developmentally appropriate, sensitive to gender, and non-judgemental. Acceptability requires that health facilities, goods, services and programmes are people-centred, and cater for the specific needs of key population groups, and do so in accordance with international standards of medical ethics of confidentiality and informed consent.

Quality – Quality health services are: evidence-based, safe, effective, people-centred, timely, equitable, integrated and efficient.

The coronavirus disease (COVID-19) pandemic highlighted deficiencies in health systems, with most countries unprepared and experiencing considerable disruptions to health services, including HIV, viral hepatitis and STI services for key populations. This is due in part to divergence of funds from essential health services and barriers to health service access, such as restricted movement, reduced ability to pay and fear of infection. The inequities experienced by key populations increased their vulnerability to COVID-19 as well as HIV, viral hepatitis and STIs. At the same time, there are positive examples of resilience from key population communities to help their peers to continued access to life-saving services, such as ART and harm reduction.

To strengthen health systems to respond to the current and potential future pandemics, WHO recommends: investment in essential public health functions; building a strong primary health care foundation; increased domestic and global investment in health system foundations; involving communities (including key population communities) and societies; and addressing pre-existing inequities and the disproportionate impact of COVID-19 on marginalized and vulnerable populations, including key populations *(1)*.

The service delivery and enabling interventions recommended in these guidelines will not only increase accessibility, availability and acceptability of HIV, viral hepatitis and STI services for key populations, but will strengthen systems to provide universal health coverage and mitigate the impact of health emergencies.

The majority of health interventions included in these guidelines are relevant for all populations, but key populations experience particular structural barriers to access health services, as described in the chapter on enabling interventions. In combination with the recommended enabling interventions, service delivery strategies described in this chapter, particularly community and key population-led delivery of services, can address these barriers, as well as contribute to person-centred care and UHC, ensuring key populations' right to health.

While different in every country, key populations access health interventions through a range of services. Traditional, facility-based services, which may not be targeted towards key populations, offer a range of health interventions, including for HIV, STI and viral hepatitis prevention, testing and treatment, which should be able to be accessed by key populations. However, stigma, discrimination and restrictive policies often deter key populations from accessing these services.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 82 of 145

Other services include community-based services, which may or not be key population led. Youth-friendly services can be accessed by young key populations. Often these services also conduct regular outreach and can provide mobile prevention, testing and/or treatment services as well. Some of these community-based services provide integrated HIV, STI and viral hepatitis interventions, as well as other health and social interventions, such as family planning, additional reproductive health and cancer screening, and sometimes legal services; these are often referred to as "one-stop-shops". Methadone and buprenorphine are often provided by specialized services, which may or may not integrate HIV, viral hepatitis, TB and/or STI services as well.

This chapter describes a range of service delivery strategies: integration; decentralization; online services; self-care; involvement of peers and task sharing.

Community-led services, task-sharing and involvement of key population peers

Key populations have a central role to play in leading programmes and services: reaching groups; providing prevention, testing and treatment services; as well as helping their peers navigate and remain in treatment services. Qualitative research conducted by four key population networks (for detailed report, please see Web Annex B) found that community-led services were unanimously endorsed and preferred by participants. Key populations described community-led services as being critical to promoting the health and human rights of marginalized groups, especially as a counterbalance to stigma experienced by some in traditional health care environments. Accordingly, participants across all population networks advocated for the scale-up of community-led interventions, as well as resources to support community-led services.

UNAIDS defines community-led organizations, groups and networks as those that are led by and for the constituencies they serve. They are self-determining and autonomous entities: for which the majority of governance, leadership, staff, spokespeople, membership and volunteers reflect and represent the experiences, perspectives and voices of their constituencies, and who have transparent mechanisms of accountability to their constituencies *(246)*.

UNAIDS further defines community-led responses as the actions and strategies undertaken by these groups to improve the health and human rights of their constituencies. These responses are informed and implemented by and for communities themselves and the organizations, groups and networks that represent them. Community-led responses are determined by and respond to the needs and aspirations of their constituents, and include a range of activities, such as advocacy, campaigning and holding decision-makers to account; monitoring of policies, practices, and service delivery; participatory research; education and information-sharing; capacity-building; and funding of community-led organizations, groups and networks. Community-led organizations and responses must be understood as distinct from those that are community-based. "Community-based" refers to where a response happens, regardless of who is implementing it, while "community-led" refers to who leads and implements the response *(246)*.

Community-led services with peers as providers have a positive impact on HIV, STI and viral hepatitis, with increased access, availability and acceptability of services *(247–252)*. Peers have an important role in reaching other key populations through outreach *(253)*, giving information, providing commodities (such as condoms, lubricants, needles/syringes, PrEP, PEP and naloxone) and providing services, including testing and treatment.

As well as key population peers, other non-specialist health care providers and lay people can provide health interventions, including nurses and outreach workers, which can reduce the workload of doctors and increase access and equity.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 83 of 145

This guideline includes a new GRADE recommendation specific to key population peers.

Peer navigation

NEW RECOMMENDATION

Peer navigators are recommended to support people from key populations to start HIV, viral hepatitis or STI treatment, and to remain in care *(conditional recommendation, moderate certainty of evidence).*

Remarks:

- A peer navigator's role is to assist key population members to access health services, navigate these services and stay in care.
- Peer navigators require adequate remuneration, recognition, training and other support to fulfil their role.
- Peer navigators are often highly valued by their peers.

Further details on evidence, decision-making, implementation considerations and research gaps related to this new recommendation can be found in Chapter 9.

Relevant WHO guidelines include those related to task sharing and peer navigation for:

- HIV treatment. See Consolidated guidelines on HIV prevention, testing, treatment, service delivery and monitoring: recommendations for a public health approach;
- HIV testing. See Consolidated guidelines on HIV testing services;
- Hepatitis testing. See Guidelines on hepatitis B and C testing;
- For general recommendations related to task sharing, please see Task shifting: global recommendations and guidelines;
- For guidance for task sharing in family planning services, please see Task sharing to improve access to family planning/contraception;
- Updated recommendation on treatment of adolescents and children with chronic HCV infection and HCV simplified service delivery and HCV diagnostics

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 84 of 145

Integration

Integration is the management and delivery of health services so that people receive a continuum of prevention, testing and treatment services, according to their needs, over time and across different levels of the health system. This is particularly relevant for people, such as some key population members, who have complex health needs and who are affected by health issues. Health systems organized around the needs of people and communities perform more effectively, cost less, improve health literacy, increase patient engagement, and are better prepared to respond to health crises *(254)*. Health service integration includes the development of referral systems and networks, and empowering patients and communities to participate in their own care, as well as the provision of multiple interventions at one site.

Table 1 provides one way of classifying health service integration, and how these can be applied to the recommendations and implementation of prioritized packages as outlined in these guidelines *(255)*.

Table 1. Types of health service integration

Type of health service integration	Definition	Application to these guidelines
Organizational	Organizations and departments within organizations plan and budget together	National programmes for HIV, STIs and viral hepatitis and other relevant health programmes review these guidelines, and use them to inform the development of integrated strategies, plans, budgets, guidelines and protocols for key populations.
Service	Different clinical services integrated at organizational level, through coordinated referral or linkage	Clinical service managers at different levels and for different clinical services review these guidelines, and work together to ensure key population members' access to the comprehensive package of health interventions across health services, through referral or linkage.
Site level	Provision of multiple interventions at one site	Site level managers of primary health care, community-based or other clinics, which serve key populations, are supported to provide multiple, appropriate, evidence-based interventions, as included in the WHO recommended package.

WHO recommends the integration of HIV, viral hepatitis and STI services, and also the integration of these with a range of other relevant clinical services, such as those for TB, maternal and child health, mental health, sexual and reproductive health services, and drug dependence treatment.

The following WHO guidelines related to integration are particularly relevant to key populations. However, this is not an exhaustive list of integration strategies, and programmes should endeavour to integrate services based on the needs of their clients.

- For guidance on HIV and TB integration, sexual reproductive health and HIV integration, ART and OAMT integration, please see Consolidated guidelines on HIV prevention, testing, treatment, service delivery and monitoring: recommendations for a public health approach.

- For guidance on integrating hepatitis C services, please see Updated recommendation on treatment of adolescents and children with chronic HCV infection and HCV simplified service delivery and HCV diagnostics
- Integration of HIV testing and linkage in family planning and contraception services: implementation brief

Decentralization

Decentralization is the transfer of formal responsibility and power to make decisions regarding the management, provision and/or financing of health services to geographically or organizationally separate actors. In effect, this moves services out of tertiary health care facilities, physically and managerially, and means that health interventions can be provided and managed at different lower- level sites, including community-based services. Key populations may feel less comfortable and may experience stigma and discrimination in tertiary hospitals, and so the provision of health services outside of hospital settings in community-based and key population-targeted services can increase acceptability and accessibility. Decentralizing health services can also reduce barriers such as transport costs and long waiting times in central hospitals. However, decentralization of services for key populations may not always be appropriate or acceptable, and people may prefer to receive services in tertiary facilities where there is greater anonymity.

- For guidance on decentralized HIV testing, please see Consolidated guidelines on HIV testing services
- For guidance on decentralized HIV treatment, please see Consolidated guidelines on HIV prevention, testing, treatment, service delivery and monitoring: recommendations for a public health approach.
- For guidance on decentralized HCV testing and treatment, please see Updated recommendation on treatment of adolescents and children with chronic HCV infection and HCV simplified service delivery and HCV diagnostics

Differentiated service delivery

Differentiated service delivery can be defined as a client-centred approach that simplifies and adapts services, in ways that both serve the needs of affected people better and reduce unnecessary burdens on the health system *(256)*. Differentiated service delivery for key populations considers where, when and by whom relevant interventions are provided, with the goal of increasing access to health services, increasing equity and increasing efficiencies in health systems. For example, to achieve these goals, service planners may decide to reduce the frequency at which people need to collect methadone doses for OAMT and support community-based distribution.

WHO has several recommendations related to differentiated service delivery for ART, including rapid ART initiation, reduced frequency clinical visits and ART pick-up and adherence support, as well as recommendations for differentiated HIV testing services.

- Please see Consolidated guidelines on HIV prevention, testing, treatment, service delivery and monitoring: recommendations for a public health approach for more details.

Virtual interventions

Increasingly, services designed for key populations are using virtual platforms, conducting outreach to reach people at risk; providing information about available services; providing self-test information and tests; booking appointments for testing; and linking people diagnosed with HIV, viral hepatitis or STIs with treatment service providers *(257–259)*. This approach to service delivery may be of particular relevance and importance to complement and enhance existing health

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 86 of 145

infrastructure and service delivery for the younger key population community, always under the condition that potential concerns about sensitive content and data privacy can be addressed *(257)*.

Different interventions are implemented online. Common categories include the following.

1. **Online outreach** to potential key populations service users through online platforms. This involves reaching out to those who had not been reached before, by using systems and structures like websites and social media apps, where key populations can communicate, access information and socialize.
2. **Online case management** for key populations diagnosed with HIV, HCV or STIs who need to engage in services to assess risk and adhere to necessary treatment. Providing case management through online systems can potentially reduce loss to follow-up, provide helpful prompts (such as reminders to book an appointment or take a medication) and support for key populations.
3. **Targeted health information** uses internet sites and social networking apps to allow for communication to be targeted, based on user demographics and characteristics. For example, social media advertisements can target users of certain ages, political profiles, geographic locations, etc. Population segmentation may allow for more specific targeting of key population audiences to provided tailored information or linkage to health services.

The potential advantages of online services include reaching a broader audience, reaching people who are geographically isolated, targeting information to specific people, improved efficiencies and convenience for clients.

Online services should be complementary to face-to-face services and not replace them. Online services may not reach all key populations, and some key population members may prefer face-to-face services, or have concerns about privacy when accessing online. Some key population members, often the most vulnerable, have additional barriers, such as the cost associated with network data, illiteracy, language barriers and limited access to phones, tablets or computers.

Online platforms can provide a safe space for key populations to access information and services; however, efforts to protect the safety of users and eliminate online mistreatment need to also be implemented and monitored closely. The engagement and involvement of key populations, in all their diversity and ages, in the development of apps or online tools and services will increase the likelihood of apps being culturally and age-appropriate and friendly, and ensure the information is age-appropriate *(257, 260)*. Lastly, it is important to ensure trustworthy platforms, with staffing by trained operators, counsellors, and key populations themselves, to provide developmentally appropriate health and welfare information to young key populations, as well as the opportunity for referrals to relevant services *(257)*.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 87 of 145

Online interventions

NEW RECOMMENDATION

Online delivery of HIV, viral hepatitis, and STI services to key populations may be offered as an additional option, while ensuring that data security and confidentiality are protected *(conditional recommendation, low certainty of evidence).*

Remarks:

- Choice is important, and online services should form a part of a menu of interventions, not stand-alone interventions, and should not be a replacement for face-to-face services.
- Efforts should be made to increase equitable access to the internet, improve literacy and provide appropriate training for key population members where needed.
- Consideration should be given to the preferences of different key population groups, given the current lack of published evidence from sex workers and people who inject drugs.

Further details on evidence, decision-making, implementation considerations and research gaps related to this new recommendation can be found in Chapter 9.

Self-care

WHO uses the following working definition of self-care: Self-care is the ability of individuals, families and communities to promote health, prevent disease, maintain health, and cope with illness and disability with or without the support of a health worker *(182)*. The scope of self-care as described in this definition includes health promotion; disease prevention and control; self-medication; self-testing; providing care to dependent persons; seeking hospital/specialist/primary care if necessary; and rehabilitation, including palliative care. It includes a range of self-care modes and approaches. While this is a broad definition that includes many activities, it is important for health policy to recognize the importance of self-care, especially where it intersects with health systems and health professionals.

For key populations, who may feel a lack of control of their health in the face of persistent structural barriers, engagement in self-care can be empowering, as well as increasing accessibility and availability of health interventions.

Relevant, recommended approaches that can be self-administered or managed include:

- emergency contraception;
- abortion and post-abortion contraception;
- HPV, chlamydia, and gonorrhoea self-sampling;
- self-care after sexual assault and violence;
- pregnancy testing; and
- HIV and HCV self-testing.

For more details on self-care, please see WHO guideline on self-care interventions for health and well-being.

For more details on HIV self testing, see WHO Consolidated guidelines on HIV prevention, testing, treatment, service delivery and monitoring: recommendations for a public health approach.

For more details on HCV self-testing, see Recommendations and guidance on hepatitis C virus self-testing.

CHAPTER 7

Programme and service considerations for young key population groups

"The barriers that impede our access to high-quality health services also affect us uniquely. We know the solutions to these barriers, but we need spaces to engage in mitigating them."

Fahe Kerubo, Y+ Global

This chapter summarizes and updates information from four WHO HIV technical briefs for young key population groups published in 2015[26] *(261–264)*. WHO did not publish a technical brief on HIV and young people in juvenile detention and prison, but many considerations for young people who sell sex, young men who have sex with men, young trans and gender diverse people, and young people who inject drugs will also apply to this population. This chapter aims to catalyse and inform discussions about how best to provide health services, programmes and support for young key populations. While the focus is on health for young key populations, the considerations will be relevant to other programmes: welfare, justice, protection, education and social protection *(261–264)*.

Background

Attention is growing globally on the importance of addressing the specific health needs of young people (those aged from 10 to 24 years). Adolescence and young adulthood are periods with significant physiological changes, and a time where young people establish identities and sexual preferences and explore new life experiences *(265)*. Structural factors and the vulnerabilities of youth (power imbalances in relationships; evolving identity and capacity; restricted access to sexual and reproductive health; effective prevention interventions; and, sometimes, alienation from the school system, family and friends) reduce young people's access to prevention, harm reduction, and reproductive health services, and put them at higher risk of infection from HIV, STIs and viral hepatitis *(261–264, 266–268)*.

Epidemiological data on the global status of HIV, STIs and viral hepatitis among young people remain limited, with significant gaps for young key populations *(265, 269, 270)*. Available data show that young key populations are disproportionally vulnerable to, and affected by, HIV *(270)* and STIs compared to their peers and older key populations *(183, 271–276)*. For HCV infection, data show that rates are high and rising among young people who inject drugs and young men who have sex with men *(277–280).* Transmission of HBV mainly occurs in early childhood, from mother to child, and many countries have high HBV immunization programme coverage. Despite this, young people born before the initiation of the infant immunization programme, or not vaccinated, will remain susceptible to HBV infection *(19, 281)*. Young people remain at higher risk for STIs, and may be biologically more susceptible to STIs, particular younger women *(183, 282)*.

The global response to HIV, STIs and viral hepatitis has not reached adequate numbers of young key populations *(269)*. Young key populations' lower access to prevention, diagnosis and treatment is due to a range of factors *(282–290)*:

- misconceptions about risks;
- lack of knowledge and accurate age-appropriate information;
- lack of comprehensive sexuality education (CSE);
- low awareness of available, friendly health services; and
- barriers to access and uptake of services (including legal and policy barriers around consent requirements).

In addition, social determinants, such as wealth, race and gender inequality, and access to education greatly impact health behaviour and outcomes for this population *(269, 291)*.

[26] Young trans and gender diverse people, young men who have sex with men, young people who sell sex and young people who inject drugs.

Services and providers are often poorly equipped to provide services for young key populations, and staff frequently lack training, skills and knowledge to deliver acceptable and appropriate services for young key populations *(292–294).* Furthermore, inadequate investments and availability, or use of age- and sex-disaggregated data in primary research, monitoring and evaluation is a barrier to programming for young key populations *(295–298)*.

States have a legal obligation to respect, protect and fulfil children's right to life, health and development. Societies share an ethical duty to ensure this right for all young people. Addressing underlying structural barriers for young key populations is critical.

One of the added structural barriers specifically young key populations face that is distinct from their adult counterparts' barriers is the requirement for parental, caregiver or guardian consent *(261–264)* to access services, including harm reduction services. For young people who do not wish to disclose an issue to their caregivers, this can be directly inhibitive to accessing care, resulting in missed opportunities for prevention and treatment. Countries are encouraged to examine their age of consent policies, and to consider revising them to reduce age-related barriers to access and uptake of services and interventions that are critical to the health and wellbeing of this population.

Changes to the legal and policy environments

The United Nations Convention on the Rights of the Child (CRC) obliges the state to protect the rights of all young people under 18 years of age. The treaty includes protection from sexual exploitation and sexual abuse; it emphasizes four guiding principles: non-discrimination; the best interests of the child; the right to life, survival and development; and respect for the young person's views *(299)*. Commitment to the CRC includes lowering the risk of infectious diseases and strengthening protective systems to reduce vulnerabilities for young people. The rights of children are contravened when those young people under 18 years of age are excluded from effective HIV, STI and viral hepatitis prevention and life-saving prevention, testing, treatment, care and support services *(261–264)*.

Elements of successful programming for young key populations

WHO recommended interventions and service delivery strategies for all key population groups also apply to young key populations (See Chapters 4–7).

Fig. 4. Summary of key characteristics of effective young key population services

Informed by WHO and UN partner publications, the elements of successful programming for young key populations update the 2015 WHO policy briefs *(261–264)*. Services must be designed and delivered to consider the differing needs and rights of young people according to their age, gender identity, sexual orientation, specific behaviours, the complexities of their social and legal environment and the epidemic setting, while simultaneously respecting the CRC.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 91 of 145

Meaningful involvement of young people

The WHO global consensus statement on meaningful adolescent and youth engagement states that meaningful adolescent and youth engagement requires a mutually-respectful partnership between adolescents, youth and adults. Power is thereby shared; respective contributions are valued; and young people's ideas, perspectives, skills and strengths are integrated into the design and delivery of programmes, strategies, policies, funding mechanisms and organizations that affect their lives and their communities, countries and world *(300)*. Meaningfully and ethically involving young key populations in the planning, design, implementation, monitoring and evaluation of services requires acknowledging and building upon the strengths, competencies and evolving capacities of young key populations, especially their ability to express their views and articulate what services they need *(301)*.

- Global consensus statement: meaningful adolescent and youth engagement. Geneva: WHO; 2020.

Work with trusted partners and existing infrastructure to design and deliver services

It is important to partner with community-led youth and key population organizations, build upon their experience and credibility, and use appropriate, effective and efficient approaches to design and provide services for young people.

- UNAIDS. Young people's participation in community-based responses to HIV — from passive beneficiaries to active agents of change. Geneva: WHO; 2019.

Provide quality, comprehensive and adolescent-friendly services

It is crucial to ensure that health (including immunization), welfare, justice, protection, education and social protection services are integrated, linked and multidisciplinary in nature, with a strong system for referral along the continuum of care. Provision of a comprehensive range of services with online delivery options (see the service delivery chapter) can help to address the overlapping vulnerabilities and intersecting behaviours of different young key populations. The WHO adolescent-friendly health services principles guide adolescent-friendly health services *(302)*. WHO and UNAIDS have also published global standards that define the quality in delivering of health services for adolescents *(303)*.

- Adolescent-friendly health services for adolescents living with HIV: from theory to practice. Geneva: World Health Organization; 2019.
- United Nations Children's Fund (UNICEF). Improving HIV service delivery for infants, children and adolescents: a framework for country programming. Geneva: WHO; 2020.
- UNAIDS, WHO. Global standards for quality health-care services for adolescents: a guide to implement a standards-driven approach to improve the quality of health care services for adolescents. Geneva: WHO; 2015.
- Youth-centred digital health interventions: a framework for planning, developing and Implementing solutions with and for young people. Geneva: WHO; 2021.

Improve access to and retention in services

It is essential to ensure that young key populations have access to the necessary health services and information regardless of their marital status and caregiver consent. Medical treatment without caregiver consent is possible and should be considered when in the individual's best interests. Making services accessible includes ensuring that service locations are easy, affordable, confidential and safe for young key populations to access, and are provided at times that are convenient to young people. Providers have discretion to provide services to young people and should not be prosecuted for doing so. Adolescents, irrespective of age, should be permitted access to counselling and advice without the consent of a parent or guardian *(303)*. Young people should be made aware of their rights to confidentiality, and any limits of confidentiality made clear by those with mandatory reporting responsibilities *(304)*.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 92 of 145

Provide developmentally appropriate information and education

Services for young key populations must provide developmentally appropriate, accurate and inclusive information and education. Prevention of HIV, STI and viral hepatitis prevention, in addition to comprehensive sexuality education for young key populations and their partners (including for adolescents and young people out of school) should focus on skills-based risk reduction. Information can be shared using various media platforms, such as online, mobile phone technology and participatory approaches *(261–264, 305–307)*.

Build capacity in the health sector and beyond

Sufficient capacity amongst professionals, particularly in the health, social welfare, justice and education sectors, to work with young key populations and apply rights-based approaches and evidence-informed practice is critical. Capacity-building involves expanding knowledge on the health needs and rights of different young key populations, and relevant overlapping vulnerabilities (namely, injecting drugs, sexual exploitation or selling of sex) *(308, 309)*. Training is needed on providing respectful, non-judgemental services that consider sexual and gender diversity, gender and power relations, gender-affirming care, and further development of communication and negotiation skills – as they relate to key populations *(310)*.

- Assessing and supporting adolescents' capacity for autonomous decision-making in health care settings. Geneva: WHO; 2021.
- Core competencies in adolescent health and development for primary care providers. Geneva: WHO; 2015.
- How to plan and conduct telehealth consultations with children and adolescents and their families. Geneva: WHO; 2021.
- Guidelines to strengthen social service workforce for child protection. UNICEF; 2019.

Implement peer-driven models

Adolescent and youth peer-driven models and support are key implementation strategies towards the global standard of adolescent participation *(311, 312)*. Young people highly value peer support programmes. Peer navigators are crucial in bridging online information and offline action, such as accessing testing and treatment services *(313)*. Appropriate training, support and mentoring are essential to help young key populations advocate within their communities to support them in accessing services *(204, 261, 263, 264)*. The WHO technical brief *Adolescent-friendly health services for adolescents living with HIV (302)* provides implementation considerations for adapting and scaling-up peer-based, adolescent-friendly models.

- Adolescent friendly health services for adolescents living with HIV: from theory to practice. Geneva: WHO; 2019.

Strengthen protection and welfare for families

Helping parents and families to fulfil their responsibilities to protect, care for and support young key populations effectively is critical. For adolescents aged between 10 and 17 years old, it is important to try to reintegrate them with their families when appropriate, if in their individual best interests, or to provide other appropriate living arrangements and care options in line with the 2010 *UN Guidelines for Alternative Care (314)*.

Update national policies

To ensure harmonized implementation across programmes, evidence-informed services for young key populations must be clearly stated in national policies; that is, the National Strategic Plans (NSPs). (See Chapter 9.)

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 93 of 145

- WHO, UNAIDS, UN WOMEN, UNFPA, WORLD BANK GROUP, UNICEF. Accelerated Action for the Health of Adolescents (AA-HA!) A manual to facilitate the process of developing national adolescent health strategies and plans. WHO; 2019.
- Online toolkit for adolescents and young key populations. UNICEF; 2021.
- This toolkit is a collection of online resources to help plan and scale-up HIV prevention programmes with adolescents and young key populations (ayKP) – people aged 10–24 years.

Monitoring and evaluation

Programming for young people needs to consider the population size, demographics and epidemiology; data disaggregation should be done by sex or gender and age group *(298)*. Collect and collate baseline measurements, monitoring and evaluation systems into programmes to strengthen quality and effectiveness and develop a culture of learning and evidence-based practice to better inform future policies and programmes. (See Chapter 9.)

- Strengthening the adolescent component of national HIV programmes through country assessments. UNICEF; 2016.
- Collecting and reporting of sex- and age-disaggregated data on adolescents at the sub-national level. UNICEF; 2016.

Addressing the additional needs and rights of young key populations

Ensuring that the needs of young key populations are met will improve health outcomes and overall wellness for these populations. The following particular needs should be considered when designing and implementing programmes and services *(261–264)*.

- Protection is needed from all forms of physical, emotional and sexual violence and exploitation, whether by law enforcement officials or other perpetrators *(315–320)*.
- Access to information on the harm that early marriage and early pregnancy can cause is needed.
- Young people who become pregnant need access to health services sensitive to their rights and needs. This includes providing access to sexual and reproductive health services, including family planning, contraception and information and access to youth friendly safe abortion services, adequate and comprehensive obstetric care, and counselling *(321–323)*.
- Psychosocial support services are called for; namely, therapy, counselling, peer support groups and networks to address the impact of self-stigma, discrimination, social exclusion, coming out, gender-affirming care, and to address mental health issues *(312, 324)*.
- Support is critical to remain in or to access education or vocational training, and opportunities to return to school need to be offered, and access to preventative strategies for bullying, stigma and discrimination *(307, 315, 317, 325, 326)*.
- Independent living and group housing shelter are necessities as immediate or long-term accommodation arrangements *(327, 328)*.
- Food security, including nutritional assessments, is all-important *(329, 330)*.
- Livelihood development, economic strengthening, and support to access social services and state benefits are needed *(331)*.
- Access to free or affordable legal information and services is critical, including information about their rights, reporting mechanisms and access to legal redress.
- Counselling for families when requested to facilitate access to services is essential, especially where parental/guardian consent is required.

CHAPTER 8

Developing the response: the decision-making, planning and monitoring process

Introduction

Action on the guidance in these guidelines requires a strategy appropriate to the local context. Planning, decision-making and monitoring are parts of an ongoing process. Once a plan is developed and implemented, it must be monitored and evaluated. The resulting findings then inform revision of the strategy and its implementation.

Situational analysis

> Data and a strong evidence base should guide the response, but lack of this information is not a reason to stop or not initiate a response to improve the health of key populations and work towards the elimination of HIV, viral hepatitis and STIs as public health threats.

Particularly when programmes and services are first being developed, it is important to undertake a situational analysis. For a local response to be appropriate, acceptable and most effective, risks and needs must be examined locally, and local key population members must be consulted and actively involved in this situational analysis. Local people from key populations should ideally be drawn from networks, where they exist, or people acknowledged as community leaders who can represent community opinions.

It is critical to understand the dynamics of local epidemics; the characteristics of the populations affected; the physical, social and political environments that influence risk and vulnerability; the specific needs of people from key populations, and any factors that might enable or hinder efforts to address these needs; and the health systems and community infrastructure. With this information in hand, an evidence-informed plan can be developed and implemented.

As already described, people from key populations face elevated HIV, viral hepatitis and STI risk and burden, and have specific and sometimes complex health-related needs. While many of these risks and needs may be common across key populations in different settings, some factors will differ among key populations, and some will be specific to a particular context.

It is also important to recognize the diversity and varying levels of risk within each key population. In many settings, those most at risk are likely to be people who could be considered members of more than one key population; for example, some men who have sex with men may also inject drugs or engage in sex work. People from key populations may also have other characteristics that could increase their risk or vulnerability, or create additional health or welfare needs. For example, people from key populations may be homeless, impoverished, educationally disadvantaged, disabled, experience mental health conditions, or have other acute or chronic health concerns.

Key population size and location (that is, where people live or congregate) can vary from place to place, with some constants, such as the overall proportion of adult men who have sex with other men *(332)*. To determine the required scale of the response, the appropriate balance and cost effectiveness among different interventions and where interventions should be targeted, it is important to appreciate the size and concentration of key populations, among other factors. (See Box 2 and Section 3.) It is important to note the difficulty in conducting key population size estimates and the lack of reliable data about key population size *(333)*. Efforts should be made to validate key population size estimates and limitations recognized.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 96 of 145

Box 1. Stakeholders to include in the planning process

- Key population-led community organizations and key population community representatives, including young key population members;
- Managers and health care workers from the following fields in both the public and private sectors: HIV programmes and clinics, hepatology service providers, sexual and reproductive health programmes and clinics, including family planning and STIs, maternal and child health, mental health, TB services, drug dependence, NSPs, OAMT services and prison health programmes;
- Civil society, including people living with HIV and viral hepatitis, women's and youth groups, religious leaders and people with disabilities;
- Technical specialists in specific areas, such as laboratory services, pharmacology, drug resistance, toxicity management, supply chains and community health;
- Government partners, including representatives of relevant ministries, such as health, justice and law enforcement, internal affairs, finance, planning and regional (such as provincial) authorities;
- Non-governmental organizations, including international agencies, faith-based organizations, other local nongovernmental and community-based organizations, and private-sector service organizations;
- Finance and budget experts, such as programme budget officers and health economists;
- Academic institutions, including experts in operational research, implementation science, ethics, training and supervision;
- International donors and implementers;
- Human rights institutions; and
- Professional associations of various cadres of health workers (such as physicians, nurses and community health workers).

The makeup, characteristics and needs of key populations change over time, as do various contextual and environmental factors. Updating a situational analysis through ongoing monitoring and evaluation will identify changing parameters, and make it possible to refine or refocus the response.

A situational analysis will almost certainly identify gaps in knowledge. An agenda for further research can address these gaps.

It is also important, whenever analysing and interpreting data, to evaluate the quality of the data and the presence of any sources of bias.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 97 of 145

Box 2. Key information required for decision-making and planning

Information required	Source of information
Key population size	Population size estimation
Prevalence of HIV, viral hepatitis B and C and priority STIs among key populations	Sero-surveillance
Key population location/geographic distribution; identification and mapping of key populations accessible online	Mapping exercises (including online mapping)
Key population characteristics, risk behaviours and health concerns	• Demographic surveys • Behavioural surveys • General health surveys
Important structural factors, barriers to implementing a response to HIV, viral hepatitis and STIs, and the needs of key populations	• Audit of current legislation, policy and practice • Consultation with community members, community-led organizations and other stakeholders • Behavioural surveys
Accessibility, coverage, quality, outcome and impact of interventions	• Programmatic data • Disease notification registries • Integrated bio-behavioural surveys (See Box 3 for further description of national programme monitoring and evaluation framework)

In settings where services for key populations are not well established, and where much of the information listed above has not been previously compiled, undertaking a rapid assessment may be appropriate. Rapid assessment and response guides are available to help guide initial and ongoing assessments, using multiple methods to gather data and to conduct analyses at multiple levels. These guides focus largely on HIV, and were developed earlier in the HIV epidemic, but the principles and methods described remain relevant to gathering information on HIV, as well as viral hepatitis and STIs:

- Rapid assessment and response adaptation guide on HIV and men who have sex with men. Geneva: WHO; 2002
- The rapid assessment and response guide on injecting drug use (IDU-RAR). Geneva: WHO; 1998
- The rapid assessment and response guide on psychoactive substance use and sexual risk behaviour (SEX-RAR). Geneva: WHO; 2002
- Rapid assessment and response adaptation guide for work with especially vulnerable young people. Geneva: WHO; 2004
- HIV in prisons: Situation and needs assessment toolkit. Vienna: UNODC; 2010

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 98 of 145

Planning and implementing the response

The effectiveness of the interventions included in the essential health interventions package is well established. Experience in multiple countries has demonstrated the generalizability of these interventions in diverse settings. While national strategies should be guided by the health intervention packages recommended in these guidelines, local factors do have a bearing on intervention effectiveness and impact, and have a bearing on how an intervention is implemented to optimize access and effectiveness. With the information gathered on the local setting, as described above, planning processes should be taken forward with participation of stakeholders, particularly key populations, and decisions can be made on how interventions should be implemented.

The following are some of the decisions that need to be taken while developing and implementing a national response to HIV, viral hepatitis and STIs among key populations. Guidance on planning and implementing the response is listed in Box 3.

Targeting the response

- Which key populations and which subgroups within key populations are most at risk?
- Which strategies, legislation, policies and guidelines need to be developed or revised?

Implementation

- Are key populations' members effectively leading the response?
- Which interventions need to be implemented and where, and how should implementation be prioritized?
- How can services addressing HIV, viral hepatitis, STIs and broader health be integrated at the organizational, service and site levels (see the service delivery chapter) to optimize accessibility and impact for key populations?
- Where and at what scale do interventions need to be provided?
- What targets and timelines should be set for the implementation and scale-up of interventions?
- How and to what extent should services be decentralized and integrated to provide the best service coverage for key populations?
- Which modes of service delivery are most appropriate?
- What are the roles and responsibilities of the various stakeholders in implementing the response and achieving the agreed targets?

Resources required

- What financial, human and other resources and infrastructure are required to implement the response? What resources are currently available, what additional inputs will be required and how might these be obtained? What types of health care and other workers (including key population peers) are required, and how will they be recruited and trained? How can task shifting and sharing optimize the use of available human resources and expand service delivery?
- How will economies of scale and synergies among interventions save on costs and improve service provision?
- What resources are available from donor organizations and what resources will need to be mobilized from national sources? Greater funding for HIV may be available through The Global Fund and PEPFAR, but funds for STIs and viral hepatitis may need to be integrated in national plans.

Monitoring and evaluation

- How will implementation of the response be monitored and evaluated?
- How do strategic information systems for M&E need to be strengthened?

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 99 of 145

Risks, outcomes and impacts

- What are potential risks and vulnerabilities of the planned response, and what strategies would mitigate their impact? Risks might include domestic factors such as budget cuts, theft of consumables, attrition of health care workers, and emergence of drug resistance. External factors could include loss of external financial support, political instability and natural disasters.

Box 3. Guidance on planning and implementing the response to HIV, viral hepatitis and STIs for key populations

- Considerations in planning and budgeting for a key population trusted access platform. Global HIV Prevention Coalition; 2020
- Establishing community-led monitoring of HIV services — Principles and process. UNAIDS; 2021

Monitoring and evaluating the responses

Monitoring and evaluation is an essential part of the HIV, viral hepatitis and STI response for key populations

A monitoring and evaluation system is needed to assess both structural and health sector components of the response to HIV, viral hepatitis and STIs in key populations. It is critical that these systems are practical, not overly complicated, and that they collect information that is current, useful and readily used while adhering to human rights principals as described previously.

WHO and UN partner agencies have developed frameworks for monitoring the response to HIV in the general population and key populations. The following documents described these frameworks:

- Tool to set and monitor targets for HIV prevention, diagnosis, treatment and care for key populations. Geneva: WHO; 2015;
- Consolidated strategic information guidelines for viral hepatitis: planning and tracking progress towards elimination. Geneva: WHO; 2019;
- Consolidated guidelines on person-centred HIV patient monitoring and case surveillance. Geneva: WHO; 2017;
- Consolidated HIV strategic information guidelines: driving impact through programme monitoring and management. Geneva: WHO; 2020;
- Strategies and laboratory methods for strengthening surveillance of sexually transmitted infection. Geneva: WHO; 2012.

These frameworks recommend sets of national-level indicators. These indicators assess key factors related to the enabling environment; measure the availability, coverage and quality of specific interventions; and examine their outcome and impact (Box 4). The indicators can also be used when preparing proposals or reporting progress to donor organizations.

The M&E process requires data from a variety of sources, including behavioural and sero-surveillance surveys, programmatic and administrative data, community-led monitoring as well as information gathered through reviewing policy documents and legislation, and consultation with experts and stakeholders (Box 5). The quality and limitations of these data should be assessed and considered when undertaking analysis and interpretation.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 100 of 145

Ongoing planning and development of the response

Setting clear, achievable but ambitious targets is crucial when planning to scale-up interventions to have an impact on HIV, viral hepatitis and STIs. Targets concretely define what a successful national programme or project should achieve within a specified timeframe. Targets can be set for both intervention-specific indicators and cross-cutting outcome and impact indicators (Box 4).

Intervention and enabling environment indicators reflect the availability, coverage and quality of an intervention or service, or assess changes in environmental factors, such as revision of legislation, within a specified timeframe. Targets are set with the aims of achieving reductions in HIV, viral hepatitis and STI risk, sufficiently to reduce transmission and ensure the adequate provision of appropriate treatment and care for those living with HIV, viral hepatitis or with an STI.

Outcome and impact indicators seek to gauge the impact that interventions have had on outcomes that affect exposure to risk, such as changes in risk behaviours (for example, the percentage of people who use condoms consistently) or on impacts on the course of HIV, viral hepatitis or STI epidemics; for example, reductions in incidence of HIV, viral hepatitis or STIs (Box 4).

Like planning overall, the target-setting process should be collaborative, involving a range of stakeholders. Those setting the targets should consider whether they are realistic and whether data can be practically collected. Targets, in keeping with programme strategies, should be tailored to the local epidemic and what the strategy can realistically achieve with obtainable funding and resources. Modelling can help to identify how different target levels would affect epidemics.

Baseline assessment – initial assessment should measure the scale of the current response, assessing the availability, coverage and quality of current interventions, and appraise current environmental enablers and barriers using agreed indicators. This information serves as a baseline for tracking progress. Also, currently available resources and technical capacity must be determined to estimate what more is needed, and how to scale the intervention appropriately. From this information, realistic, achievable targets can be set and the timeframe specified.

Estimating cost associated with implementation is a key step in planning the roll-out. Several costing tools and resources are available.

Spectrum, for example, is a suite of models and analytical tools to support decision-making for HIV and STI programming. It comprises several software apps, including AIM (AIDS Impact Model) and Goals (Cost and Impact of HIV Interventions). Most countries already have AIM files prepared as part of their national epidemiological estimates, and so both modules can be rapidly applied. Spectrum can be accessed online at: https://www.unaids.org/sites/default/files/media_asset/QuickStartGuide_Spectrum_en.pdf.

OneHealth is a software tool designed to strengthen health system analysis and costing, and to develop financing scenarios at the country level. It is specifically designed for LMICs. It provides planners with a single framework for planning, costing, impact analysis, budgeting and financing of strategies for all major diseases and health system components. OneHealth can be downloaded free of charge (Avenir Health, 2021) at: https://www.avenirhealth.org/software-onehealth.php.

UNAIDS has developed The Human Rights Costing Tool (HRCT), a flexible tool for costing investments in critical enablers (such as integrated treatment and rights literacy programmes, legal services, stigma and discrimination reduction programmes, and training for health care workers and law enforcement). This, too, can be downloaded free of charge along with a user guide at: http://www.unaids.org/en/media/unaids/contentassets/documents/data-and-analysis/tools/The_Human_Rights_Costing_Tool_v_1_5_May- 2012.xlsm and http://www.unaids.org/en/media/unaids/contentassets/documents/document/2012/The_HRCT_User_Guide_FINAL_2012-07-09.pdf.

WHO commissioned Avenir Health to develop the Syphilis Interventions Towards Elimination (SITE) tool which is a dynamic transmission model to evaluate and project the impact, cost and cost-effectiveness of syphilis interventions (screening, treatment and prevention) to support national control programmes: https://avenirhealth.org/software-site.php.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 101 of 145

Box 4. Indicators for monitoring and evaluating the response

To understand how well the response is functioning and its effects, its various key requirements need to be monitored for each key population. For each of these requirements there are a number of useful indicators.

These indicators are described in detail in WHO key population guidance:

- Tool to set and monitor targets for HIV prevention, diagnosis, treatment and care for key populations. Geneva: WHO; 2015
- Consolidated strategic information guidelines for viral hepatitis: planning and tracking progress towards elimination. Geneva: WHO; 2019

Specific impact indicators related to validating elimination of viral hepatitis in people who inject drugs can be found in:

- Interim guidance for country validation of viral hepatitis elimination. Geneva: WHO; 2021

Successful implementation and impact requires supportive policy, legislation and other structural factors.

Measured by ***structural*** (or enabling environment) indicators:

- audit of current legislation and policy;
- number of key population-led organizations;
- achievement of meaningful involvement of people from key populations in policy and strategy formulation;
- legal support services for key populations have been established;
- support services for people from key populations who experience violence are functioning;
- sensitization training on key populations is regularly conducted for law enforcement officers; and
- sensitization training on key populations is regularly conducted for health care and social services providers.

Interventions need to be accessible to people from key populations.

Measured by ***availability*** indicators:

- the number of sites where each intervention is available, including availability of online interventions;
- the number and percentage of key population-focused programme sites where the intervention is provided;
- the number and percentage of mainstream programme sites where the intervention is provided and that meet key population sensitization standards;
- the percentage of all sites where the intervention is currently provided that are either mainstream programmes meeting key population sensitization standards, or are key population-focused programmes;
- the percentage of the key population sample reporting that the intervention is readily accessible; and
- geographic mapping of key populations in relation to where interventions are provided.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 102 of 145

Box 4. Indicators for monitoring and evaluating the response (cont.)

Interventions must reach those who need them.

Measured by ***coverage*** indicators:

- number and percentage of key population provided with the intervention during a specified reporting period;
- number of consumable items (such as needles and syringes or condoms) distributed per member of key population during a specified reporting period; and
- percentage of the key population sample reporting that they received the intervention during a specified reporting period.

Interventions need to be properly implemented to be effective.

Measured by ***quality*** indicators:

- review of programme policy and practice using programme quality assessment checklist;
- percentage of staff that has received key population sensitization training;
- percentage of key population reporting intervention was received, and also a specific important activity or service was delivered (such as the provision of compatible lubricant with condoms); and
- percentage of occasions when intervention was provided, along with specific important activity of service (see previous).

Intended aims should be achieved.

Measured by ***outcome*** and ***impact*** indicators:

- prevalence of risk behaviour in key population;
- incidence of HIV, viral hepatitis and STI infections in key populations;
- prevalence of infection in key population;
- incidence of HIV-related mortality in key population;
- prevalence in key population of experiencing stigma or discrimination; and
- incidence of violence against people from key population.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 103 of 145

Box 5. Data sources

Behavioural and sero-surveillance surveys. These surveys of key populations can provide prevalence data and information on the experiences, risks and service utilization of people from these groups. Many countries already undertake bio-behavioural surveys of key populations periodically as part of the ongoing monitoring of the HIV and viral hepatitis epidemics. The generalizability of survey findings depends on how representative the sample is of the entire key population; it is important to consider selection bias in how participants were recruited. Behavioural surveys are susceptible to bias toward socially desirable responses and to recall bias.

Programmatic or administrative data. Most programmes routinely record at least some basic information when providing a service. This might include the number of people who received a service, basic information about the client, and numbers of supplies used or distributed. To assess services provided to people from key populations requires programme data to be disaggregated by key population, where information on key population status and behaviours can be collected safely and securely and where feasible. Key population-focused programmes may be able to provide data specific to the populations they serve, but this information is not commonly available from programmes that provide services to many different groups or to the general population.

Desk review and expert consultation. Reviewing various policy documents and legislation can identify the presence or absence of various laws or policies that may affect people from key populations.

Population size estimation. Deriving reliable population size estimates for key populations can be challenging. Various methods can be employed; each has its own advantages and limitations. Common methods include census and enumeration, general population surveys, and capture-recapture, multiplier and network scale-up methods. Deriving multiple estimates through different methodologies and triangulating the results is helpful. Definitions of key populations should be clear.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 104 of 145

CHAPTER 9

Additional information on the development of new recommendations

Introduction

As highlighted in previous chapters, this updated guidelines contains seven new recommendations or new practice statements that are included in the overall framework of health interventions and service delivery.

Methodology

WHO developed seven PICO questions. In an online survey, the Guideline Development Group members ranked the importance of each outcome to those affected by the intervention using the GRADE rating scale of 1–9 (0–3: not important; 4–6: important; 7–9: critical). Once the PICO question and priority outcomes were agreed, external researchers, supported by the WHO team, conducted a systematic review of the evidence.

The systematic review teams developed protocols and conducted a systematic review of the relevant scientific evidence. The appointed independent methodologist assessed and reviewed the protocols, as did the Steering Group, key population networks and WHO technical officers. The methodologist advised the review team on analytical decisions and synthesis and the grading of evidence . Studies providing information on feasibility, values and preferences, and cost-effectiveness were also included and summarized. The scientific evidence supporting the recommendations was evaluated using the GRADE approach, and the effectiveness and overall certainty of evidence for each intervention was determined.

The risk of bias for studies included in systematic reviews were assessed using the Cochrane Collaboration's risk of bias tool for randomized controlled trials (RCTs) *(334)* and the ROBINS-I tool for non-randomized studies *(335)*.

WHO also commissioned four global networks of key populations (men who have sex with men, sex workers, trans and gender diverse people, and people who inject drugs) to undertake new qualitative research on values and preferences among their networks. The results formed part of the evidence synthesis. Further details are provided in the next section.

Table 2. Domains considered when assessing the strength of recommendations

Domain	Rationale
Benefits and harm	When a new recommendation is developed, desirable effects (benefits) need to be weighed against undesirable effects (risks or harm), considering any previous recommendation or an alternative. The larger the gap or gradient in favour of the benefits over the risks, the more likely that a strong recommendation will be made.
Certainty of evidence	High certainty of evidence is likely to lead to a strong recommendation.
Values and preferences	If the recommendation is likely to be widely accepted or highly valued, it is likely that a strong recommendation will be made. If there is a great deal of variability or strong reasons why the recommended course of action is unlikely to be accepted, it is more likely that a conditional recommendation will be made.
Cost and financial implications	Lower costs (monetary, infrastructure, equipment or human resources) or greater cost-effectiveness contribute to a strong recommendation.
Feasibility	If an intervention is achievable in a setting where the greatest impact is expected, a strong recommendation is appropriate.
Equity and human rights	If the recommendation is likely to increase access to an intervention for those most in need, a strong recommendation is likely.
Acceptability	The greater the acceptability to all or most stakeholders, the greater the likelihood of a strong recommendation.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 105 of 145

The GRADE approach specifies four levels of certainty of evidence (Table 3.) The certainty of evidence is a key determinant of the strength of a recommendation, which can be either strong or conditional.

Table 3. Interpretation of the four GRADE levels of evidence

Certainty of evidence	Rationale
High	We are very confident that the true effect lies close to the estimate of effect.
Moderate	We are moderately confident in the estimate of effect. The true effect is likely to be close to the estimate of effect, but it could be substantially different.
Low	Our confidence in the estimate of effect is limited. The true effect may be substantially different from the estimate of effect.
Very low	We have very little confidence in the estimate of effect. Any estimate of effect is very uncertain.

Good practice statements are sometimes appropriate for use when the supporting evidence is indirect and therefore difficult to collect and summarize, but the certainty or confidence surrounding an intervention's impact is high, and when the desirable consequences of an intervention clearly outweigh the undesirable ones. Often data is not disaggregated by key population group and there is a lack of supporting evidence related to key populations, meaning that good practice statements were appropriate in the development of these guidelines. Good practice statements are, by nature, strong recommendations *(56)*.

Following the WHO guideline development process *(56)*, the Guideline Development Group formulated recommendations according to the GRADE approach to appraise evidence. The Guideline Development Group also made good practice statements. The evidence was synthesized and incorporated into an evidence-to-decision framework to help inform the discussions at the Guideline Development Group meeting. WHO convened a virtual Guideline Development Group meeting that occurred over six days between 30 August and 8 September 2021, chaired by two members of the Guideline Development Group. All conflicts of interest were managed. The methodologist assisted by the chairs facilitated the Guideline Development Group's judgements on the potential benefits and harms of the intervention, stakeholder values and preferences, acceptability, feasibility, resource use and considerations of human rights and equity. Taken together, these judgements contributed to determining the strength and direction of the recommendation *(334)*. All the recommendations were arrived at through consensus. Voting was not required, but the group agreed a priori that two thirds of the votes would be required for a decision. The draft guidelines were circulated for review to members of the Guideline Development Group and the External Review Group in November 2021.

Evidence and decision-making for new recommendations

Behavioural interventions

Background and rationale

Behavioural interventions are widely used in programmes which aim to reduce transmission of HIV, STI and viral hepatitis. There are a range of different behavioural interventions, including those that focus on providing information and education and those that take a counselling approach, but all aim to increase health-seeking behaviours and/or reduce behaviours that increase risk of HIV, STIs and viral hepatitis, including needle and syringe sharing and unprotected sex. Counselling behavioural interventions can be provided by health care workers or by peers, can be a single session or multiple sessions, can be brief or long, can be provided in groups or individually, and can be online or face-to-face.

The 2014 and 2016 WHO *Consolidated key population guidelines (3)* included recommendations related to behavioural interventions that were based on low certainty of evidence and lack of standard comparators. During the scoping exercise to review which recommendations required updating and the community and expert consultation in 2019–2020 (see methods), these recommendations were identified as in need of an update. To inform the decision-making process, the evidence review focused on behavioural interventions with a counselling component, in particular whether provision of counselling behavioural interventions impacts HIV, STIs and viral hepatitis acquisition and transmission for key populations.

Evidence review

A systematic review was commissioned by WHO to update existing recommendations, to answer the PICO question of whether counselling behavioural interventions reduces risk behaviours associated with transmission or acquisition of HIV, STIs and viral hepatitis. The primary outcomes were HBV, HCV, HIV or STI incidence and the secondary outcomes were unprotected sex (for example, condomless sex, sex without lubricant, sex without PrEP), needle and syringe sharing and mortality.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 106 of 145

A systematic review of published articles from 1 January 2010 to 1 March 2021 identified nine eligible randomized control trials (see Web Annex C). Five studies were among adult key populations and two studies were among young men who have sex with men (16–25 years old) *(336)* and young females (13–17 years old) released from juvenile detention *(337)*. Together these indicated that counselling behavioural interventions probably make little to no difference on HIV *(336, 338–343)*, viral hepatitis *(341)* or STI *(337–340, 342–344)* incidence in key populations. This was also true for unprotected sex *(336–342)* and needle and syringe sharing *(340, 341)*. There was moderate certainty in the lack of effect across outcomes.

Moderate certainty evidence from six randomized controlled trials (RCTs) among men who have sex with men, transgender women, people who inject drugs and sex workers in China, Kazakhstan, Kenya and the USA showed counselling behavioural interventions had probably no effect on *HIV incidence* in meta-analysis (combined risk ratio (RR): 0.700, 95% CI: 0.409–1.197), with no important benefit or harm *(336, 338–342)*. Low certainty evidence from one RCT among sex workers who inject drugs in Mexico showed no impact on HIV/STI incidence when findings were meta-analysed across study sites (RR: 0.663; 95% CI: 0.224 to 1.960) *(343)*.

Moderate evidence from six RCTs among people in prisons, men who have sex with men, transgender women, people who inject drugs and sex workers in China, Kazakhstan, Kenya and the USA showed probably little to no difference in *STI incidence* in meta-analysis (RR: 0.985; 95% CI: 0.741–1.308), with no statistically significant heterogeneity (Q=2.120, p=0.832, I-squared=0.000).

Moderate certainty evidence from one RCT among people who inject drugs in Kazakhstan showed probably little to no difference in *HCV incidence* when calculated as an unadjusted RR directly (RR: 0.447; 95% CI: 0.158–1.267), but there was a reduction in HCV incidence when calculated by the study authors as a rate ratio adjusting for a baseline measure of unsafe injection in the past 90 days (rate ratio: 0.31, 95% CI: 0.10–0.90).

There was very low certainty evidence from seven RCTs among people in prisons, men who have sex with men, people who inject drugs and sex workers in China, Kazakhstan, Kenya and the USA on the impact of counselling behavioural interventions on *unprotected sex* (using various measures of condomless sex; RR: 0.821, 95% CI: 0.663–1.018). This meta-analysis showed statistically significant heterogeneity (Q=22.015, p=0.001, I-squared=72.746), which was not clearly explainable by subgroup analyses or other reasons, and it is uncertain whether counselling behavioural interventions reduce unprotected sex.

Low certainty evidence from two RCTs among people who inject drugs in the USA and Kazakhstan showed that there may be no impact on *needle and syringe sharing* in meta-analysis (RR: 0.719; 95% CI: 0.317–1.628), with no statistically significant heterogeneity (Q=1.135, p=0.287, I-squared=11.909).

Feasibility, cost and cost effectiveness

A systematic review identified two studies with cost data on counselling behavioural interventions for key populations, both from the USA. Costs ranged from US$ 682 to US$ 782 for a single session and from US$ 1823 to US$ 3890 annually *(345, 346)*.

One cost-effectiveness analysis of an intervention among sex workers along the Mexican and USA border that included multiple components was identified *(346)*. For a hypothetical 1000 sex workers, receiving a once-only intervention, they calculated an incremental cost of US$ 78 200, 33 HIV cases prevented and 5.7 months of quality-adjusted life-years (QALYs) gained, compared to no intervention. Additional cost per QALY gained was US$ 183. For sex workers receiving the intervention annually, they calculated an incremental cost of US$ 389 000, 29 additional HIV cases prevented and 4.5 additional months of QALY compared to the once-only intervention. The additional cost per QALY was US$ 1075.

There is little evidence of cost or cost effectiveness of counselling behavioural interventions in different settings or for different modalities.

Values and preferences

Two studies from the USA, one with men who have sex with men and one with transgender women, both focused on HIV, found that participants generally viewed specific counselling behavioural interventions favourably *(347, 348)*.

Qualitative research conducted by four global networks of key populations found that key population members (see Web Annex B for full report) value peer-led education information, counselling and outreach as it is more likely to be non-judgemental and is provided by people who understand key populations' needs. They indicated a preference for multiple, consistent interventions, rather than one-off interventions and interventions delivered through a variety of mechanisms.

People who inject drugs appreciate access to information and education, but adequate access to evidence-based harm reduction approaches, such as NSPs, OAMT, and overdose management, remains a priority, in order to put health education into practice.

The focus of comments from all four key population networks in relation to other factors impacting access to behavioural interventions (including education and counselling) overwhelmingly related to structural issues, including: negative community and service-provider attitudes; problematic approaches and messaging; stigma and discrimination; and the need for law reform and education to change the way that key populations are perceived and treated.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 107 of 145

Equity and acceptability

Provision of counselling behavioural interventions may increase access if a wide range of different interventions are available with tailored content that focuses on increasing access to health services and empowering key populations. However, the key population networks research identified a lack of formal education and literacy as barriers to HIV, STI and HCV prevention education. It noted the need for more specific, ongoing, peer-based and community-led HIV, STI and HCV education. When delivered through a variety of mechanisms and formats to account for different levels of access, knowledge and literacy, and when combined with counselling and other psychosocial supports, it leads to maximum effectiveness.

Key populations reported that behavioural interventions that promoted abstinence from drug use, or rehabilitation or cessation of sex work would reduce equity by creating barriers to service usage and should be avoided. Methods claiming to so-called cure homosexuality, such as conversion therapy, or other alleged methods to change gender identity or sexual orientation are harmful, are human rights violations and should never be conducted *(349)*. Potential individual harm may occur when counsellors or counselling behavioural interventions promote abstinence from drug use, rehabilitation, cessation of sex work or advocate so-called cures for homosexuality, which can discourage key population members from accessing services. Moreover, diversion of funds to these forms of interventions can limit the availability of evidence-based interventions.

Evidence assessment and decision-making

Following the WHO guideline development process, the Guideline Development Group considered the evidence and concluded that it was not possible to recommend counselling behavioural interventions to reduce HIV, viral hepatitis and STI incidence, given that there was no evidence of impact of the intervention on the outcome. However, the Guideline Development Group felt strongly that counselling and information sharing can enable informed consent and decision-making to initiate and continue certain interventions such as PrEP, ART, OAMT and NSPs. Counselling can enhance relationships between providers and clients and may encourage service access. The group determined to develop a good practice statement to make policy-makers and providers aware that while counselling interventions have other potential positive effects, there is moderate certainty of evidence that they probably do not reduce HIV, viral hepatitis or STI incidence.

Implementation considerations

Given that a systematic review did not find any effect of counselling behavioural interventions on the incidence of HIV, viral hepatitis or STI, the choice to include counselling behavioural interventions in standard and minimum packages of interventions for key populations should be made with an understanding of the potential limitations on incidence outcomes.

If behavioural interventions are implemented, ongoing training for peers and health care workers is needed, and stigmatizing attitudes within the health system and structural barriers to care should be addressed urgently.

If implemented, behavioural interventions should be developed and implemented in collaboration with key population groups. These interventions should be tailored to specific key population groups and individuals, recognizing that people are in different stages of life and have different priorities and needs. Some people may be currently unable to change their risk behaviours, or may not want to make changes, and this should be accepted without judgement. Interventions which focus on cessation of drug use, rehabilitation, ending employment as a sex worker and purported cures for homosexuality create barriers to service usage, are not recommended and should be avoided.

Research gaps

While further research to measure the impact of counselling behavioural interventions on HIV, STIs and viral hepatitis is not required, future research may allow us to better understand the effect of different aspects of counselling interventions on building client and provider relationships, psychosocial improvements and mental health. Research is required across a range of settings and for each of the key population groups. For young people, peer-based counselling has been shown to be a strategy that improves ART adherence, but more research is required on its impact on PrEP adherence for HIV prevention *(350)*.

For the detailed evidence profile, please see Web Annex C.

Chemsex

Background and rationale

Chemsex is a growing phenomenon where individuals engage in sexual activity while taking stimulant drugs such as methamphetamine, mephedrone or gamma-hydroxybutyrate (GHB). Chemsex typically involves multiple participants, the use of multiple drugs (including injecting drug use), and occurs over a prolonged time, for example, in group sex or orgy parties *(351–353)*. Chemsex is also known by other names, such as slam sex (associated with injecting drug use), party and play, or sexualized drug use. There have been increasing reports of chemsex in some communities of men who have sex with men *(352)*, most often in high income settings in Europe and North America, though a recent qualitative scoping review of sexualized drug use and chemsex among men who have sex with men and transgender women found it to be increasingly common in Asia *(354, 355)*. The associate editor of The New England Journal of Medicine *Journal Watch Infectious Diseases* commented in 2018 that the "markedly high rate" of HIV infections among men who have sex with men participating in chemsex in a London study *(356)* "identifies a high-priority (but often challenging) population for

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 108 of 145

prevention efforts (including pre- and postexposure prophylaxis, mental health, chemical health, health promotion, and harm minimalization interventions)" *(357)*.

Chemsex may be associated with unprotected sex and unsafe injecting, as well as hazardous drug use, overdose, drug dependence and adverse mental health outcomes *(358)*, with one systematic review finding inconsistent evidence of increased HIV and HCV prevalence in those engaging in slam sex (injecting drugs before or during planned sexual activity) *(351)*.

During the scoping exercise for the development of these guidelines, there was a request from key stakeholders for WHO to investigate further whether behavioural interventions can help increase uptake of services among people engaging in chemsex, reduce harms, and have an impact on HIV, viral hepatitis and STIs.

A systematic review did not identify any articles meeting the inclusion criteria for effectiveness or cost-effectiveness. Five articles assessing values and preferences were identified in the review *(359–363)* and qualitative values and preferences research on the topic (see Web Annex C) was undertaken by four key population networks. Overall, the values and preferences research revealed a preference for:

- specialist chemsex services (for example, specialized counselling with a single professional about both drug and sex-related issues);
- tailored, non-judgemental, peer-led services focusing on the principles of harm reduction rather than cessation of drug use;
- integrated sexual health and HIV, STI and viral hepatitis services; and
- more chemsex specific information and education to be available through various modalities that include explanations of potential risks.

Qualitative values and preferences research (see Web Annex B) showed that perceptions surrounding chemsex and its relevance varied both across and within the four key population networks. Although chemsex is most widely recognized and practiced among gay, bisexual and other cis men who have sex with men, participants beyond these communities also noted that they engage in drug use to enhance or prolong sexual experiences or both. Some participants described this activity without using the term chemsex. Some sex workers reported engaging in chemsex due to pressure from clients and from financial necessity.

The key population groups highlighted the need to promote awareness and education surrounding chemsex, as well as to address stigma and discrimination towards those who engage in chemsex. People who inject drugs stressed the importance of expanding the understanding and changing the framing of chemsex to the concept of "sexualized drug use" to help reduce judgement and rather encourage and support people to engage in "cultures of care", including ideas such as "hosting packs" or "safety kits" that are harm-reduction focused and encourage people to "plan to be safe".

WHO recommends various HIV, STI and viral hepatitis prevention options, which are relevant for those engaging in chemsex, including recommendations for condoms and lubricant for the prevention of sexual transmission of HIV and STIs, pre-exposure prophylaxis and post-exposure prophylaxis for HIV prevention, and provision of sterile needles and syringes for the prevention of HIV and viral hepatitis *(3)*. Despite this guidance, communities and clinicians are increasingly concerned about the low uptake of these prevention interventions before, during and after engaging in chemsex, and about the ongoing risk. Interventions which aim to increase the uptake of these evidence-based prevention interventions, as well as the linkage to testing and treatment services and the integration of services, could have an impact on transmission among people engaging in chemsex. Referral to other relevant services for those reporting instances of non-consensual sex or drug use is essential.

Based on the available preferences of the key population community, the experience gained from implementation and from the evidence-based interventions already recommended by WHO, the Guideline Development Group made a good practice statement. The group recognized the importance of highlighting this phenomenon to HIV, STI and hepatitis programmes to ensure people engaging in chemsex are linked to the appropriate services in a non-judgemental manner.

Online interventions

Background and rationale

Increasingly, services designed for key populations are going online, conducting outreach to identify people at risk, providing information about available services, providing self-test information and tests, booking appointments for testing, and linking people diagnosed with HIV, viral hepatitis or STIs with service providers. The potential advantages of online services include: reaching a broader audience, reaching people who are geographically isolated, targeting information to specific people, improved efficiencies and convenience for clients.

Different forms of interventions are implemented online, the most common of which are:

1) **Online outreach** to potential key populations service users through online platforms involves reaching out to those who previously hadn't been engaged, by using systems and structures like websites and social media apps, where key populations communicate and learn information and socialize.
2) **Online case management** for key populations who have tested positive and need to engage in services. Providing case management through online systems could potentially reduce loss to follow-up and provide helpful nudges (such as reminders to book an appointment or take a medication) and support for key populations.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 109 of 145

3) **Targeted health information** uses internet sites and social networking apps to allow for messages to be targeted at user demographics and characteristics. For example, Facebook advertisements can target users of certain ages, political profiles, geographic locations, etc. Population segmentation may allow for more specific targeting of key population audiences to provide tailored information or linkage to health services.

Evidence review

A systematic review was commissioned by WHO to answer the question of whether providing services online improves uptake of HIV, viral hepatitis, STI prevention, testing, linkage to treatment and treatment retention for key populations, compared to standard care .

Given the range of online interventions, the evidence review was split to consider the following separately: online outreach, online case management and targeted health information. The outcomes tested were for the following:

- online outreach – number or proportion of previously unreached people reached, use of prevention services, PrEP adherence, PEP uptake, PEP adherence, counselling, condoms, uptake of testing services for HIV, viral hepatitis and STIs, and treatment initiation for HIV, viral hepatitis and STIs;
- online case management – use of prevention services, uptake of testing services for HIV, viral hepatitis and STIs, treatment initiation for HIV, viral hepatitis and STIs, treatment retention or completion for HIV, viral hepatitis and STIs, viral load (for example, HIV and HCV), cure (for curable STIs, for instance HCV, syphilis and gonorrhoea) and mortality; and
- targeted online health information – use of prevention services, uptake of testing services for HIV, viral hepatitis and STIs, treatment initiation for HIV, viral hepatitis and STIs, treatment retention/completion for HIV, viral hepatitis and STIs, viral load (for example, HIV and HCV), cure and mortality.

Two RCTs *(364, 365)* and one serial cross-sectional study *(366)*, all among men who have sex with men, were included in a review of online outreach; four RCTs *(367–370)* among men who have sex with men, transgender women and people in prisons, and three observational studies *(371–373)* among men who have sex with men, transgender women and people in prisons were included in the review of online case management; and two RCTs *(374, 375)* and one observational study *(376)*, all among men who have sex with men, were included in the review of targeted online health information.

Online outreach

A stepped-wedge cluster RCT among men who have sex with men (aged 16 years and older) in China found comparable (little or no difference) in self-reported condom use between clusters who received the online HIV testing intervention compared to conventional HIV testing programmes, routinely provided by local centres of disease control and community-based organizations (RR: 1.00, 95% CI: 0.86–1.17). There was high certainty that the estimated lack of effect is close to the true effect *(364)*. Another RCT of men who have sex with men in China found that online outreach may make little or no difference to self-reported condom use, regardless of partner type, with low certainty evidence (RR: 0.90, 95% CI: 0.39–2.06) *(377)*.

Moderate certainty evidence from a meta-analysis of the same two RCTs showed a probable increase in HIV testing (RR: 1.39, 95% CI: 1.21–1.60) *(364, 377)*. Moderate certainty evidence from one of these RCTs showed probably no difference in syphilis testing (RR: 0.92, 95% CI: 0.70–1.21) *(364)*.

Moderate certainty evidence from one serial cross-sectional study among men who have sex with men in the USA showed probably more previously unreached people getting reached *(366)*. When only traditional outreach methods were used (October 2011 to March 2012) the local public health department had contact with 60 men who have sex with men. After implementing outreach via Grindr (from October 2013 to March 2014), the department made contact with 816 men who had had sex with men. There was no denominator to calculate rates, only number of contacts (which may include duplicates), and possible confounding from other factors, creating the potential risk of bias.

Online case management

In terms of PrEP adherence, low certainty evidence from one RCT among young men who have sex with men and transgender women (from 15 to 19 years old) in Thailand showed that there may be no difference in use of PrEP services when comparing those who used an online case-management application (provided alongside standard youth-friendly services) to no application, but with the same youth-friendly services (RR: 1.12, 95% CI: 0.78–1.59) *(370)*.

One RCT among men who have sex with men in the USA showed no difference in uptake of repeat HIV testing (RR: 1.24, 95% CI: 0.78–1.95) *(367)*, but due to the very low certainty there is limited confidence in this estimate.

A cohort study among people in prisons living with HIV in the USA found that there may be no difference in linkage to care after release from prison, when comparing those who used an online tailored or personalized website with those who only have access to an online provider directory webpage (RR: 1.09, 95% CI: 0.92–1.29) (low certainty) *(373)*. Another cohort study among men who have sex with men and transgender women in the USA found that there may be a modest increase in the proportion who received primary HIV care in the last six months, when comparing those who completed a six-month digital HIV care navigation intervention with those who did not (RR: 1.20, 95% CI: 1.01–1.42) (low certainty) *(372)*.

One RCT with moderate certainty among 90 stimulant-using men who have sex with men living with HIV in the USA found probably higher overall ART adherence in the intervention than the control arm at 4 months: 89.0% (95% CI: 83.4–94.6)

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 110 of 145

intervention versus 77.2% (95% CI: 66.7–87.7) control, giving a difference in ART adherence of 11.8% (95% CI: 0.34–23.2; p= 0.04). However, two months after the intervention the improvements in adherence had probably dissipated: 85.3% (95% CI: 80.0–90.6) intervention versus 89.0% (95% CI: 83.2–94.9) control, giving a difference of -3.7% (95% CI: -11.4–4.0; p =0.34) *(368)*.

One RCT with low certainty among 110 soon-to-be or recently released people in prisons living with HIV in the USA found that online outreach may make little or no difference in engagement in HIV care, measured by having seen an HIV care provider in the community at least once in the past 24 weeks (RR: 0.98, 95% CI: 0.85–1.12) *(369)*. A cohort study with low certainty among 120 men who have sex with men and transgender women living with HIV in the USA found online case management may make little to no difference in the proportion of people in each group self-reporting currently taking ART (RR: 1.19, 95% CI: 0.97–1.45) *(372)*.

The RCT with low certainty among people in prisons living with HIV in the USA found that being in an intervention group that received a computerized motivational interview and individual risk reduction plan pre-release, plus text messaging about care navigation post-release, made little or no difference to viral suppression (lab-assessed viral load < 200 copies/ml) (RR: 0.97, 95% CI: 0.69-1.36) *(369)*. A cohort study among men who have sex with men and transgender women living with HIV in the USA also found that using online case management makes little or no difference to viral suppression (self-reported viral load < 200 copies/ml) (RR: 1.05, 95% CI: 0.79–1.40) *(372)*. However, another cohort study with moderate certainty among 1201 people in prisons in the USA found probable improvement in the proportion of participants who had lab-assessed virologic suppression at any of their first six care visits (RR: 1.53, 95% CI: 1.43–1.64) *(371)*.

No studies measured our other outcomes of cure (for example, HCV, syphilis or gonorrhoea) or mortality.

Targeted health information

One RCT with low certainty among men who have sex with men in the USA found that targeted health information may make little or no difference in testing for HIV (measured by following up for HIV test result after requesting a HIV self-test kit and returning the kit) (RR: 2.19, 95% CI: 1.20–4.01), though more participants in the intervention arm requested the kit than in the control arm *(375)*. A serial cross-sectional study among men who have sex with men in Canada with low certainty determined with GRADE methodology also found little or no difference in the number of people who ordered a syphilis test before, during or after a syphilis testing advertisement campaign (RR: 1.00, 95% CI: 0.94–1.07) *(376)*. Another RCT was conducted among young men who have sex with men (aged from 15 to 24 years old) in the USA . Based on these results, it is uncertain whether virtual targeted health information improves testing rate for HIV or STIs (RR: 1.46, 95% CI: 0.72–2.94) because the sample size was very small *(374)*.

Based on evidence from one RCT among men who have sex with men in the USA, it is uncertain whether targeted health information improves uptake of prevention services (STI vaccination) because the certainty of evidence is very low *(374)*. No studies measured other outcomes of interest: treatment for HIV, viral hepatitis and STIs, treatment retention or completion for HIV, viral hepatitis and STIs, viral load (for example, HIV and HCV), cure (for STIs, for example, syphilis and gonorrhoea) or mortality.

Feasibility, cost and cost effectiveness

Access to the internet and social media apps has grown exponentially in recent years, even in low-income settings. Many government and community-based programmes are already using online services for key populations, suggesting it is a feasible intervention in many settings *(378)*.

Only one study was included in the cost review *(379)*. This study among men who have sex with men in Canada found that syphilis testing campaign advertisements released over one month over four platforms had the lowest cost-per-click ratio on the hook-up platforms Grindr and Squirt, compared to more traditional social media platforms like Facebook and the Gay Ad Network. No studies measured cost effectiveness.

Indirect evidence from FHI360 *Going online budgeting guide (380)* shows a wide range of costs for programmes, depending on scope of work, including, but not limited to: country or regional costs, connectivity level, programme intensity or scale, vendors, in-person trips or training needs and equipment needs.

Values and preferences

Related to online outreach, in Spain, men who have sex with men thought it acceptable to receive unsolicited messages about rapid HIV, syphilis or HCV testing on social media or hook-up apps *(381)*. In Kenya, Rwanda, South Sudan, Tanzania and Uganda, almost half of respondents who self-identified as a sexual or gender minority were “very likely” to engage in a sexual health programme if outreach was conducted online using either text messages or emails *(382)*. In China, men who have sex with men stated high interest and willingness to use a “men who have sex with men-friendly physician finder function” within gay mobile on-line applications *(383)*.

Related to online case management, men who have sex with men in China expressed interest in features or functions related to sexual health that could be embedded in existing smartphone apps or developed as standalone apps *(384)*. Men who have sex with men in the USA were strongly in favour of a smartphone app developed for online case management *(385)*. Positive features of such apps were their ease of use (easy to navigate, fast and convenient), the ability to set reminders or alarms to take medication at a certain time each day, trackers for adherence and communication with providers, which helped users feel supported in their care process. Several studies mentioned concerns regarding ensuring confidentiality in the online environment *(368, 385, 386)*.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 111 of 145

When asked about targeted online health information specifically, men who have sex with men expressed a diverse range of acceptability; however, most were comfortable interacting with health services online *(376)*.

Qualitative research conducted by four key population networks (see Web Annex B) showed that, overall, participants across key population groups and regions supported the use of online services and platforms to augment in-person services. At the same time, many participants described challenges associated with varying levels of internet access, digital competencies, as well as the broader implications of poverty.

It was stressed across all key population groups that online services and platforms cannot replace in-person health services. Participants emphasized the importance of maintaining in-person, face-to-face services as a gateway to broader health and support services, as well as a means to foster personal connections and trust. Participants raised security concerns associated with leaving a digital footprint.

Equity and acceptability

In a qualitative, questionnaire-based study among frontline outreach workers, managers or public health volunteers who worked with men who have sex with men in Canada *(387, 388)*, it was noted that online technologies have reshaped the "gay or queer community", changed norms for social and sexual interactions, and that these online technologies can help reach out to hard-to-reach people. They found that, generally, online outreach allowed for more non-intrusive and anonymous communication (beneficial for clients), yet quick feedback helped them be responsive to user needs. They also outlined some barriers to online outreach, such as quality of service, collaboration between outreach service agencies and companies that own apps and websites, budgetary and staff or volunteer capacity constraints, and data security and safety. From their own experiences, service providers mentioned four ethical dilemmas as outreach moved to online platforms: 1) managing personal and professional boundaries with clients; 2) disclosing personal and identifiable information to clients; 3) maintaining client confidentiality and anonymity; and 4) security and data storage measures of online information.

While noting that online platforms can be particularly impactful amongst harder-to-reach sub-populations, such as migrant sex workers or young men who have sex with men, participants in the key population networks' values and preferences research also highlighted the role that digital inequality plays in mediating access to, and uptake of, online services. Concerns, including reduced access to technology or electricity, high data costs and differing levels of digital competencies, were all cited as factors affecting the use and impact of online tools and platforms. Those with limited or controlled access to mobile devices, particularly women and adolescents, were particularly vulnerable to digital inequality *(378)*. These issues can be exacerbated by criminalization and law enforcement actions.

Evidence assessment and decision-making

Overall, the evidence indicates that online service delivery is at least as effective as face-to-face services in terms of reaching new people, use of HIV and STI prevention services, linkage to and retention in HIV care. While the evidence of effect was modest or small for some outcomes, and for other outcomes there was no effect found, the evidence did not show worse outcomes when employing any online service delivery method. These interventions are feasible, acceptable and may increase equity. The resource requirements will vary depending on setting and intervention, and cost effectiveness is uncertain.

For some people who are unable to attend face-to-face services, online services may offer the only means of receiving information, support, referral and case management. But while the use of online services is increasing, there are still limitations related to reach. Furthermore, key populations said they value online services, but felt strongly that these services should complement and not replace face-to-face services. Potential harms related to data security and confidentiality was of particular concern for key populations who may engage in criminalized and stigmatized activities and experience discrimination, arrest or harassment if confidentiality is breached. For these reasons a conditional recommendation was made in favour of online services.

Implementation considerations

Online services complement but do not replace face-to-face interactions and should be part of larger HIV, STI and viral hepatitis programmes for key populations. Systematic planning of the ways in which online services can complement other services and target audiences should be conducted with key populations playing a central role in their design, implementation and monitoring. Content development should be informed by appropriate and accurate health content and information aligned with recommendation practices (for example, from health programme guidelines or evidence-based normative practices) *(389)*. Demand creation plans, service delivery packages and approaches need to be customized, based on country contexts and priorities. Online services can effectively be managed and implemented by key population peers.

Efforts should be made to make access to the internet equitable, improve literacy and provide appropriate training where needed. Where barriers to key populations accessing online services remain, this needs to be taken into consideration when planning and implementing online programmes.

Safety and security in online services need to be maintained by the following means: monitoring for harm, explicitly stating and using de-identified information as much as possible; maintaining data protection and storage, and training all staff in data security measures; thinking about the setting and using broad branding that does not lead to identifying certain groups of key populations; training staff in client confidentiality; verifying health worker licenses and credentials

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 112 of 145

where applicable; using secured internet, devices and apps; and providing services only with informed consent from clients *(390)*.

WHO has further guidance and recommendations on general population digital health, as well as a framework for planning, developing and implementing solutions with and for young people *(180, 389)*.

Research gaps

Available published research about online services for key populations is mainly among men who have sex with men in high income countries and related to HIV. Further research is needed on the accessibility, safety and effectiveness of online services for other key populations, the various experiences and preferences of different key populations in low- and middle-income settings, and their effect on outcomes related to STIs and viral hepatitis. Continuing monitoring and evaluation and publishing the implementation results will also support and help to refine future guidance.

More research is needed on the cost effectiveness of different types of online services by key population groups.

Peer navigators

Background

Peer navigation is rooted in the concept of *patient navigation*, where vulnerable patients are directly assisted to help find their way through complex health care systems to obtain timely diagnoses and treatment. Instead of formal health workers, lay staff members who are peers of the participants and therefore could promote trust among the population fill this role *(391)*. While lay providers, including key populations, are recommended to provide HIV testing and ART distribution *(190)*, the role of a peer navigator is different. Key population peer navigators are often employed at community-based services, primary health care settings and testing and treatment facilities that are designed to serve people from key population groups. Their role is to support key populations, after screening positive, to access confirmatory diagnosis and treatment services; to support the early stage of treatment with regular peer support, as well as to accompany key populations to appointments; and support navigation to other related health services. This is important as key population members are often under-represented in treatment programmes, and can be reticent to access treatment due to their fear of discriminatory attitudes among health care providers and other staff in health care settings, and due to their lack of experience with traditional, facility-based programmes.

Evidence review

WHO commissioned a systematic review to answer the question of whether peer navigators improve initiation and retention in HIV, viral hepatitis and STI treatment programmes for people from key populations. The outcomes tested were: time to diagnosis or linkage to care , treatment initiation, treatment retention and completion, viral load, cure and mortality.

Four studies (two RCTs and two observational studies) were included in the systematic review designed to find the effect of peer navigators on time to diagnosis, linkage to care, treatment retention or completion, and viral load or disease cure. All these studies measured HIV outcomes, and none measured STI or viral hepatitis outcomes.

One RCT in the USA, with high certainty evidence, found no difference in probability of HIV care visits after release from jail for people in prisons with involvement of peer navigators (RR 0.95, 95% CI: 0.81–1.12) *(391)*, one RCT among sex workers in Tanzania found there may be improvements in linkage to care (RR 1.44, 95% CI: 1.15–1.80), but there was low certainty of this effect *(128)*, and one observational study among transgender women in the USA found improvements in linkage to care when people were assisted by peer navigators (regression coefficient 0.38; 95% CI: 0.09–0.67) with moderate certainty that the true effect was close to this estimate *(392)*.

The employment of peer navigators was found to result in modest improvements in current ART use in one RCT in Tanzania (RR 1.28, 95% CI: 1.05–1.55) *(128)* and one observational study in the Dominican Republic (RR 1.11, 95% CI: 1.03–1.19*) (393)*, both with low certainty of evidence. The RCT among people in prisons found no difference in ART use with peer navigation (RR 0.97, 95% CI: 0.87–1.08) and there was moderate certainty that the true effect was close to this estimate *(391)*.

One RCT showed improvements in undetectable viral load with peer navigation (RR 1.38, 95% CI: 1.03–1.85) with high certainty indicating that this estimate is very close to the true effect *(391)*, but the other studies found no difference *(128, 392, 393)*, all with moderate certainty. No studies measured the outcomes of treatment initiation, cure or mortality.

Feasibility, cost and cost effectiveness

Peer navigators have been employed at community and facility-based services in several different settings, and it is feasible to introduce this role to new or existing programmes.

A systematic review did not identify any research on the cost or cost effectiveness of key population peer navigators in HIV, STI or viral hepatitis programmes. Guideline Development Group members judged that as peer navigators work to support existing programmes, the cost associated with their employment may be considered to be moderate and related to salary, training, transport and tools such as mobile phones.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 113 of 145

Values and preferences

Key population network-led qualitative research was undertaken to assess values and preferences associated with peer navigation in all key population groups, except for people in prisons (for detailed report, please see Web Annex B). Although the term "peer navigators" was not universally recognized by all participants, the practice of peers assisting with health service access, information, education and referral was greatly valued by participants across all four key population groups. Participants both supported the concept of peer navigators, as well as their capacity to "act as a bridge between two different worlds". In some settings, peer navigators were described as one of the only available tools for reaching communities. Peer navigators were considered as facilitators throughout the testing and treatment cascade – including treatment linkage, continuity and re-engagement.

Equity and acceptability

Key population peer navigators improve linkage to care and retention in treatment programmes for populations who may otherwise be excluded due to structural barriers, including stigma, poor literacy and poverty. In this respect, peer navigators have an important role in improving equity by assisting those with inequitable access to health care to enter testing and treatment programmes.

A systematic review identified two studies of acceptability related to key population peers, which found overloaded health workers welcomed assistance from peer navigators and suggested appropriate tasks for them. However, concerns were expressed about clients becoming too dependent on peer navigators (that they are not able to self-manage), and there were some negative and discriminatory community reactions to support groups for men who have sex with men *(394)*. In Mexico, staff at a community-based organization felt peer navigators could address stigma and social support. However, they discussed concerns about police interference with peer navigators, and whether it put peers and their clients at risk of harassment and arrest *(395)*.

Assessment of evidence and decision-making

The benefits of using peer navigators include, as described above, the prospect of them improving linkage to care and retention in treatment. Key population members highly value services provided by their peers, and community empowerment is an evidence-based intervention *(122, 127)*. It was noted that support from peer navigators is not always desired by all key population members, particularly when people do not wish to disclose their disease status to a peer.

Peer navigators increase equity, and peer navigation is a feasible intervention. The costs vary greatly depending on setting, and cost effectiveness is unknown.

The evidence included in the systematic review was only relevant to HIV programmes, although STI and viral hepatitis programmes also employ peer navigators. It was decided that there was adequate indirect evidence to make a recommendation that applies to the three disease areas. Based on the moderate certainty of evidence supporting peer navigators, the value placed on peer navigators by key populations, and the likely beneficial effect on equity, the Guideline Development Group made a conditional recommendation in favour of peer navigation.

Implementation considerations

Key population peer navigators are increasingly employed at health services, along with key population peers who undertake different roles (including planning, mapping, management, education, adherence support, outreach, testing, distribution of medicines, overdose management, condoms and needles/syringes, etc). All peers who work within HIV, STI and viral hepatitis services need to be recognized as part of the health workforce, be fairly remunerated and receive ongoing training and development to fulfil their roles. Peer navigators can be subject to additional risks, such as arrest and violence, because they can be identified by police or others as members of the key populations; therefore, efforts should be made to protect peer navigators, in particular young key population peers, from any additional risks.

According to participants in the key populations' values and preferences research, the key traits of successful peer navigators include: passion for the community and the health issue, communication, compassion, supportive listening skills, first-hand experience, trustworthiness, empathy and dedication. Participants also stressed the importance of having peer navigators with appropriate age, gender, cultural and linguistic backgrounds.

While valued by key populations in general, not all key population members need or want the support of a peer navigator. Concerns about confidentiality may mean that some people prefer not to disclose their infectious disease status to a peer; therefore, they will not be comfortable using the services of a peer navigator, which highlights the importance of informed choice when implementing this intervention.

Research gaps

While there is considerable research about the effectiveness of peers as treatment support staff and patient navigators, there is far less research that is specific to key populations. More studies are needed to understand the effectiveness of different approaches for various key population groups of all ages, as well as for STIs and viral hepatitis. Overall, better research on what works to improve treatment outcomes among key populations is needed.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 114 of 145

HCV recommendations: introduction

Effective and affordable diagnostics and treatment are available for HCV and recommended by WHO *(184, 185, 193, 396)*, but a rapid increase in the availability and accessibility of HCV testing and treatment for all populations, including those at increased risk and those with HCV reinfection, will be needed to reach the elimination targets.

HCV causes both acute and chronic infection. Acute HCV infections are usually asymptomatic, and most do not lead to a life-threatening disease. Following recently acquired HCV infection, approximately 30% (15–45%) of infected persons spontaneously clear the virus within 6 months of infection without treatment *(15)*, with a median time to clearance of 16.5 weeks. Spontaneous clearance is more likely to occur in women, genotype 1 infection, and people with clinical evidence of acute hepatitis, but less likely to occur in people with HIV *(397)*. The remaining 70% (55–85%) will develop chronic HCV infection. Of those with chronic HCV infection, the risk of cirrhosis ranges from 15% to 30% within 20 years *(193)*. Importantly, individuals that clear HCV infection spontaneously or after treatment are not immune to the virus, and those with ongoing risk and exposure can become reinfected.

"Treatment-as-prevention" is becoming a key part of a multifaceted public health approach to HCV elimination. Early identification of primary and recurrent HCV infections, as well as timely treatment, is vital for a treatment-as-prevention approach, in order to reduce transmission and liver disease-related morbidity and mortality *(398)* – especially in countries where many of the new HCV infections are among key populations.

HCV retesting after resolved HCV infection

Background and rationale

After HCV infection and DAA treatment or spontaneous clearance of HCV, ongoing risk behaviours, poor access to prevention interventions, and persistent structural barriers for groups such as people who inject drugs and men who have sex with men may lead to HCV reinfection, which often goes undiagnosed. The potential for HCV reinfection remains a major obstacle to achieving the HCV elimination goals. From a patient perspective, concern for HCV reinfection remains a major driver for provider and health system-level barriers to HCV treatment of persons perceived to be at high risk for reinfection after cure *(399)*. From a population perspective, elimination is dependent on diagnosing and treating enough infected individuals, so as to reduce overall population prevalence, and thereby reduce the pool of individuals who can sustain the epidemic by transmitting infections to others. If people with high risk of transmission do not receive HCV diagnosis and treatment in a timely manner, this may present an ongoing challenge to community-wide and global HCV elimination *(220)*.

To address missed diagnoses of HCV reinfection among priority groups, to offer continued care and to increase access to treatment, several national and international guidelines, including WHO's, suggest serial testing for hepatitis C reinfection in priority groups, but do not state a specific testing frequency *(184, 400)*. Determining this optimum frequency will assist in a treatment-as-prevention approach to reduce HCV incidence and prevalence, notably among most-affected populations.

Evidence review

A systematic review was commissioned by WHO to answer the question of how often people with ongoing risk of HCV infection should be retested for evidence of viremia (using NAAT) for HCV RNA or HCV core antigen after treatment-induced or spontaneous HCV clearance. The primary outcome tested was the detection rate of HCV reinfection and the secondary outcomes were testing uptake for viremia (RNA or HCV core antigen) testing; linkage to clinical assessment or treatment initiation following reinfection or both; risk behaviour and adverse events or social harm.

No RCTs or comparative studies were identified. Thirty-five other studies were included in the review; 33 were single-armed observational studies and two were modelling studies. The 33 observational studies comprising 10 857 participants (key population groups included in the literature were people who inject drugs, people in prison or closed settings and men who have sex with men) at risk of HCV reinfection reported HCV reinfection incidence per 100 person-years (py), hence were included in a meta-analysis. The included studies did not report results for any of the secondary outcomes.

The studies had varying testing intervals; in order to answer the research question, the most meaningful comparison was between studies testing at 3–6-monthly intervals versus studies testing at greater than 6-monthly intervals.

The overall pooled HCV reinfection incidence estimate was 4.73 per 100 py (95% CI: 3.68, 5.78). The pooled incidence estimate among people who inject drugs was 3.94 per 100 py (95% CI: 2.83, 5.05), among men who have sex with men 7.11 per 100 py (95% CI: 4.16, 10.06) and among people in custodial settings 6.00 per 100 py (95% CI: 0.00, 12.31). Very low certainty evidence showed that among studies that reported a testing interval of 3–6 months, the pooled incidence estimate of 5.88 per 100 py (95% CI: 4.14, 7.61) was higher than studies reporting testing less frequently than every 6 months (up to every 12 months) at 3.08 per 100 py (95% CI: 1.81, 4.35). Additionally, among the people who inject drugs population, very low certainty evidence showed that pooled reinfection incidence was higher in those tested every 3–6 months at 5.39 per 100 py (95% CI: 3.47, 7.31) compared to those tested less frequently than every 6 months (up to every 12 months) at 1.84 per 100 py (95% CI: 0.64, 3.05). Given the very low certainty, confidence in these results is limited. Differences in incidence were not reported in other population groups from the studies included.

Two modelling studies were also identified that directly compared more and less frequent HCV testing regimes. A modelling study in India used a closed Markov model of reinfection among people who inject drugs in India. They

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 115 of 145

assumed 6.2 million chronic HCV patients, 10% infections diagnosed/year, a reinfection rate 1.0/100 py, baseline DAA efficacy off 90%, the cost of DAAs US$ 900 for a 3-month course, and standard Indian costs for hepatitis C treatment. In a sensitivity analysis post successful treatment, the authors compared a one-off testing strategy at 1 year post-SVR compared to a regular annual testing strategy. They found that ongoing annual testing was more effective (0.4 QALY/person treated), cost-saving (US$ 993 per person), and very cost effective, with a negative incremental cost-effectiveness ratio *(401)*.

A modelling study in France used a deterministic dynamic compartment model among HIV-positive men who have sex with men in France, assuming a baseline HCV prevalence of 3.6%. Their baseline scenario involved DAA treatment of all patients and 12 monthly population testing, and projected that HCV incidence would fall from 0.98 to 0.24/100py. The authors found that more frequent testing (3, 3–6 or 6-monthly) was associated with further reductions over baseline in overall HCV incidence by 2030. The reinfection incidence in these scenarios was also modelled, and demonstrated that 3, 3–6 and 6-monthly testing reduced HCV reinfection incidence by 2030 significantly more than baseline (12 monthly) testing, though there was little difference between reductions from 6-monthly (18.5%), 3–6-monthly (21.5%), and 3-monthly testing (23%) *(402)*.

Overall, there is very low certainty evidence that more frequent testing may identify more infections, and therefore be beneficial in contributing to preventing onward transmission if individuals are linked to treatment and care. Some of the differences between testing intervals may have been found because researchers and clinicians were more likely to frequently test patients at higher risk of reinfection.

Values and preferences

Preferences regarding frequency of HCV testing varied greatly across the three key population groups who were asked this question in the key population-led values and preferences qualitative study (people who inject drugs, men who have sex with men, and sex workers) (see Web Annex B). Men who have sex with men pointed out a lack of protocols and the need for evidence to guide frequency of HCV testing recommendations. Meanwhile, sex workers had a wide range of preferred HCV testing frequencies – from once a week to once a year – with many participants considering 3–6 months as optimal. People who inject drugs suggested that individuals be tested every 3-months for the first year following viral clearance, and then subsequently every 6 or 12 months, depending on risk profile.

Sex workers and people who inject drugs preferred that regular HCV RNA testing and retesting following cure be made available, and promoted similarly to HIV "Test and Treat" approaches, whereby regular monitoring is publicly and positively promoted, widespread testing is facilitated, and immediate treatment for those diagnosed is encouraged. All groups highlighted concerns associated with criminalization, stigma, and discrimination, noting that testing should always be voluntary.

Overwhelmingly, key populations preferred HCV services to be community-led and available within community settings, in order to address concerns related to safety, confidentiality, stigma and discrimination, as well as criminalization. Increased training and resources to support community organizations in this work will be required. People who inject drugs emphasized the importance of embedding HCV testing within a broader harm reduction approach that did not focus on abstinence, including offering pan-genotypic DAA treatment and HCV prevention for people in prisons.

No additional studies on related values and preferences were identified through the systematic review.

Resource-use: cost and cost effectiveness

The costs, both for tests confirming the presence of HCV viremia and for treatment for those identified HCV positive, vary considerably, depending on settings and countries. In particular, NAAT and HCV core antigen are relatively expensive in many lower- and middle-income settings.

More frequent testing could involve increased short-term costs of tests, costs of outpatient visits, including personnel and, if more reinfections are identified, the short-term costs of increased treatment. The approach may also entail opportunity costs for time and attention spent by medical personnel and administrators. Testing people more often after they have been successfully treated may also divert resources away from other testing programmes, such as those aiming to reach a larger population of people who have not had access to testing or treatment.

In the long-term, there may be cost savings by averting costs of advanced hepatitis disease and liver failure. There is some support from modelling evidence *(401, 403)*, with one modelling study suggesting that more frequent annual testing for reinfection of people who inject drugs post-treatment was overall cost-saving, compared to a one-time only retest *(220)*.

Equity

More frequent HCV testing could potentially increase early diagnosis and treatment of HCV reinfection in priority groups, thus reducing HCV infection and improving health equity. However, increased testing frequency could also potentially increase the burden of medical interventions for patients who may have multiple comorbidities and a high treatment and investigation burden. Testing should be voluntary, and streamlining medical visits and investigations should always be considered.

Feasibility and acceptability

NAAT and HCV core antigen testing accessibility and cost vary widely across settings. Thus, feasibility is dependent on the context, availability of resources and health system capacities. In settings with existing point-of-care solutions or

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 116 of 145

well-developed linkage services, frequent retesting may be a feasible approach. For some people though, offers of more frequent testing based on risk may be stigmatizing and create barriers to accessing services. Also, it may be difficult to correctly assess ongoing risk, particularly in settings where key populations are criminalized and stigmatized, as people may choose not to disclose risk behaviours, and equally it will not always be possible to know about individuals' history of treatment or clearance. Moreover, increased frequency of testing, especially in the 3–6-monthly range, may be a significant time and resource burden, which may influence acceptability among providers and policy-makers.

Assessment of evidence and decision-making

The review found very low certainty evidence, from one-armed observational studies and limited modelling studies, in favour of more frequent retesting in people at ongoing high risk for HCV reinfection, particularly in people who inject drugs. Overall, the Guideline Development Group determined the certainty of evidence to be very low. While evidence of effect was small across the principal outcome, the Guideline Development Group highlighted that testing for presence of viremia in people with ongoing risk and previously cleared infection may be beneficial at both the individual and population level.

The main physical harms of more frequent blood testing for HCV are relatively minor, such as short-lived discomfort and bruising. The very rare risk of false positives should also be considered.

Considering the evidence of benefits for 3–6-monthly testing for reinfection; the relatively strong support from community values and preferences; the potential for expanding patient choices; the feasibility to implement; as well as potential for cost-effectiveness and improved equity, the Guideline Development Group deemed that the overall benefits outweigh the potential harms and risks. More frequent testing of people at ongoing risk can identify more people with viraemic HCV; the potential benefits of this include population-level ones, such as reduced HCV incidence and prevalence over time, due to more infections being treated and accordingly less potential for community transmission, and better individual patient outcomes related to early diagnosis. Patients may also benefit from better engagement in the health care system for other interventions, such as OAMT.

The Guideline Development Group recognized that testing frequency for reinfection should be contextualized and adapted to the reinfection incidence of a population. Furthermore, short-term costs and accessibility of diagnostics for presence of viremia (NAAT and HCV core antigen testing) may be a limitation to scaling-up the recommendation in some settings. Given the range consideration, the Guideline Development Group agreed to make a conditional recommendation.

Implementation considerations

In general, a successful response to HCV requires available, accessible, affordable and coordinated prevention, testing and treatment services, with well designed integrated service delivery and referral pathways**.** It is important to highlight that the frequency of retesting needs to be contextualized, and that the recommendation is meant to orientate programmes towards a potential testing frequency. Planning country-level testing frequency needs to factor in resource needs and evolving epidemiological patterns in certain populations and settings. Additionally, HCV management should include screening for HIV, STIs and voluntary partner notification for HCV testing where appropriate. Importantly, testing approaches and policies need to be developed with support from, and in exchange with, affected communities.

One of the major objectives of extending testing, referral and linkage to treatment to people with ongoing risk is the potential of population level benefits and a reduction of HCV transmission. Frequent testing for viremia should be offered alongside additional, evidence-based interventions to reduce HCV risk, and primary prevention services, such as harm reduction (NSPs and OAMT), which remain a priority and should be offered alongside testing for reinfection and not be de-prioritized. This new recommendation is particularly relevant for countries and settings where the reduction of HCV incidence is a major aim of the programme, and includes approaches such as micro-elimination in certain population groups.

Given that NAAT for occurrence of HCV RNA and HCV core antigen testing accessibility varies widely across settings and is often centralized, with the majority of tests requiring processing at central laboratories, decentralized models of care – with increased availability of point of care testing – are needed to make more frequent retesting feasible. It is important that frequent retesting is implemented in a way that does not reduce the number of people assessed for longstanding chronic HCV infection.

It is important to differentiate between HCV reinfection and treatment relapse in people with past DAA treatment. Evidence of HCV clearance and cure is evaluated 12 weeks after end of treatment (sustained virological response at 12 weeks post-treatment (SVR12)). SVR12 is widely considered to be equivalent to virologic cure. In the oral DAA era, rates of virologic relapse after the achievement of SVR12 are very low *(399)* and, when it occurs, it is usually within the first four weeks after end of treatment. Thus, a diagnosis of HCV reinfection can be made when HCV viremia is detected in persons who achieved SVR12 following completion of treatment with an effective oral DAA combination regimen, notably in persons who also have probable or definite risk factors for reinfection. In people with viremia between treatment completion and SVR12 assessment, or people for whom SVR12 is unknown, a further differentiation between relapse and reinfection may be useful and needed to orientate treatment decisions.

Monitoring and reporting systems are critical for all approaches to viral hepatitis testing and treatment, and it is essential for programmes to utilize or adapt existing systems to monitor and report on adverse events, in order to address harm if and when it occurs.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 117 of 145

Research gaps

Current research about HCV testing and detection of viraemic infections in people with ongoing risk comes largely from high-income countries.

Therefore, more research, ideally through comparative longitudinal studies comparing 12 monthly testing with more frequent testing or modelling, is needed to answer the question of whether more frequent testing after reinfection, followed by immediate treatment (namely, test and treat), would support a treatment-as-prevention strategy and micro-elimination of HCV with population-level benefits. There is a need for more research from LMICs. Real-world studies in different settings are needed to further establish cost-effectiveness and assess resource needs, feasibility and acceptability.

HCV treatment for recently acquired infection

Background and rationale

WHO currently recommends HCV therapy with pan-genotypic DAAs for all persons with chronic infection over the age of 18 years and irrespective of disease's stage. DAAs can cure most persons with chronic HCV infection, and treatment duration is short (usually from 12 to 24 weeks), depending on the absence or presence of cirrhosis *(193)*. However, DAA treatment is not currently approved by certain regulators for the treatment of recently acquired hepatitis C *(404)*. The rationale for this policy is to avoid unnecessary treatment and costs, since around 30% of people will clear the virus without treatment. This argument may become less important in contexts in which the costs of treatment is reducing. More recently, clinical guidelines from umbrella organizations in Europe and the USA recommend the treatment of recently acquired infection, recognizing the benefits, such as reductions in loss to follow-up, avoiding chronic infection and reducing ongoing transmission *(405, 406)*.

Evidence review

A systematic review was commissioned by WHO to determine the benefits and harm of immediate treatment of recently acquired hepatitis C in people at ongoing risk, and to update the current body of evidence informing the timing of HCV treatment. The outcome measures were hepatitis C incidence, treatment initiation, engagement in care (adherence), overtreatment, adverse events, treatment completion and SVR12.

A post-hoc review of the search results was conducted to identify modelling studies evaluating the effectiveness of treating recently acquired HCV infection, and any studies that reported on values and preferences of stakeholders.

No randomized controlled trials nor comparative studies were identified in the systematic review. Twelve noncomparative studies were included in the review: three single-group prospective cohort studies *(407–409)* five retrospective cohort studies *(410–414)*, three cohorts embedded in open label trials *(415–417)* and one case series study *(412)*. Across all these studies, all outcomes were rated as providing very low certainty evidence using the GRADE approach. In general, this was due to the noncomparative nature of these study designs and the indirectness and inconsistency of the data.

Two retrospective cohort studies and one prospective cohort (embedded within an open label trial) reported HCV incidence among men who have sex with men living with HIV, and allowed a comparison of incidence before and after the implementation of an HCV treatment policy for recently acquired infection *(411, 412, 416)*. Two of these studies reported a decrease in HCV incidence at the end of the study period; a study set in a Swiss cohort which reported a decrease in incidence from 0.53/100 py in 2014 to 0.12/100 py in 2019 *(416)*, and a study set in the United Kingdom, which reported a decrease from 11.28/1000 py in 2016 to 4.63/1000 py in 2018 *(412)*. One study found an increase in incidence over the study duration, from 0.73/100 py in 2015 to 1.25/100 py in 2018 *(412)*. These studies were in large cohorts of men who have sex with men, where most of the patients were being treated in the chronic phase of infection rather than recently acquired infections. As treating chronic hepatitis C can reduce incidence on population level as well *(418)*, it was not possible to identify the distinct effect of treating acute infection on incidence in these cohorts. Given the very low certainty, there is limited confidence in these results.

Seven studies (three retrospective and two prospective cohorts, one open label trial and one case series), including a total of 567 participants with recently acquired hepatitis C, reported SVR12 in men who have sex with men, people living with HIV and people who inject drugs *(407, 409, 410, 413, 414, 417, 419)*. The studies showed with a very low certainty evidence that people with ongoing risk treated for recently acquired HCV infection with DAA achieved consistently high rates of cure, consistent with the rates of cure seen for those treated with antivirals for chronic HCV in key risk groups. Pooled SVR12 across all risk groups was 95.9% (95% CI: 92.6–99.3%; I2 = 61.3%). With men who have sex with men, the pooled SVR12 was 96.9% (95% CI: 93.1–100%); with people living with HIV, pooled SVR12 was 97.0% (95% CI: 90.7–100%); and with people who inject drugs, pooled SVR12 was 80.4% (95% CI: 66.1–90.6%). Overall, confidence in these results is limited due to the very low certainty.

The one case series and one open label trial reported 100% HCV treatment completion rates in 25 men who have sex with men living with HIV *(419)* and among 27 people living with HIV *(415)*. Two open label trials *(415, 417)* reported on adherence: one found adherence of 81% amongst people living with HIV *(415, 417)* and another found adherence ranging from 79% to 85% among people who inject drugs, men who have sex with men and people living with HIV *(417)*.

Adverse events were reported in four studies *(409, 415, 417, 419)*; one serious adverse event, an episode of rhabdomyolysis (rash and raised creatinine kinase) requiring hospitalization was described *(417)*, while all other adverse events were considered minor. Adverse event rates ranged from 22% (21/95) to 36% (9/25). However, confidence in these results and those for adherence is limited due to the very low certainty.

No studies included a comparator group, so it was not possible to assess overtreatment.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 118 of 145

Values and preferences

Qualitative research carried out by key global population networks (see Web Annex B) found that awareness of and access to HCV treatment with pan-genotypic DAAs varied greatly across key populations. Of those participants who were aware of, and felt able to comment on, HCV and HCV treatment, most reported ongoing barriers to the access and utilization of HCV services, including cost, treatment delays, stigma and discrimination, and lack of research and political will. Some sex workers had not heard of pan-genotypic DAA treatments for HCV. People who inject drugs in particular noted that in certain contexts, cessation or abstinence from drug use (and sometimes OAMT) continues to be used as a criterion for HCV treatment access. This major barrier continues to occur, despite WHO recommendations to provide HCV treatment regardless of ongoing drug use.

People who inject drugs conveyed the most knowledge of pan-genotypic DAA treatment and recommended the expansion of HCV DAA treatment options and settings to maximize access and uptake, including at NSPs, OAMT clinics, drop-in centres and general health care settings. Given the high cure rates, good tolerability, low pill burden, fewer drug–drug interactions and significantly fewer side effects than the previous therapies, people who inject drugs expressed strong preferences for reducing barriers to treatment and making HCV DAA treatment as accessible as possible for people who inject drugs, including people who may have already been successfully treated and subsequently contracted a new HCV infection, as well as people with recently acquired HCV infection.

People who inject drugs did not express concern about the potential for overtreatment associated with offering treatment without delay for recently acquired infection, either among people who are treatment naïve or for retreatment. Rather, they expressed the concern that it is dangerous to deny access to treatment purely on the basis that some people will spontaneously clear (without treatment) – not only for the health of the individual concerned (and potential loss to follow-up), but also due to the potential for further transmission. People who inject drugs were more concerned about the ongoing lack of access to the highly effective HCV DAA treatments in certain countries and regions than about any hypothetical risk of overtreatment. Finally, people who inject drugs also emphasized the importance of offering HCV DAA treatment (and HCV prevention, including NSPs and OAMT, as well as management overdose) for people in prisons. This is particularly important in the context of an overwhelming lack of access to sterile injecting equipment and other harm-reduction measures in most prisons globally, coupled with high levels of incarceration associated with drug-related offences.

Most participants from other key population groups expressed limited knowledge about treatment with pan-genotypic DAAs, and the implications of treating recently acquired infection without delay or not. Nonetheless, most participants were open to this treatment, provided that they receive adequate information on its efficacy and side effects, as well as sufficient education and research to guide treatment implementation.

No additional studies on related values and preferences were identified through the systematic review.

Resource-use: cost and cost effectiveness

None of the studies identified from the systematic review and meta-analysis directly addressed resource requirements or cost-effectiveness.

A post-hoc modelling search to identify additional cost-effectiveness models in both high- and low-income settings *(420–423)* supported the value of treatment without delay of recently acquired HCV infection and potential population-level benefits. For example, in a Dutch model, earlier treatment of recent infection will cost €68.3 million over 40 years, compared to €75.1 and €98.4 million to delay treatment – either waiting for spontaneous clearance or delaying treatment until F2 stage[27], respectively. This study model also reported treatment of recent infection will prevent 7070 new infections and gain 3419 QALYs compared to F2 treatment, with resulting cost saving incremental cost effectiveness ratio (ICER) *(423)*. Other modelling studies from China *(421)* and the USA *(420)* also showed that treating acute HCV is cost effective and cost saving compared to deferring treatment to the chronic stage; however, there were increased costs associated with HCV treatment for recent infection in patients who were not at risk of transmitting HCV *(420)*.

One modelling study demonstrated a potential reduction in HCV incidence as a result of immediate treatment *(423)*. This study modelled treatment scenarios in a Dutch cohort of HIV-positive men who have sex with men, and found that treatment of recently acquired HCV infection lowered incidence from 1.2/100 py to 0.2/100 py, an 88% reduction in incidence compared to treatment at liver fibrosis stage F2.

The Guideline Development Group was of the view that overall costs in the short term for treatment and testing could be increased if people are treated for recently acquired infection with significant uncertainty due to variation in costs of testing and treatment between settings, including low-, middle- and high-income countries, changes in DAA and other medication costs over time, and the variable opportunity cost of diverting staff and attention.

Equity

No studies assessing equity were identified in the systematic review.

It can be argued that providing DAA treatment to people with recently acquired hepatitis C expands choice (namely, by providing a second option to deferral of treatment until chronic infection) for key populations, and may reduce loss to follow-up, thereby increasing the number of people accessing treatment. It is important that there are no restrictions

[27] METAVIR liver biopsy scoring system which ranges from 0 to 4.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 119 of 145

related to treatment of chronic or acute HCV infection and concurrent ongoing drug use, or drug dependence treatment or ongoing sexual risk.

In settings where access to DAAs is limited, implementing treatment for people with recently acquired infection without increasing overall DAA supply may have a negative health equity impact if DAAs are re-allocated from people with chronic hepatitis C, who are beyond the point of spontaneous clearance, and require treatment to prevent future morbidity and mortality. People with recently acquired hepatitis, on the other hand, may not necessarily require treatment, due to the remaining possibility of spontaneous clearance. Increased availability of affordable HCV treatment is needed to achieve elimination goals and ensure equity.

Feasibility and acceptability

None of the identified studies from the systematic review and meta-analysis directly addressed feasibility or acceptability.

Overall, it could be argued that feasibility will depend greatly on context and health systems' capacities. Offering treatment without delay to people independent of chronicity may simplify HCV treatment and care algorithms and increase patient choice, and thus be a feasible option in many different settings and countries. In settings with existing decentralized services for HCV testing and treatment, or well-developed linkages, treatment without delay may be particularly feasible. Furthermore, improving awareness of HCV and DAA among key population members will be required.

It is possible that the risk of adverse events from HCV treatment – however mild – may be unacceptable to people with recently acquired hepatitis C if the possibility of achieving spontaneous clearance has not yet been exhausted. Allowing individuals to make an informed choice between immediate and deferred treatment is therefore important. Similarly, it is unclear whether routinely prescribing a treatment to individuals with recently acquired hepatitis C without a period of observation for spontaneous clearance is acceptable to clinicians.

The Guideline Development Group judged that the intervention would probably be acceptable to most key stakeholders. There was some uncertainty around whether routinely prescribing a treatment to individuals with recently acquired hepatitis C without a period of observation for spontaneous clearance would be acceptable to clinicians.

Assessment of evidence and decision-making

The Guideline Development Group agreed that the issue of treating recently acquired HCV infection in persons with continuous risk exposure was a priority for public health and HCV elimination, and that the benefits clearly outweighed the harm. Benefits overall were judged to be large or moderate, and the related harm was trivial or small. Overall, the Guideline Development Group determined the certainty of evidence to be very low.

While evidence of effect was small across all outcomes, the Guideline Development Group highlighted that HCV treatment without delay for recently acquired HCV infection for those with ongoing risk can be beneficial, at both the individual and population level. Improved identification and treatment of recently acquired HCV may bring the benefit to the individual of being cured as soon as possible after diagnosis, rather than having to wait to access treatment and the associated risk of loss-to-follow-up, and thus would increase patient choices. The Guideline Development Group acknowledged the potential broader population-level benefit from curing an individual as soon as possible; namely, reducing the period of time during which they are infectious, and thereby reducing HCV incidence in certain population networks.

The group acknowledged that, following infection with hepatitis C, approximately one third of individuals will spontaneously clear the virus (that is, cure without any medical intervention). Therefore, treating all people with recently acquired hepatitis C immediately means that people who would have otherwise cleared their infection spontaneously are unnecessarily exposed to treatment. However, adverse events are very rare, and there was a clear preference for having treatment as an option.

Considering the evidence regarding good treatment outcomes of recently acquired infection in people with ongoing risk, the potential for reduction of HCV transmission in certain communities and populations, the strong support from community values and preferences, the potential for expanding patient choices and its feasibility to implement, as well as potential for cost-effectiveness and improved equity, the Guideline Development Group deemed that the overall benefits largely outweigh the potential harm and risk. The recommendation was thought to provide a potential for reduced stigma and simpler clinical care. Given all these elements, the group made a strong recommendation that applies to all populations with ongoing risk in all settings.

Implementation considerations

Extending HCV treatment to people with ongoing risk and recently acquired infection, requires several areas to be considered in order to facilitate implementation in countries. The latest WHO HCV treatment and care guidelines should be consulted for further details on the clinical management of HCV *(424)*.

Firstly, treatment without delay, independent of chronicity, is an additional indication for HCV treatment, and national treatment guidelines need to be amended. Furthermore, insurance policies for the treatment for recently acquired infection would ideally be streamlined with those for chronic HCV infection; this needs policy change and dialogue with funders and health insurance schemes in order to achieve this policy harmonization. Amendments to treatment guidelines or treatment policies need to provide a case definition for recently acquired infections, describe how a distinction can be made for treatment failure among people with a history of past HCV treatment, and how respective

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 120 of 145

treatment strategies may differ. Moreover, it is important to identify and define certain subpopulations in which a treatment delay should be strongly considered, such as pregnant women. Furthermore, people at ongoing risk need to be offered adequate and frequent testing in order to be able to describe and discover recent HCV infection.

Secondly, patients need to be informed about the benefit and harm associated with both immediate and deferred treatment. Individuals with recently acquired infection must have the option to make an informed choice about starting treatment immediately or delaying treatment initiation. Key populations expressed preference for decentralization, with an expansion of treatment settings and simplified test and treat approaches.

Finally, one of the major objectives of extending treatment to people with recent infection and ongoing risk is the potential of population-level benefits and a reduction of HCV transmission. For the greatest impact, treatment for recently acquired infection should be offered alongside additional, evidence-based interventions to reduce HCV risk and primary prevention services, as outlined in these guidelines.

The Guideline Development Group discussed the importance and relevance of, in the future, expanding this new recommendation to promote treatment without delay in all populations, and not only for those people at ongoing risk.

Research gaps

Current research about HCV treatment without delay for key populations is mainly among men who have sex with men in high income countries. Further research is needed to describe the impact and added value of extending treatment without delay to recent HCV infection on individual and population level in different settings and populations.

Real world cost-effectiveness and feasibility studies would be valuable to further strengthen the case for treatment of recently acquired HCV infection. Implementation science that evaluates feasibility and acceptability of this approach in different key populations would be beneficial.

The potential for truncated courses of DAAs administered during recently acquired HCV may prove to be a benefit to early treatment of HCV and warrants further research.

Pooling samples from different anatomical sites for the diagnosis of *Neisseria gonorrhoeae* and *Chlamydia trachomatis*

Recommendation

Where biologic samples are collected from multiple anatomical sites in the same individual, they may be pooled for molecular testing of *Neisseria gonorrhoeae* and *Chlamydia trachomatis* infections *(conditional recommendation, moderate certainty of evidence for men who have sex with men, and low certainty of evidence for other key populations).*

Remarks:

- Collection of biological samples from all anatomical sites should always be voluntary.
- WHO recommends NAAT for the detection of *N. gonorrhoeae* and *C. trachomatis*.
- WHO recommends self-collection of samples for NAAT for the detection of *N. gonorrhoeae* and *C. trachomatis*.
- Community values and preferences did not include cisgender women, transgender men and non-binary people assigned female at birth, to inform this recommendation.

Background

Key populations are disproportionately affected by STIs. Several STIs are highly transmissible and often asymptomatic. Syndromic management of STIs misses asymptomatic cases and results in overtreatment. Furthermore, overtreatment contributes to antimicrobial resistance *(425)*. For example, inappropriate management of *N. gonorrhoeae* may accelerate the emergence of multidrug-resistant *N. gonorrhoeae* and increase onward transmission *(426)*. This underscores the need for aetiological diagnosis to optimise STI case management, particularly among key populations who practice oral and anal sex.

N. gonorrhoeae and *C. trachomatis* can infect different anatomical sites. Thus, aetiological screening of all appropriate anatomical sites (oropharynx, urethra, endocervix and anorectum) is needed when an individual engages in anal or oral sex or both. Considering the high proportion of asymptomatic infections caused by these pathogens, a significant proportion of cases would be missed if only genital screening was undertaken *(427)*. Studies have demonstrated that up to one third of gonorrhoea cases would be missed if only urethral or urine samples were tested in men who have sex with men *(428, 429)*.

Whilst separate testing from different anatomical sites is preferable, there is an additional cost associated with testing samples from each site. This is especially relevant in LMICs where the cost of NAAT recommended for the diagnosis of these infections is a major barrier *(430)*.

Evidence review

A systematic review was commissioned by WHO to answer the question of whether pooling of samples from different anatomical sites should be used for STI laboratory screening of gonorrhoea and chlamydial infection, compared to individual samples from three anatomical sites (urethra, anorectum and oropharynx). The outcome of interest was diagnostic accuracy.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 121 of 145

For chlamydial infection, a meta-analysis of sensitivity and specificity included 15 estimates from 14 studies of 5891 patients *(431)*. For multisite pooled testing for chlamydia infection, the review found the combined sensitivity[28] was probably 93.1% (95% CI: 90.5–95.0, I(2)=43.3), and combined specificity[29] was probably 99.4% (95% CI:99.0–99.6, I(2)=52.9) (moderate certainty evidence). This means, if 1000 people are tested with a background prevalence of 10% for chlamydial infection (100 cases), switching from single-site testing to pooled testing will probably result in seven missed cases (out of 100 true cases), and five people being overtreated.

For gonorrhoea, 14 estimates from 13 studies were used for the meta-analysis with data from 6565 patients. For multisite pooled testing for gonorrhoea, the review found the combined sensitivity using NAAT was probably 94.1% (95% CI: 90.9–96.3, I(2)=68.4) (low certainty evidence), and pooled specificity may be 99.6% (99.1–99.8, I(2)=83.6) (moderate certainty evidence). This means, if 1000 people are tested with a background prevalence of 10% for gonorrhoea, switching from single-site testing to pooled testing will probably result in six missed cases (out of 100 true cases), and four people being overtreated.

Meta-regression analyses did not show any significant impact on the accuracy of multisite pooled testing according to study population (men who have sex with men compared to men who have sex with women), study population size (<100 versus >100), country-income level, sample collection (self-collected versus clinician-collected) or publication year (before 2020 versus 2020 or after).

Four studies among men who have sex with men provided information specifically on the sensitivity of detecting oropharyngeal infections using pooled testing versus the standard of care (namely, testing individual samples from the three anatomic sites for chlamydia and gonorrhoea) *(432-435)*. All oropharyngeal infections with *C. trachomatis* were detected using pooled testing in three out of four studies *(10–12)*. In the remaining study, pooling samples resulted in one case missed out of six with oropharyngeal infection *(433)*. On the other hand, overall, the sensitivities of oropharyngeal gonorrhoea testing using individual samples were found to be lower for identifying infection across all studies *(432–435)*. The authors hypothesised that the reduced sensitivities were attributed to the lower bacterial load in the pharynx compared to other anatomic sites. Furthermore, two studies highlighted that most *N. gonorrhoeae* infections occurred in the pharynx, several of which would have been missed if this anatomical site was not sampled *(9)*.

It is also important to note that the studies included in the systematic review were predominantly conducted in high-income countries (82.6%, 14/17) and men who have sex with men were the most frequently studied population (70.6%, 12/17).

In summary, although different methods of pooling were used across the studies (related to flow and timing, different order of pooling sample, different volumes of urine used), the consistently high accuracy of multisite pooled testing, despite diverse methodologies of pooling, suggest that accuracy was not significantly impacted by the method of pooling. Overall, the certainty of evidence was downgraded to moderate, mainly because of potential risk of bias in most studies due to patient selection bias, with moderate heterogeneity observed for studies contributing to gonorrhoea sensitivity results.

Feasibility, cost and cost-effectiveness

No study included in the systematic review reported the feasibility to combine samples for multisite pooled testing. However, the Guideline Development Group noted that while pooling samples was generally feasible, this could vary depending on setting due to different laboratory structures, flow and technical capacities, among other things.

The systematic review identified three studies that estimated the cost savings of pooling samples from different anatomical sites for chlamydia or gonorrhoea testing. One study of 1064 men who have sex with men attending sexual health clinics and hospital sites between October 2012 and August 2013 in the United Kingdom suggested that pooled testing offers cost savings of up to two thirds of the costs of the assays alone, as well as savings in consumables, processing time and clinical pathway efficacy *(433)*. A prospective study between February 2018 and July 2019 of 501 female sex workers in Belgium demonstrated a 35% decrease in reagent costs and lab technician time when using pooled testing (calculated using the obtained prevalence of 6.5% and 3.5% for chlamydia and gonorrhoea, respectively) *(436)*. Finally, one study assessed the efficacy of pooled testing among 497 men who have sex with men in four West African countries, and demonstrated a 56% decrease in costs, in which unpooling of triple-site pooling was only undertaken when the pooled sample result was invalid *(437)*.

One cost-effectiveness study was identified. For men who have sex with men attending sexual health clinics in the United Kingdom, researchers reported that using a willingness to pay threshold of £60 per person tested, pooled testing had a 100% probability of being cost-effective. Compared with individually analysed samples, pooled testing saved £13.37 to £18.22 per individual tested, depending on the symptom status or population group (namely, men who have sex with men and women from the general population) *(438)*.

Values and preferences

Qualitative research by key population networks of gay and other men who have sex with men and sex workers of all genders on values and preferences associated with pooled sampling for STI testing was conducted with men who have sex with men, cisgender males and transgender women sex workers, but not among people who inject drugs, cisgender

[28] Sensitivity is a measure of how well a test can identify true positives.

[29] Specificity is a measure of how well a test can identify true negatives.

Case 1:26-cv-12638-WGY Document 13-5 Filed 06/10/26 Page 122 of 145

women who work as sex workers or others assigned female at birth. Most participants in the research indicated that they were not familiar with this method for chlamydia and gonorrhoea screening. Nonetheless, most participants stated that they were willing to have samples taken from three anatomical sites and pooled, particularly if this method would yield the most accurate results. There was uncertainty across all regions among men who have sex with men about how accurate these tests using pooled samples are. This would indicate that more education must be done at the clinical and community level about the efficacy of these testing choices.

Men who have sex with men noted that due to the stigma surrounding anal sampling, the practice of simultaneously collecting and pooling samples from anorectum, oropharyngeal and urethral swabs could offer a less stigmatizing way to test for STIs. Pooling samples would also reduce the need for health care providers to ask clients what kind of sex they engage in, thus decreasing judgement and potential risky disclosure on sexual practices. Caution should be taken in extending the practice of not asking clients what kind of sex they engage in to other key populations, as the other populations were not consulted. For a detailed report, please see Web Annex B.

Additionally, two studies identified through the systematic review indicated that individuals (men who have sex with men and cisgender women) found self-sampling for chlamydia or gonorrhoea testing to be acceptable and easy to perform *(433, 439)*.

Equity and acceptability

Seven studies discussed the health equity impact pooling could bring by increasing testing coverage *(434–437, 440–442)*, especially for asymptomatic individuals who would not otherwise have been tested in LMICs *(437)*. A study also suggested that pooled testing should be incorporated in HIV PrEP programmes in resource-limited countries *(17)*. In addition, cost savings via pooled testing would allow more people with infection to be detected and treated, or for those at higher risk of infection to be tested more frequently with a similar budget.

A web-based survey of clinic heads in the United Kingdom from 2018 reported that 84% (41/49) of sexual health clinicians in England considered the most significant benefit of pooling was cost savings, but were concerned about barriers such as lack of national guidance, loss of infection site information and a perceived reduction in sensitivity or specificity *(441)*. In addition, most (77%, 40/52) clinicians requested more validation studies on diagnostic accuracy, 75% (39/52) wanted clinical guidelines of pooling and 48% (25/52) of clinicians requested further cost analysis *(441)*.

Assessment of evidence and decision-making

The Guideline Development Group discussed the benefits of pooling samples from three anatomical sites for gonorrhoea and chlamydia testing, based on the evidence review and the values and preferences of the communities.

Considering the high sensitivity and specificity of pooling samples for molecular testing for both chlamydia and gonorrhoea, the benefits of pooling samples include:

1) increased detection of extra-genital infections by using the same test for multiple anatomical sites, and an increase of test coverage, especially testing more asymptomatic individuals at higher risk of STIs, due to potentially significant cost savings;
2) potential decrease in the risk of HIV acquisition if more extra-genital infections and individuals are correctly diagnosed and treated; and
3) decreased workload for laboratories and other health services, especially when implementing testing at or near the point of care.

Furthermore, self-sampling, which is highly acceptable, does not affect the accuracy of multisite pooled sampling.

The values and preferences research among the key population communities (see Web Annex B) was limited to men who have sex with men, cisgender male sex workers and transgender women sex workers, and did not include cisgender women who work as sex workers, transgender men and other people assigned female at birth. For this reason, the Guideline Development Group felt that there was a possibly important uncertainty and variability in the assessment of key populations' values and preferences for pooled-site sampling. The Guideline Development Group member from NSWP in particular expressed their concern about the omission of cisgender women and transgender men in the values and preferences survey and requested that this research be undertaken as a matter of priority.

Potential harms discussed by the Guideline Development Group were that, compared to a gold standard, single-site test, there would be small numbers of missed cases (five for chlamydia, six for gonorrhoea) and overtreated cases (five for chlamydia, four for gonorrhoea) if pooling samples from multiple anatomical sites in a population of 1000 people with a 10% background prevalence. Furthermore, there is uncertainty about the sensitivity of pooled-site sampling to detect oropharyngeal gonorrhoea, and without retesting, it is not possible to know exactly which sites are infected. However, this small loss in sensitivity was balanced by the opportunity to test the multiple anatomical sites when using pooled testing in settings where oropharyngeal sampling is not routinely performed because of cost.

The potential benefits of pooling samples from multiple anatomical sites to diagnose these two pathogens outweighed the harms of slightly lower accuracy. Thus, the Guideline Development Group decided to make a recommendation in favour of the intervention. There was overall moderate certainty evidence of sensitivity and specificity of pooled samples for both chlamydia and gonorrhoea. However, the limited data from LMICs and from other key populations, besides

men who have sex with men, led the Guideline Development Group to downgrade the certainty for other populations to low. Based on the above considerations the Guideline Development Group made a conditional recommendation with moderate certainty of evidence for men who have sex with men and low certainty of evidence for other key populations.

Implementation considerations

Multisite pooled-sample testing is highly sensitive and specific with potential associated cost-saving benefits and creates an opportunity to increase the detection of extra-genital infection and screening coverage, particularly in LMICs using NAAT.

Countries should consider conducting national lab validation methods for the use of pooled samples to diagnose chlamydial and gonococcal infections, and to include pooled sampling into national quality assurance and control protocols. The question of who would pool the samples has to be considered; for example, would the task be completed by self-sampling, health providers or lab technicians. Each approach will require adapting national protocols, training providers when point-of-care or near point-of-care tests are used and, when applicable, lab procedures and logistics, including the reorganization of sample flow, testing platform, and adjusting necessary supplies for sample collection.

Pooling samples from multiple anatomical sites can also have an impact on countries with national guidelines recommending different dosages and treatment schedules, depending on the anatomical site. In this case, there may be a need to retest samples from the different sites separately to prescribe the recommended treatment. If new samples need to be collected from positive individuals, it must be balanced against the risk of treatment delays and lost-to-follow-up patients. These concerns will not apply to countries following current WHO recommendations for the treatment of genital or anorectal chlamydial infection, for which doxycycline can be used in the same dosage in both cases as first line, or for gonorrhoea using dual therapy as the first line, when either no or insufficient data are available from local gonococcal antimicrobial resistance *(443, 444)*. However, due to growing gonococcal antimicrobial resistance to ceftriaxone and azithromycin, WHO is updating the treatment guidelines for *N. gonorrhoea* infections, which may have implications for the treatment of infection at different anatomical sites.

Research gaps

Based on the review of the evidence, a critical knowledge gap to be addressed is the accuracy of testing for *N. gonorrhoeae* – comparing oropharyngeal samples alone versus pooled with samples from other anatomical sites. Regarding the performance of pooled-sample testing, further studies are needed to define the optimal dilution of pooled samples for best accuracy, including optimal urine volume (when urine samples are used instead of swabs), and to understand the potential effects of the order of samples for pooling.

Additionally, there is a need to study the cost-effectiveness of pooling samples against different background prevalence of infections, and to model the optimal cut-off point for the utility of single-site pooled testing to maximise cost-effectiveness in different settings.

It is also critical to better understand the values and preferences of key population members who are cisgender women, transgender men and non-binary people assigned female at birth, as they were not included in the values and preferences research conducted for the development of these guidelines. Implementation research is important to support the adoption of multisite testing, including exploring the perception of those men who have sex with men interviewed as part of the values and preferences study, regarding the possibility of having biological samples collected from the three anatomical sites as a standard of care; namely, not requiring the disclosure of sexual practices to providers, has the potential to reduce perceived stigma and discrimination, and to increase access to care by men who have sex with men.

Finally, for countries using different treatment regimens for gonococcal and chlamydial infections or both based on anatomical site, it would be relevant to better understand the benefits versus harms of opening sample pools (retesting samples) after a positive result, considering potential treatment delays and lost-to-follow-up in different settings. Conducting an economic evaluation of retesting multiple sites in different contexts should also be considered.

AMERICAN ACADEMY OF HIV MEDICINE; HIV MEDICINE ASSOCIATION, a division of the INFECTIOUS DISEASES SOCIETY OF AMERICA; INTERNATIONAL ASSOCIATION OF PROVIDERS OF AIDS CARE; JENNIFER K. BRODY, MD; and CHRISTOPHER B. FOX, NP, *Plaintiffs*, v. HEALTH RESOURCES AND SERVICES ADMINISTRATION; THOMAS J. ENGELS, in his official capacity as the Administrator of the Health Resources and Services Administration; U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES; and ROBERT F. KENNEDY, JR., in his official capacity as Secretary of the U.S. Department of Health and Human Services, *Defendants*.	Case No.

DECLARATION OF JENNIFER K. BRODY, MD

I, Jennifer K. Brody, MD, hereby declare and state as follows:

1. I am over 18 years of age, of sound mind, and in all respects competent to testify.

2. I have personal knowledge of the facts set forth in this declaration and would testify competently to those facts if called to do so.

3. I am a plaintiff in the above-captioned case, bringing claims on behalf of myself and on behalf of my transgender patients.

4. I submit this declaration in support of Plaintiffs' Motion for Preliminary Relief under 5 U.S.C. § 705 and for a Preliminary Injunction, which seeks to prevent Defendants from giving effect to certain conditions relating to transgender people and gender-affirming medical care set forth in Ryan White HIV/AIDS Program ("Ryan White Program") Notices of Funding Opportunity issued or forecasted to be issued in 2026 and the 2026 Updated HRSA General Terms and Conditions, issued on March 11, 2026 (collectively, "the Challenged Conditions").

5. I oversee a Ryan White-funded HIV program serving people experiencing homelessness and other significant barriers to care through an integrated model that combines HIV treatment, behavioral health services, case management, housing support, and gender-affirming medical care. Many of our patients rely on Ryan White-funded services as their consistent source of healthcare. Ryan White funding supports not only HIV treatment itself, but the integrated and wraparound services necessary to keep patients engaged in care and virally suppressed. For our transgender patients living with HIV, gender-affirming medical care and affirming treatment environments are crucial components of effective HIV care. Without that care, patients are more likely to disengage from treatment, lose trust in providers, and experience interruptions in care that jeopardize their health and increase the risk of HIV transmission. The Challenged Conditions would dismantle this integrated model of HIV care we have relied upon for years, force providers to withhold medical treatment from transgender patients, undermine patient trust, worsen health outcomes, and threaten the continued operation and staffing of essential Ryan White-funded programs.

I. Background and Professional Role

6. I am a physician and hold both an M.D. and Master of Public Health. I serve as the Director of HIV Services at Boston Health Care for the Homeless Program ("BHCHP"), where I

lead clinical programs focused on the treatment and care of people living with HIV who are experiencing homelessness and housing instability.

7. I am a resident of Boston.

8. I am a member of the American Academy of HIV Medicine, the HIV Medicine Association, and the International Association of Providers of AIDS Care.

9. I have been an attending physician providing HIV care since 2009 and have seventeen years of experience in this field. I am board-certified in Internal Medicine and Addiction Medicine and am an American Academy of HIV Medicine-certified HIV Specialist. My clinical and academic work has focused on HIV care, health equity, and improving outcomes for structurally marginalized populations, particularly individuals experiencing homelessness.

10. In my role, I oversee and provide comprehensive HIV primary care to approximately 350–400 patients living with HIV, many of whom are experiencing homelessness or unstable housing. My work includes delivering care in nontraditional settings such as shelters, street outreach programs, and specialized clinics designed to meet patients where they are, in addition to more traditional clinical environments.

11. My patient population is predominantly composed of individuals from marginalized communities who face overlapping structural barriers to care. Approximately three-quarters of my patients are Black or Latinx, and approximately 7% are transgender, which is significantly higher than the proportion of transgender individuals in the general population, reflecting the disproportionate impact of HIV and related barriers to care on transgender communities. Many of my patients also experience co-occurring conditions, including substance use disorders, mental health conditions, and chronic medical comorbidities, all of which complicate engagement in consistent HIV care.

12. The services I oversee and provide include comprehensive HIV treatment and primary care, addiction medicine, behavioral health services, specialized nursing care, case management, and support groups. Since 2011, I have also provided hormone therapy to my transgender patients who need it as treatment for their gender dysphoria (also known as "gender-affirming medical care" or "gender-affirming hormone therapy") as part of my clinical practice.

13. The health services I provide are delivered through an integrated, multidisciplinary model that addresses both medical needs and the social determinants of health, such as housing instability, stigma, and access to basic resources, that are critical to achieving and maintaining HIV viral suppression.

III. BHCHP's Use of Ryan White Funding

14. The Ryan White Program is designed to provide comprehensive holistic clinical and support services to low-income people living with HIV.

15. In my experience, the Ryan White Program enables a model of care that is both clinically effective and humanizing. It recognizes patients as whole people and affirms their identities while addressing their medical and social needs.

16. As part of my practice through BHCHP, I rely on Ryan White funding under Parts A, B, and C.

17. BHCHP uses Part B funding provided through the Massachusetts Department of Public Health to fund a special outreach program for patients who struggle to stay engaged in care and take their HIV medications. This includes transgender patients with HIV who often feel stigmatized by healthcare providers or are less likely to adhere to their HIV care when their gender-affirming medical care needs are left unaddressed. BHCHP also used part B funds indirectly by

referring patients to our state AIDS Drug Assistant Program which supports access to medication coverage when needed.

18. BHCHP uses Part C funding to support critical staffing to the clinic, primarily nurses who provide intensive case management, counseling, and care navigation. It also supports portions of my administrative role, including quality improvement initiatives. Part C is used in case management, as well as medication education and adherence support with regards to our gender-affirming medical care services.

19. BHCHP uses Part A to fund medical case management, including for transgender patients, housing advocacy, rental assistance, and medical transportation.

20. Ryan White funding is deeply integrated into all aspects of care we provide. It supports both clinical services, including gender-affirming health services, and the wraparound services that enable patients to engage in and remain in care. Ryan White Funding is a majority of our grant-supported budget for the HIV program.

IV. Importance of Gender-Affirming Medical Care for my Transgender Patients with HIV

21. Gender-affirming care is an integral component of primary care for many of my transgender patients with HIV and is essential to effective HIV treatment.

22. Many of my transgender patients have experienced significant stigma and harm within the healthcare system. Providing gender-affirming medical care to these patients is often necessary to establish and maintain a therapeutic doctor/patient relationship. For many transgender people living with HIV, their primary health concern is access to the gender-affirming medical care that enables to them to live as themselves. Indeed, often, the only reason many of our transgender patients started coming to us for care is because they were seeking gender-affirming medical services.

23. Providing gender-affirming medical care also keeps people connected to HIV care and increases trust with the community. In my clinical experience, patients experiencing homelessness are particularly vulnerable to discontinuity in medication adherence. Without stable housing, safely storing medications and maintaining a daily regimen is already challenging. Removing gender-affirming medical care from the clinical setting would exacerbate these challenges by reducing patients' motivation to remain engaged in care, leading to missed medications, treatment interruptions, and increased risk of viral rebound.

24. Patients experiencing homelessness face significant structural barriers to maintaining consistent HIV care, including lack of stable transportation, limited access to communication (such as phones or internet), and competing priorities like securing food and shelter. These challenges make continuity of care difficult even under ideal circumstances. Gender-affirming medical care, when integrated into HIV services, helps stabilize engagement by addressing a core aspect of patients' identity and well-being, making it more likely that they will return for care and remain connected to treatment.

25. Every single one of our patients experiencing homelessness relies on Ryan White funded programs not only for HIV treatment, but also for wraparound services such as case management, mental health care, and referrals to housing and social services. These integrated services are critical to addressing the social determinants of health that directly impact HIV outcomes.

26. There are few, if any, alternative providers in Boston who can meet the complex needs of patients experiencing homelessness, particularly those who are transgender and living with HIV. As a result, if I am unable to provide my transgender patients with gender-affirming medical care within my practice, many of these transgender patients would have no realistic

pathway to obtain that care elsewhere. Although I could technically continue to provide HIV treatment alone, that is not how care functions in practice for this population. My patients often seek care from me precisely because I provide affirming, integrated services in a setting they trust. If I am unable to acknowledge and respect my transgender patients' identities within my practice, even if unconnected to the gender-affirming medical care, many of these transgender patients would feel discriminated against and be unlikely to remain in our care. Many of my transgender patients have experienced stigma or discrimination in traditional medical environments and are unwilling to engage with providers who lack the cultural competency to treat them holistically.

27. If I am unable to acknowledge and respect my transgender patients' identities and to provide them with gender-affirming medical care when they need it, my patients may lose trust in me and in the healthcare system more broadly, and they may disengage from care altogether.

V. Gender-Affirming Medical Care and the Ryan White Program

28. Because Ryan White funding has long supported comprehensive, patient-centered HIV care, including services necessary to meet the needs of HIV patients' co-occurring conditions, including for transgender patients, and realizing the clinical importance of gender-affirming medical care for this population, I obtained specialized clinical training in gender-affirming medical care, including the provision and management of hormone therapy, and incorporated these services into my practice in 2011.

29. In reliance on the Ryan White Program's longstanding directives and funding structure prioritizing medically underserved populations and populations disproportionately affected by HIV, we have intentionally developed and structured our model of care to meet the needs of transgender and gender-diverse people living with HIV. Consistent with Ryan White Program requirements, guidance, local planning priorities, and identified community needs, we

integrated gender-affirming healthcare and related supportive services into our HIV care delivery model.

30. In our practice, Ryan White funding enhances our ability to deliver integrated care by supporting the services and infrastructure necessary to provide gender-affirming medical care for those transgender patients with HIV who need it through Parts A, B, and C.

31. The Ryan White Program funds most of the clinical and support systems that make HIV care possible for our clinic, including case management, behavioral health services, and care coordination. All of the patients who receive gender-affirming medical care in our program do so as part of concomitant, fully integrated, Ryan White-funded services.

32. In many cases, gender-affirming medical care serves as an entry point into HIV care. Patients may initially seek care for gender-affirming medical services, and through that relationship, engage in HIV treatment. If gender-affirming medical care is restricted within these programs, it would disrupt this comprehensive model of care and further marginalize patients who already have limited alternatives.

VI. Impact of the Challenged Conditions on HIV Care

33. The Challenged Conditions, including prohibitions on acknowledging and respecting transgender people's identities and on the provision of gender-affirming medical care in connection with Ryan White-funded services, would have severe consequences for my patients.

34. Many of my HIV patients, particularly those experiencing homelessness, prioritize their most immediate and pressing needs. If gender-affirming medical care is their primary need and if I cannot provide it, they are unlikely to return for HIV care.

35. Similarly, transgender patients with HIV seek and need access to care, even if unrelated to gender-affirming medical care, that is affirming and respectful of their identities. If

am prohibited from acknowledging and respecting my transgender patients' identities, such as by using pronouns consistent with their identities, they are likewise unlikely to return for HIV care.

36. The Challenged Conditions would thus lead to disengagement from care; loss of viral suppression; increased risk of HIV transmission; and significant deterioration in mental health, including increased depression and suicidality.

37. In my experience, patients who lose access to routine HIV care and instead rely on emergency services experience worse health outcomes, causing increased strain on the healthcare system and other social impacts. This dynamic is particularly pronounced among patients experiencing homelessness, who already face significant barriers to accessing consistent outpatient care. Without stable access to HIV services, these patients are more likely to show up at emergency rooms with advanced or preventable conditions, including complications related to untreated HIV or interruptions in antiretroviral therapy, which are significantly more difficult to treat once they have progressed to that stage.

38. Emergency care settings are not equipped to provide the continuity, trust, or comprehensive services required for effective HIV management or gender-affirming medical care, resulting in fragmented treatment and poorer health outcomes. This shift not only undermines individual patient health but also increases overall healthcare costs and places additional burden on already strained emergency systems. Intermittent access to HIV medications through acute and emergency care settings also can contribute to viral resistance to medications which can make HIV more difficult to treat over time both at the individual and community level. Viral resistance can be transmitted to others, making treatment more complex and challenging at the time of diagnosis (often requiring more medications with more side effects and drug interactions) which can impact chances of viral suppression over the life course.

VII. Impact of the Challenged Conditions on My Ability to Provide Care

39. A prohibition on using Ryan White funding for gender-affirming medical care would force me to deny medically necessary care to my transgender patients, thereby denying the comprehensive care that Ryan White seeks to provide, and override my clinical judgment in ways that conflict with accepted standards of care. For my patients experiencing homelessness, this conflict is especially acute because they often have no alternative source of care; my clinic may be the only place where they can access both HIV treatment and gender-affirming health services in a coordinated, low-barrier setting. Denying this care would mean not only withholding necessary treatment but also removing a critical point of engagement that allows these patients to remain connected to the healthcare system at all.

40. This would cause significant moral and ethical distress to me. As a physician, I understand gender-affirming medical care to be medically necessary for many patients, and being unable to provide it would cause moral and ethical injury. This distress is compounded in the context of homelessness, where I routinely care for patients with profound unmet needs and limited options. Being forced to withhold care from patients who already face extreme marginalization and barriers to access would directly conflict with my professional obligation to provide equitable, evidence-based, patient-centered care.

41. Such a prohibition, along with any prohibition on my acknowledging and respecting the identities of my transgender patients, would also harm my ability to provide effective HIV care by damaging the trust and therapeutic relationships I have built with my patients. Among patients experiencing homelessness, trust is often fragile and must be built over time through consistent, respectful, and affirming care. Being able to access care that is affirming and inclusive of gender-affirming medical care is frequently a cornerstone of that trust. If patients

perceive that I am unable or unwilling to meet their basic healthcare needs, they may disengage entirely, leading to missed appointments, interruptions in antiretroviral therapy, and increased risk of viral rebound and forward transmission.

42. Even uncertainty or perceived restrictions on the ability to affirm patients and to provide them with gender-affirming medical care would be harmful. Providers avoid assessing, documenting, or addressing gender-related needs, which could compromise patient safety and continuity of care. For patients experiencing homelessness, who often receive care across multiple settings, including shelters, street outreach, emergency departments and acute care hospitals, accurate and complete assessments and documentation of any conditions is essential to maintaining continuity. Any reluctance to provide care that is needed, or to document conditions experienced and the need for such care, would exacerbate fragmentation, increase the risk of medical errors, and further destabilize already tenuous care relationships.

43. Operationally, such a policy would create confusion and disruption. Compliance with the Challenged Conditions would be difficult to implement without fundamentally altering core aspects of patient care, including standard assessments and treatment planning. In programs serving patients experiencing homelessness, where care is often delivered in flexible, non-traditional settings and must be responsive to complex, co-occurring needs, such restrictions would be particularly unworkable. They would interfere with integrated care models, strain limited clinical resources, and undermine the ability of providers to deliver comprehensive, coordinated services that are essential for both HIV treatment and overall patient stability.

VIII. Financial and Programmatic Impact of the Challenged Conditions

44. Ryan White funding is essential to the operation of my program. If we were found non-compliant with funding conditions, we could lose critical funding, particularly under Parts A, B and C. The majority of the grant funding for my clinic comes from Ryan White.

45. The Ryan White Program is a "payer of last resort," designed specifically to fill gaps for patients who have no other source of coverage or whose insurance is insufficient to meet their medical needs. Many of my patients have inconsistent access to health insurance and rely on the Ryan White Program to access core HIV treatment, medications, and support services that are not otherwise available to them through Medicaid, Medicare, or private insurance.

46. There is no comparable funding source that could replace these services if our Ryan White funding was lost. My transgender patients would have no other source of coverage outside of Ryan White to receive affirming HIV care and gender-affirming medical care. Even where patients have some form of insurance, Ryan White funding remains necessary to cover gaps such as cost-sharing, coverage limitations, and essential support services that enable patients to remain in care and achieve viral suppression. Without Ryan White-supported services, many patients would face reduced or interrupted access to care, as other parts of the healthcare system are not structured to absorb or replace this safety-net function.

47. Loss of such funding would jeopardize staffing, including nursing and case management positions, and could cause the program to collapse or be absorbed into less comprehensive primary care services.

48. This would significantly reduce access to specialized HIV care and support services for an already extremely vulnerable population.

IX. Public Health Impact of the Challenged Conditions

49. Prohibiting HIV care providers from acknowledging, affirming, and respecting their transgender patients and limiting access to gender-affirming medical care for transgender patients with HIV would undermine efforts to achieve viral suppression and control the HIV epidemic. In my clinical experience serving patients experiencing homelessness, affirming transgender patients' identities and gender-affirming medical care are often critical components of engagement in HIV treatment. When patients feel respected and affirmed, they are more likely to attend appointments, adhere to antiretroviral therapy, and remain in care - each of which is essential to achieving and sustaining viral suppression.

50. Limiting access to such care would harm not only transgender individuals. This impact would be especially severe for transgender patients experiencing homelessness, who already face intersecting barriers related to stigma, poverty, housing instability, and limited access to healthcare. These patients often rely on a small number of safety-net providers, such as BHCHP, for comprehensive and affirming care. Restricting gender-affirming medical care in these settings would further isolate an already underserved population.

51. The resulting disengagement from care would likely lead to increased HIV transmission, as well as worsening outcomes for other communicable and chronic conditions. Especially among patients experiencing homelessness, even short disruptions in care can result in loss of follow-up, treatment interruptions, and rapid clinical decline. In addition to HIV, many of my patients have co-occurring conditions - including hepatitis C, substance use disorders and treated or untreated mental illness - that require consistent management. Disengagement from care would therefore have cascading effects across multiple health conditions, increasing both individual and public health risks.

52. Broader impacts would include increased emergency room utilization, declining mental health, loss of employment, housing instability, and overall community harm. For patients experiencing homelessness, the healthcare system often serves as a primary point of stability and support. When access to comprehensive, affirming care is disrupted, patients are more likely to cycle through emergency departments and inpatient settings, rather than receiving preventive and ongoing care. This not only increases healthcare costs but also exacerbates mental health crises, undermines efforts to secure and maintain housing, and destabilizes already vulnerable communities.

X. Additional Harms Caused by the Challenged Conditions

53. The harms caused by the Challenged Conditions would be difficult or impossible to reverse. In my experience caring for patients experiencing homelessness, disruptions in care often have lasting consequences because re-engagement is extremely challenging once patients are lost to follow-up. When patients disengage due to a loss of affirming and comprehensive care, there is often no reliable way to reconnect them to services, particularly given the instability of their living situations and the limited availability of outreach resources.

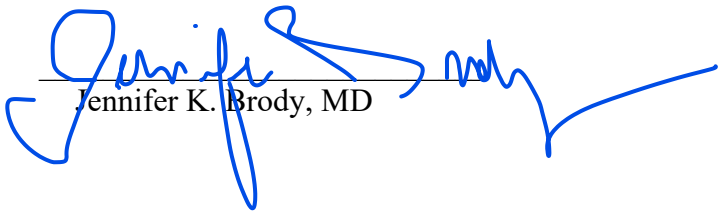
54. Trust between patients and providers is hard-won and easily lost. Once patients disengage from care, they may not return. This is especially true for patients experiencing homelessness, many of whom have had repeated negative or stigmatizing encounters within the healthcare system. Establishing trust requires consistent, respectful, and affirming interactions over time. If that trust is broken, particularly by prohibiting acknowledgement and affirmation of a transgender patient's identity or by denying medically necessary gender-affirming medical care, patients may avoid not only my care but healthcare systems more broadly, making future engagement significantly more difficult.

55. Interruptions in HIV treatment can result in lasting health consequences, including disease progression and increased transmission risk. For patients experiencing homelessness, maintaining consistent access to antiretroviral therapy is already challenging due to factors such as unstable housing, lack of medication storage, and competing survival needs. Any disruption in care increases the risk of viral rebound, development of drug resistance, and progression of HIV-related illness.

56. In practical terms, when a patient stops or misses their HIV medications, the virus can quickly begin to multiply again, increasing the amount of the virus in their body. As the virus replicates, it can mutate and become resistant to the medications that were previously effective, making the disease harder to control and limiting future treatment options. At the same time, a rising viral load weakens the immune system, leaving the patient more vulnerable to serious infections and chronic complications that are more difficult to treat once they occur. These interruptions also undermine public health efforts to reduce transmission, as patients who are not virally suppressed are more likely to transmit HIV.

57. Patients may also experience severe psychological harm, including trauma, depression, and suicidality. Among patients experiencing homelessness, particularly those who are transgender, the burden of mental health conditions is already high due to chronic stress, stigma, and exposure to violence and discrimination. Access to care that is respectful and affirming and gender-affirming medical care are critical components of psychological stability and well-being for these patients. Removing access to this care would exacerbate existing mental health conditions, increase feelings of isolation and hopelessness, and heighten the risk of self-harm and suicidality, with consequences that may be immediate and enduring.

XI. Conclusion



58. Based on my experience, providing care that is affirming and respectful of the identities of transgender patients with HIV as well as gender-affirming medical care are essential components of effective HIV treatment for my transgender patients with HIV. Conditioning Ryan White funds on not doing so would have immediate and harmful consequences for my patients.

59. Many of my transgender patients rely on integrated care, where HIV treatment and gender-affirming services are provided together in a trusted and affirming clinical setting. If that care is disrupted, I expect that some patients will disengage from treatment altogether. This not only harms the individual patient but also increases the risk of HIV transmission in the community. In my opinion, these disruptions will lead to preventable complications, and in some cases, could result in patient deaths.

60. Prohibiting Ryan White funding recipients from affirming and respecting the identities of transgender patients with HIV or the use of Ryan White funds for gender-affirming medical care would harm my transgender patients, undermine public health, and prevent me from fulfilling my obligations as a physician.

I declare under penalty of perjury that the foregoing is true and correct.

Dated: June 8, 2026

Jennifer K. Brody, MD

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF MASSACHUSETTS

AMERICAN ACADEMY OF HIV MEDICINE; HIV MEDICINE ASSOCIATION, a division of the INFECTIOUS DISEASES SOCIETY OF AMERICA; INTERNATIONAL ASSOCIATION OF PROVIDERS OF AIDS CARE; JENNIFER K. BRODY, MD; and CHRISTOPHER B. FOX, NP, *Plaintiffs*, v. HEALTH RESOURCES AND SERVICES ADMINISTRATION; THOMAS J. ENGELS, in his official capacity as the Administrator of the Health Resources and Services Administration; U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES; and ROBERT F. KENNEDY, JR., in his official capacity as Secretary of the U.S. Department of Health and Human Services, *Defendants*.	Case No.

DECLARATION OF CHRISTOPHER B. FOX, NP

I, Christopher B. Fox, NP, hereby declare and state as follows:

1. I am over 18 years of age, of sound mind, and in all respects competent to testify.

2. I have personal knowledge of the facts set forth in this declaration and would testify competently to those facts if called to do so.

3. I am a plaintiff in this case, and I bring claims on behalf of myself and my transgender patients.

4. I submit this declaration in support of Plaintiffs' Motion for Preliminary Relief under 5 U.S.C. § 705 and for a Preliminary Injunction, which seeks to prevent Defendants from

giving effect to certain conditions relating to transgender people and gender-affirming medical care set forth in Ryan White HIV/AIDS Program ("Ryan White Program") Notices of Funding Opportunity issued or forecasted to be issued in 2026 and the 2026 Updated HRSA General Terms and Conditions, issued on March 11, 2026 (collectively, "the Challenged Conditions").

5. In this declaration, I explain that integrated primary healthcare is an essential component of HIV care. I emphasize the significance of providing gender-affirming medical care to my patients with HIV, drawing on two specific patient examples. I then describe how my clinic and patients utilize Ryan White Program funding. I also highlight the impossibility of segregating gender-affirming medical care in a clinic that relies on these funds and discuss the potential consequences for myself, my clinic and colleagues, and my transgender patients if there were restrictions on the ability to acknowledge our transgender patients and the provision of gender-affirming medical care under the Ryan White Program.

I. Background and Professional Role

6. I am a Nurse Practitioner and an Assistant Professor of Medicine in the Division of Internal Medicine and Geriatrics at Oregon Health and Science University ("OHSU"), where I provide patient care, teach, and conduct research. I am also a faculty member of the Oregon AIDS Education and Training Center/Oregon Primary Care Association.

7. Before joining OSHU in 2016, I was a Nurse Practitioner at the University of California San Francisco Medical Center and an Assistant Clinical Professor at the University of California San Francisco School of Nursing. I also worked as a volunteer clinician and clinical staff nurse for the San Francisco AIDS Foundation and as a Community Health Specialist for the San Francisco Department of Public Health.

8. I received my Master of Science in Nursing as an Adult Nurse Practitioner specializing in HIV/AIDS at the University of California San Francisco.

9. I am credentialed as an HIV Specialist by, and am a member of, the American Academy of HIV Medicine.

10. I serve as a clinician in the HIV clinic at OHSU. At the clinic, I provide primary care to patients with HIV. Although the majority of my patients live in Portland, I also use telemedicine to reach my HIV patients who live in rural Oregon to increase accessibility and reduce the frequency of trips they have to make to Portland for in-person clinical visits with me. For many of my rural patients, I provide the closest competent and accessible HIV care. I provide HIV primary care for approximately 300 patients, HIV treatment consultations for approximately 75 patients, and HIV prevention consultations for approximately 50 patients.

11. As part of my practice, I have several transgender patients to whom I provide not only HIV care but also hormone therapy as treatment for their gender dysphoria (also known as "gender-affirming medical care" or "gender-affirming hormone therapy").

12. In my faculty role with the Oregon AIDS Education and Training Center, my focus is on educating the HIV workforce. I provide regular educational presentations and individual mentoring on HIV prevention and treatment to healthcare providers statewide. And I founded and lead a monthly Community of Practice for Nurses who serve patients with HIV.

13. Likewise, my scholarship focuses on HIV prevention and treatment. My current research focuses on the implementation of long-acting antiretroviral therapy. I also wrote textbook chapters in Collins-Bride & Saxe's *Clinical Guidelines for Advanced Practice Nursing*, namely, the chapters titled *HIV Infection in Adolescents and Adults* and *Primary Care of HIV-Infected*

Adults. The Collins-Bride & Saxe's *Clinical Guidelines* also include chapters specific to the care of transgender patients with HIV.

14. From 2013 to 2016, I received a Human Resources & Services Administration grant called HIV/AIDS Primary Care Capacity in Nursing for curriculum development.

II. Integrated Primary Healthcare for HIV Patients

15. Fundamentally, HIV is a virus that attacks a person's immune system. Antiretroviral therapy, what people typically think of as HIV medication, reduces the amount of HIV in the blood, known as the viral load. When a patient with HIV has an undetectable viral load, they will not sexually transmit HIV to others.

16. Because HIV attacks the immune system, people with HIV are susceptible to many different infections and diseases throughout their lives. And because of the stigma and other social factors associated with people who have HIV, they are also likely to require healthcare associated with mental health challenges, substance use disorders, and other diseases prevalent in populations associated with HIV. Some who do not work within the field of HIV care believe that HIV care is focused solely on HIV medication management, but that could not be farther from the truth.

17. The field of HIV care has trended towards integrating HIV care with all primary care because this model has proven very effective for HIV patients. However, with many HIV patients, our visits focus on care for comorbidities—in particular, their chronic health conditions or mental health issues. A lot of our work is helping people navigate those other health conditions, such as management of diabetes, hypertension, cardiovascular disease, and other bread-and-butter issues of primary health care. This is important because it motivates our patients to show up and stay engaged with their HIV medication management.

18. If an HIV specialist takes care of the primary health needs of an HIV patient, the patient will have better outcomes. For instance, within HIV medicine, cardiovascular risks are an important part of patient care. People with HIV have heightened cardiovascular risks because of chronic inflammation, exposure to prior drug therapies with harmful cardiovascular effects, and lifestyle factors like smoking or substance use. Integrated care enables HIV providers to proactively monitor and treat these risks within the context of HIV treatment, leading to improved long-term health outcomes and reduced mortality. Therefore, HIV specialists typically focus on the cardiovascular aspects of their patients' primary health care.

19. Another benefit of integrated primary care is the providers' ability to monitor polypharmacy issues. People with HIV often take multiple medications for HIV and co-occurring conditions, increasing the risk of adverse drug interactions and side effects. The literature is clear that co-locating HIV care with primary care, including gender-affirming medical care, is beneficial for our patients. It allows a single clinical team to coordinate prescribing decisions, monitor for drug interactions, and adjust treatment in real time.

20. Restricting integrated primary care would undermine these clinical safeguards by fragmenting treatment, increasing the risk of harmful drug interactions, and undermining patients' engagement in their care. Further, this would disrupt the coordinated, patient-centered care that is essential to achieving optimal health outcomes for people living with HIV.

III. Importance of Gender-Affirming Medical Care for Transgender Patients with HIV

21. The clinic operates under a care model that ensures we provide competent HIV care to underserved populations, as is mandated under the Ryan White Program.

22. Several of my patients are transgender. For most of my transgender patients, I am their primary care provider. At OHSU, we have strong values guiding how we take care of our

transgender patients. Our electronic records reflect those values, and we make sure to respectfully record and use a patient's name, gender identity, and pronouns.

23. Gender dysphoria is a serious medical condition characterized by the clinically significant distress that a transgender person may experience because of the incongruence between their gender identity and their birth-assigned sex. It is codified as a diagnosis in the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders, 5th edition, Text Revision.*

24. Well-established, evidence-based clinical guidelines, such as those published by the World Professional Association for Transgender Health and the Endocrine Society, provide for the multidisciplinary care of transgender individuals and describes criteria for medical interventions to treat gender dysphoria, including gender-affirming hormone therapy. The goal of medical treatment for gender dysphoria is to eliminate clinically significant distress by helping a transgender person live in accordance with their gender identity. The provision of gender-affirming medical care is widely accepted within the medical community, including by the vast majority of major medical organizations in the United States.

25. If left untreated, gender dysphoria can result in debilitating anxiety, severe depression, self-harm, and even suicidality.

26. At our clinic, beyond hormone therapy and surgical referrals, our gender-affirming care provides support to the whole person. Their experience with gender and holistic support is an integral part of their experience as a patient.

27. For example, I care for a transgender woman in her 30s living with HIV who suffered a life-threatening portal vein blood clot—a clot in the vein carrying blood from the intestines to the liver. Her hematologist concluded the clot was likely related to estradiol and

advised that she should never use hormone therapy again. From a traditional medical standpoint, that recommendation was understandable: avoid estrogen permanently to reduce the risk of another potentially fatal clot. But that recommendation failed to account for another serious risk—the harm caused by abruptly ending gender-affirming medical care that was addressing the patient's gender dysphoria. For this patient, estradiol was not an optional treatment. It was medically necessary treatment to address the distress associated with her diagnosed gender dysphoria and central to the affirmation of her identity, emotional stability, and overall well-being. Removing it entirely carried its own profound mental and physical health consequences, which would have negatively affected her HIV care. Instead of treating the issue as a simple contraindication, the patient and I approached it through shared decision-making. We openly discussed both risks: recurrence of a dangerous clot versus the consequences of terminating gender-affirming medical treatment. Ultimately, we chose a safer compromise by switching her from oral estradiol to a low-dose transdermal patch, which is associated with a lower clotting risk. The patient was deeply grateful to work with a provider who understood all of her medical needs and who respected her priorities.

28. This example demonstrates that gender-affirming medical care is not ancillary medicine. HIV care and gender-affirming medical care are medically necessary care that must be provided considering the whole person and their needs and priorities. Providers who understand this can help patients safely navigate complex risks, while providers who do not may unintentionally cause serious harm by ignoring what is at stake. In this case, the patient was at risk of losing trust in the medical system if she were required to end her gender-affirming care. Because I took care of my transgender patient's medical needs, she trusts me and has continued to show up for her HIV care.

29. I also care for a transgender woman in her 20s living with HIV, whom I first met shortly after she was diagnosed with HIV. Soon after we met, she disengaged from care. She missed follow-up visits and became unreachable for nearly a year. During that time, clinic staff funded through the Ryan White Program, including our nurse and medical case manager, continued persistent outreach rather than allowing her to fall through the cracks. When we finally reconnected, the underlying reasons became clear: the patient had been struggling with depression and methamphetamine use, both related to stigma from her HIV diagnosis. She had recently stopped using meth and wanted to re-engage in care. I managed her gender-affirming hormone therapy as part of her HIV care, reducing barriers by consolidating healthcare treatment in one place. Our social worker helped her qualify for breast augmentation surgery. Importantly, our nurse was able to connect her gender-affirming goals with her medical care, explaining that HIV viral suppression would likely be necessary for surgery. That goal became a powerful motivator. Over the past eight months, the patient has re-engaged successfully. She started long-acting injectable HIV treatment, is consistently attending medical appointments, and has an undetectable viral load. She obtained her mental health support letter, remains adherent to hormone therapy, and has completed her surgery consultation with surgery anticipated in the coming months.

30. This example illustrates that gender-affirming medical care can be a critical pathway to engagement in life-saving HIV treatment. For some patients, access to care that is affirming and respectful of their identities and to transition-related care is not separate from HIV care—it is the reason they return, stay connected, and achieve stability. When providers understand that, being respectful and affirming of a transgender patient's identity and providing gender-affirming medical care become tools for improving adherence, viral suppression, mental health, and long-term outcomes.

IV. Role of the Ryan White Program in Supporting Gender-Affirming Care

31. Working at an HIV clinic means that funding from the Ryan White Program is embedded in the infrastructure of our clinic. At our clinic, we rely on Ryan White Part A to fund the salary of our HIV clinic nurse. Without this funding, I'm not sure how we could keep her. She is the hub of our clinic, and she is the person that our patients work with to receive care. She is credentialed through the Association of Nurses and AIDS Care, and she understands the complexities of the medical therapies our patients receive. Our nurse knows our patients personally, communicates with them through the patient portal for me, and her presence makes a concrete difference in whether they show up for their appointments and how they follow their medical regimens. Our patients, including our transgender patients, must interact with her to receive expert care at our clinic. Our HIV clinic nurse teaches them about their hormone therapy and helps with referrals for surgery. She also monitors for medication side effects, provides counseling on self-management strategies, teaches self-injection techniques, provides counseling to support treatment adherence, flags abnormal test results, discloses laboratory and other test results to patients and counsels on their meaning, schedules follow up appointments and provides reminders, follows up when patients miss appointments to get them rescheduled or trouble-shoot attendance barriers like lack of transportation, coordinates care across the complicated health system, including advocating for the patient to providers at OHSU and in the community, and builds patient trust in the healthcare system by approaching patient care with an expert understanding of the specific issues and challenges that transgender people with HIV experience on a daily basis. I would not be able to provide primary care, including gender-affirming care, to our transgender patients without the support of our clinic nurse.

32. At OSHU, we also receive Ryan White Parts A and B funds through Partnership Project, which is our medical case management program. This program helps people stay connected to care, provides insurance assistance, and helps manage referrals to mental health and substance use treatment, housing, and more. It specifically helps support people in accessing hormone therapy and becoming appropriate surgical candidates, such as ensuring that patients have access to housing while recovering from gender-affirming surgery. This medical case management program is required to keep transgender patients connected to their HIV and gender-affirming care treatments. And I rely on it to provide primary care, including gender-affirming care, to my patients.

33. Ryan White Part B also funds the state program "Care Assist." Some of our patients use Care Assist funding to cover what is not covered by other forms of health insurance.

34. Providers at our clinic, including myself, also benefit from the use of Ryan White Part F funds to support workforce development.

V. Impact of Prohibiting Gender-Affirming Care

35. Logistically, I do not know how it would work to lose our Ryan White program funding for gender-affirming medical care or how to operationalize a policy that prohibits us from acknowledging, affirming, or respecting the identities of my transgender patients. This would be the first time we would need to discriminate based on the person who is receiving care, which is something our institution would not do.

36. I do not know how I would advise my clinic nurse and medical case management program staff. For example, can our nurse still teach our transgender patients how to do injections for hormonal therapy? And if we somehow found funding for these functions, although I am not aware that any such funding exists, to fund a non-Ryan White nurse to take care of just our

transgender patients, our patients would be at risk of harm without the special HIV expertise of Ryan White nurses. It seems impossible to provide my patients with appropriate gender-affirming care and HIV care without Ryan White-funded personnel.

37. There is already an HIV workforce shortage. We need to increase the number of doctors, nurse practitioners, physician associates, nurses, social workers, case managers, pharmacists, and others who know how to care for people with HIV.

38. Traditionally, co-location of gender-affirming medical care and HIV care has been the standard of care because it improves HIV outcomes. Co-location of care requires providers who are trained in both HIV and gender-affirming medical care. If the gender-affirming medical care part is removed, a generation of providers may never get the experience of managing hormone therapy, counseling patients about surgical procedures, or offering transgender-specific health screenings. This will degrade the HIV specialty profession for all healthcare disciplines and lead to a profound loss of professional knowledge over time. A generation of new providers may lose the ability to provide what is now considered the standard of care.

39. I also do not know how my colleagues at our clinic and I can comply with the Challenged Conditions' prohibition while acknowledging, affirming, and respecting the identities of our transgender patients. If we cannot continue to respectfully record and use a patient's name, gender identity, and pronouns, it is likely that our transgender patients would stop coming and would drop off from all care, including HIV care. But if we do, we risk losing all Ryan White funding.

40. The restrictions created by the Challenged Conditions will erode trust in the healthcare system. Exclusion of gender-affirming medical care and forbidding affirmation of their identities will cause many transgender patients to lose trust in their healthcare providers and the

clinic in general, leading to a lack of engagement in healthcare and avoidance of dealing with acute or chronic illness, including the cessation of HIV treatment. When patients do show up for care, they may not feel like they can be open and honest with their healthcare providers about symptoms, behaviors, and healthcare needs. Lack of honest communication leads to misdiagnosis, missed diagnosis, not being offered preventative health services like screenings, and other adverse health outcomes.

41. These restrictions will cause increased emotional distress and decreased self-esteem. Although all transgender people have unique life experiences, most of my patients have experienced discrimination and prejudice related to their gender at some point. Many have experienced physical or emotional violence, and, commonly, they have experienced rejection by family and friends. The combined toll of these experiences, along with the stigma associated with an HIV diagnosis, contributes to frequent mental health struggles like depression, suicidality, feelings of low self-worth, and low self-efficacy. If I had to stop providing gender-affirming medical care, or even stop respecting my patients' dignity by using pronouns that cause them harm, that would only make it more likely for them to drop out of care.

42. Without access to our Ryan White nurse and case managers, my transgender patients who become disengaged in care may not return to care until they have experienced a life-threatening complication of their HIV infection. When a patient disengages from care, too often they show up in the hospital with an AIDS-related illness from which they may not recover or could lead to severe disability.

43. And if all HIV clinics that are funded by Ryan White funding stop providing gender-affirming care to their transgender patients, some or many of those patients will likely stop receiving HIV care. Besides the adverse effects on the health of those individual patients, it will

increase the viral load population-wide and increase transmission rates. It will affect our clinic and our ability to provide the same level of care to each of our patients because we do not close our doors; we respond to the need. It would mean that I would have to work more hours, our patients would have decreased access, there would be delays in care, and my colleagues and I would all feel the increased stress. And we would all face an increased potential for burnout. We already do not have enough HIV providers due to losses from retirement and COVID. And a malfunctioning HIV system would require more funding. A restriction on gender-affirming care would disrupt the whole HIV care system.

44. The restrictions created by the Challenged Conditions, including prohibiting the use of Ryan White funds for gender-affirming medical care for my HIV patients, would cause me to question my ability to do the work that I am doing. I spend the vast majority of my work hours providing primary care. And there is a huge emotional stress to not being able to provide proper care to my patients. It is distressing for us as providers. But if I burned out and left HIV care, I would feel stress and guilt for abandoning the people who need me most. I really dread the emotional challenges that this ban would bring to my daily life.

45. I believe it is my ethical responsibility to continue providing the same integrated care to my patients that takes into account all their health needs as I have done to that and to be affirming and respectful of my patients. The restrictions created by the Challenged Conditions are contrary to my ethical responsibilities and my oath as a healthcare professional.

I declare under penalty of perjury that the foregoing is true and correct.

Dated: June __, 2026

_____
Christopher B. Fox, NP

I declare under penalty of perjury that the foregoing is true and correct.

Dated: June 8, 2026

Christopher B. Fox, NP

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF MASSACHUSETTS

AMERICAN ACADEMY OF HIV MEDICINE; HIV MEDICINE ASSOCIATION a division of the INFECTIOUS DISEASES SOCIETY OF AMERICA; INTERNATIONAL ASSOCIATION OF PROVIDERS OF AIDS CARE; JENNIFER K. BRODY, MD; and CHRISTOPHER B. FOX, NP, *Plaintiffs*, v. HEALTH RESOURCES AND SERVICES ADMINISTRATION; THOMAS J. ENGELS, in his official capacity as the Administrator of the Health Resources and Services Administration; U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES; and ROBERT F. KENNEDY, JR., in his official capacity as Secretary of the U.S. Department of Health and Human Services, *Defendants*.	Case No.

DECLARATION OF DANIELLE DOE, NP

I, Danielle Doe, NP, hereby declare and state as follows:

1. I am over 18 years of age, of sound mind, and in all respects competent to testify.

2. I have personal knowledge of the facts set forth in this declaration and would testify competently to those facts if called to do so.

3. I am offering this declaration as a member of the American Academy of HIV Medicine, which is bringing claims on behalf of their members, like me, and on behalf of the transgender patients of their members, like mine.

4. Danielle Doe is a pseudonym. I am submitting this declaration under a pseudonym to protect my privacy and to protect my family and me from harassment, violence, and retaliation.

5. I submit this declaration in support of Plaintiffs' Motion for Preliminary Relief under 5 U.S.C. § 705 and for a Preliminary Injunction, which seeks to prevent Defendants from giving effect to certain conditions relating to transgender people and gender-affirming medical care set forth in Ryan White HIV/AIDS Program ("Ryan White Program") Notices of Funding Opportunity issued or forecasted to be issued in 2026 and the 2026 Updated HRSA General Terms and Conditions, issued on March 11, 2026 (collectively, "the Challenged Conditions").

6. I also submit this declaration in support of Plaintiffs' Motion for Leave to Submit Pseudonymous Declarations and for a Protective Order.

7. In this declaration, I describe how my clinic and patients use Ryan White Program funding to provide comprehensive HIV care. I explain how gender-affirming medical care is integral for our transgender patients' primary care and essential for their HIV services, and that their lives and health are improved by the comprehensive care made possible by the Ryan White Program. Disruption to structured care coordination would cause disease progression, preventable mortality, and the loss of continuity of care. As a result, public health would be in danger.

I. Background and Professional Experience

8. I am a Nurse Practitioner with full practice authority to practice advanced nursing in Massachusetts.

9. I work at a clinic in central Massachusetts.

10. I have provided HIV care and gender-affirming medical care since 2022. I also completed a community-based HIV fellowship funded in part by the Ryan White Program.

11. I am an HIV specialist credentialed through and a member of the American Academy of HIV Medicine ("the Academy").

12. I provide HIV care and gender-affirming medical care funded in part by the Ryan White Program.

13. My clinic provides comprehensive HIV treatment and primary care to approximately 400 patients living with HIV, many of whom are experiencing economic instability. The clinic provides gender-affirming medical care to all of our transgender patients with HIV. These services are delivered through an integrated, multidisciplinary model that addresses both medical needs and social determinants of health, such as housing instability, stigma, and access to basic resources, which are critical to achieving and maintaining viral suppression.

II. Need for Pseudonymity

14. I am submitting this declaration under a pseudonym because I reasonably fear professional and personal retaliation if my identity is publicly disclosed, as well as subject me, my family, and my patients to a substantial risk of harm, harassment, and retaliation.

15. Although Massachusetts generally supports access to HIV care and gender-affirming medical care, people in Massachusetts are not immune from the current national climate surrounding these issues, which is highly contentious. For example, I am aware of people making death threats against healthcare providers who provide gender-affirming medical care in

Massachusetts.[1] Similarly, just a few months ago, a member of the Massachusetts Commission on the Status of Women was subjected to harassment and death threats because she was transgender.[2]

16. Indeed, providers who serve transgender patients, particularly those relying on federal funding streams like the Ryan White Program, have increasingly been subject to harassment, targeted complaints, and threats to their employment and licensure.

17. Accordingly, I am concerned that public identification would endanger my safety as well as the safety of my family, my colleagues, and my patients.

18. I am also concerned that public identification could expose me to scrutiny or adverse action by federal agencies, jeopardize my institution's funding, and subject me to harassment that would interfere with my ability to provide care. Based on media reports, I am aware that the current federal administration has targeted those who support transgender care or oppose their priorities.

19. For these reasons, I believe it is necessary to proceed anonymously while still providing truthful and accurate information to the Court.

20. I am willing to disclose my identity to the Court as directed under a protective order.

III. The Ryan White Program Funding

21. The Ryan White Program is designed to provide comprehensive clinical and support services to low-income people living with HIV.

22. The clinic receives Ryan White funding under Parts B, C, D, and F.

---

23. The clinic benefits from Ryan White Part C, which largely funds the case management team of nurses and staff. Our clinic's Ryan White-funded nurses are the bedrock of our HIV practice; they are deeply knowledgeable in HIV, administer vital HIV care, and have meaningful long-term relationships with our HIV patients. They provide comprehensive case management, which often includes going the extra mile. For example, our nurses call patients repeatedly to confirm appointments and labs, escort patients to pick up their medication from the hospital system's pharmacy, and sit with patients before they receive surgery.

24. The case management nurses and staff are vital to patients scared of engaging with the medical system—especially transgender patients who have historically experienced discrimination in medical settings—because they provide a sense of safety, making healthcare feel accessible. Our case managers are the foundation of the care we provide, and they are crucial for the health of our patients and my job as a provider.

25. The clinic also benefits from Ryan White Part B, which funds the Massachusetts HIV Drug Assistance Program.

26. Ryan White Part D, a funding stream that serves women of childbearing age and young people up to age 26, funds MassCARE, a system that supports our patients.

27. And the clinic benefits from Ryan White Part F funds, which contribute to our hospital system's HIV care education. Specifically, Part F funds supported my fellowship's focus on HIV education, and through that work, particularly in learning about populations disproportionately affected by HIV, it became essential to further engage with colleagues and external resources to deepen my understanding of gender-affirming medical care.

28. Ryan White funding is deeply integrated into all aspects of the care I provide. It supports both clinical services and the wraparound services that enable patients to engage in and remain in care.

IV. Importance of Gender-affirming Medical Care for Transgender Patients with HIV

29. At the clinic, we co-locate our services to help our patients live physically, mentally, and socially healthy lives. We provide a holistic, all-encompassing approach to medical care that covers the full spectrum of a patient's needs. When we co-locate services, we improve access to care and support engagement in treatment, which helps reduce HIV transmission and meet expected standards of care.

30. Gender-affirming medical care is an integral part of primary care for transgender patients and supports optimal HIV-related health outcomes. Transgender patients benefit from receiving both primary care and HIV care from a single competent and affirming provider.

31. If a component of this comprehensive approach were removed, it would force fragmentation of care and disproportionally impact patients with limited financial resources. It is imperative that patients stay engaged in care for both their health and the community's health.

32. In my experience, access to gender-affirming medical care as part of comprehensive healthcare motivates transgender patients to become engaged with and remain in HIV care. Providing gender-affirming medical care is necessary to establish the provider-patient relationship and begin building trust because many of our transgender patients, who frequently experience discrimination in healthcare settings, prioritize gender-affirming medical care over other areas of healthcare and may avoid healthcare settings altogether if it is not tied to supporting this care. When transgender people come to me to establish gender-affirming medical care, it is much easier to simultaneously provide them with HIV care.

33. My transgender patients who routinely attend appointments for gender-affirming medical care maintain viral suppression, which keeps them healthy and prevents HIV transmission.

V. One of My Patients Exemplifies the Importance of Ryan White Funding for Gender-Affirming Medical Care

34. I am the primary care provider for a transgender woman in her early 40s whom I have followed for 2.5 years after she relocated to the area and re-engaged in HIV care following nearly eight years out of treatment. At the time of re-engagement, she had also been without gender-affirming hormone therapy, having lost access during relocation due to the scarcity of providers offering co-located HIV and gender-affirming care.

35. She re-presented with advanced HIV following hospitalization for Pneumocystis jirovecii pneumonia, an AIDS-defining opportunistic infection reflecting severe immunosuppression. She had already sustained significant end-organ damage, including bilateral avascular necrosis of the hips and retinal detachment resulting in partial blindness. Despite restarting antiretroviral therapy and improving adherence, she later developed additional HIV-associated complications, including Kaposi sarcoma and multicentric Castleman disease, reflecting the long-term consequences of advanced untreated HIV.

36. Her care is among the most complex I manage. She follows with oncology, palliative care, orthopedics, and ophthalmology, and coordination across these services would not be manageable without strong system-level support, particularly given her blindness, chronic pain, significant mobility limitations, and inability to drive.

37. Ryan White–funded case management is central to her care. Her case manager coordinates across specialties, helps manage insurance and medication issues, facilitates communication between providers, and arranges transportation through a community-based

transport system. Without this level of support, she would be at high risk of disengaging from care, as has happened previously.

38. Her engagement is not driven by antiretroviral therapy alone. It is built on trust, specifically the ability to receive HIV care, behavioral health services, social support, and gender-affirming hormone therapy within a single affirming clinical environment. After spending years outside the medical system due to a lack of safe and competent care, that integration has been key to her re-engagement and stability.

39. Policies that restrict the ability to provide care that is affirming to our transgender patients or to provide gender-affirming medical care within Ryan White–supported settings would disrupt this model. For patients like her, the impact would not just be loss of hormone therapy and HIV care that is respectful of her identity, but fragmentation of care into separate systems. That would mean additional providers, more administrative burden, possible insurance issues, and loss of established clinical trust. For someone with her level of medical complexity, each added barrier increases the risk of falling out of care.

40. The Ryan White Program infrastructure that supports her transportation, case management, adherence, and specialty coordination also enables this integrated care model. These supports are not separate from her medical care. For this patient, with advanced HIV and significant dependence on structured care coordination, disruption of this system risks more than inconvenience. It risks treatment interruption, disease progression, preventable mortality, and loss of continuity with a provider who knows her full story.

VI. Impacts of Prohibiting Gender-affirming Medical Care

41. If I lose the ability to provide affirming care that is respectful of my transgender patients who rely on the Ryan White Program and/or to provide gender-affirming medical care

through the Ryan White Program, the impact on my patients and the broader public health would be catastrophic.

42. Building trust is essential to keep a patient in care—especially for transgender patients and those living with HIV who experience higher rates of discrimination in healthcare settings. In fact, transgender patients' viral suppression is associated with supportive clinical relationships. In my experience, when a provider is hostile or disrespectful to a transgender person's identity, the patient is less likely to return for care. This means that they may not get the additional medical treatment they need, which can lead to worsening health outcomes, including symptomology and ultimately higher viral loads.

43. My clinic works very hard to maintain patient trust and signal to new patients that we respect transgender identity. For example, staff members wear pronoun pins, we display gender-inclusive flyers in our clinical space, and we ask for sexual orientation and gender identity data on medical intake forms. Our staff is also trained in transgender identity competency, and our case managers have developed long-term relationships with transgender patients.

44. If the Challenged Conditions' prohibitions on respecting transgender patients' identities and the provision of gender-affirming medical care go into effect, they will obliterate the trust my clinic works so hard to build with transgender patients. For example, we have one nurse case manager who has been doing HIV work for over 30 years. This longevity has earned deep trust with our patients. I anticipate that the sudden loss of a key part of their healthcare will lead transgender patients feeling betrayed by their providers and to disengage care with us altogether. As a result, they will experience a disruption of their HIV care.

45. Disruptions in HIV care can cause serious health consequences. When patients fall out of HIV care, our hospital system sees an increase in them not adhering to their prescribed HIV

medication, which can lead to opportunistic infections, higher rates of emergency department utilization, and hospitalization. It can also lead to higher rates of community HIV transmission**.**

VII. Impact on Massachusetts

46. Massachusetts has developed a comprehensive, data-driven HIV response that depends on the Ryan White Program to provide integrated care to people living with HIV, particularly those who are low-income, uninsured, or underinsured. In the Boston Eligible Metropolitan Area ("EMA"), which includes Bristol, Essex, Middlesex, Norfolk, Plymouth, Suffolk, and Worcester counties, Ryan White funding supports a coordinated system of care designed to meet the needs of the populations most affected by HIV through an Integrated Care Plan. A copy of Massachusetts and Boston's EMA integrated HIV/AIDS prevention and care plan is attached hereto as **Exhibit A**.

47. In Massachusetts, HIV care for transgender patients is not delivered in isolation. Rather, it is provided through integrated care models that combine HIV treatment with behavioral health services, case management, housing support, and, where appropriate, gender-affirming medical care. A copy of Boston's EMA Ryan White Part A prevention and care plan is attached hereto as **Exhibit B**.

48. A federal restriction prohibiting providers from respecting transgender patients' identities as well as the use of Ryan White funds for gender-affirming medical care would directly undermine this integrated system. The Integrated Plans are premised on coordination across funding streams and service categories to eliminate gaps in care. The restrictions would force providers to fragment care, exclude necessary services for a defined population, and create gaps that the Integrated Plans are specifically designed to prevent.

49. The disruption would be particularly acute where the clinic is located because the majority of people living with HIV in Massachusetts reside in or near this area and receive services through Ryan White–supported providers.

50. Moreover, because Ryan White is a payer of last resort, many patients in Massachusetts who rely on this program have no meaningful alternative source of care. The Integrated Plans assume the continued availability of Ryan White–funded services to fill gaps in coverage and ensure continuity of care across systems. Removing a critical component of care from that system would leave many patients without viable options.

VIII. Impact on Our Ability to Provide Care

51. This restriction puts our medical institution in the impossible position to decide which medical care to cut, but this decision is heartbreaking. Transgender patients' lives and health are no less important than non-transgender plaintiffs.

52. If these restrictions go into effect, our clinic will be forced to discontinue providing gender-affirming medical care for Ryan White patients in order to continue participating in the Ryan White Program.

53. Personally, it would be devastating if I could not provide gender-affirming medical care for the patients who need it. I believe that patients should receive the proper care—including gender-affirming medical care—to live healthy lives. It would be horrible to discontinue this care for no justified medical reason. I would feel that the medical system had completely failed our patients, and with a finality that would make me feel discouraged about my job too.

54. One of my colleagues shared that she will leave her job if this restriction goes into effect. She said that she staked her profession on providing gender-affirming medical care and could not practice ethically as a medical practitioner with this restriction in place because it would

be a betrayal of both her own conscience and patients. She does not know what she would do next, but she said that staying in her job is not an option because doing so would be an abandonment of her personal and professional values.

55. Moreover, the restriction prohibiting providers from respecting transgender patients' identities is so unclear that our clinic is unsure how to implement it. We do not know if our nurse case managers could even call transgender patients regarding their HIV care. We do not know the boundaries of this restriction and our hospital system is likely to take a conservative approach, which will ultimately push transgender people further out of care.

56. This restriction would also accelerate a chilling effect on talking about gender-affirming medical care in our medical system. Our clinic is already operating in an environment of heightened concern about potential scrutiny related to recognizing transgender patients for who they are. As a result, providers may be hesitant to speak openly about gender-affirming medical care due to possible political or legal implications. No other class of patients faces this level of caution or indirect pressure around discussion of basic medical care.

57. This chilling effect is not limited to my hospital system. For example, a colleague shared that at a conference panel focused on HIV care and related to the Ryan White Program, panelists refused to answer a question about drug interactions with gender-affirming hormone therapy due to fear of backlash. After informing the audience that the panel could not say anything, the panelists turned over the question and answer to the audience to crowd source an accurate medical answer to the important question. Questions of drug interactions are not political; they are vital for our understanding as medical providers to administer competent care.

IX. Harms Caused by the Challenged Conditions

58. The harm caused by the Challenged Conditions' restriction would be difficult or impossible to reverse. It would destroy patient trust carefully and diligently built by our team over the course of many years. In my experience, once trust is lost, it becomes significantly more challenging to re-engage patients in any kind of care.

59. As a result, patients would experience a disruption in their gender-affirming medical care and HIV care. Many would no longer be able to receive gender-affirming medical care from a non-Ryan White provider due to their economic instability and would cease HIV care entirely. The result would be a patient population who experiences worse health outcomes and a potential community-wide increase in HIV transmission.

60. As a medical provider, I have tried to make contingency plans if my ability to provide gender-affirming medical care suddenly stopped. But none of these plans could circumvent the immediate harm caused by the loss of trust from patients, or the heartbreaking reality that they can no longer receive gender-affirming medical care from me.

X. Conclusion

61. Based on my experience and clinical judgment, gender-affirming medical care is an essential component of effective HIV management for many patients.

62. Prohibiting Ryan White funding recipients from respecting their transgender patients' identities and from using Ryan White funds for gender-affirming medical care would harm my patients, undermine public health, and prevent me from fulfilling my obligations as a medical provider.

I declare under penalty of perjury that the foregoing is true and correct.

MASSACHUSETTS AND BOSTON EMA INTEGRATED HIV/AIDS PREVENTION AND CARE PLAN

ENDING THE HIV EPIDEMIC IN THE COMMONWEALTH: 2022-2026

MASSACHUSETTS DEPARTMENT OF PUBLIC HEALTH (MDPH); BUREAU OF INFECTIOUS DISEASE AND LABORATORY SCIENCES (BIDLS); OFFICE OF HIV/AIDS (OHA)

BOSTON PUBLIC HEALTH COMMISSION; INFECTIOUS DISEASE BUREAU; RYAN WHITE SERVICES DIVISION

STATEMENT OF MISSION, VISION, AND COMMITMENT TO INTEGRATED HIV PREVENTION AND CARE PLANNING OVERVIEW

The *Massachusetts and Boston EMA Integrated HIV/AIDS Prevention and Care Plan, Ending the HIV Epidemic in the Commonwealth: 2022-2026,* was developed based on the mission, vision, and commitments described below. Community stakeholders and public health planners worked together to identify new priorities focused on achieving racial health equity.

INTEGRATED HIV PREVENTION AND CARE PLAN MISSION

The Boston Public Health Commission (BPHC), Infectious Disease Bureau (IDB), Ryan White Services Division (RWSD), and The Massachusetts Department of Public Health (MDPH), Bureau of Infectious Disease and Laboratory Sciences (BIDLS), Office of HIV/AIDS (OHA) are committed to eliminating new HIV infections, improving health outcomes and prosperity of people with HIV, and eliminating persistent disparities in health among affected populations, notably residents who are African American/Black, Latinx, gay and bisexual men and other men who have sex with men (including transgender, nonbinary, and gender expansive people who have sex with men), persons who use drugs, persons who are non-US born, and people who are transgender, nonbinary, and gender expansive.

"End transmissions, end stigma, promote health."

VISION

All Massachusetts residents and those in the Boston Eligible Metropolitan Area (EMA) have health and prosperity, free of stigma and disease.

VALUES

Caring and Respect: Individuals are treated with caring and respect across all sectors of HIV planning and response.

Collaborations: Collaborations and partnerships are valued to inform priorities and to deliver on them.

Inclusive and Equitable Community Engagement: Stakeholder engagements with traditionally marginalized people and communities improve our understanding of affected population needs to inform tailored responses.

Racial Equity: We focus on racial equity with new vigilance by using the levers to make change and by creating new service models.

End Stigma: Pursue opportunities to address the drivers and manifestations of stigma that may lead to avoidance of health services, nondisclosure, and people experiencing treatment failure.

GUIDING PRINCIPLES

Collaborators that developed this plan are committed to working together to meet the needs of affected populations, identify and address social determinants of health, and learn from those with lived experience to advance integrated and trauma-informed service models.

SECTION I: EXECUTIVE SUMMARY OF THE INTEGRATED PLAN AND SCSN

The Boston Public Health Commission (BPHC), Infectious Disease Bureau (IDB), Ryan White Services Division (RWSD), and The Massachusetts Department of Public Health (MDPH), Bureau of Infectious Disease and Laboratory Sciences (BIDLS), Office of HIV/AIDS (OHA) are committed to eliminating new HIV infections, improving health outcomes and prosperity of people with HIV, and ending persistent disparities in health among affected populations, notably residents who are African American/Black, Latinx, gay and bisexual men and other men who have sex with men (including transgender, nonbinary, and gender expansive people who have sex with men), persons who use drugs, persons who are non-US born, and people who are transgender, nonbinary, and gender expansive.

– MISSION OF THE INTEGRATED HIV PREVENTION AND CARE PLAN

OVERVIEW

This Integrated HIV Prevention and Care Plan builds upon the findings and engagement efforts of previous planning efforts including the 2016-2021 Integrated HIV Prevention and Care Plans produced and submitted separately by MDPH and BPHC, the 2020 Ending the HIV Epidemic (EHE) in Suffolk County Massachusetts Plan, and the Massachusetts Getting to Zero Coalition's Massachusetts Comprehensive Plan to Eliminate HIV Discrimination, AIDS Related Deaths, and New HIV Infections.

This document, the joint Massachusetts and Boston EMA Integrated HIV Prevention and Care Plan - Ending the HIV Epidemic in the Commonwealth: 2022-2026, achieves several "firsts."

One, it is the first time that the Commonwealth of Massachusetts and the Boston Eligible Metropolitan Area (EMA) submit an Integrated HIV Prevention and Care Plan, including the Statewide Coordinated Statement of Need, jointly, to Centers for Disease Control and Prevention (CDC) and the Health Resources and Services Administration (HRSA). This partnership builds upon the cooperation engendered in preparing the 2020 Ending the HIV Epidemic in Suffolk County Massachusetts that initiated the ongoing and current collaboration between the two entities.

Two, this is the first large scale HIV plan in Massachusetts to explicitly center racial equity throughout the plan. It does this by incorporating a health and racial equity framework and an anti-racism lens through essential public health services such as health assessments, policy development, and the assurance that resources and services are aligned with data throughout its duration.

Three, this plan is the result of the largest scope of stakeholder engagement that both MDPH and BPHC implemented. This includes significant participation over a period of one year of both the Massachusetts Integrated Prevention and Care Committee (MIPCC) and the Boston EMA Planning Council (PC). In addition, MDPH groups representing Black, Latinx, Transgender, Gay Men, and Women populations met repeatedly over several months. In addition, "all stakeholder" meetings were held that included representatives of behavioral health, people who use and/or inject drugs as well as the Statewide [HIV] Consumer Advisory Group. All these groups include a significant number of people at risk for and with

HIV. Information gleaned at group meetings generated suggestions for assessments, objectives, activities, and strategies that have been incorporated into this plan. All stakeholders understood that they were contributing to a "living document" that will continue to evolve and improve as it is implemented.

PLAN SUMMARY

The Massachusetts and Boston EMA Integrated HIV/AIDS Prevention and Care Plan - Ending the HIV Epidemic in the Commonwealth: 2022-2026 sets out a blueprint for public health action on HIV over the stated five-year period while meeting all the requirements set out in the joint CDC-HRSA Guidance.

This blueprint for public health action is based upon the Epidemiologic Snapshot, Continuum of Care, and Needs Assessment information outlined in Sections III. Throughout this section, data current as of December 31, 2020, are used consistently for both Massachusetts and the Boston EMA, including the EMA's three New Hampshire counties.

Based on information in Section III, men who have sex with men continues to be the largest percentage of incident cases (39%) followed by no identified risk (28%), people who inject drugs (14%), heterosexual sex (8%), and presumed heterosexual sex (7%). Only the category of people who inject drugs has increased in recent years.

From 2018-2020, with respect to race/ethnicity, white, non-Hispanic, people have the highest incidence (36%), followed by Black, non-Hispanic/non-Latinx (32%), Hispanic/Latinx (27%) and Asian/Pacific Islander (3%). However, when looked at by population rate, Black, non-Hispanic/non-Latinx, and Hispanic/Latinx individuals were diagnosed with HIV during 2018–2020 at rates eight and four times that of white, non-Hispanic/non-Latinx, individuals, respectively.

From 2018-2020, 38% (N=620) of all individuals diagnosed with HIV were born outside the US. An additional 12% of Hispanic/Latinx individuals diagnosed with HIV during this time were born in Puerto Rico. Recent, newly arriving immigrants crossing the U.S. southern border have included an increased number of women of color with HIV from Haiti, Uganda, and other countries.

Both the situational analysis and the goals/objectives section recognize that this Integrated Plan is and will be a living document. Thus, with ongoing input and engagement from the multiple stakeholder groups, this Integrated Plan will continue to evolve to achieve its goals regarding the local HIV epidemic with a lens toward strategies and activities that counter structural racism to improve overall effectiveness across the entire HIV continuum and reduce (and where possible eliminate) racial inequities.

Monitoring and implementation of the plan (Section VI) will both lead to improvements in the plan but will also inform the next procurements by BPHC and MDPH of the HIV system of prevention and care in Massachusetts. This substantial investment in the HIV system will present an opportunity to restructure how HIV prevention and care services will be designed and implemented in Massachusetts and the Boston EMA. The procurement will be developed using a racial equity lens and many of the goals/objectives indicate that change-related strategies and activities will feed into the procurement language.

APPROACH TO PREPARING THE PLAN

In Section II, the Integrated Plan documents how MDPH and BPHC used a combination of existing material and new material to develop this plan. This Integrated Plan builds previous plans including the 2016-2021 Integrated Plans produced and submitted separately by MDPH and BPHC, the 2020 Ending the HIV Epidemic in Suffolk County Massachusetts plan, and the Massachusetts Getting to Zero Coalition's Massachusetts Comprehensive Plan to Eliminate HIV Discrimination, AIDS Related Deaths, and New HIV Infections.

In addition, both the prior Epidemiological Profiles and Statewide Coordinated Statement of Need were reviewed to assist with the structure and contents of this Integrated Plan. For a full listing of where existing versus new material was used, see the Integrated Plan Checklist in Appendix 1. A full listing of the wide-ranging engagement of stakeholders is included in Appendix 4: People with HIV and Key Stakeholder Representation in Planning.

DOCUMENTS SUBMITTED TO MEET REQUIREMENTS

The Massachusetts and Boston EMA Integrated HIV/AIDS Prevention and Care Plan - Ending the HIV Epidemic in the Commonwealth: 2022-2026 meets all the requirements of the Integrated Plan Guidance issued by CDC and HRSA.

It meets the requirements for the Statewide Coordinated Statement of Need by including:

- Participation in the planning process by representatives of Ryan White HIV/AIDS Program (RWHAP) Parts A, B, C, D, and F located in Massachusetts.
- Inclusion and engagement in the planning process of people with lived experience including both people at risk for HIV and AIDS and people with HIV and AIDS.
- Inclusion of comprehensive needs assessment data including the most recent available information on HIV incidence, the HIV continuum of care, and results of assessments of access to services, including gaps and barriers. For each of these areas, overall findings are presented, as well as trend analysis and breakdowns by demographic factors including race/ethnicity, gender, age, exposure mode, and place of birth.

It meets the requirements for the Integrated Plan by including, in Section V, a minimum of three goals/objectives for each of the EHE strategies – Diagnose, Treat, Prevent, and Respond. In addition, this Integrated Plan includes a fifth strategy – Workforce. For each goal/objective there are related activities, partnerships, data indicators and sources, and which part of the HIV care continuum and which goal of the National HIV/AIDS Strategy each one will impact.

In addition to the documents mentioned in the Appendix 1 Checklist, this Integrated Plans has included the following documents as attachments:

- Appendix 2: Massachusetts and Boston EMA HIV Prevention, Care, and Treatment Resource Inventory
- Appendix 3: Massachusetts HIV Financial Inventory
- Appendix 4: People with HIV and Key Stakeholder Representation in Planning

Section II: Community Engagement and Planning Process

Engagements with community members, people with HIV/AIDS, and other key stakeholders are an essential component of the Commonwealth's response to the HIV epidemic. Massachusetts has a longstanding and highly effective state HIV/AIDS planning system. This network has historically contributed to prevention and care planning across state-, CDC- and HRSA-supported investments, and serves in an advisory capacity to the Office of HIV/AIDS (OHA) and Ryan White Services Division regarding the identification of population, local and regional service priorities, program development, and policy initiatives. Engagements to develop this plan were strategic, thoughtful, and bold for new efforts to end HIV. The ability to meet our HIV prevention and care goals relies on strategic application of health and racial equity approaches to all program investments, as described throughout this plan, but by also continuing to benefit from the knowledge, expertise, and experience of stakeholders, advisory bodies, and other partners within and outside of Massachusetts.[1]

Community and stakeholder engagement activities in Massachusetts embody the goals of the Integrated HIV Prevention and Care Plan, National HIV/AIDS Strategy (NHAS), and HIV Strategic Plan. Public health policies and programmatic responses are informed by consultative engagements with advisory groups, and frequent reports to those entities on the implementation status of their recommendations. Routine engagement with members of OHA-convened advisory groups, provider-led forums, and consumer-focused dialogues will serve to monitor progress, assess service needs, identify gaps and barriers, and implement responsive prevention and care initiatives. Engagements with the leadership and members of these groups ensure the prioritization of key initiatives and facilitates a sense of shared responsibility to achieve jurisdictional priorities.[2]

Initial planning efforts sought to effectively engage the coalitions that successfully created each of the existing plans, identify shared objectives and priorities, and synthesize complementary recommendations to accelerate our progress toward ending the HIV epidemic in Massachusetts and Boston EMA. An advisory response framework was developed to identify optimal practices based on the five core strategies (Diagnose, Prevent, Treat, Respond, and Workforce).

JURISDICTION PLANNING PROCESS

METHODS FOR CONDUCTING INTEGRATED PLANNING

An experienced public health planning partner was contracted to conduct advisory engagements and develop the joint Massachusetts and Boston EMA Integrated HIV Prevention and Care Plan - Ending the HIV Epidemic in the Commonwealth: 2022-2026. Weekly Zoom meetings were organized with members of the state and local public health staff to develop a schedule of advisory engagements, plan advisory meeting agendas, document proceedings, and discuss all phases of developing the plan. Meeting summaries of each advisory engagement were used to confirm priorities, goals, and objectives.

A year-long, rigorous schedule of distinct advisory group engagements concentrated on identifying population and service system priorities. To ensure the health and safety of advisory group members, planning partners, and public health staff, all advisory activities were conducted through Zoom virtual

platform to maximize the use of technology to conduct engagement remotely, to promote accessibility of these engagements, and to share important information.

ADVISORY GROUP FEEDBACK

MASSACHUSETTS INTEGRATED PREVENTION AND CARE COMMITTEE (MIPCC)

MIPCC is the integrated HIV prevention and care advisory group for the Commonwealth of Massachusetts is to design and provide guidance to implement the comprehensive HIV prevention, care, and treatment plan that promotes service integration.

MIPCC engages in activities required by both the Centers for Disease Control and Prevention (CDC) and the Health Resources and Services Administration (HRSA). MIPCC is an inclusive advisory body, with participation by individuals of diverse racial/ethnic backgrounds, gender diversity and expression, sexual orientation, HIV status, and ages. Members have a range of educational backgrounds, professions, lived experience, and perspectives reflecting Massachusetts's urban and rural areas and service settings. Additionally, expertise and representation from key governmental and non-governmental agencies ensures planning promotes inclusion of other partners.[3]

MIPCC identified the following concerns, priorities, strategies, and recommendations:

- Need to ensure inclusion of Black and Latinx communities affected by HIV in initial and ongoing priority setting, strategies to increase knowledge about local HIV prevention and care services, how to access services through print, digital, and online methods.
- Need to establish new dedicated infectious disease testing, linkage, and retention service initiatives, with increased funding and support, tailored to the needs of Black, Latinx, and gay, bisexual, and other men who have sex with men, including transgender, nonbinary, and gender expansive people in geographic hot spots.
- Require contractors to collaborate with partners, such as oral health settings, that may not regularly provide HIV services but could reach and engage people with or at risk for HIV who have not been effectively reached by existing services.
- Develop and fund integrated care models (where medical and behavioral health providers share treatment plans and coordinate services) to address the urgent need to screen, detect, and respond to behavioral health problems, particularly those among Black and Latinx communities and those who have experienced trauma and sexual and domestic violence.
- Increase flexibility and proportion of effort of infectious disease testing, linkage, and adherence services for programs that primarily focus on addressing complex needs of persons who inject and use substances (that deliver syringe services programs and overdose education and Naloxone distribution services).
- Need to eliminate barriers experienced by clients attempting to obtain substance use and behavioral health treatment services.
- Increase inclusion of paraprofessionals on prevention and care teams by advancing training, supervision, financing, and team-based care service delivery models.

[3] Massachusetts Department of Public Health, Office of HIV/AIDS, CDC PS19-1906: Strategic Partnerships and Planning to Support Ending the Epidemic in the United States, 2020, 5-6.

- Improve access to age- and developmentally-appropriate sexual health information about HIV, including information on the latest prevention options and the effectiveness of HIV treatments among youth and young adults, notably among Black, Latinx, gay and bisexual men and other men who have sex with men, including transgender, nonbinary, and gender expansive people, and sex workers.
- Provide resources, incentives, training, and technical assistance to expand workforce and system capacity to provide or link clients to culturally competent and linguistically appropriate HIV testing, prevention, and support services, notably in areas with shortages that are geographic (urban-rural), population, or facility based.
- Increase awareness of HIV among people, communities, and the health workforce in geographic areas disproportionately affected (urban-rural).
- Need to ensure community health workers and/or peers' roles are part of future integrated prevention and care service teams.
- Expand medical and non-medical case management services for people at risk for HIV infection and recently infected people with HIV, particularly for Black and Latinx communities.
- Establish a statewide expansion of rapid antiretroviral treatment.
- Enhance partnerships for people at-risk for HIV infection and people with HIV to obtain safe, affordable, and accessible housing.
- Improve coordination and communication between service providers when responding to disease outbreaks and provide guidance on "actions to take".
- Need for more open communication between members and funders on a regular basis as an opportunity to hear about priorities, system gaps, and emerging needs and trends.
- Need for flexible funding to support service innovations and community building activities, notably in non-clinical settings.
- Dedicate ongoing attention to the language used in planning and epidemiologic documents and other materials to avoid further stigmatizing and/or dehumanizing people, cultural and rural communities, and people with HIV.
- Engage the publicly-funded workforce in learning about the impact of white supremacy culture, racism, homophobia, transphobia, HIV-related stigma, and structural barriers to prevention, care, and treatments, and take action to create solutions.
- Support culturally tailored interventions and solutions to address digital inequities in communities heavily affected by HIV.
- Need to understand the social, behavioral, and economic effects of the COVID-19 pandemic and monkeypox outbreak on HIV risk and opportunities develop responsive, integrated public health messaging and service models.
- Improve diversity and representation in the workforce and governance, including hiring people with lived experience (lived experience of living with HIV, living Black, Latinx, Transgender, gay, immigrant in the US.
- Ensure hiring practices and job descriptions are screened for bias, prioritize lived experiences as much as learned.
- Prioritize and compensate staff at all levels in the program for language skills.
- Enhance engagement of people with lived experiences in agency-based advisory activities and groups, including direct participation in indecision-making.

- Require funded programs to become anti-racist, to dismantle white, hetero, cis supremacy through policy and practice changes – including support in shifting from retributive supervision/HR paradigms to more restorative and/or healing practices.
- Ensure funded programs are intentional with implementing justice, equity, diversity, and inclusion training.
- Promote hiring practices that actively encourages and prepares individuals who use funded services.
- Require funding to organizations in becoming anti-racist, working to dismantle white, hetero, cis supremacy through policy and practice revisions and to share lessons learned for replication.
- Give preference to funding organizations that shift from retributive supervision/HR paradigms to more restorative/healing practices.

Boston Part A EMA HIV/AIDS Services Planning Council

The Boston Part A EMA HIV/AIDS Services Planning Council (hereafter, the Planning Council) is a legislatively mandated planning body that works to organize, evaluate, prioritize, and allocate RWHAP Part A HIV funding in the Boston EMA. The Planning Council is appointed by the Mayor of Boston and works with staff of the BPHC Infectious Disease Bureau to administer the Part A grant. The Planning Council has thirty-eight members, representing HIV care providers, people with HIV, advocates, policy experts, and representatives from OHA, State Medicaid Office, and BPHC. The Planning Council meets monthly and assigns priority to service investments in particular service areas. Additionally, a variety of sub-committee meetings are convened throughout the year, including the Consumer Committee.[4]

The Boston Part A EMA Planning Council identified the following concerns, priorities, strategies, and recommendations:

- Ensure future service models include peer support programming, including capacity building and mentorship opportunities so that people with HIV can expand their participation in planning groups and consider direct service roles.
- Increase the capacity of the publicly funded care workforce to effectively identify, diagnose, and provide holistic care and treatments for people with HIV.
- Concern about workforce shortages and high turnover of staff are barriers to expanding and maintaining access to HIV care and treatment.
- Embrace, invest, and support new options, technologies, and approaches to receiving Ryan White Part A services.
- Expand and support social media anti-stigma efforts.
- Ensure required training for care providers to deliver medical case management services in a standardized, nondiscriminatory, confidential, and client-centered manner.
- Expand safe spaces where people with HIV feel supported to connect to and stay in HIV care, supports for adherence to treatment, and to get help with HIV disclosure skills.
- Support new and novel care strategies and support access to current and emerging therapeutics to better reach and retain the most vulnerable to non-adherence or dropping out of care.

[4] Massachusetts Department of Public Health, Office of HIV/AIDS, CDC PS19-1906: Strategic Partnerships and Planning to Support Ending the Epidemic in the United States, 2020, 7.

BOSTON EMA PLANNING COUNCIL – CONSUMER COMMITTEE

The Boston EMA Planning Council Consumer Committee identified stigma as a key priority of the Planning Council. Participants shared challenges and recommended innovative solutions, including the following:

- Offer rapid HIV testing when facing unique circumstances, e.g., people who inject drugs.
- Develop peer support groups across the state for various communities, e.g., sexual, and domestic sexual assault survivors, sex workers, parents in need of support, and remove barriers that limit acceptance into these programs.
- Support HIV and infectious disease education in schools, particularly in middle/high schools.
- Strategically using digital and social media to engage priority populations.
- Increase women's visibility and intentionally including them in planning, advisory, and review of service outcomes.
- Expand video and digital communications focusing on reducing HIV-related stigma.
- Ensure training opportunities and commensurate compensation for peers and community health workers.
- Incentivize and partner with clinical education initiatives on current biomedical prevention technologies for prevention and care (including the use of condoms).

STATEWIDE CONSUMER ADVISORY GROUP (SWCAG)

The SWCAG is a designated forum for engagements with people with HIV. The SWCAG meets quarterly to provide advisory regarding HIV prevention and care, treatment services, and policy strategies. Members of the SWCAG design and co-facilitate local forums for people with HIV in urban and rural areas to learn more about service delivery needs and make recommendations to improve HIV care continuum outcomes.[5]

The SWCAG identified the following concerns, priorities, strategies, and recommendations:

- Develop digital health technologies to address HIV-related stigma and other social determinants of health impacting linkage and retention in care.
- Provide new opportunities for people with HIV to engage with public health entities and others to ensure persons with lived experiences are centered in policy and program decision making.
- Develop, test, and implement telemedicine-based approaches and digital technologies for expanding the reach of HIV prevention and care for priority populations (urban-rural).
- Develop strategies for overcoming barriers to delivering prevention, care, and treatment for individuals with substance use disorders and HIV and other infectious illnesses.
- Support activities for the workforce on the effects of racial inequity, cultural differences, and social structures on health disparities in HIV care, and develop tools for ameliorating these disparities.
- Develop interventions to reduce the stigma that impedes access to health care for people with HIV, notably those with substance use disorders and co-occurring conditions (unstable housing, violence, etc.).
- Advance access to new treatment opportunities for Black and Latinx people with HIV.

[5] Massachusetts Department of Public Health, Office of HIV/AIDS, CDC PS19-1906: Strategic Partnerships and Planning to Support Ending the Epidemic in the United States, 2020, 6.

- Need for enhanced attention for those 50+ (and better) and receiving skilled nursing services to address their HIV and overall health service needs.
- Expand the publicly funded capacity to provide holistic care to older adults with HIV and long-term survivors.
- Concern about increasing numbers of people with HIV who are aging engaged in transitions in care, often leading to going without medication or are under-treated, especially if they are seeking non-HIV care.
- Concern that vulnerable older people with HIV are having transitions from independent living settings to assisted living or nursing facilities where they may experience stigma and where HIV care may not be optimal.
- Ensure condom promotion activities in funded organizations and that print and electronic materials include how to access, store, use and dispose of condoms.
- Support empowerment-based activities, including prevention and care bill of rights, to support clients in being active participants in prevention and care services.

Suffolk County Ending the HIV Epidemic (EHE) Steering Committee

The EHE Steering Committee is comprised of diverse representatives, including people with HIV or at-risk for HIV, Suffolk County local health departments and boards of health (Chelsea, Revere, and Winthrop); local healthcare facilities, behavioral health providers, family planning and women's health providers, correctional health providers, addiction treatment providers, including providers of medication-assisted treatment for opioid use disorder, professional associations, peer advocates, community-and faith-based organizations, and representatives from academic and research institutions. Members of the EHE SC were represented in MIPCC, the Boston EMA Part A Planning Council, SWCAG, and population health engagements to maximize coordination and map alignment of priorities.

COMMUNITY HEALTH IMPACT AND POPULATION HEALTH ADVISORY GROUPS

In its commitment to health and racial equity, and in response to recommendations from community members, the OHA created a new and expanded advisory system to improve service responses. In 2019, new advisory groups were formed, explicitly organized by sexuality, race, ethnicity, gender identity, and mode of exposure to provide specific input about ways to improve health outcomes, reduce new infections, and address health disparities among impacted populations – these groups include the Black Advisory Group, the Latinx Advisory Group, the Gay Men's Advisory Group, the Transgender, Nonbinary, and Gender Expansive Advisory Group, the Women of Color Advisory Group (2022), the Behavioral Health Advisory Group, and the Harm Reduction Workforce Advisory Group.

Members of each advisory group addressed factors that affect risks and resilience relative to HIV infection and health outcomes along the HIV care continuum. Members identified concerns, priorities that require further action, or expansion for their respective populations.

Black Advisory Group

The Black Advisory Group provides specific input about ways to improve health outcomes, reduce new HIV infections, and address health disparities among Black individuals. The advisory group examines data to identify assets and challenges experienced by Black residents, inclusive of African Americans and Black persons who are non-US born or with recent ancestry in a non-US born country. The group addresses factors that impact risks and resilience relative to HIV infection and health outcomes along the HIV care continuum.

This group identified the following concerns, priorities, strategies, and recommendations:

- Increase understanding of the Black community's experience with HIV and integrate into training and capacity building opportunities for prevention and care service providers.
- Fund flexible, culturally-adapted models and approaches that achieve core and optional service requirements in a way that is appropriate for the clients they serve.
- Initiate and sustain new and dedicated Black community HIV testing, linkage, and adherence initiatives that promote "whole community" engagement and response, centering efforts with non-medical and non-traditional partnerships.
- Develop and distribute a knowledge and experience assessment to the Black community to learn current attitudes, values, and beliefs about HIV, sex, and sexual health.
- Institute a system of low-threshold housing that does not involve strenuous qualification process and assigning separate housing case managers to individuals receiving these services.
- Ensure Black peers with HIV and community health workers are equitably compensated and offered professional development and advancement opportunities.
- Support program interventions that are tailored specifically to the Black community and place advertisements and other campaign messages in areas frequented by the Black community.
- Ease restrictions on emergency funds to allow them to be more culturally relevant financial assistance provided in a timely and low-threshold manner.
- Create new health promotion and disease prevention materials about accessing nPEP, PrEP, and current and future HIV treatments tailored for Black communities.
- Partner with schools and teaching hospitals and other institutions that offer education in the areas of public health, administration, and social work with a concentration of Black students for workforce recruitment.
- Allow direct engagement on social media applications (e.g., Grindr, TikTok, etc.) catering to disproportionately-impacted Black community members.

LATINX ADVISORY GROUP

The Latinx Advisory Group provides specific input about ways to improve health outcomes, reduce new HIV infections, and address health disparities among Latinx individuals. The advisory group examines data to identify assets and challenges experienced by Latinx people, and the ways those factors impact risks and resilience relative to HIV infection and health outcomes along the HIV care continuum.

This group identified the following concerns, priorities, strategies, and recommendations:

- Prioritize engagement of Latinx-serving health and social service provider organizations to address the lack of funded Latinx prevention and care service providers in all health service regions.
- Need for increased understanding of the unique Latinx communities impacted by HIV to tailor health communications, prevention, care, and treatment services.
- Initiate and sustain new dedicated Latinx community HIV testing, linkage, and adherence initiatives that promote "whole community" engagement and response, centering efforts with non-medical and non-traditional partnerships.
- Reduce language, service setting, and cultural barriers experienced by new Spanish speaking residents, notably improving access to nPEP, PrEP, and syringe service programs.

- Need to initiate MDPH-supported statewide program coordination activities among funded programs serving Latinx communities.
- Eliminate all barriers to using technology to educate, market, and link Latinx community members to prevention and care services.
- Allow direct engagement on social media applications (e.g., Grindr, TikTok, etc.) catering to disproportionately impacted Latinx community members.
- Continue to develop social marketing and print materials in Spanish.
- Concern about overall lack of culturally competent community-based and medical services providers.
- Recommendation to require outreach, engagement, and testing efforts in partnership with non-traditional partners, including Latinx businesses and nightclubs.
- Urgent need to increase awareness of and access to integrated HIV, STD, and HCV testing, linkage, and adherence services, nPEP, PrEP, and new methods of prevention and treatments to at-risk and newly diagnosed Latinx populations with HIV.
- Increase awareness and understanding of the U = U (undetectable = untransmittable) message in service settings and health promotion and disease prevention materials.
- Ensure workforce development opportunities are offered in Spanish to mirror service setting contexts.

Gay Men's Advisory Group

The Gay Men's Health Advisory group provides specific input to MDPH about ways to improve health outcomes, reduce new infections, and address health disparities among gay men and other men who have sex with men (MSM). The advisory group focuses on identifying assets and challenges experienced by gay men and the ways those factors impact risk and resilience relative to HIV infection and health outcomes along the HIV care continuum.

This group identified the following concerns, priorities, strategies, and recommendations:

- Recommendation to emphasize the importance of continuing to prioritize gay-identified men and other men who have sex with men since this is the most disproportionately impacted group relative to new HIV infections.
- Reduce barriers to retaining PrEP clients due to medication wait times, changes in employment status, and financial barriers implemented by clinical care organizations.
- Ensure each funded prevention and care provider has a dedicated and clearly understood pathway for same-day access to nPEP, PrEP, and HIV care, particularly during screening assessments and care appointments.
- Initiate and sustain new dedicated gay men's HIV testing, linkage and adherence initiatives that promote "whole community" engagement and response, centering efforts with non-medical and non-traditional partnerships, particularly among Black, and Latinx communities of gay and bisexual men and transgender and gender diverse individuals who have sex with men.
- Eliminate cultural biases by developing new strategies to address populations whose cultural norms prohibit the discussion of sexually related topics, types of relationships between men, and sexual behaviors.
- Ensure that language in procurements, guidances, and work plan tools don't further stigmatize gay men, men who have sex with men, including transgender, nonbinary, and gender expansive people.

- Require and monitor contractor diversity and representation with public health partners, particularly among gay-identified and non-traditional public health organizations.
- Encourage new and strengthen existing engagements with contacts of highly impacted sexual subcultures and entertainment figures as ambassadors to access underserved gay and bisexual men, including transgender, nonbinary, and gender expansive people (who have sex with men), particularly among those who are Black and Latinx.
- Recommendation to emphasized that HIV prevention health promotion messages be delivered in an affirming and sex positive manner, including increasing the utilization of U = U (undetectable = untransmittable) messages, improved access to nPEP and PrEP, expansion of the MDPH Care that Fits You campaign (https://carethatfitsyou.org/) in greater number of venues (subway and bus stations, service locations).
- Eliminate restrictions on the use of social media among funded programs to reach more diverse groups of gay men both with and at risk for HIV infection.
- Integrate infectious disease prevention, care, treatment, and adherence supports with current and emerging stimulant use treatment and recovery support services.

Transgender, Nonbinary, and Gender Expansive Advisory Group

The Transgender, Nonbinary, and Gender Expansive Health Advisory Group addresses challenges and identifies best practices and opportunities to improve prevention and care services for transgender, nonbinary, and gender expansive people. This group provides input to MDPH regarding transgender, nonbinary, and gender expansive health needs and informs plans that respond to policy and program priorities in accordance with those identified in service plans.

This group identified the following concerns, priorities, strategies, and recommendations:

- Need for system-wide competency training for health and social service providers to improve the service response for transgender, nonbinary, and gender expansive people with and at-risk for HIV infection.
- Need to ensure meaningful inclusion of transgender, nonbinary, and gender expansive people as members of direct service prevention and care teams.
- Need for continued input and advisory to MDPH to ensure tailored strategies that recognize the varying gender identities and sexual orientation of transgender, nonbinary, and gender expansive people and the ways in which those dynamics impact vulnerabilities for HIV infection or disease progression, and opportunities to optimize health.
- Need to align prevention, care, and treatment services alongside other gender affirming health care services remains an important service development need.
- Need for dedicated OHA-facilitated program development support for each program that identifies serving transgender, nonbinary, and gender expansive people.
- Need for ongoing clinical education focusing on the use of hormone drugs and their interactions with STD treatments, and biomedical interventions.
- Need to review epidemiologic and service utilization data to ensure accuracy in submission.
- Reduce challenges faced by transgender, nonbinary, and gender expansive youth in accessing sexual health and infectious disease testing, linkage, and retention services (e.g., services requiring approval by parents/guardians and disclosure to parents/guardians by insurance providers).
- Need to increase education among personnel in emergency departments and urgent care centers to ensure that the care provided by these facilities is culturally responsive for transgender, nonbinary, and gender expansive people.
- Need for dedicated attention to address challenges in hiring and retaining transgender, nonbinary, and gender expansive people in the HIV prevention and care workforce, specifically transgender, nonbinary, and gender expansive people from Black and Latinx communities.
- Need for dedicated advisory to engage transgender, nonbinary, and gender expansive people of color with HIV about their unique experiences receiving HIV prevention, care, and treatment services to inform quality improvement activities.

Women's Advisory Group

The Women's Advisory Group addresses challenges and identifies best practices and opportunities to improve prevention and care services for women-identifying individuals. This group provides input to MDPH regarding women's health needs and inform plans that respond to program priories in accordance with plans and initiatives. This group prioritizes the needs of women most affected, notably Black and Latinx women.

This group identified the following concerns, priorities, strategies, and recommendations:

- Need to develop peer support programs that extend beyond the traditional hours and days of operation.
- Insufficient attention to the needs of women at risk for HIV or with HIV, particularly Black and Latinx women, and recommended the development of a new training module for providers focusing on the needs of women.
- Need for increased statewide access to mental health services for women at risk and with HIV.
- Concern that there is typically disproportionate attention to other populations with greater number incident HIV infections resulting in too little focus on women.
- Urgent need to disseminate accurate and accessible information about HIV to women at risk in the areas of nPEP, PrEP, and HIV prevention and testing services as well as the benefits of early HIV treatments.
- Need to ensure that future advisory groups, including the newly formed Women's Advisory Group, include women from non-urban areas.
- There is an overall need to think more broadly in reaching women at risk and with HIV beyond the clinical setting – such as, nail and hair salons, addiction treatment programs, grocery stores, WIC, family planning, and reproductive health programs.
- Need for dedicated housing search and advocacy services, including housing case managers to help navigate housing options and application procedures.
- Need to ensure that childcare services are available for advisory activities and when obtaining services.

COLLABORATION WITH RWHAP PARTS – STATEWIDE COORDINATED STATEMENT OF NEED (SCSN) REQUIREMENT

- This plan is a joint submission between RWHAP Parts A (Boston EMA) and B (Massachusetts Department of Health) recipients
- Participation of RWHAP Part C directly-funded service providers, typically community health clinics, which includes the following:
    - Beth Israel Deaconess Hospital-Plymouth
    - Boston Healthcare for the Homeless, Inc.
    - Brockton Neighborhood Health Center
    - Cambridge Health Alliance
    - Dimock Community Health Center
    - East Boston Neighborhood Health Center
    - Family Health Center of Worcester, Inc.
    - Fenway Community Health Center
    - Greater Lawrence Family Health Center
    - Greater New Bedford Community Health Center
    - Harbor Health Services
    - Holyoke Health Center, Inc.
    - Lynn Community Health, Inc.
    - University of Massachusetts Medical School

- Participation of RWHAP Part D programs, which includes the following:
    - Boston Medical Center Corporation
    - Dimock Community Health Center
    - Greater New Bedford Community Health Center, Inc.
- Participation of RWHAP Part F programs which includes:
    - New England AIDS Education and Training Center
    - Boston University – Dental Program
    - Harvard University – Dental Program
    - Trustees of Boston University – Dental Program

ENGAGEMENT OF PEOPLE WITH LIVED HIV EXPERIENCE – SCSN REQUIREMENT

To ensure proper representation of all communities, people with HIV were regularly engaged in all stages of the Integrated Plan from priority setting and goals and objectives development to quality improvement activities. Both MIPCC and the Planning Council include, at a minimum, the required number of unaligned people with HIV who actively participated in the discussions of priorities. Each of OHA's population health advisory groups include people with HIV, and many of these group members represent individuals with intersectional identities and lived experience. The SWCAG is a critical stakeholder group that provides input to the OHA representing people with HIV across Massachusetts. Members of this group actively participated in other advisory group sessions.

Separate coordinated meetings were held with representatives of all Ryan White Parts to identify needs and syntheses priorities for the Statewide Coordinated Statement of Need (SCSN). The results were later reviewed and confirmed with all Ryan White part representatives.

Across all groups contributing to the SCSN, the following synthesized recommendations were identified:

- Ensure all service models prioritize racial equity, including assurance of access in locations and venues that are desirable and convenient to intended client populations.
- All services are to be tailored and delivered in a culturally and linguistically-competent manner and staffed by credible community members and peers.
- Flexibility in service models and eligibility requirements to optimize access to services in a timely manner.

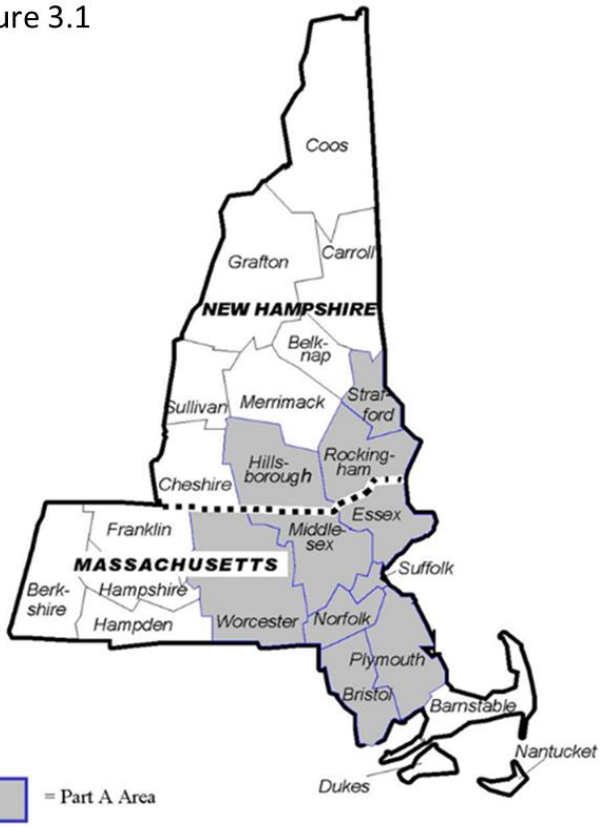
SECTION III: CONTRIBUTING DATA SETS AND ASSESSMENTS

DATA SHARING AND USE

The data source for all Massachusetts HIV/AIDS epidemiological data is the MDPH BIDLS HIV/AIDS Surveillance Program. The data source for all HIV/AIDS epidemiological data for the three New Hampshire counties that are part of the Boston Eligible Metropolitan Area (EMA) is the New Hampshire Department of Health and Human Services (NHHS), Division of Public Health Services, Bureau of Infectious Disease Control HIV/STI/Viral Hepatitis Surveillance Program. BPHC receives epidemiological data from the two state health departments through data-sharing agreements that allow for aggregate-level data analysis. Both states also have representatives on the Boston EMA Planning Council. During the development of this Integrated Plan, epidemiologic data was presented to both MIPCC and the Boston EMA Planning Council in the interest of helping the two planning groups make data-driven decisions.

Data used to complete the HIV Prevention, Care and Treatment Resource Inventory primarily comes from the knowledge each recipient has about the various agencies and services funded directly in their jurisdiction, as well as their knowledge of service providers funded by other leveraged sources. This knowledge of other providers comes from long-standing relationship building via groups such as the Boston EMA Planning Council and MIPCC. Needs assessment data comes from focus groups and meetings conducted with MIPCC, the Boston EMA Planning Council, and population health advisory groups conducted specifically in preparation for this Integrated Plan.

Data-to-care approaches (i.e., using health information about newly diagnosed people with HIV and people with HIV in general to direct service development) are central to Massachusetts's efforts to reduce the impact of the HIV epidemic in ways that are responsive to the needs of at-risk populations, prevent new HIV infections, and improve health outcomes along the HIV care continuum. Examining recent trends in new diagnoses informs prevention approaches, while understanding the population of people with HIV in the Commonwealth guides the design, locations, and interventions delivered by the service system.



EPIDEMIOLOGIC SNAPSHOT

GEOGRAPHY AND GENERAL POPULATION

MASSACHUSETTS

Located in the Northeast region of the United States, the Commonwealth of Massachusetts is the most populous state in New England, the third most densely populated U.S. state, and the 15th most populous state in the U.S. As of July 1, 2021, the U.S. Census Bureau estimated that the Commonwealth is home to 6,984,723 individuals.[2] In terms of race and ethnicity, 70.1% of Massachusetts residents are white, 9.3% of residents are Black/African American, and 12.8% of the total population identifies as Hispanic/Latinx.[6]

Figure 3.1

BOSTON EMA

The Boston EMA includes ten counties, with seven in Massachusetts (Bristol, Essex, Middlesex, Norfolk, Plymouth, Suffolk, and Worcester) and three in New Hampshire (Hillsborough, Rockingham, and Strafford - Figure 3.1). These ten counties cover an area of 6,451 square miles and have a total population of 6,766,204,[7] as of July 1, 2021. In terms of race and ethnicity, 71.9% of Boston EMA residents are white, 8.9% are Black/African American, and 9.5% of the total population identifies as Hispanic/Latinx.

EPI SNAPSHOT - MASSACHUSETTS[8]

- The number of people with HIV (PWH) in Massachusetts increased by 16% from 20,094 in 2011 to 23,368 in 2020.
- After remaining relatively stable at approximately 700 diagnoses per year from 2011 to 2013 (three-year average = 695), then approximately 640 diagnoses per year from 2014 to 2018 (five-year average = 640), the number of new HIV diagnoses declined to a ten-year low of 539 in 2019. In 2020, the number of new HIV diagnoses declined to 437, although caution should be used in the interpretation of this decline due to the impact of COVID-19 on access to HIV testing and care services, and case surveillance activities.

[6] https://www.census.gov/quickfacts/MA
[7] https://www.census.gov/data/datasets/time-series/demo/popest/2020s-counties-total.html
[8] The following sections and graphics pulled from: Massachusetts Department of Public Health, Bureau of Infectious Disease and Laboratory Sciences. Massachusetts HIV/AIDS Epidemiologic Profile, Statewide Report – Data as of 1/1/2022 https://www.mass.gov/lists/hivaids-epidemiologic-profiles Published February 2022. Accessed October 19, 2022.

- The number of deaths due to any cause among PWH increased by 18% from 266 in 2011 to 314 in 2020.
- Although there have been reductions in new cases, vulnerable populations remain disproportionately impacted:
    - Men who have sex with men (MSM) continued to represent the largest proportion of new HIV infection diagnoses (39% overall and 54% among individuals assigned male at birth [AMAB] in 2018–2020, as of 1/1/2022).
    - During 2018–2020, the HIV diagnosis rates among Black (non-Hispanic) and Hispanic/Latino individuals were eight and four times that of white (non-Hispanic) individuals, respectively.
    - Individuals with IDU exposure mode accounted for 32% of deaths among individuals with HIV in 2020 but only 16% of all PWH in 2020.

TRENDS IN HIV DIAGNOSES OVER TIME - MASSACHUSETTS

- The number of individuals diagnosed with HIV has decreased over the past decade in Massachusetts, but disparities persist by exposure mode, race/ethnicity, place of birth, and age.
- Male-to-male sex (MSM) remained the predominant exposure mode from 2011 to 2020.[9]
- After declining by 48% from 2011 (N=60) to 2014 (N=31), the number of reported cases with injection drug use (IDU) as the primary exposure mode peaked at 116 in 2017 then decreased to 59 in 2019. The increase was primarily due to an outbreak among persons who inject drugs in the northeast part of the state between 2016 and 2018.[10] Following an intensive and targeted public health response, the number of HIV infection diagnoses attributed to IDU in the northeast has decreased. However, in early 2019, a new cluster of HIV infection was identified in Boston among PWID who were experiencing or had experienced recent homelessness, and the total statewide number of reported cases with IDU as the primary exposure increased to 76 in 2020. As of June 1, 2022, a total of 179 cases diagnosed since November 2018 have been investigated and identified as part of the Boston cluster. As it is an active cluster of concern, additional cases will continue to be investigated and added. Emerging trends among those newly diagnosed in the Boston cluster (N=66 cases diagnosed in 2020) include an increase in polysubstance and methamphetamine use.[11]
- The distributions of individuals diagnosed with HIV by sex assigned at birth, place of birth, and race/ethnicity remained relatively stable from 2011 to 2020.
- From 2011 to 2020, the proportion of individuals diagnosed with HIV at age 30–39 years increased from 25% to 35%, while the proportion of individuals diagnosed at age 40–49 years decreased from 29% to 14%.

[9] Please consider the impact of the COVID-19 pandemic on infectious disease screening, treatment, and surveillance in the interpretation of 2020 data.

RECENT HIV DIAGNOSES - MASSACHUSETTS

- Those with no identified risk (NIR), as defined by the CDC, comprised the second largest exposure mode group reported to the Massachusetts Department of Public Health (MDPH), accounting for 28% of recent HIV diagnoses and consisting predominantly of individuals AMAB (65%), individuals born outside the US (55%), and individuals of Black (non-Hispanic) (50%) race and Hispanic/Latino (24%) ethnicity. Beginning in 2019, all new diagnoses of HIV infection were assigned to field epidemiologists for partner services, education, and linkage to HIV care. Please note that although field epidemiologists offer additional support in the collection of risk information as part of this process, some of the information doesn't meet the CDC-defined exposure mode categories. For example, risks occurring outside the US, such as occupational exposure, are not assigned as a primary exposure mode because it is not possible to verify the information internationally. MDPH collects and maintains expanded risk information for local analyses and future use in case the CDC-defined exposure mode categories are updated.
- One in five (20%) individuals assigned female at birth (AFAB) and diagnosed with HIV from 2018 to 2020[12] reported IDU as their primary exposure mode, compared to one in eight (12%) individuals assigned male at birth (AMAB).
- Black (non-Hispanic) and Hispanic/Latino individuals were diagnosed with HIV during 2018–2020 at rates eight and four times that of white (non-Hispanic) individuals, respectively.
- During 2018 to 2020, 38% (N=620) of all individuals diagnosed with HIV were born outside the US. This proportion varied by race/ethnicity: 73% of Asian/Pacific Islander individuals diagnosed with HIV were born outside the US, compared to 55% of Black (non-Hispanic) and 46% of Hispanic/Latino individuals. An additional 12% of Hispanic/Latino individuals diagnosed with HIV during this time were born in Puerto Rico. Thirteen percent of white (non-Hispanic) individuals were born outside the US or in Puerto Rico.

[12] Please consider the impact of the COVID-19 pandemic on infectious disease screening, treatment, and surveillance in the interpretation of 2020 data.

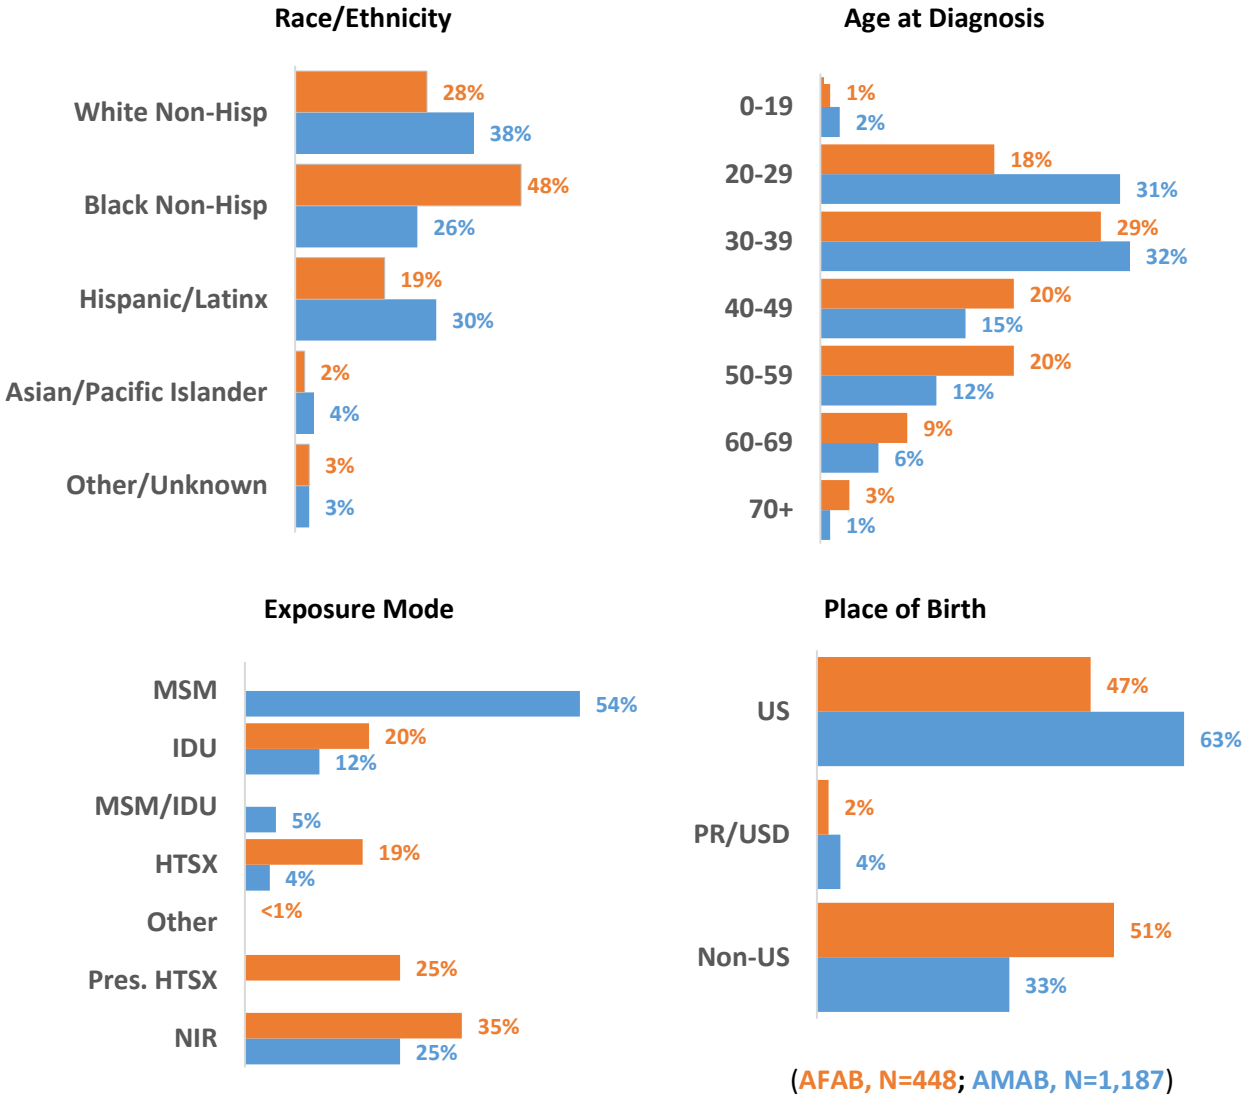

FIGURE 3.5 Percentage of individuals diagnosed with HIV by exposure mode and race/ethnicity, Massachusetts 2018-2020

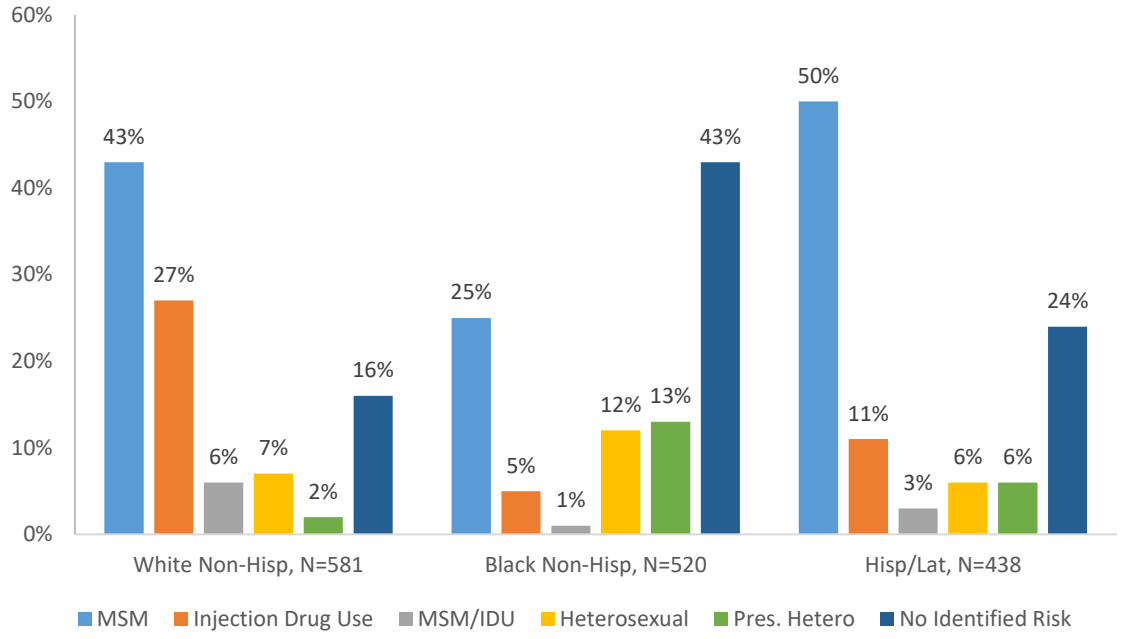

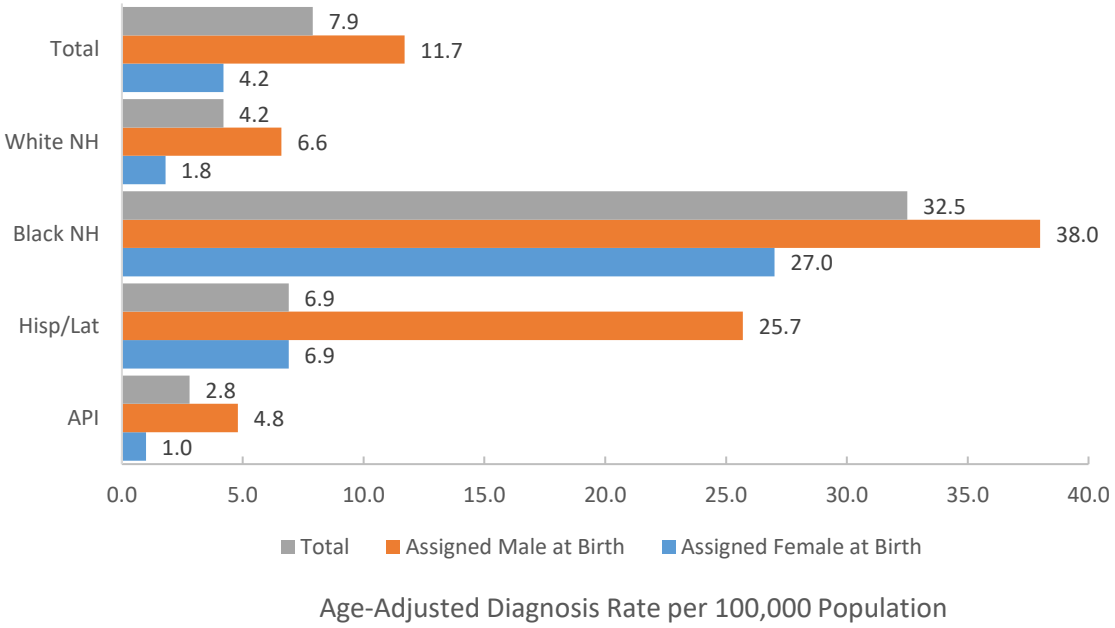

FIGURE 3.6 Average annual age-adjusted HIV diagnosis rates per 100,000 population by sex assigned at birth and race/ethnicity, Massachusetts 2018–2020 (N=1,635)

HIV PREVALENCE[13] - MASSACHUSETTS

- There were an estimated 24,600 (95% confidence interval: 23,500 - 25,600) persons living with HIV infection in Massachusetts in 2019. This estimate includes the 23,291 individuals diagnosed with HIV, reported to MDPH, and presumed to be living in Massachusetts, plus an estimated number of undiagnosed and unreported individuals.[14]
- Racial/ethnic disparities persist among PWH, and marked differences exist by current gender, age, and exposure mode. PWH in Massachusetts are predominantly male (70%), older (34% among 50–59-year-olds), and white non-Hispanic (40%). Male-to-male sex was the most frequently reported exposure mode, at 40%.
- A total of 77% of Asian/Pacific Islander PWH in Massachusetts in 2020[15] were born outside the US, compared to 51% of Black (non-Hispanic), 32% of Hispanic/Latino, and 8% of white (non-Hispanic) PWH.
- The distributions of PWH by race/ethnicity, exposure mode, and place of birth varied by sex assigned at birth: the largest proportion of PWH assigned male at birth (AMAB) was white (non-Hispanic) (46%), while the largest proportion of individuals assigned female at birth (AFAB) was Black (non-Hispanic) (47%). MSM (56%) was the predominant exposure mode among individuals AMAB compared to heterosexual sex (35%) and presumed heterosexual sex (31%) among individuals AFAB. A larger proportion of individuals AFAB (41%) than AMAB (25%) was born outside the US.
- The predominant exposure mode among white (non-Hispanic) PWH was MSM (60%). Among Black (non-Hispanic) PWH, the largest proportion was reported with no identified risk (26%), followed by heterosexual sex (21%), presumed heterosexual sex (19%), and MSM (19%). Among Hispanic/Latino PWH, the largest proportion was MSM (31%), followed by IDU (24%).
- In 2020, the age-adjusted HIV prevalence rate per 100,000 population of individuals assigned male at birth (AMAB) was three times that of individuals assigned female at birth (AFAB). There were large disparities in age-adjusted HIV prevalence rates by race/ethnicity: the rates among Black (non-Hispanic) individuals and Hispanic/Latino individuals were nine and six times that of white (non-Hispanic) individuals, respectively. The age-adjusted HIV prevalence rates among Black (non-Hispanic) and Hispanic/Latina individuals AFAB were 23 and 10 times greater than the rate among white (non-Hispanic) individuals AFAB, respectively. Among Black (non-Hispanic) and Hispanic/Latino individuals AMAB, the age-adjusted HIV prevalence rates were six and five times greater than the rate among white (non-Hispanic) individuals AMAB, respectively.

[13] Please note: 2019 HIV prevalence estimates are presented because CDC recommended against producing estimates of HIV prevalence for the year 2020. The CDC's CD4-based model did not produce reliable estimates due to the significant declines in HIV testing and diagnoses that occurred in the United States during the COVID-19 pandemic.

[14] Data source for HIV prevalence estimate: Massachusetts Department of Public Health (MDPH), Bureau of Infectious Disease and Laboratory Sciences (BIDLS), using CDC's methodology for estimating HIV prevalence. For more information, see: Centers for Disease Control and Prevention. Estimated HIV incidence and prevalence in the United States, 2015–2019. HIV Surveillance Supplemental Report 2021; 26(No. 1). http://www.cdc.gov/hiv/library/reports/hiv-surveillance.html. Published May 2021

[15] Please consider the impact of the COVID-19 pandemic on infectious disease screening, treatment, and surveillance in the interpretation of 2020 data.

MORTALITY AMONG INDIVIDUALS REPORTED WITH HIV/AIDS - MASSACHUSETTS

- Disparities in mortality among individuals reported with HIV paralleled those in diagnosis rates by sex assigned at birth, race/ethnicity, and place of birth, but not exposure mode. Individuals with IDU exposure mode were over-represented among PWH who died.
- The average age at death among PWH increased by 6.5 years, from 52.3 years in 2011 to 58.8 years in 2020. For comparison, the average age at death of the general Massachusetts population remained between 75.5 and 76.8 from 2011 to 2020.
- Survival of individuals diagnosed with AIDS has increased over time. In the earliest cohort of AIDS diagnoses (1986–1990), estimated survival at five years after AIDS diagnosis was 16%, compared to 87% in the most recent cohort (2016–2020).

FIGURE 3.12 Average annual age-adjusted death rates among individuals reported with HIV per 100,000 population by sex assigned at birth and race/ethnicity, Massachusetts 2018–2020 (Total number of deaths among individuals reported with HIV from 2018–2020=910)

TRENDS IN DEATHS AMONG INDIVIDUALS REPORTED WITH HIV/AIDS - MASSACHUSETTS

- The proportion of deaths among PWH attributed to HIV-related causes decreased from 34% (N=91/266) in 2011 to 16% (N=51/314) in 2020.

GEOGRAPHIC DISTRIBUTION OF HIV - MASSACHUSETTS

- The cities and towns with the highest average annual rate of HIV diagnosis during 2018 to 2020 included Brockton (27.8 per 100,000), Everett (23.3), Lawrence (19.7), Lowell (18.9), and Chelsea (18.9). Boston had the highest number of new HIV diagnoses from 2018–2020 (N=364), followed by Worcester (N=93).
- Suffolk County was selected as one of 48 counties nationally that is prioritized for funding in the U.S. Health and Human Services' initiative "Ending the HIV Epidemic (EHE): A Plan for America". Suffolk County had the highest average age-adjusted rate of HIV diagnosis during 2018 to 2020 among all Massachusetts counties at 15.8 per 100,000.

EPI SNAPSHOT - BOSTON EMA[18]

- As of December 31, 2020, there were 20,539 people with HIV in the Boston EMA and 1,431 newly diagnosed HIV cases.
- 84% (n=19,580) of people with HIV in 2020 resided in the seven Massachusetts EMA counties, of which 32% (n=6,415 people with HIV) were living in Suffolk County.

RECENT HIV DIAGNOSES- BOSTON EMA

- **Race/Ethnicity:** HIV continues to disproportionately impact people of color in the Boston EMA. Although Black residents make up 7% and Hispanics make up 11% of the population, they accounted for 33% and 26%, respectively, of newly diagnosed HIV cases in 2020. By contrast, white residents, comprising 73% of the population, accounted for only 36% of all new cases in 2020.
- **Sex:** Individuals assigned male at birth (AMAB) continued to account for a majority of newly diagnosed HIV cases in the Boston EMA; 72% of newly diagnosed cases of HIV infection in 2020 were AMAB.
- **Age:** More than three-quarters (77%) of all new HIV cases in 2020 were persons 20-49 years of age. Additionally, 20% were between 50-69 years of age, 1% were ages 70 or older, and 2% were under 20 years of age.

[16] Other includes perinatal and clotting factor /transfusion/transplant-related exposures
[17] Ninety-nine percent of individuals reported with HIV/AIDS who died from 2011–2020 who were born in a US dependency (USD) were born in Puerto Rico (PR)
[18] Data consolidated from Massachusetts and New Hampshire HIV epidemiological data.

- **Transmission:** In 2020, 41% of new HIV cases in the Boston EMA had transmission risk category identified as MSM. Heterosexual contact, including presumed heterosexual, was the second most reported transmission risk category (16%). Presumed heterosexual transmission is defined as females who have sexual partners of unknown infection or risk status. IDU was the third most reported transmission risk category (15%). No Identified Risk (NIR) transmission risk category was 28% of cases.

HIV PREVALENCE - BOSTON EMA

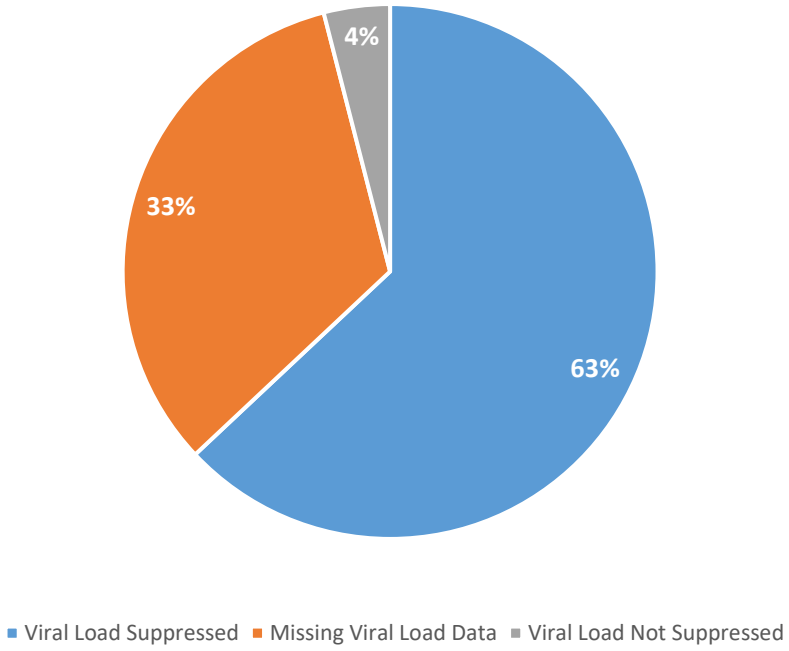
- **Race/Ethnicity**: In the Boston EMA, evidence of HIV's disproportionate impact on people of color was observed within the prevalence data as well. Black and Hispanic people with HIV accounted for 32% and 24%, respectively, of people with HIV in 2020, at levels considerably higher than their 7% and 11% respective population proportions. By comparison, the proportion of white people with HIV (40%) was much lower than of white residents in the general population (73%).
- **Sex**: In 2020, individuals AMAB accounted for 71% of people with HIV in the EMA, consistent with national data.
- **Age:** Most (57%) people with HIV in 2020 were 50-69 years of age. Additionally, 37% were 20-49 years of age, 6% were 70 or older, and less than 1% were under age 20.
- **Transmission:** MSM and heterosexual contact were the two most common transmission risk categories, representing 40% and 23%, respectively, among all people with HIV in 2020, as well as in the two previous years, 2018 and 2019. IDU, including MSM/IDU, accounted for 18% of all cases. One percent were classified as pediatric transmission, and 17% were other/unknown.

HIV Care Continuum - Massachusetts[19]

The HIV care continuum is an important tool to measure and track the effectiveness of efforts to combat the HIV epidemic. Timely linkage to care after an HIV diagnosis and consistent engagement and retention in medical care are both critical to assure access to treatment and promote health for people with HIV. High rates of viral suppression are associated with improved health outcomes and substantially lower risk of HIV transmission. The HIV care continuum is a model used by federal, state, and local agencies to identify issues and opportunities related to improving the delivery of services to people with HIV across the entire continuum of care. The HIV care continuum is a way to show, in visual form, the proportion of people with HIV who are engaged at each stage of HIV care including linkage to care, retention and viral suppression.

- Among individuals newly diagnosed with HIV in 2019, 89% overall were virally suppressed,[20] with 92% of those linked to care,[21] and 94% of those retained in care[22] reaching viral suppression. Viral suppression was lowest among individuals with injection drug use exposure mode (77%, compared to 83% to 95% among other exposure modes).

[19] The following sections and graphics pulled from: Massachusetts Department of Public Health, Bureau of Infectious Disease and Laboratory Sciences. Massachusetts HIV/AIDS Epidemiologic Profile, Statewide Report – Data as of 1/1/2022 https://www.mass.gov/lists/hivaids-epidemiologic-profiles Published February 2022. Accessed October 19, 2022.



[20] Virally Suppressed" is defined as having a VL <200 copies/mL for the most recent VL test drawn during the 12-month period after diagnosis.

[21] "Linked to Care" is defined as having ≥1 viral load (VL) or CD4 test result within 3 months of diagnosis.

[22] "Retained in Care" is defined as having ≥2 VL or CD4 test results at least 3 months apart during the 12-month period after diagnosis.

- Among PWH in 2020, 63% overall were virally suppressed, with 91% of those engaged in care and 94% of those retained in care reaching viral suppression.
- Among 21,817 PWH in Massachusetts at the end of 2020 (and diagnosed through 2019), 63% were virally suppressed, 4% were not virally suppressed, and 33% did not have a viral load test in 2020. Rates of care engagement and retention were lower in 2020 (69% and 39%, respectively) than in 2019 (75% and 54% respectively), likely because of the COVID-19 pandemic. However, please note that the total number of PWH used to calculate these rates includes all individuals who have ever been diagnosed with HIV in Massachusetts with no evidence of death or having moved out of the state or country. Quality assurance efforts are currently being conducted to update the number of PWH used for this analysis.
- Among those PWH who were engaged in care (N=15,143) and retained in care (N=8,445), rates of viral suppression were higher at 91% and 94%, respectively.

FIGURE 3.15 Viral load status among people with HIV in Massachusetts, 2020 (N=21,817)

Note: Missing viral load includes individuals who have not had a lab reported in the past year.

HIV PREVENTION, CARE AND TREATMENT RESOURCE INVENTORY

The Massachusetts and Boston HIV Prevention, Care and Treatment Resource Inventory is included as Appendix 2. The table includes the following information:

- Organizations and agencies providing HIV care and prevention services in the jurisdiction
- HRSA (including all RWHAP parts) and CDC funding sources
- Leveraged public and private funding sources, when the information was available, including HUD's HOPWA program and SAMHSA programs
- Services and activities provided by these organizations and which priority population(s) the agency serves

Massachusetts is fortunate to have a strong and stable resource base to provide highly effective services that reduce the impact of HIV, HCV, and STI infections and improve health outcomes.

Detailed information regarding funding sources in Massachusetts, including funding amounts and services provided, is outlined in Appendix 3: Massachusetts HIV Financial Inventory. Massachusetts relies on a combination of state and federal funds to accomplish a system that can ensure uninterrupted access to prevention, care, and treatment services; as well as partnerships with community-based organizations, and guidance from population health advisory groups, including the Massachusetts Integrated Prevention and Care Committee (MIPCC) and the Statewide Consumer Advisory Group (SWCAG).

STRENGTHS OF THE INVENTORY

Massachusetts is a national leader in the delivery of high quality and accessible healthcare. Massachusetts was the first state to accomplish state healthcare reform, enacting landmark legislation in 2006 that made affordable health insurance products available to all residents of the Commonwealth. Today, Massachusetts has the highest percentage of insured residents of any state in the U.S. at 97%[23]. Residents can access healthcare at leading medical facilities, private medical practices, academic teaching hospitals, or through a system of community health centers (CHC) located in communities disproportionately impacted by HIV throughout the Commonwealth.

In Massachusetts, the HIV/AIDS prevention and care infrastructure is woven into the fabric of this extensive healthcare system; prevention and care services are provided both in these medical care sites, as well as through a network of non-medical, community-based organizations (CBO). Massachusetts relies on a combination of meaningful community engagement and advisory, highly effective HIV prevention and care programs, and core public health activities and interventions. Massachusetts is committed to utilize the full range of tools available to reduce new HIV infections, support engagement and retention in care, and improve rates of viral suppression.

Boston EMA - BPHC communicates quarterly with HOPWA and Ryan White Parts B and D recipients to discuss jointly funded subrecipients, investment strategies, and the development, maintenance, and monitoring of service standards. These discussions help to inform where Part A funds are most needed to reduce service barriers for people with HIV along the HIV Care Continuum. BPHC continues to explore with its state partners the topics of surveillance data sharing and expansion of access to and coordination of syringe service programs. BPHC also collaborates heavily with various planning bodies to review community needs and investment strategies; specifically, to determine which Part A services require the greatest

23 https://www.kff.org/other/state-indicator/total-population/

support in future funding cycles. BPHC participates in MIPCC, the Boston EMA Planning Council, the New Hampshire HIV Planning Group and the EHE Steering Committee. In addition, BPHC regularly engages with agencies in other EMAs to inform its own activities. Examples of this engagement include conversations with other jurisdictions about the implementation of rapid start programs best practices for service provision and evaluation.

Public Health Investments

MASSACHUSETTS DEPARTMENT OF PUBLIC HEALTH

The mission of MDPH is to prevent illness, injury, and premature death; ensure access to high quality public health and health care services, and to promote wellness and health equity for all people in the Commonwealth. Health Department programming explicitly addresses health disparities through purposeful stakeholder and community engagements, improved collection and use of data, and rigorous monitoring to ensure equal access to health care services. Community based HIV/AIDS services in the Commonwealth are administered and supported by several bureaus, offices, and programs within MDPH and local public health departments.

BUREAU OF INFECTIOUS DISEASES AND LABORATORY SERVICES

A merger between the Bureau of Laboratory Sciences and Bureau of Infectious Diseases, completed in February 2016, created a new Bureau known as the Bureau of Infectious Disease and Laboratory Sciences (BIDLS). This new structure supports the shared work and priorities of the Office of HIV/AIDS (OHA) and the Massachusetts State Public Health Laboratory (MSPHL) and further enhances opportunities to improve communications and collaborations between these two important entities.

OFFICE OF HIV/AIDS (OHA)

The Office of HIV/AIDS (OHA) is the division within the BIDLS responsible to administer state and federal resources for HIV prevention, care, and treatment services. OHA works with medical and non-medical organizations, community-based programs, people with HIV, and other stakeholders to advance HIV prevention and care services. This includes needs assessment, community engagement and HIV service planning, awarding contracts for services, capacity building assistance, service monitoring, and evaluation.

OHA funds a range of services in medical, non-medical, and community-based settings across the state for persons living with or at risk for HIV infection. These services include prevention and risk reduction services, integrated testing for HIV, hepatitis C, and sexually transmitted infections, and linkage to care and treatment; as well as opioid overdose education and naloxone distribution (OEND) activities, syringe services programs (SSP), non-occupational post-exposure prophylaxis (nPEP) and pre-exposure prophylaxis (PrEP). OHA funds a range of direct care health promotion services for people with HIV with the aim of supporting engagement and retention in care and improving health outcomes. Medical case management programs assist in the coordination of medical care and support services, and either directly provide or coordinate access to, HIV treatment, adherence counseling, health systems navigation, peer support, nutrition, housing search and advocacy, rental/utility assistance, legal services, and benefits counseling services.

OHA staff work closely with programs throughout the Commonwealth serving a range of population groups, including gay and bisexual men and other men who have sex with men, including transgender, nonbinary, and gender expansive people, persons who inject drugs, LGBTQIA+ youth and young adults, racial/ethnic communities, non-US born immigrants and refugees, individuals who are homeless or unstably housed,

persons who are incarcerated or transitioning from a correctional facility, and other vulnerable population groups. OHA also collaborates with other MDPH programs that serve these individuals.

HEALTH PROMOTION AND DISEASE PREVENTION

The Health Promotion and Disease Prevention (HPDP) Unit is responsible for managing integrated prevention, medical case management, and health-related supportive services contracts to promote high quality service provision and to ensure compliance with federal, state, MDPH, and OHA requirements. Integration of prevention and care enables responsive community outreach and engagement services; access to risk reduction interventions relative to both sexual and drug injection behaviors; broad availability of integrated HIV, hepatitis C, and STI testing; rapid linkage to care and treatment for persons newly-diagnosed with HIV infection, including people with HIV reengaged in care through the prevention and screening system; linkage to treatment for individuals diagnosed with hepatitis C, Chlamydia, gonorrhea, and syphilis; and access to services that help individuals maintain treatment and ongoing access to healthcare.

BEHAVIORAL HEALTH AND INFECTIOUS DISEASE PREVENTION

The Behavioral Health and Infectious Disease Prevention Unit (BHID) integrates behavioral health, infectious disease frameworks, and population health data to inform service plans, models to better meet the needs of individuals disproportionately impacted by HIV and viral hepatitis. Public health interventions are planned and coordinated with stakeholders to effectively address complex health conditions to maximize outcomes in the OHA-contracted prevention and care service system. Coordination of community engagement, advisory, and planning activities are an integral component of this work.

FEDERAL GRANTS AND INFECTIOUS DISEASE DRUG ASSISTANCE PROGRAM

The Federal Grants and Infectious Disease Drug Assistance Program (FG & IDDAP) Unit is responsive for ensuring that the grant requirements for the HRSA RWHAP Part B and CDC HIV and EHE Funding awards are met, including applications for funding, annual narrative and data reports, fiscal and programmatic oversight of subrecipients, and the implementation of quality management activities. The Unit also oversees the Infectious Disease Drug Assistance Program contract, which includes the HIV Drug Assistance Program (HDAP), the TB Drug Assistance Program (TBDAP), and the PrEP Drug Assistance Program (PrEPDAP).

HIV DRUG ASSISTANCE PROGRAM

The Massachusetts HIV Drug Assistance Program (HDAP) ensures access to medication for the treatment of HIV and HIV-related conditions through three program components: full-pay medication coverage for individuals who are uninsured, under-insured, or serving sentences in a county correctional facility, assistance with premiums associated with health insurance coverage, and drug co-pay assistance for insured clients. State resources in the HDAP also enable coverage of non-occupational post-exposure prophylaxis (nPEP) and pre-exposure prophylaxis (PrEP) for individuals who experience HIV exposure or are at high risk for seroconversion. Finally, HDAP includes the Benefits Resources Infectious Disease Guidance & Engagement (BRIDGE) Team which provides education about HDAP and health insurance coverage opportunities available to individuals living with HIV/AIDS, as well as direct health insurance enrollment support.

MASSACHUSETTS STATE PUBLIC HEALTH LABORATORY

The mission of the Massachusetts State Public Health Laboratory (MSPHL) is to protect the health of the people of Massachusetts through excellence in public health laboratory science. The MSPHL is a critical

resource for the publicly funded HIV/AIDS prevention and care system. The MSPHL currently tests biologic samples for HIV and hepatitis C (though a co-testing platform), as well as gonorrhea, chlamydia, and syphilis. The MSPHL utilizes a 4th generation HIV testing algorithm, with the capacity to detect HIV infection during the acute phase.

DIVISION OF STD PREVENTION

The Division of STD Prevention (DSTDP) works to reduce the burden of chlamydia, gonorrhea, and syphilis in Massachusetts, reduce the risk of HIV acquisition and transmission, and reduce health disparities through strategies including accessible STD testing and treatment in accordance with CDC guidelines, delivery of partner services through deployment of Field Epidemiologists, training and technical assistance to STD care and treatment providers, and prompt linkage to care, treatment, and prevention services for persons newly diagnosed with an STD. The Division of STD Prevention oversees HIV and STD surveillance and monitors the quality and timeliness of the public health response to these infections.

MASSACHUSETTS HIV/AIDS SURVEILLANCE PROGRAM

The goal of the Massachusetts HIV/AIDS Surveillance Program (MHASP) is to provide a comprehensive picture of the HIV/AIDS epidemic through data collection, quality assurance, and analysis, to support prevention and health service activities delivered by the DPH and a statewide system of health care and social service organizations. Epidemiologists are responsible for the collection, analysis, and interpretation of adult and pediatric HIV/AIDS case data. HIV/AIDS Surveillance data are disseminated widely throughout the Commonwealth, to governmental agencies, public and private providers, advocacy groups and consumers. The program distributes specialized and routine data reports. The program also works collaboratively with planning and policy groups, health care providers and other Bureaus within the Department of Public Health, providing surveillance information and assisting with assessment of resource distribution and ongoing planning to ensure that the needs of people living with or at risk for infection are met.

VIRAL HEPATITIS PROGRAM

Hepatitis C (HCV) activities are integrated throughout the BIDLS, including within the OHA. Massachusetts conducts reflex testing of all HIV samples submitted to the MSPHL for HCV antibodies and promotes HCV prevention alongside HIV prevention in publicly funded programs that serve people who use drugs and other individuals at risk for HCV acquisition. HCV is reportable as an acute and chronic infection in Massachusetts, and OHA works with staff in the Division of Epidemiology and Immunization to ensure that the BIDLS programmatic response is driven by and evaluated with up-to-date surveillance data and understanding of HCV epidemiology. The Bureau holds an ad hoc Viral Hepatitis Advisory Committee that includes staff from multiple areas within the BIDLS, other areas within MDPH (including the Bureau of Substance Abuse Services), and community partners. This group guides BIDLS on issues ranging from interpretation of the HCV care cascade to perinatal HCV infection and other policy related issues.

BIDLS OFFICE OF RESEARCH AND EVALUATION

The Office of Research and Evaluation (OR&E) is tasked with advancing the science of BIDLS activities to improve the quality of life of all Massachusetts residents through the elimination of communicable diseases. OR&E aims to support ongoing activities to increase the scientific dissemination of BIDLS work in the form of reports, abstracts and peer-reviewed papers, support evaluation of BIDLS partner activities to improve quality of services, facilitate the application of evaluation data for policy decisions, and to lead and

facilitate new scientific studies to further the understanding of the communicable diseases and the impact of prevention interventions.

NATIONAL HIV BEHAVIORAL SURVEILLANCE: BRIEF HIV BIO-BEHAVIORAL ASSESSMENT (NHBS-BHBA)

The National HIV Behavioral Surveillance (NHBS) is a comprehensive system for bio-behavioral surveillance conducted since 2003 in populations with high burden of HIV. Traditional NHBS circulates through three populations – Men who have sex with Men, Persons who inject Drugs, and Heterosexually active persons at increased risk for HIV infection and collects data on behavioral risk factors for HIV (e.g., sexual behaviors, drug use), HIV testing behaviors, receipt of prevention services, and use of prevention strategies (e.g., condoms, PrEP). All NHBS participants are offered an HIV test. Massachusetts has participated in NHBS since the beginning (2002). This year, BIDLS received funding for a new approach to NHBS, utilizing Brief HIV Bio-Behavioral Assessments (BHBAs). This mixed methods approach to behavioral assessments will allow for flexibility in the area of the state and the populations assessed. It requires increased input from community stakeholders and allows for more rapid analysis of collected data and dissemination of results. The project team is committed to producing actionable data that integrates into the overall approach to ending HIV transmission in Massachusetts.

MASSACHUSETTS COMMUNITY AIDS RESOURCE ENHANCEMENT (MASSCARE)

MassCARE (Massachusetts Community AIDS Resource Enhancement) is a statewide program which provides access to coordinated, comprehensive, family-centered, culturally, and linguistically competent medical care, social service support and peer services for women, infants, children, and youth living with HIV and their affected family members. MassCARE promotes early identification and enhances available care in a community-based setting with an HIV medical home approach. It is funded under Ryan White Part D and is in federally qualified community health centers in three sites.

BUREAU OF SUBSTANCE ADDICTION SERVICES (BSAS)

Since the MPDH's early response to the HIV/AIDS epidemic in Massachusetts, BIDLS and the Bureau of Substance Addiction Services (BSAS) have had an ongoing, strategic, and successful partnership. This partnership addresses the continuum of prevention, care, treatment for persons living with and at risk for HIV and viral hepatitis due to substance use disorders and specifically, the sharing of injection equipment. This collaboration is essential to the implementation of the Integrated Plan, ensuring the needs of people who inject drugs are represented and reflected throughout our goals, objectives, and strategies.

OFFICE OF LOCAL AND REGIONAL HEALTH

The Office of Local and Regional Health (OLRH) provides a focus for state-local public health systems coordination. The OLRH supports improvements in local public health performance and quality, promotes a skilled public health workforce, connects local public health partners with MDPH programs, services, and resources, and advances public health planning at the local level.

Working with the Massachusetts Coalition for Local Public Health (CLPH) and other stakeholders, the OLRH collaboratively addresses the needs of local boards of health and establishes priorities from among identified challenges and needs. CLPH comprises the five statewide public health professional associations: Massachusetts Health Officers Association, Massachusetts Association of Health Boards, Massachusetts Association of Public Health Nurses, Massachusetts Environmental Health Association, and Massachusetts Public Health Association.

BOSTON PUBLIC HEALTH COMMISSION

The Boston Public Health Commission (BPHC), the local health department for the City of Boston, administers Ryan White Part A HIV funding to the Boston Eligible Metropolitan Area (EMA). The Boston EMA is home to 83.5% of persons living with HIV in Massachusetts, and the work of BPHC supports delivery of responsive, highly effective services to people with HIV in eastern Massachusetts. Awards from BPHC support the following services: medical case management, psychosocial support, medical transportation, housing search and advocacy, and nutritional programs. BPHC staff provides programmatic support to Ryan White-funded agencies in the Boston EMA. Support includes contract management, monitoring client demographics and service utilization data, working with agencies to maximize distributed funds, and providing technical assistance on grant management and reporting requirements. BPHC also awards City funding to support evidence-based interventions for HIV-negative individuals at high risk for HIV, HCV, and STI acquisition. OHA and BPHC annually collaborate on the annual Clinical Chart Review to assess the quality of medical care in Ryan White funded agencies, relative to established treatment and quality measures.

RYAN WHITE DENTAL PROGRAM

The Ryan White Dental Program is a comprehensive dental access program for people with HIV in Massachusetts, funded under Ryan White Part A and supported by funds from the Massachusetts Department of Public Health. The program is designed to remove or reduce barriers to oral health services for people with HIV. The program provides access to oral healthcare for eligible and enrolled clients through referrals to nearly 200 public and private dental providers. Oral health services in Massachusetts are also supported through resources directly awarded by HRSA to eligible dental care providers.

NEW ENGLAND AIDS EDUCATION AND TRAINING CENTER

Supported by Ryan White Part F funding, the New England AIDS Education and Training Center (NEAETC) provides training on HIV-related clinical issues to physicians, nurse practitioners, physician assistants, nurses, mental health professionals, dentists, and other health care providers throughout the six-state New England region. Recent efforts by the NEAETC include increased training to primary care providers to respond to acute HIV infection, managing HIV and hepatitis C co-infection, and maximizing HIV treatment options to improve viral suppression.

OPPORTUNITIES FOR IMPROVEMENT

HEALTH EQUITY

During community engagement sessions, community members identified significant gaps in organizations that historically and currently serve communities of color (Black, Latinx) had closed in recent years due to funding changes and other impacts. Members of the Black and Latinx Advisory Groups, MIPCC, and SWCAG expressed significant concerns about the cultural responsiveness of some provider agencies, including whether staff is reflective of people with and at risk for HIV.

GEOGRAPHIC DISPARITIES

Like many other jurisdictions, rural areas of both Massachusetts and the Boston EMA tend to have fewer HIV prevention and care services available than urban and suburban areas. Transportation, concerns about confidentiality, stigmas, lack of available or reliable digital infrastructure, technological devices, and digital literacy have a direct impact in engagement in prevention and access to care activities for people living in rural areas.

OCCURRENCES OF HIV CLUSTERS OR OUTBREAKS

The most notable recent HIV outbreaks in Massachusetts and the Boston EMA were among persons who inject drugs, a population that had seen declines in new infections for many years prior. To strengthen the outbreak and cluster response, providers recommend increased collaboration and coordination, particularly among substance use providers, homeless agencies, local businesses, and other partners that may not commonly be engaged with HIV work to reach the population more effectively.

UNDERUSE OF NEW HIV PREVENTION TOOLS

Advisory stakeholders noted a lag of nPEP and PrEP uptake among MSM of color, women, particularly Black and Latinx, and populations living in rural areas, due to a variety of factors including lack of promotion of these options and medical mistrust. At the time this Plan was in development, uptake of injectable PrEP remained low among all populations. Across all advisory groups, there was consistent call for increasing the utilization of technology and digital platforms to educate, promote services, and adherence supports.

OTHER ENVIRONMENTAL IMPACTS

The ongoing impact of COVID-19 across nearly every aspect of service provision cannot be overstated, even as conditions improve. Both MDPH and BPHC are closely monitoring and responding to the emerging needs of the Monkeypox pandemic and the potential impacts it may have on HIV prevention and care service delivery and how it will affect populations already disproportionately impacted by HIV.

APPROACHES AND PARTNERSHIPS

Data used to complete the HIV Prevention, Care and Treatment Resource Inventory primarily comes from the knowledge each jurisdiction of RWHAP and HIV Prevention and care recipient has about the various agencies and services funded directly in their jurisdiction, as well as their knowledge with service providers funded by other leveraged sources. This knowledge of other providers comes from long-standing relationship building with groups such as the Boston Ryan White Planning Council and MIPCC. Additional data on leveraged resources came from listings of recipients and grantees on federal websites (e.g., Ryan White Part C recipients, HOPWA).

NEEDS ASSESSMENT

BOSTON EMA NEEDS ASSESSMENT FY 2020

The Boston EMA Planning Council's most recent Assessment of Needs was released in FY 2020. The survey was informed by consumers of HIV services, community members affected by HIV, and providers who treat people with HIV. The assessment findings were like previous years. The populations most in need of HIV services are those who are minoritized people and groups; specifically, Black and Latinx MSM, Black and Latinx heterosexual women, persons who inject drugs, and immigrants. BPHC will provide support for the residual and disproportionate impact that COVID-19 has had on Black and Latinx people with HIV. For example, the Planning Council decided to increase MAI Other Professional Services, Legal, in comparison to the prior fiscal year due to expected housing insecurity resulting from COVID-19. This service will assist racial and ethnic cultural communities of people with HIV if housing evictions occur during or post pandemic.

MASSACHUSETTS ADVISORY GROUPS INPUT SESSIONS

Between January to November 2022, MDPH and BPHC worked with a third-party public health contractor to conduct community input sessions with various advisory groups including MIPCC, the Boston EMA

Planning Council, and population health advisory groups. This dynamic system of community engagement has generated considerable progress toward identifying ways to promote access and address gaps currently and for the future. These input sessions are described in further detail in Section II of this plan.

Summary of Needs Assessment Data

SERVICES FOR PEOPLE AT-RISK NEED TO STAY NEGATIVE

All groups identified the importance of accessible HIV testing. Massachusetts has a strong system in place to provide comprehensive and integrated HIV, STI, and Hepatitis testing through blood draws and utilizing 4th generation HIV testing technology. One area of concern brought up in all input sessions was the lack of MDPH funding for rapid HIV testing, in non-clinical settings working with people who inject drugs, and others.

PrEP and continued investment in condom availability was identified as important prevention tool by all advisory groups. There are noted disparities of PrEP uptake in the Black and Latinx MSM communities compared to the white MSM community, and in women compared to men. Advertising and promoting PrEP among at risk populations in culturally appropriate ways was raised as an essential component of this plan.

Input session members frequently mentioned the need for using community health workers and peers as important influencers to encourage at-risk populations to get tested and engage in other prevention activities such as PrEP. Though they were not named specifically, the proposed interventions were very similar in design to behavioral intervention such as Social Network Strategies and Popular Opinion Leader.

SERVICES NEWLY DIAGNOSED PEOPLE WITH HIV NEED TO RAPIDLY LINK TO HIV MEDICAL CARE AND TREATMENT

Rapid Start programs for people newly diagnosed with HIV exist in some parts of Massachusetts, but not in all areas. Rapid start programs work in different ways depending on the provider, but essentially every program allows for a newly diagnosed person to walk away from the testing appointment where they have received a diagnosis of HIV, with a starter prescription for ART. Further expansion and use of this model throughout the jurisdiction would lead to more equitable linkage to care.

SERVICES PEOPLE WITH HIV NEED TO STAY IN HIV CARE AND TREATMENT AND REACH VIRAL LOAD SUPPRESSION

One of the most common needs identified for people with HIV related to long-term engagement in care was the lack of support groups through many parts of the jurisdiction. Though some groups have continued to meet during the COVID pandemic, the groups can be challenging to attend virtually for people with HIV who do not have access to technology and/or the internet. Other support groups have stopped meeting over the years prior to COVID, but many people expressed their strong recommendation to bring back these groups.

Related to technology issues, many providers began offering telehealth options for HIV medical appointments. Though there has been a return to in-person appointments, many providers do still cover telehealth appointments as an option. Telehealth options can be helpful for people with HIV who have transportation issues, but there are people with HIV who do not have access to the required technology, available (particularly in rural communities) or reliable internet of have digital literacy.

BARRIERS TO ACCESSING EXISTING HIV TESTING, HIV PREVENTION SERVICES, AND HIV CARE AND TREATMENT SERVICES

One important need identified across all services during the needs assessment process was the need for culturally tailored, competent, and responsive services. This need was identified for race/ethnic-specific groups, as well as among the Gay Men's and the Transgender, Nonbinary, and Gender Diverse Population Advisory Groups.

The disparities in the number and variety of services potentially available to people with HIV compared to what is available to at-risk populations who test negative was also noted. Many of the same determinants of health impact both populations and not having access to stable and safe housing, community and partner violence, substance use and addiction, reliable transportation, healthcare, insurance, and other benefits continue to put many at-risk for HIV.

PRIORITIES

In addition to the priorities identified above, refer to Section II for priorities identified by the various advisory groups consulted.

FURTHER ADVISORY INITIATIVES: ADDRESSING RAPID HIV TESTING, HIV AND OVER 50 POPULATION, STIGMA, AND INTEGRATION OF BEHAVIORAL HEALTH SERVICES

During the development of this plan, four areas were identified requiring further advisory consultation. Results from these future advisory activities will be updated in this plan and be used to respond to client needs.

MDPH will convene a Rapid HIV Testing Consultation to further explore initial feedback and recommendations for the use of rapid HIV testing technology for select clients, notably among persons who inject drugs.

Members of all advisory groups, specifically the SWCAG, noted the importance of conducting additional planning to support the HIV prevention, care, and service needs of people with HIV over 50. Members of this group noted the importance of aligning planning with the local HIV and Over 50 conference activities with partners at NEAETC. Members also expressed concern about the lack of available testing and prevention tailored to 50+, notably senior (60+) populations. These seniors often feel more vulnerable, invisible, and isolated by retirement. Historical and ongoing discrimination have created significant and lifelong challenges for this demographic group: limited wealth and savings, low wages, few labor protections, changeable housing, food insecurity, stigma, immigration, HIV status, and high mortality from treatable conditions. These challenges and experiences contribute to a lack of well-being and lower quality of life.

Members of the Behavioral Health Advisory group noted the well-documented crisis in mental health in Massachusetts prior and after the acute phase of the COVID-19 pandemic. Members of this group recommended further advisory to identify opportunities to integrate behavioral health services and training of staff into HIV prevention and care programming. Members of this group noted that HIV prevention, care, and treatment programs are in a unique position to identify behavioral health problems and to provide effective ease of access to practical and clinical management of problems, including monitoring conditions and collaborating with allied community partners.

APPROACH

People with HIV and other key stakeholders were engaged in the planning process through a series of meetings and input sessions conducted over the last year. Groups engaged included MIPCC, the Boston EMA Planning Council, and various population health groups representing priority populations. Section II of this Plan describes how people with HIV and other key stakeholders were engaged in the needs assessment process in further detail. Appendix 4 includes a table showing the representation of people with HIV and other key stakeholders in the planning process, including the Needs Assessment process.

SECTION IV: SITUATIONAL ANALYSIS

This situational analysis includes a coordinated synthesis of priorities identified from extensive stakeholder engagement, analysis of local data, policy and program success in the HIV response, current HIV plans, and new opportunities to expand on best practices. For each pillar, planning included discussions on what is working, what is not, new, or expanded opportunities, additional partners to be engaged, resources and funding to be obtained or redirected, and data to be shared to optimize the response. A set of priority activities for each of the pillars, as well as corresponding workforce development objectives, were identified and serve as the basis to implement service responses.

INITIAL FRAMING FROM EXISTING PLANS

As demonstrated by the four existing plans from MDPH, BPHC, and The Getting to Zero Coalition, the needs of people at risk and with HIV in the Commonwealth are diverse, complex and will evolve as conditions and circumstances change. This plan builds upon the findings and engagement efforts of these previous plans. The existing plans and corresponding situational analyses may be access at the following links: (put links here to current Integrated Plans, EHE Plan, Boston EMA Plan, and Getting to Zero).

The overarching themes from these situational analyses emphasize that over the past 20 years, Massachusetts have seen declines in the overall number of new HIV infections, and these declines have been experienced across racial/ethnic populations and exposure mode groups. People with HIV are also living longer and healthier lives. Massachusetts has made strides over the decades to improve community engagement, HIV prevention and care services, including the following:

- Integrated HIV prevention and care services and planning systems.
- Expanded access to Medicaid for non-disabled persons with HIV who are low-income.
- Authorization of verbal consent to HIV testing.
- Operation and rapid expansion of locally approved syringe services programs (SSPs).
- Legalization of over-the-counter sterile syringes.
- Legislation that requires public and private insurers to cover prescribed HIV-related lipodystrophy treatments, the first of its kind in the country.
- Universal public health follow-up for all individuals new diagnosed with HIV infection.
- Integrated testing for HIV, hepatitis C, and sexually transmitted infections in all MDPH-supported testing and linkage programs.
- More funding available to provide food vouchers to address food insecurity among people with HIV, especially people who have lost jobs recently due to pandemic related reasons.
- Ability to deliver food to clients who are unable to leave their houses to do grocery shopping.
- Implementation of molecular HIV surveillance to optimize HIV cluster response and care services.
- Urgency to further integrate behavioral health and non-HIV infectious disease services to address gaps in care and respond to emerging diseases of public health importance for priority populations.
- Strong coordination among state and local public health and advisory partnerships.

State and EMA-level data revel major gaps in health outcomes by race, ethnicity, gender identity,

Sexual orientation, and other factors. To address these gaps, this plan prioritized several key populations

that are disproportionately impacted by HIV and other infections, such as STDs and viral hepatitis. These priority populations include men who have sex with men (MSM), Black individuals, Latinx individuals, non-US born immigrants and refugees, persons who inject drugs, and transgender, nonbinary, and gender expansive people. This plan aims to improve the health of all residents at situational or ongoing risk, and living with HIV, but this goal is not possible without first addressing the needs of historically minoritized and stigmatized communities and groups. The explicit focus on race/ethnicity will require paradigm shifts, such as utilizing a universal design framework, to promote access for all who can benefit from affirming service environments for optimal client experience. If we prioritize those individuals and groups who experience the most barriers to prevention and care and develop new strategies and interventions to reduce those barriers, we will be improving access for all.

Notably, there is overlap between several priority populations listed below (e.g., MSM who are Black and non-US born individuals). For this reason, advisory bodies emphasized an intersectional approach to health equity is critical. To address the concern around "low risk" populations, specifically cisgender women not receiving testing or counseling, there are several calls for universal testing and screening in the Goals section of this plan.

RACIAL EQUITY

Providers, advocates, consumers, and community leaders called for increasing tailored population-level responses and new investments with dedicated health department supports to optimize prevention and care services. Despite higher levels of engagement in care, retention in care, and viral suppression as compared to nationwide data, there continue to be unacceptable disparities in HIV incidence and health outcomes based on race, ethnicity, age, gender, mode of exposure and other factors.

The inequities that systemic racism produces in housing, education, access to quality food options/nutrition, employment, the built and social environments, and health care are felt across generations, across the urban-rural divide and intersect with inequities based on gender identity and sexual orientation. Stakeholders recommended this plan explicitly center on racial equity, within the continuum of prevention and care, while also addressing intersecting HIV-related disparities by gender identity and sexual orientation.

Planning partners affirmed our commitments to leading explicitly – though not exclusively – with race. Our analysis and strategy to address systemic racism will be applied as a framework to address the intersecting forms of oppression and discrimination that impact heath including homophobia, transphobia, sexism, ableism, classism, xenophobia, violence, and others. We will leverage and expand opportunities to achieve equitable prevention, care, and treatment by allocating resources based on data, exercise the influence of our institutions to advance system changes and improvements, and work in close partnership with stakeholders to understand health related social needs and factors influencing social determinants of heath. This plan recognizes addressing health care disparities is an important step to prioritize racial equity and we acknowledge that we are still learning how to best to do this effectively.

Advisory input identified future investments in integrated service models to function as equity-driven public health response models to intentionally meet the needs of Black and Latinx communities, gay men, persons who use drugs, transgender, nonbinary, and gender expansive people. Advisors further identified that future service models focus on leveraging a comprehensive care team that includes investment in community health workers, peers, and integrated behavioral health care that leverages strengths-based

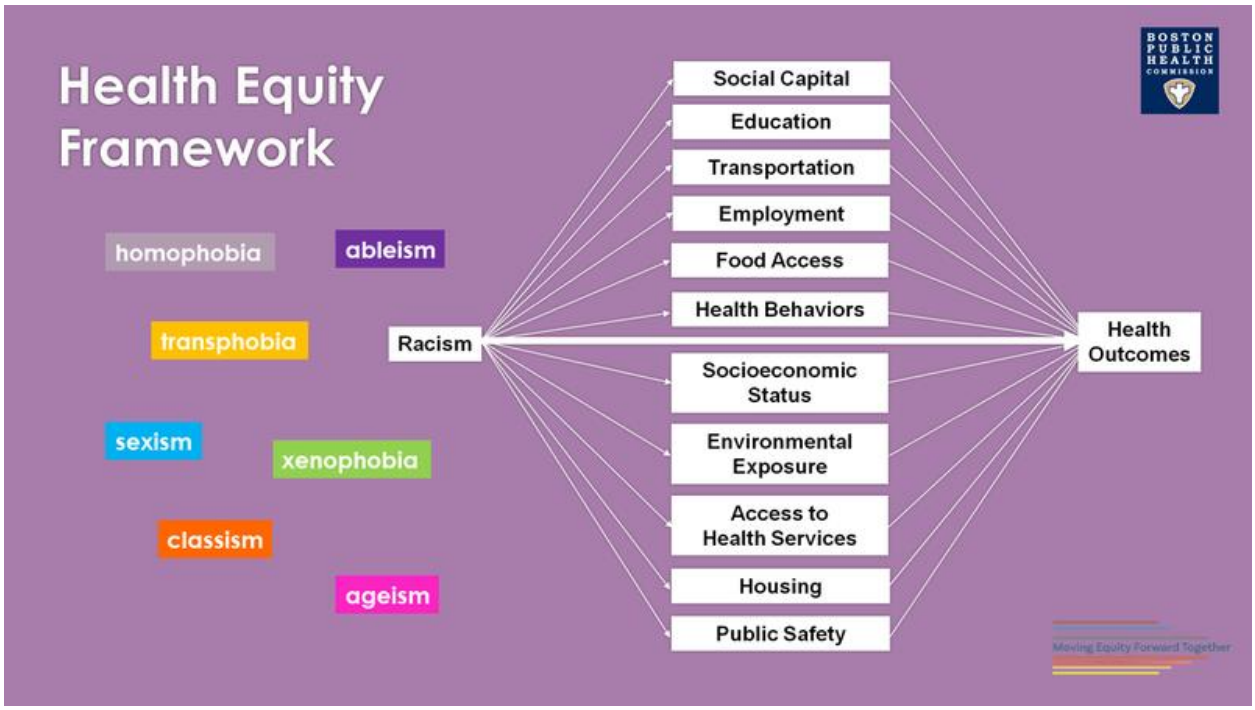
approaches to build on the resilience of populations to identify and mitigating health risks, and actively address the impacts of racism to reduce service barriers.

The MDPH Office of Health Equity (OHE) has published both a Racial Equity Road Map Graphic and a Racial Equity Data Road Map to support departmental programs in assessing and addressing health inequities. The OHE provides information and linkage to Interpreter Services at Health Care Facilities across Massachusetts.

Both health departments jointly submitting this plan have increased fiscal resources for language access services, improvement in racial equity training series for all levels of public health leadership and employees, implementation of new data collection standards, increased racial equity practices for local public health, and integration of racial equity principles into competitive procurements.

BOSTON RYAN WHITE EMA

Racial equity in health is a necessity to address many health disparities across the United States and in Massachusetts and the Boston Ryan White EMA. Racial inequities in HIV diagnoses have grown worse over the course of the epidemic. Similarly, recent reports show that the racial gap in access to PrEP is increasing. Health departments recognize the importance of centering racial equity in their work on HIV/AIDS, as well as COVID-19, monkeypox, environmental health, and other health and public health concerns.



The Boston Public Health Commission has been centering racial justice and health equity since 2000.[24] The City of Boston, where the Part A recipient, the Boston Public Health Commission (BPHC) is based, is a city with majority of residents are people of color and Boston continues to be listed as one of the most racially segregated cities. There are persistent inequities in health outcomes for Black and Latinx Bostonians compared to white Bostonians. On June 12, 2020, the city officially declared racism to be a public health crisis.

The BPHC defines Racial Justice as "The creation and proactive reinforcement of policies, practices, attitudes, and actions that produce equitable power, access, opportunities, treatment and outcomes for all people, regardless of race."[25]

The following graphic depicts the BPHC Health Equity Framework and how it views the impact of racism on health:

PRIORITY POPULATIONS

The populations most in need of HIV prevention and care services are those who are most often marginalized and for whom health inequities are the greatest. Based upon input from community engagement and population advisory groups, as well as the epidemiologic data regarding HIV incidence and prevalence, viral suppression, and the HIV care continuum, six main populations of emphasis are as follows:

- Black people including gay, bisexual, and other men who have sex with men, transgender, nonbinary, and gender expansive people, and both cisgender and transgender women
- Black women who have recently immigrated to the United States
- Gay, bisexual, and other men who have sex with men
- Injection drug users (IDU)
- Latinx people including gay, bisexual, and other men who have sex with men, transgender, nonbinary, and gender expansive people, and both cisgender and transgender women
- Transgender, Nonbinary, and Gender Diverse People

POPULATION HIGHLIGHTS

POPULATION GROUPS: BLACK PEOPLE INCLUDING GAY, BISEXUAL, AND OTHER MEN WHO HAVE SEX WITH MEN, TRANSGENDER, NONBINARY, AND GENDER EXPANSIVE PEOPLE, AND BLACK WOMEN WHO HAVE RECENTLY IMMIGRATED.

There are significant gaps in prevention and care for Black individuals in Massachusetts, both those who are living with HIV and those at risk for HIV infection. Black individuals represent just 8.4% of the state's

population, but 30% of people with HIV. Barriers to care identified during planning efforts include stigma, historic mistrust of the healthcare system, lack of public transportation in communities with a high proportion of Black residents, and insufficient investment of prevention and care resources in Black communities and neighborhoods among non-medical organizations. One of the ongoing challenges in serving Black MSM people is reaching those who do not traditionally seek care, particularly non-gay-identifying MSM.

INCIDENCE AND PREVALENCE OF HIV AMONG BLACK PEOPLE

As mentioned in the Epidemiological Profile, HIV continues to disproportionately impact people of color in the Boston EMA and Massachusetts. Although Black residents make up 7% of the population within the Boston EMA, they accounted for 32% of newly diagnosed HIV cases in 2020. By contrast, white residents, comprising 73% of the population, accounted for only 39% of all new cases in 2020. With respect to HIV prevalence in the Boston EMA, Black people with HIV accounted for 33% of people with HIV in 2020, at levels considerably higher than their 7% of the population. By comparison, the proportion of white people with HIV (39%) was much lower than of white residents in the general population (73%).

In terms of recent HIV diagnoses across Massachusetts, Black (non-Hispanic) individuals were diagnosed with HIV during 2018–2020 at a rate eight times that of white (non-Hispanic) individuals. Among people living with HIV in Massachusetts in 2020, 64% of Black (non-Hispanic) people were virally suppressed compared with 66% of white (non-Hispanic) people.

The concerns of the Black population were expressed through the Black Advisory Group as well as other community engagement groups and needs assessment activities. For Black people including gay, bisexual, and other men who have sex with men, transgender, nonbinary, and gender expansive people, and cisgender and transgender women several barriers and potential solutions were suggested that apply across strategies. Barriers include historic lack of responsiveness of the medical system and of providers to members of the Black community, the fragmentation of care that disrupts the ability to address people's needs holistically, and insufficient attention to the social determinants of health. Each of these barriers reduces the perceived urgency of HIV prevention compared with maintaining stable housing, putting food on the table, and maintaining wellness within a culture permeated with structural racism and violence. These barriers increase the difficulty of delivering services in a trauma-informed, nonjudgmental, and holistic way. The system of care for HIV prevention and treatment services needs to address these issues to engage Black men who are gay, bisexual, same-gender loving or non-identified men who have sex with men, Black transgender, nonbinary, and gender expansive people, and cisgender women at-risk for HIV to deliver, effectively, HIV prevention messages including information regarding access to PrEP.

One strategy to address these barriers is to bring information about HIV prevention and care services to locations within the Black community, for example salons, barber shops, and Black-owned businesses. Ideally service providers are from the Black community, will employ Black HIV prevention workers and/or use community health workers with lived experience in the Black community to provide education messages about the impact that HIV has on people's health to motivate people to avoid becoming infected, will provide information about where and how to find culturally competent and trauma-informed treatment services.

POPULATION GROUP: LATINX PEOPLE INCLUDING GAY, BISEXUAL, AND OTHER MEN WHO HAVE SEX WITH MEN, TRANSGENDER, NONBINARY, AND GENDER EXPANSIVE PEOPLE, AND CISGENDER WOMEN

Over one quarter (27%) of people with HIV in Massachusetts identify as Latinx, while only 11.2% of the total population in the Commonwealth identifies as Latinx. Planning participants highlighted homophobia, heterosexism, lack of Latinx serving organizations, and stigma around sexuality and HIV as contributing to disparities among individuals who identify as Latinx. Other access barriers include poor access to culturally and linguistically appropriate services at HIV prevention and care programs, and inconsistent access to PrEP and nPEP.

As mentioned in the Epidemiological Profile, HIV continues to disproportionately impact people of color in the Boston EMA and Massachusetts. Although Latinx residents make up 11% of the population within the Boston EMA, they accounted for 25% of newly diagnosed HIV cases in 2020. By contrast, white residents, comprising 73% of the population, accounted for only 39% of all new cases in 2020. With respect to HIV prevalence in the Boston EMA, Latinx people with HIV accounted for 25% of people with HIV in 2020, at levels considerably higher than their 11% of the population. By comparison, the proportion of white people with HIV (39%) was much lower than of white residents in the general population (73%).

In terms of recent HIV diagnoses across Massachusetts, Hispanic/Latinx individuals were diagnosed with HIV during 2018–2020 at a rate four times that of white (non-Hispanic) individuals. Among people living with HIV in Massachusetts in 2020, 62% of Hispanic/Latinx people were virally suppressed compared with 66% of white (non-Hispanic) people.

The feedback from the Latinx Advisory Group as well as from other community stakeholder group touched on several ways that linguistic and cultural barriers impacted the ability of Hispanic/Latinx people with HIV or at risk for HIV to access HIV prevention, care, and treatment services.

Concerns include lack of available Latinx serving provider organizations and lack of adequate availability of HIV materials in Spanish. There are online resources in Spanish available at the MA DPH Office of HIV AIDS website and at the Massachusetts Health Promotion Clearinghouse. However, it is unclear how recently the resources have been updated as well as ongoing distribution mechanisms for reaching people newly diagnosed with HIV or those at high risk for infection.

Second, up-to-date information on HIV service providers across the state and their ability to serve monolingual Spanish speakers needs to be updated annually and more easily accessible online and at gathering sites for Spanish speaking people at risk. The expanded use of community health workers and resources who are bilingual in English and Spanish can help monolingual Hispanic/Latinx people at risk for or with HIV navigate a care system where specific programs or service providers for this population are not readily available.

Third, due to funding cuts, there is no longer a statewide organization specifically advocating for the HIV prevention and treatment needs of Hispanic/Latinx people with or at risk for HIV. One of the important functions of statewide organizations is to provide capacity building including training and technical assistance that are delivered in Spanish.

Another of the ongoing challenges in serving Latinx MSM people is reaching those who do not traditionally seek care, particularly non-gay-identifying MSM.

POPULATION GROUP: BLACK WOMEN WHO HAVE RECENTLY IMMIGRATED TO THE UNITED STATES

Recently, many immigrant women of color have arrived in Massachusetts and a large number of them have been identified as having HIV. Fourth generation HIV tests and CD4 tests have identified that many of these women were not infected recently indicating that exposure likely occurred prior to their arrival in Massachusetts.

Stigma continues to be a significant barrier for prevention and treatment, especially among immigrant communities. People who are new to this country are often not aware that having HIV or being undocumented is not a barrier to accessing HIV prevention and treatment services, at least not in Massachusetts or the Boston EMA. Therefore, it is important that information about the availability of these services be disseminated widely and in networks and locations (supermarkets, schools) where newly arrived women immigrants of color spend their time.

In general, non-US born individuals account for 29% of persons living with HIV and 37% of persons recently diagnosed in the state of Massachusetts. For non-US born individuals, (especially those who have newly arrived) there are significant gaps in HIV prevent and care services. Among the barriers identified by community engagement groups were insufficient cultural and linguistic competencies of direct service providers, limited sources of financial support and housing, and the lack of mental health and psychosocial support capable of addressing issues such as experiences of violence and trauma. These barriers are further exacerbated for individuals who are undocumented and therefore increase the need for HIV prevention and care services that are not only culturally and linguistically competent but that are also trauma informed.

POPULATION GROUP: GAY, BISEXUAL MEN AND OTHER MEN WHO HAVE SEX WITH MEN (MSM)

In addition, the first three priority groups, another group of concern remains white gay, bisexual and other men who have sex with men who account for a significant percentage of people affected by HIV within Massachusetts and the Boston EMA. It is important to address co-occurring substance use that increases their risk for HIV. Many AIDS service organizations are still recovering from previous reductions in federal funding for resources directed towards MSM in Massachusetts and the Boston EMA. Community advocates continue to stress the importance of having dedicated funding streams that ensure that MSM communities continue to receive key prevention and linkage to care services. In addition, Native American and Asian-American and Pacific Islander (API) gay, bisexual and other MSM are also at high risk for HIV. API gay, bisexual and other MSM are a smaller but consistent group impacted by HIV in Massachusetts and the Boston EMA.

In Massachusetts, men who have sex with other men is the most reported exposure mode among newly diagnosed individuals. During planning efforts, participants identified lack of access to routine HIV testing, limited provider education, absence of diversity in prevention messaging designed to reach MSM, and limited access to behavioral health services (including substance use disorder treatment) as some of the barriers to adequate HIV prevention and care services for MSM populations.

POPULATION GROUP: TRANSGENDER PEOPLE

In Massachusetts, transgender individuals comprised 1% (n=17) of all new HIV diagnoses from 2018 to 2020 and 1% (N=136) of all persons living with HIV infection in Massachusetts as of December 31, 2020. Sex with men was the exposure mode for the majority (80%) of transgender women reported to be living with HIV infection. By comparison, male-to-male sex was the leading exposure mode for all persons living with HIV infection at 39%. Half of transgender women living with HIV infection were Hispanic/Latina compared to 28% of cisgender women and 27% of all persons living with HIV infection in MA. Most

transgender women living with HIV infection in Massachusetts were under 40 years old. A total of 57% of transgender women were ages 20–39 years old as of December 31, 2020,[6] compared to 16% of cisgender women and 19% of all persons living with HIV infection in Massachusetts. The distribution of place of birth among transgender women living with HIV infection on December 31, 2020, was more like that of all persons living with HIV infection (PLWH) in Massachusetts than cisgender women. Sixty-two percent of transgender women were born in the United States compared to 61% of all PLWH and 47% of cisgender women. Forty-seven percent of transgender women reported to be living with HIV infection in Massachusetts on December 31, 2020[7] were living in the Boston HSR, compared to 22% of cisgender women and 27% of all persons living with HIV infection. A total of 14% of transgender women were living in the Western HSR, 11% in both the Central and Northeast HSRs, and 9% in both the Metrowest and Southeast HSRs.

During the development of this Integrated Plan, the transgender, nonbinary, and gender expansive community continue to experience increased attacks and other forms of harassment and violence locally, including a bomb threat at a Boston-area hospital and nationally, at Club Q, an LGBTQ+ club in Colorado Springs (on the eve of Trans Day of Remembrance). The need for safe spaces to socialize, obtain peer support and life affirming care and services are underscored by the recommendations of the Transgender Health Advisory Group to the OHA to fund a bundle of prevention and care services (now and into the future) that include gender-affirming care, training on cultural competency, including the impact of violence (including gun violence) in the lives of these populations when seeking care, and hiring community members to deliver services whenever feasible.

POPULATION GROUP: PEOPLE WHO INJECT DRUGS

After more than a decade of decline, injection drug use has emerged as an increasing risk factor for HIV infection in the region. According to surveillance data provided by MDPH, the percentage of newly diagnosed HIV infection with IDU transmission risk (excluding MSM/IDU) increased from 4% in 2013 to 17% in 2020. In New Hampshire, while the numbers are small, there has been an increase in cases related to IDU transmission risk between the 6-year period 2010 to 2015 (4 cases) and the 4-year period 2016-2019 (13 cases). As mentioned previously, an investigated cluster of new HIV diagnoses in the Lowell/Lawrence region of the Boston EMA within the Commonwealth of Massachusetts (Middlesex and Essex Counties), identified 129 molecularly and/or epidemiologically linked cases of HIV infection, with additional linked cases also occurring throughout the Boston EMA (including in New Hampshire). In addition to the Lawrence/Lowell cluster, there was an increase in the number of HIV cases among persons who inject drugs in the Boston area starting in November 2018. There have been 164 cases diagnosed thorough the end of 2021.

Among people who inject drugs, the COVID-19 pandemic has been noted as a stressor that has resulted in an increase in deaths related to opioid overdoses in both urban and rural communities. This indicator of increase used of drugs by injection increases vulnerability to HIV infection. Reaching HIV+ injection drug users with Part A funding provides different challenges. While the opioid epidemic continues to be a focal point of concern in the Boston EMA, the substance use services (residential) category has stayed stable in its funding level given the significant resources available from SAMHSA and Massachusetts Behavioral Health Partnership. The BPHC has funded subrecipients to deliver Health Education/Risk Reduction Services to people who inject drugs. Many young, often homeless, people who inject drugs are difficult to reach, as well as difficult to link to and retaining care because of the often changeable and inconsistent conditions in

which they live. They are a mobile population moving throughout the Boston EMA and all of Massachusetts (and beyond).

One response to the ongoing challenge of HIV transmission through needle sharing and the sexual activity of people who inject drugs is the Massachusetts Prevention and Rapid Response to Outbreaks of HIV Transmission through Interventional Epidemiology and Linkage to Care and Treatment (Massachusetts PROTECT) The target population for the demonstration project is people who inject drugs newly diagnosed or at risk for HIV infection, and are identified in clusters/outbreaks of HIV attributed to injection drug use in one of the seven counties of Eastern MA, encompassing 75% of the state's resident population. In MA, small to medium size cities (although not exclusively) are most affected by the opioid epidemic, and there are unique qualities to outbreak response in urban areas (highly mobile population and accessible connections to injection networks in neighboring cities and other states.). BPHC will initially focus activities on Essex, Middlesex, and Suffolk counties, where recent diagnoses of HIV attributed to IDU have most occurred. BPHC will establish capacities and protocols that can be readily deployed to respond to HIV outbreaks in other populations, including MSM and persons who engage in transactional sex, among others.

MASS AND CASS

Within the city of Boston, a small area of land is known as a place for people who inject drugs or use non-injection drugs to access services, purchase drugs, find community in its varied forms, and, for some, to live on a short- or long-term basis. The area is known as "Mass/Cass" because it is located near the intersection of Massachusetts Avenue and Melnea Cass Boulevard. The neighborhood had long attracted people who use drugs due to the location of multiple substance use disorder treatment programs, as well as the only Public Health Hospital in Massachusetts with its inpatient, outpatient, and emergency department services.

However, the closure of the bridge to Long Island, site of several SUD treatment programs and shelters, in 2014 increased both the number of people visiting the Mass/Cass area and the setting up of temporary shelters (i.e., tents.). Inevitable clashes between the occupants of the area and neighboring businesses and residents precipitated an increased call for shelter, services, and security to address the problem. Politicians, police, behavioral and physical health services providers, housing and human rights advocates and other interested groups have coalesced over many years to bring humane and holistic best practices to assisting people at Mass/Cass with shelter/housing, security, health care, harm reduction services, while respecting calls to heed the people's human rights and dignity.

One strategy to reduce new infections among people who inject would be to increase PrEP update. According to the CDC, PrEP is an effective means of preventing acquisition of HIV among people who inject. In their document "Pre-exposure Prophylaxis for the Prevention of HIV Infection in the United States - 2021 Update," they describe the sexual risk of people who inject drugs:

> "Data from NHBS also demonstrate that most persons who inject drugs report sexual behaviors that confer risk of HIV acquisition. Among HIV-negative persons who use drugs who identify as male, 69% reported having had condomless vaginal sex in the prior 12 months, and 4% reported having had condomless anal sex with a male partner. Among HIV-negative persons who use drugs who identify as female, 79% reported having had condomless

vaginal sex, and 27% reported having had condomless anal sex. 33% of HIV negative persons who use drugs reported their most recent sex was condomless sex with a partner known to have HIV."[26]

STRATEGIES TO ADDRESS HIV

DIAGNOSE ALL PEOPLE WITH HIV AS EARLY AS POSSIBLE

The COVID-19 pandemic presented unique challenges in engaging PLWH, particularly the most vulnerable populations. The disproportionate impact of COVID-19 and Monkeypox infections on vulnerable, at-risk populations has been well documented, both in terms of reduced access to HIV testing, increased infection rates as well as secondary economic and emotional well-being effects.

Public health staff continue to support programs during this time, through continued engagement via contract management staff, COVID supplemental relief funds, and other resources. Furthermore, the pandemic presents opportunities to enhance the model of engagement for people at risk and with HIV as well as to implement new strategies for early intervention and care completion services, through expansion of telehealth capabilities. Additionally, strengthening of MassHealth during the pandemic through coverage protections, emergency waivers, and self-attestation for eligibility requests will continue to complement efforts to engage and retain people with HIV in care.

Engagement of people at risk to get tested for HIV is hampered by several factors. These include a lack of trust in the healthcare system, access to routine testing in convenient settings, and the stability of lifestyle required to return for test results. These challenges are addressed in the goals/objectives section which address expanding HIV screening pilots in hospital emergency departments and outpatient urgent care settings, deployment of mobile clinics that collaborate with local public health partners, in oral health settings, use of Peer Advocates/CHWs to bridge the "trust gap" to reach the homeless population as well as to increase bi- and multilingual capacity of HIV testing and counseling services.

TREAT PEOPLE WITH HIV RAPIDLY AND EFFECTIVELY TO REACH SUSTAINED VIRAL SUPPRESSION

Many of the challenges to expand access to treatment services are similar to the challenges facing the entire system of care for HIV in Massachusetts and the Boston EMA. These include cultural competency and the need to acknowledge and address structural racism, the issue of homelessness and housing instability making linkage to and maintenance in care difficult, mistrust and lack of positive experiences with the medical system, and the need to address social determinants of health including poverty, malnutrition, and lack of transportation. These factors often interfere with keeping medical appointments, maintaining consistent access to and use of ART, and the ability to reach and maintain viral suppression.

Some of the goals/objectives to improve treatment outcomes include the expansion of the Rapid Start model, ongoing work to Increase cultural awareness, competency and humility in care and treatment services, efforts to Increase access to housing and behavioral health services and increased opportunities for peer interactions for people with HIV. By December 31, 2026, these goals/objectives, and the activities to implement them, are intended to improve rates of viral suppression by 10% for all people with HIV, while

[26] Pre-exposure Prophylaxis for the Prevention of HIV Infection in the United States - 2021 Update p.26. Accessed online at https://www.cdc.gov/hiv/pdf/risk/prep/cdc-hiv-prep-guidelines-2021.pdf

improving viral suppression rates for racial/ethnic minorities to be equivalent to rates in white (non-Hispanic) populations.

PREVENT NEW HIV TRANSMISSIONS BY USING PROVEN INTERVENTIONS, INCLUDING PRE-EXPOSURE PROPHYLAXIS (PREP) AND SYRINGE SERVICES PROGRAMS (SSPS)

The Prevent strategy will focus on addressing racial equity for the priority population groups of Black and Latinx people including gay, bisexual, and other men who have sex with men, transgender, nonbinary, and gender expansive people, cisgender women, and Black women who have recently immigrated to the United States.

Assessments within both the Black and Latinx communities are needed to gauge current understanding of HIV, HIV risk, how concern about HIV ranks against social determinants of Health (education, employment, housing, transportation, etc.), and what messages and messengers are most effective. This information can be used to develop updated materials for both the Black (non-Hispanic) and Latinx communities at risk for acquiring HIV.

For Black women who have recently immigrated to Massachusetts and the Boston EMA, prevention services need to focus on secondary prevention as many are HIV+ prior to arriving in the United States. An important strategy is to engage recent Black women immigrants in the HIV care and treatment services so that their viral load is undetectable and the virus is untransmittable.

One strategy to do this include use of community health workers with lived experience in communities similar or parallel to the countries of origin to the Black women. Another strategy is to develop materials that stress the importance of HIV treatment to achieve viral suppression by way of messages and messengers that reflect their culture, and especially their language (Haitian Creole, Luganda, etc.). These materials should provide clear guidance on how to obtain HIV treatment services and should reach them through the locations and media sources they frequent.

RESPOND QUICKLY TO POTENTIAL HIV OUTBREAKS TO GET NEEDED PREVENTION AND TREATMENT SERVICES TO PEOPLE WHO NEED THEM

Young, often homeless, people who inject drugs are difficult to reach and difficult to link to and retain in care due in part to the changeable and inconsistent conditions in which they live. They are a mobile population moving throughout Massachusetts as well as the entire Boston EMA.

RESPONDING TO MONKEYPOX AND OTHER INFECTIOUS DISEASES

Much of the infrastructure development in Massachusetts by the OHA has been built upon by BIDLS (the Bureau within which OHA exists) to help with both COVID-19 and, more recently, monkeypox. The importance of strengthening and building upon this infrastructure has been recognized by the Commonwealth of Massachusetts. Each State Budget Year, the line item for HIV needs to be renewed and some years additional language accompanies the funding allocation to help direct its use. This year the language explicitly has been expanded to include infectious diseases that also affect people with HIV.

Specifically, the HIV line item included this language:

> For human immunodeficiency virus and acquired immune deficiency syndrome, or HIV/AIDS, services, programs, and related services for persons affected by the associated conditions of viral hepatitis, sexually transmitted

> infections, tuberculosis, and other infections of public health importance; provided, that funding shall be provided to proportionately serve each of the demographic groups afflicted by HIV/AIDS and associated conditions…. (emphasis added) - Massachusetts FY23 Budget Line 4512-0103 HIV/AIDS Prevention Treatment and Services

This language points to a model of service by OHA that can sufficiently respond to HIV and infectious diseases outbreaks to the degree they impact populations of focus. This includes, in addition to the named diseases, monkeypox. In terms of monkeypox, the community most affected has been Black gay, bisexual and other men who have sex with men. Thus, not only has the state's "Respond" infrastructure been activated to respond to monkeypox prevention (including vaccination) and treatment, but the provider and community networks have been a key source of information on how this community has been impacted and have also provided service models to reach those most at risk.

SECTION V: 2022-2026 GOALS AND OBJECTIVES

GOALS AND OBJECTIVES DESCRIPTION

OHA and the BPHC's Ryan White Divisions are responsible for overseeing a significant amount of state and federal funds on an annual basis. Together they support an HIV prevention and care system for over 23,000 people with HIV or roughly 2% of the estimated 1.2 million people with HIV in the United States. In addition, both OHA and BPHC provide prevention services to reduce the number of new HIV infections across Massachusetts. To accomplish this, both jurisdictions administer contracts with many subrecipients and work with community engagement groups to set programmatic and policy direction. Therefore, there are a substantial number of goals/objectives in this Integrated Plan, representing an ambitious agenda to address all components of HIV across the five strategies: diagnose, treat, prevent, respond, and workforce.

Based on needs assessment findings, including the SCSN, extensive consultation with community engagement and population advisory groups, and building on previous plans, racial equity emerged as a key issue to be addressed. As described in the Situational Analysis, the disparity in infection rates for both the Black population and the Latinx population have been persistent in Massachusetts and the Boston EMA since the beginning of the epidemic. To continue addressing these disparities, the goals/objectives and associated activities in this Integrated Plan will focus specifically on these two populations. In response to recent epidemiological data, the plan will also address the HIV prevention and care needs of immigrant women of color, including Black and Latinx women.

UPDATES TO OTHER STRATEGIC PLANS USED TO MEET REQUIREMENTS

This Integrated Plan builds upon other strategic plans the goals/objectives of the EHE Plan for Suffolk County Massachusetts, the most recent of these plans. Many of the objectives in the EHE plan are included in this plan and have been expanded to encompass the entire State and EMA. For each of the goals/objectives in this plan, it is noted what goal of the National HIV/AIDS Strategy is supported, as well as which, if any, previous goal/objective builds upon.

2022-2026 GOALS AND OBJECTIVES

DIAGNOSE – GOAL A: INCREASE THE ABILITY TO IDENTIFY NEW HIV CASES

- **Objective A1:** Move the MA-Boston HIV System to a 100% Status Neutral Approach
- **Objective A2:** Expand a Syndemic Approach to Diagnosis of HIV and other Infectious Diseases among 100% of funded providers
- **Objective A3:** Implement strategies to ensure equitable access to HIV testing/counseling services by sexual and racial/ethnic communities made vulnerable to HIV across the State and EMA (urban-rural)
- **Objective A4:** Consult with stakeholders about rapid HIV testing
- **Objective A5:** Increase access to testing for individuals lacking medical and personal homes
- **Objective A6:** By 2021, achieve a reduction in the proportion of cases reported to Massachusetts HIV Surveillance Program with No Identified Risk (NIR), from 30% to 15% of all reported cases

OBJECTIVE A1: BY DECEMBER 31, 2026, MOVE THE MA-BOSTON HIV SYSTEM TO A 100% STATUS NEUTRAL APPROACH

A.1.2 Develop guidance on a Status Neutral Approach so that there is "no wrong door" for OHA and BPHC Ryan White-funded service providers.

A.1.3 Integrate guidance on Status Neutral Approach into subsequent procurements for HIV prevention and care services.

A.1.4 Monitor implementation of Status Neutral Approach in HIV prevention and care services.

- **Outcomes (reported annually, locally monitored):** Status neutral approach is implemented in all OHA and BPHC funded HIV prevention and care settings.
- **Monitoring Data Source:** Status Neutral Approach is described in procurements, competitive funding opportunities, applied in annual work plan submissions from contracted prevention and care vendors, as part of training and capacity building initiatives, and in federal applications and reports.
- **Expected impact on the HIV Care Continuum:** Improve identification of people at risk and living with HIV, increase linkage to care, and expand access to testing, linkage, and adherence support services.
- **Expected impact racial/ethnic and other inequities:** Reduce racial and ethnic disparities across all modes of transmission with respect to access to diagnostic services.
- **Links to which goal/s of the NHAS and/or other previous plans:** Links to Goal 1 of NHAS
- **Responsible party or parties/key partners:** OHA and BPHC, funded prevention and care providers, and members of community engagement and population health advisory groups, Boston EMA Planning Council.
- **Potential funding sources:** State, CDC, HRSA

OBJECTIVE A2: BY DECEMBER 31, 2026, EXPAND A SYNDEMIC APPROACH TO DIAGNOSIS OF HIV AND OTHER INFECTIOUS DISEASES TO 100% OF FUNDED PROVIDERS

A.2.1 Throughout the course of this Integrated Plan, the OHA will consult with population health advisory groups and impacted populations on ways to promote access to integrated HIV/HCV/STI, and tuberculosis (TB) testing for Black and Latinx populations, gay men, persons who inject drugs, transgender, nonbinary, and gender expansive people, and non-US born individuals.

A.2.2 By December 31, 2026, the OHA and funded capacity building providers will ensure training plans for the workforce address integrated infectious disease testing including (at a minimum) HIV, syphilis, and Hepatitis C.
A.2.3 By December 31, 2026, expand laboratory services to include viral load for Hepatitis C.
A.2.4 Adopt a syndemic approach that includes emerging health threats such as monkeypox.
A.2.5 Incorporate a syndemic approach into subsequent procurement of HIV prevention and care services.

- Outcomes (reported annually, locally monitored more frequently): All serum samples are screened for HIV, all urine and extra-genital samples have been co-tested for gonorrhea and chlamydia.
- Monitoring Data Source: Annual work plan submissions, service utilization data, State Public Health Laboratory reports
- Expected impact on the HIV Care Continuum: Impact on diagnoses of HIV, syphilis, Hep C and other STIs
- Expected impact racial/ethnic and other inequities: Increased diagnoses of HIV and other STIs that disproportionately impact Black and Latinx people, and increased access to prevention, care, and treatments
- Links to which goal/s of the NHAS and/or other previous plans: NHAS Goal 1, builds upon Objectives 1.1 and 3:5 of the MA EHE Plan for Suffolk County
- Responsible party or parties/key partners: State Public Health Laboratory, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, NEAETC, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- Potential funding sources: State, CDC

OBJECTIVE A3: IMPLEMENT STRATEGIES TO ENSURE EQUITABLE ACCESS TO HIV TESTING/COUNSELING SERVICES BY SEXUAL AND RACIAL/ETHNIC POPULATIONS, ESPECIALLY BLACK PEOPLE AND LATINX PEOPLE, WHO HAVE BEEN MADE VULNERABLE TO HIV

A.3.1 Develop education program to reduce provider stigma regarding best practices in taking a sexual history, including for Black women (especially those who are foreign born).
A.3.2 Develop education program on transgender, nonbinary, and gender expansive people and sexual practices to support appropriate screening for HIV and other STIs.
A.3.3 Increase HIV outreach in physical spaces such as clubs, sexual cultures, Pride events and festivals as well as Social Networking Model for testing (and/or linkage to care.)

- Outcomes (reported annually, locally monitored more frequently): Increase in testing of Black and Latinx gay, bisexual, and other men who have sex with men, Black and Latinx transgender, nonbinary, and gender expansive people, women, and immigrant women of color
- Monitoring Data Source: Service utilization data
- Expected impact on the HIV Care Continuum: Increase in percentage of people with HIV and STIs who are aware of their status and are linked to care
- Expected impact racial/ethnic and other inequities: Reduce or eliminate inequities in access to HIV and STI testing, and counseling based on race, ethnicity, sexual orientation, gender identity, and immigration status
- Links to which goal/s of the NHAS and/or other previous plans: NHAS Goals 1 and 3

- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, NEAETC, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC

OBJECTIVE A4: CONSULT WITH STAKEHOLDERS ABOUT RAPID HIV TESTING

A.4.1 Convene an advisory consultation with clinicians, harm reduction, LGBTQIA+, program manager, and consumer representatives to discuss serum and rapid HIV test technologies in the context of ending transmissions.

A.4.2 Summarize and report findings and recommendations from ad hoc group to BIDLS, BSAS, OHA leadership, and to members of OHAs advisory groups.

- **Outcomes (reported annually, locally monitored more frequently):** A diverse and representative c advisory consultation is conducted with a summary and key points shared with BIDLS, BSAS, OHA leadership, and OHAs advisory groups
- **Monitoring Data Source:** Completed standardized meeting summary template for advisory meetings and consultations
- **Expected impact on the HIV Care Continuum:** Improved access to HIV and integrated infectious disease testing, and linkage to care and treatments for newly identified people with HIV
- **Expected impact racial/ethnic and other inequities:** Improve access to HIV testing among vulnerable population groups to identify and link people at risk for HIV and people with HIV to prevention, care, and treatments
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 1, 2 and 3
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, BSAS, community-based organizations, including LGBTQIA+ organizations, healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC, HRSA

OBJECTIVE A5: INCREASE ACCESS TO TESTING FOR INDIVIDUALS LACKING MEDICAL AND PERSONAL HOMES, PEOPLE IN RURAL AREAS, AND OLDER INDIVIDUALS

A.5.1 By December 31, 2026, the OHA will expand an HIV screening pilot program in health care setting emergency departments to 10 high prevalence communities.

A.5.2 By December 31, 2026, OHA will assess the feasibility and mechanism through which to offer HIV screening in a pharmacy-based setting, urgent care centers, and dental care settings, in five or more high prevalence communities.

A.5.3 Establish a deployment protocol for mobile clinics (including serving rural areas), and fund at least five programs, that includes local collaboration with public health partners, and ensuring inclusion of cultural and linguistic capacities (cross-cutting activity).

A.5.4 Build strategies to increase trust including use of Peer Advocates/CHWs to bridge the "trust gap" to reach the homeless or marginally populations.
A.5.5 Increase capacity of PCPs to treat HIV to reduce need for referrals to specialty care which may reduce access to care/more patient education on value of Rapid Start.

- **Outcomes (reported annually, locally monitored more frequently):** Competitive procurement initiated and completed, vendors identified, increased HIV testing among persons at risk for HIV in communities with high HIV prevalence, increased number of persons who are aware of their HIV status, increased identification of HIV-negative persons at risk for HIV infection referred for nPEP, PrEP, and PrEPDAP, and increased participation in HIV partner services among persons diagnosed with HIV infection.
- **Monitoring Data Source:** Service utilization reports
- **Expected impact on the HIV Care Continuum:** Increase number of people with HIV who are aware of their status, and are linked and retained in care
- **Expected impact racial/ethnic and other inequities:** Reduces racial and other health inequities by reaching Black, Latinx, Black and Latinx gay and bisexual men, other men who have sex with men, including transgender, nonbinary, and gender expansive people, people who inject drugs who are disproportionately homeless or unstably housed, people in geographic areas with limited access to HIV testing in traditional health care settings, and older people (60+) at risk for HIV
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 1, 2 and 3, Objectives 1.2, 1.3 and 1.4 of the MA EHE Plan for Suffolk County
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC

OBJECTIVE A6: BY DECEMBER 31, 2026, ACHIEVE A REDUCTION IN THE PROPORTION OF CASES REPORTED TO MASSACHUSETTS HIV SURVEILLANCE PROGRAM WITH NO IDENTIFIED RISK (NIR), FROM 30% TO 15% OF ALL REPORTED CASES.

- **Outcomes (reported annually, locally monitored more frequently):** Reduced percentage of newly diagnosed cases with NIR as exposure
- **Monitoring Data Source:** HIV surveillance data
- **Expected impact racial/ethnic and other inequities:** NIR cases are disproportionately among people of color. Reducing the %NIR cases will improve ability to link and retain people in care.
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goal 3,
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA

community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers

- **Potential funding sources:** State, CDC, HRSA

TREAT – GOAL B: IMPROVE HEALTH OUTCOMES FOR PEOPLE LIVING WITH HIV

- **Objective B1:** Build upon the EHE effort to boost the Rapid Start model with a goal of making it universal and available in all health services regions (urban-rural) to achieve improvements in ART uptake, viral suppression, and retention in care
- **Objective B2:** Increase cultural awareness, competency and humility in care and treatment services to support linkage to and maintenance in care
- **Objective B3:** Increase access to housing and behavioral health services to support linkage to and maintenance in care
- **Objective B.4:** By December 31, 2026, improve rates of viral suppression by 10% for all people with HIV while improving viral suppression rates for Black and Latinx residents to be equivalent to rates in white (non-Hispanic) populations
- **Objective B.5** Increase opportunities for peer interaction for people with HIV

OBJECTIVE B1: BUILD UPON THE EHE EFFORT TO BOOST THE RAPID START MODEL WITH A GOAL OF MAKING IT UNIVERSAL AND AVAILABLE IN ALL HEALTH SERVICE REGIONS (URBAN-RURAL) TO ACHIEVE IMPROVEMENTS IN ART UPTAKE, VIRAL SUPPRESSION, AND RETENTION IN CARE

B.1.1 Increase the capacity of PCPs to treat HIV to reduce need for referrals to specialty care which may reduce access to care/more patient education on value of Rapid Start.
B.1.2 Develop patient education materials on value of Rapid Start.
B.1.3 Require use of Rapid Start model in subsequent procurement of HIV care services (see Prevent goal for incorporation of Rapid Start into prevention services to ensure a status neutral approach).

- **Outcomes (reported annually, locally monitored more frequently):** Procurement for services that includes Rapid Start model funded across all health service regions
- **Monitoring Data Source:** Annual work plans, service utilization reports of funded organizations
- **Expected impact on the HIV Care Continuum:** Improve linkage and retention in care
- **Expected impact racial/ethnic and other inequities:** Reduce racial/ethnic disparities, treatment interruptions by linking newly diagnosed and out of care people with HIV who are disproportionately Black or Latinx
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goal 2
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, NEAETC, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC, HRSA

OBJECTIVE B2: INCREASE CULTURAL AWARENESS, COMPETENCY, AND HUMILITY IN PREVENTION, CARE, AND TREATMENT SERVICES TO SUPPORT LINKAGE TO AND MAINTENANCE IN CARE

B.2.1 By Dec 31, 2026, the OHA and funded capacity building providers will ensure training plans for the workforce address client-centered and culturally responsive care for Black and Latinx and non-US born populations. To accomplish this, OHA will systematically review all training plans and update as needed to ensure that they are client-centered and anti-racist.

B.2.2 By December 31, 2026, the OHA will expand Community Health Worker (CHW)/Peer service models by adding CHWs and/or Peers to interdisciplinary prevention and care teams across MA and the EMA.

B.2.3 Work with BSAS to increase cultural competency on transgender, nonbinary, and gender expansive people among those working in SUD treatment programs.

B.2.4 By December 31, 2026, OHA will expand Correctional Linkage to Care (CLTC) services for individuals diagnosed with HIV and/or hepatitis C (HCV) who are incarcerated in correctional facilities across MA and the Boston EMA.

- Outcomes (reported annually, locally monitored more frequently): Improved rates of Black and Latinx people with HIV retained in care and virally suppressed
- Monitoring Data Source: State public health laboratory viral load reports, examples of training materials and notes that explicitly address anti-racist and transgender, nonbinary, and gender expansive educational content, and services inventory identifying CHWs in prevention and care teams
- Expected impact on the HIV Care Continuum: Increase rates of people with HIV retained in care and virally suppressed
- Expected impact racial/ethnic and other inequities: Reduction of inequities between Black, Latinx and non-Hispanic whites with respect to retention in care and viral suppression
- Links to which goal/s of the NHAS and/or other previous plans: NHAS Goals 2 and 3, Objectives 2.1, 2.3 and 3.5 of the MA EHE Plan for Suffolk County
- Responsible party or parties/key partners: State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, NEAETC, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- Potential funding sources: State, CDC, HRSA

OBJECTIVE B3: INCREASE ACCESS TO HOUSING AND BEHAVIORAL HEALTH SERVICES TO SUPPORT LINKAGE TO AND RETENTION IN CARE

B.3.1 Work collaboratively with HOPWA, and other entities to increase the availability of low-threshold housing available to people with HIV made vulnerable by poverty, racial and linguistic discrimination, prior arrest, or criminal record.

B.3.2 Work collaboratively with BSAS to increase availability of low-threshold housing including sober housing and housing for transgender, nonbinary, and gender expansive people.

B.3.3 By December 31, 2026, the OHA will increase programmatic investments in rapid-response housing and stabilization service models for newly diagnosed homeless and unstably housed people with HIV who inject drugs.

B.3.4 Increase access to mental health treatment that is culturally and linguistically competent and accessible, notably to existing treatment programs including SSPs.
B.3.5 Ensure CHWs involved with mental health care are adequately trained and supported through ongoing training and clinical supervision.
B.3.6 In subsequent procurement, OHA will purchase CHW, MH/BH support via FTE as staff of the integrated prevention and care team.

- **Outcomes (reported annually, locally monitored more frequently):** Increase linkage to and retention in HIV care, increased wellness
- **Monitoring Data Source:** Service utilization reports
- **Expected impact on the HIV Care Continuum:** Improve linkage to care, retention in care
- **Expected impact racial/ethnic and other inequities:** Strategies are intended to reach people with HIV who are experiencing homelessness or housing instability and those with behavioral health issues which both disproportionately impact Black and Latinx people
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goal 2, Objective 2.2 of the MA EHE Plan for Suffolk County
- **Responsible party or parties/key partners:** OHA, BPHC, BSAS, SAMHSA, HOPWA, community-based organizations, including LGBTQIA+ organizations, healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC, HRSA, SAMHSA, HOPWA

OBJECTIVE B.4 BY DECEMBER 31, 2026, IMPROVE RATES OF VIRAL SUPPRESSION BY 10% FOR ALL PEOPLE WITH HIV WHILE IMPROVING VIRAL SUPPRESSION RATES FOR RACIAL/ETHNIC MINORITIES TO BE EQUIVALENT TO RATES IN WHITE (NON-HISPANIC) POPULATIONS

B.4.1 By December 31, 2026, the OHA will utilize electronic laboratory reporting surveillance data to identify people with HIV who are out of care, to increase HIV care retention rates.
B.4.2 Increase rates of viral suppression through education about U=U; medications and side effects, housing access programs and medication assistance programs.
B.4.3 Initiate discussion regarding new and emerging prevention and treatment modalities (injectable, long-term treatment options, including injectable PrEP).
B.4.4 Utilize community-based education models that enhance acceptance and access to integrated testing and linkage to care.
B.4.5 OHA will provide expected models of service with tailored activities to increase role of local decision making in how services are delivered and therefore to engage and build trust in services.
B.4.6 Increase education on aging with HIV for providers, integrated prevention and care team staff, consumers, and others, to ultimately improve health outcomes.
B.4.7 Support people with HIV and dementia at long-term care facilities through education about HIV and LGBTQIA+ (and especially transgender, nonbinary, and gender expansive people) issues.
B.4.8 By December 31, 2026, the OHA will launch a new data dashboard for MA and EMA counties in MA that displays key indicators including rates of retention in care and viral suppression stratified by race, ethnicity, gender identity, age, mode of exposure, and geography.

- **Outcomes (reported annually, locally monitored more frequently):** Improved viral suppression rates
- **Monitoring Data Source:** State public health laboratory viral load reports

- **Expected impact on the HIV Care Continuum:** Increase rates of people with HIV retained in care and virally suppressed
- **Expected impact racial/ethnic and other inequities:** Reduction of inequities between Black, Latinx and non-Hispanic whites with respect to retention in care and viral suppression
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 2 and 3, Objectives 3.2 and 3.3 of the MA EHE Plan for Suffolk County
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, NEAETC, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC, HRSA

OBJECTIVE B.5 INCREASE OPPORTUNITIES FOR PEER INTERACTION AMONG PEOPLE WITH HIV

B.5.1 Increase both virtual and in-person resources for peer support to increase linkage to and maintenance in care while developing guidance for preserving privacy for individuals as needed.

B.5.2 For Boston EMA: Consider support groups for women (and others) who are survivors of sexual and domestic violence; sex workers; parents/moms who need support to increase linkage to and maintenance in care.

- **Outcomes (reported annually, locally monitored more frequently):** Number of support groups offered with sufficient attendance
- **Monitoring Data Source:** Service utilization reports
- **Expected impact on the HIV Care Continuum:** Retain people with HIV in care and virally suppressed
- **Expected impact racial/ethnic and other inequities:** Help Black and Latinx people find support to help them stay in care, virally suppressed, with improved overall health and wellness
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goal 2
- **Responsible party or parties/key partners:** OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, HRSA

Adapted from MA EHE Application for Suffolk County and expanded to include the entire jurisdiction (state and EMA):

OBJECTIVE 2:4: BY JUNE 30, 2026, THE OHA WILL HAVE SUSTAINED CONSULTATIONS WITH THE BOSTON PUBLIC HEALTH COMMISSION ON THE DEVELOPMENT AND IMPLEMENTATION OF A RED-CARPET ENTRY MODEL OF SERVICE THAT EXPEDITES LINKAGE TO HIV MEDICAL CARE AND TREATMENT

PREVENT – GOAL C: REDUCE NUMBER OF NEW HIV INFECTIONS AND INCREASE HIV AWARENESS AND KNOWLEDGE AMONG THE PUBLIC

- **Objective C1:** By December 31, 2026, reduce new HIV infections among US born-and foreign-born Black populations by 20%
- **Objective C2:** By December 31, 2026, reduce new HIV infections among native- and foreign-born Latinx populations by 20%
- **Objective C3:** By December 31, 2026, reduce new HIV infections among people who inject drugs by 20%
- **Objective C4:** By December 31, 2026, reduce new HIV infections among native Americans and native- and foreign-born people from Asia including East Asia, South Asia, the Middle East, and Eastern Europe by 20%
- **Objective C5:** By December 31, 2026, increase PrEP uptake by 35%
- **Objective C6:** Increase targeted prevention efforts through increased assessments and partnerships
- **Objective C7:** Develop and conduct HIV prevention education campaigns to increase HIV awareness and reduce stigma
- **Objective C8:** Develop resource to improve access to information about prevention and other HIV services

OBJECTIVE C1: BY DECEMBER 31, 2026, REDUCE NEW HIV INFECTIONS AMONG NATIVE- AND FOREIGN-BORN BLACK POPULATIONS BY 20%

C.1.1 By December 31, 2026, the OHA will award funding for up to ten organizations that include peers and others in the role of community health workers (CHWs) as well as behavioral health providers on interdisciplinary prevention and care teams.

C.1.2 By December 31, 2026, OHA will develop tailored health communications and educational materials to promote effective prevention strategies and health promotion topics relevant for Black people at risk for HIV including Black gay, bisexual and other men who have sex with men, including transgender, nonbinary, and gender expansive people, as well as Black people made vulnerable by substance use and mental health disorders, homelessness and housing instability, and poverty. Education efforts will also focus on Black partners of people with HIV.

C.1.3 Develop prevention messages and materials for immigrant women of color, and translate prevention messages in languages of these communities including Haitian Creole and Luganda.

- **Outcomes (reported annually, locally monitored more frequently):** Reduce new HIV infections
- **Monitoring Data Source:** HIV Surveillance program
- **Expected impact on the HIV Care Continuum:** Reducing number of new HIV infections
- **Expected impact racial/ethnic and other inequities:** Reduce new infections among the Black population in MA and the Boston EMA including immigrant women of color
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goal 1, Objectives 1.5, 1.7 and 1.11 of the MA EHE Plan for Suffolk County
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA

community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- OHA, Boston Public Health Commission/Ryan White Division
- **Potential funding sources:** State, CDC

OBJECTIVE C2: BY DECEMBER 31, 2026, REDUCE NEW HIV INFECTIONS AMONG NATIVE- AND FOREIGN-BORN LATINX POPULATIONS BY 20%

C.2.1 By December 31, 2026, the OHA will award funding for up to ten organizations that include peers and others in the role of community health workers (CHWs) as well as behavioral health providers on interdisciplinary prevention and care teams.

C.2.2 By December 31, 2026, OHA will develop tailored health communications and educational materials to promote effective prevention strategies and health promotion topics relevant for Latinx people at risk for HIV including Latinx gay, bisexual, and other men who have sex with men, including transgender, nonbinary, and gender expansive people, as well as Latinx transgender, nonbinary, and gender expansive people made vulnerable by stigma, discrimination, and poverty. Education efforts will also focus on Latinx partners of people with HIV.

- **Outcomes (reported annually, locally monitored more frequently):** Reduce new HIV infections
- **Monitoring Data Source:** HIV Surveillance program
- **Expected impact on the HIV Care Continuum:** Reducing number of new HIV infections
- **Expected impact racial/ethnic and other inequities:** Reduce new infections among the Hispanic/Latinx population in MA and the Boston EMA
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goal 1, Objectives 1.7 and 1.11 of the MA EHE Plan for Suffolk County
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC, HRSA

OBJECTIVE C3: BY DECEMBER 31, 2026, REDUCE NEW HIV INFECTIONS AMONG PEOPLE WHO INJECT DRUGS BY 20%

C.3.1 By December 31, 2026, expand syringe service programming to five or more cities/towns that have not yet approved it (addressing stigma, role of local authority, and procedure for funding syringe services).

C.3.2 Develop a strategy to expand access to PrEP among people who inject drugs and are eligible for PrEP based on needle sharing or condomless sex. The strategy should focus on several communities where there is a concentration of people who inject drugs including Mass/Cass.

- **Outcomes (reported annually, locally monitored more frequently):** Reduce new HIV infections
- **Monitoring Data Source:** HIV/STD Surveillance program
- **Expected impact on the HIV Care Continuum:** Reducing number of new HIV infections
- **Expected impact racial/ethnic and other inequities:** Reduce new infections among people who inject drugs in MA and the Boston EMA

- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goal 1, Objectives 1.5, 1.7 and 1.11 of the MA EHE Plan for Suffolk County
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, Office of Local and Regional Public Health, MA-based harm reduction providers, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC

OBJECTIVE C4: BY DECEMBER 31, 2026, REDUCE NEW HIV INFECTIONS AMONG NATIVE AMERICANS AND NATIVE- AND FOREIGN-BORN PEOPLE FROM ASIA INCLUDING EAST ASIA, SOUTH ASIA, THE MIDDLE EAST, AND EASTERN EUROPE BY 20%

C.4.1 By December 31, 2026, engage at-risk and vulnerable Native American and native-and foreign-born individuals from Asia, including Ease Asia, South Asia, the Middle East, and Eastern Europe in integrated testing services.

C.4.2 Utilize culturally tailored and effective venues and strategies to provide integrated testing alongside holistic approaches to care services.

- **Outcomes (reported annually, locally monitored more frequently):** Reduce new HIV infections
- **Monitoring Data Source:** HIV Surveillance program
- **Expected impact on the HIV Care Continuum:** Reducing number of new HIV infections
- **Expected impact racial/ethnic and other inequities:** Reduce new infections among foreign-born people from Asia including East Asia, South Asia, the Middle East, and Eastern Europe in MA and the Boston EMA
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goal 1, Objective 1.11 of the MA EHE Plan for Suffolk County
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC

OBJECTIVE C5: INCREASE PREP PRESCRIPTIONS BY 35% BY DECEMBER 31, 2026

C.5.1 By December 31, 2026, collaborate with area health service and capacity building partners to assess provider prescribing practices for biomedical prevention services and increase PrEP and nPEP prescriptions to MA and EMA-based residents.

C.5.2 Increase provider education to reduce HIV-related stigma, hesitancy and improve screening process in prescribing PrEP, increase utilization of PrEP assistance programs, and limit patient costs (co-pays, monitoring tests) related to PrEP receiving a Grade; classification by the USPSTF.

C.5.3 Expand marketing of PrEP to reach cisgender women, transgender, nonbinary, and gender expansive people, and gay/bi/MSM of color.
C.5.4 Identify strategy to increase same-day PrEP modeled upon Rapid Start for people with HIV.

- **Outcomes (reported annually, locally monitored more frequently):** Increase in PrEP prescriptions among populations disproportionately impacted by HIV, including those in rural communities
- **Monitoring Data Source:** Pharmacies, patient assistance programs
- **Expected impact on the HIV Care Continuum:** Fewer people diagnosed
- **Expected impact racial/ethnic and other inequities:** Reduce disparities in use of PrEP between white non-Hispanic population and Black and Latinx populations.
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 1 and 3
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC, HRSA

OBJECTIVE C6: INCREASE TARGETED PREVENTION EFFORTS THROUGH INCREASED ASSESSMENTS AND PARTNERSHIPS

C.6.1 Implement an acuity scale (including an abbreviated version) for prevention to account for people at risk for multiple conditions as well as understand the impact of social determinants of health and trauma in relationship to implementation of HIV prevention strategies (as well as Hepatitis C, other STIs, SUD, etc.).
C.6.2 Partner with Black Lives Matter and Black excellence movements to promote HIV prevention into Black spaces.
C.6.3 Reduce risk for women who have sex with men by increasing prevention among men who have sex with men but may not identify as gay or bisexual.

- **Outcomes (reported annually, locally monitored more frequently):** Reduced HIV infections and promote sexual health
- **Monitoring Data Source:** OHA contract managers, including annual work plans, and end of year report summary
- **Expected impact on the HIV Care Continuum:** Reduce number of people diagnosed with HIV
- **Expected impact racial/ethnic and other inequities:** Expand the types and numbers of partners from Black communities involved in community-wide prevention, linkage, and retention services
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS goals 1 and 3
- **Responsible party or parties/key partners:** OHA, BPHC Ryan White Program, CBOs serving Black communities across MA and EMA
- **Potential funding sources:** State, CDC

OBJECTIVE C7: DEVELOP AND CONDUCT HIV PREVENTION EDUCATION CAMPAIGNS TO INCREASE HIV AWARENESS AND REDUCE STIGMA

C.7.1 Create a targeted education campaign for older adolescents and young adults (ages 16-24) regarding the health impact of HIV infection despite the availability of effective treatment.
C.7.2 For Boston EMA: Collaborate with the Boston public school system to increase HIV education in the schools.

C.7.3 By December 31, 2026, work collaboratively with school-based health centers and school-based sexual health programs, and MA Commission on LGBTQ+ Youth to support youth and young adults with access to medically accurate and developmentally informed sexual health services, including access to nPEP and PrEP, etc.
C.7.4 Pool resources to support prevention activity on dating sites (Jack'd, Scruff, Grindr) to enable agencies to utilize this important space to provide HIV prevention messages to gay, bisexual, transgender, nonbinary, and gender expansive people, and other men who have sex with men.
C.7.5 For Boston EMA: Continue to promote and utilize Someone You Know video and messages to combat stigma and increase HIV awareness.

- Outcomes (reported annually, locally monitored more frequently): Increased HIV awareness, access to prevention methods, reduced HIV incidence, and decreased stigma
- Monitoring Data Source: Community health needs assessments, BRFSS, YRBS, school-based health center monitoring and data collection
- Expected impact on the HIV Care Continuum: Reduction in new HIV cases
- Expected impact racial/ethnic and other inequities: Decreased HIV infections among Black and Latinx youth and young adults
- Links to which goal/s of the NHAS and/or other previous plans: NHAS Goals 1 and 3, Objective 3.4 of the MA EHE Plan for Suffolk County
- Responsible party or parties/key partners: State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, school-based health centers, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- Potential funding sources: State, CDC

OBJECTIVE C8: DEVELOP RESOURCES TO IMPROVE ACCESS TO INFORMATION ABOUT PREVENTION AND OTHER HIV SERVICES

C.8.1 Improve access to basic information about available services (and be specific about which services) (cross-cutting goal/objective) and how to access them, including Spanish language information, and transgender, nonbinary, and gender expansive competency.
C.8.2 Create web portal or other mechanism to increase community-facing information related to HIV prevention services, stakeholder meetings, and other opportunities for engagement.

- Outcomes (reported annually, locally monitored more frequently): Increase knowledge about HIV services and how to access them as well as opportunities for community engagement
- Monitoring Data Source: Input from community engagement and population advisory groups, MIPCC, Boston EMA Planning Council
- Expected impact on the HIV Care Continuum: Improvement across entire continuum
- Expected impact racial/ethnic and other inequities: Overall improvement in outcomes should disproportionately benefit Black people and Latinx people
- Links to which goal/s of the NHAS and/or other previous plans: NHAS Goals 1, 2, 3
- Responsible party or parties/key partners: OHA, BPHC Ryan White Program, community engagement and population advisory groups
- Potential funding sources: State, CDC, HRSA

RESPOND – GOAL D: IMPROVE HIV RESPOND FUNCTIONS THROUGH SYSTEMS STRENGTHENING

- **Objective D1:** Implement and improve upon cluster and outbreak detection and response plans
- **Objective D2:** Conduct assessments to create new data sources, strengthen existing data sources, and monitor data sources to anticipate needs of populations vulnerable to outbreaks
- **Objective D3:** Strengthen response function at community level and in rural areas
- **Objective D4:** Increase equity in response to outbreaks by reducing structural racism and strengthening programs that address social determinants of health
- **Objective D5:** Address monkeypox epidemic and ensure vaccine equity to build trust in response system

OBJECTIVE D1: IMPLEMENT AND IMPROVE UPON CLUSTER AND OUTBREAK DETECTION AND RESPONSE PLANS

D.1.1 Build Health Department infrastructure and local HD partner model (as local capacity permits) to respond to emergent outbreaks by establishing dedicated personnel and response protocol in OHA to respond sufficiently, including ensuring dedicated community-based capacities and resources to meet the need.

D.1.2 By December 31, 2026, the OHA will engage members from its Community Engagement and Population Health Advisory Groups to address concerns regarding data confidentiality, including the use of molecular surveillance, client-level data, rationale for data collection, and protocols for consent, data storage, and analysis.

D.1.3 By December 31, 2026, in partnership with the Boston Public Health Commission, update HIV cluster detection and outbreak response policies and protocols, including review of partnerships, processes and data systems to improve real-time cluster detection and response to improve sharing of data between state and local public health and providers.

D.1.4 Move toward more digitized solutions, including virtual meetings and online appointment booking to support a more rapid response.

D.1.5 Support availability of high quality and timely data for decision making (cross-cutting into other areas).

D.1.6 Continue and expand use of molecular surveillance while utilizing person-centered language when utilizing this resource to avoid stigmatizing language. This includes the use of molecular, socioeconomic, and demographic data (including information about sub-populations at risk, such as country of origin, social determinants of health and relevant outcomes) to investigate and intervene in networks with active transmission.

D.1.7 Include "Respond" in subsequent OHA and BPHC procurements with development of guidance for service providers, including who should be involved in the "Respond" function and a description of their responsibilities.

- **Outcomes (reported annually, locally monitored more frequently):** More effective response to HIV clusters, successful procurement of integrated respond function into programs of funded contractors
- **Monitoring Data Source:** After action reports of HIV outbreaks, successful procurement, and funding of contractors
- **Expected impact on the HIV Care Continuum:** Reduce new HIV infections, identify people with HIV who do not know it, linkage to and retention in care

- **Expected impact racial/ethnic and other inequities:** Reduce impact of HIV outbreaks which disproportionately impact Black people and Latinx people
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS goals 1 and 2; Objectives 2.5, 2.6 and 3.7 of the MA EHE Plan for Suffolk County
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC, HRSA

OBJECTIVE D2: CONDUCT ASSESSMENTS TO CREATE NEW DATA SOURCES, STRENGTHEN EXISTING DATA SOURCES, AND MONITOR DATA SOURCES TO ANTICIPATE NEEDS OF POPULATIONS VULNERABLE TO OUTBREAKS

D.2.1 Conduct assessment of size of populations of transgender, nonbinary, and gender expansive people in MA including size of population living with HIV (consider same for Black people, Native Americans, and at-risk women).

D.2.2 Identify gaps in knowledge and infectious disease service assessment of Black (and other) populations to learn what they know about HIV and other STIs.

D.2.3 Monitor substance use among gay and bisexual men, other MSM, and transgender, nonbinary, and gender expansive people about risks associated with injecting meth (slamming).

- **Outcomes (reported annually, locally monitored more frequently):** Increase in current information regarding areas currently requiring additional assessment
- **Monitoring Data Source:** HIV needs assessments including surveys, stakeholder groups, Boston EMA Planning Council input and other sources to be determined
- **Expected impact on the HIV Care Continuum:** Reduce HIV outbreaks by increasing ability to interfere with transmission in communities disproportionately impacted by HIV
- **Expected impact racial/ethnic and other inequities:** Increase ability to address HIV outbreaks among Black people, Latinx people, transgender, nonbinary, and gender expansive people, and people who inject drugs
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 1 and 3
- **Responsible party or parties/key partners:** OHA, BPHC Ryan White Program, funded contractors, community engagement and population advisory groups, Boston EMA Planning Council
- **Potential funding sources:** State, CDC, HRSA

OBJECTIVE D3: STRENGTHEN RESPONSE FUNCTION AT COMMUNITY LEVEL AND IN RURAL AREAS

D.3.1 Increase use of Community Health Centers (CHCs) for Respond activities.

D.3.2 Improve collaboration between CHCs and community-based organizations through data sharing and other agreements to help strengthen service provision to identified people with HIV or people at risk for HIV.

D.3.3 Implement strategies, such as telehealth and improved transportation, to support equal access to care for people living in rural areas.

- **Outcomes (reported annually, locally monitored more frequently):** Number of CHCs engaged in Respond activities, improved coordination among CHCs, community-based organizations and others in response activities
- **Monitoring Data Source:** After action reports
- **Expected impact on the HIV Care Continuum:** Reduce new infections, linkage, and retention in HIV care
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 1 and 2
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Mass League of CHCs, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC

OBJECTIVE D4: INCREASE EQUITY IN RESPONSE TO OUTBREAKS BY STRENGTHENING PROGRAMS THAT ADDRESS SOCIAL DETERMINANTS OF HEALTH TO REDUCE IMPACT OF STRUCTURAL RACISM IN HIV OUTBREAKS

D.4.1 Identify opportunities to reduce disparities in response to outbreaks in all aspects of the HIV prevention and care system through use of trusted messengers including CHWs, treating people holistically, and being transparent in use of molecular surveillance and privacy protections.

D.4.2 Integrate social determinants of health (housing, education, transportation, childcare, etc.) into all parts of the HIV care continuum to strengthen response to outbreaks.

- **Outcomes (reported annually, locally monitored more frequently):** Racial equity in response to outbreaks
- **Monitoring Data Source:** After action reports
- **Expected impact on the HIV Care Continuum:** Reduce new infections, linkage, and retention in HIV care
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 1 and 3
- **Responsible party or parties/key partners:** State Public Health Laboratory, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, case reporters in healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Mass League of CHCs, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State, CDC

OBJECTIVE D5: ADDRESS MONKEYPOX EPIDEMIC AND ENSURE VACCINE EQUITY TO BUILD TRUST IN RESPONSE SYSTEM

D.5.1 Ensure protocols for vaccine distribution and tracking reach communities in greatest need, notably the population of Black gay men, bisexual men and other men who have sex with men.

D.5.2 Engage with new stakeholders, sexual subcultures and affinity groups and spaces, including media/social media, and others with a stake in reducing monkeypox infections and impact among Black gay men, Black bisexual men, Black transgender, nonbinary, and gender expansive people.

D.5.3 Collect demographic data for those receiving monkeypox vaccine, specifically race/ethnicity data.

- **Outcomes (reported annually, locally monitored more frequently):** Number and race/ethnicity of people vaccinated for monkeypox, race and ethnicity of people reported infected with monkeypox
- **Monitoring Data Source:** MAVEN, MIIS, service intervention plans
- **Expected impact on the HIV Care Continuum:** Reduce new infections, linkage to care
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 1 and 3
- **Responsible party or parties/key partners:** OHA, BPHC Ryan White Program, funded subrecipients, Massachusetts League of Community Health Centers, BIDLS infections disease reporting system (MAVEN) Massachusetts Immunization Information System (MIIS)
- **Potential funding sources:** State, CDC, HRSA

WORKFORCE – GOAL E: STRENGTHEN AND EXPAND HIV WORKFORCE

- **Objective E1:** Increase HIV workforce participation and satisfaction through various strategies
- **Objective E2:** Increase racial and ethnic equity in the HIV workforce
- **Objective E3:** Increase equity in the HIV workforce for the transgender, nonbinary, and gender expansive communities

OBJECTIVE E1: INCREASE HIV WORKFORCE PARTICIPATION AND SATISFACTION THROUGH VARIOUS STRATEGIES

E.1.1 Dedicate an OHA staff person to focus on workforce issues.
E.1.2 Increase opportunities, including tuition reimbursement, for professional development of existing staff and new staff entering field.
E.1.3 Continue to preferentially support full-time work at competitive wages through policy, including utilizing procurements and workforce development initiatives.
E.1.4 Re-establish provider networks for support, knowledge exchange, and better care coordination through strategies like Communities of Practice.
E.1.5 Work with professional licensing boards in MA to include training in HIV care as part of continuing education (alternative: as part of licensure requirements).
E.1.6 Support hiring of qualified individuals with both lived (living with HIV, living Black, Latinx, transgender, gay, and immigrant in the US) and learned experiences as well as those who've received prevention and care services.
E.1.7 Require funded organizations to review hiring practices and job descriptions for biases, prioritize compensation for language skills, and support organizations to shift from retributive supervision/HR paradigms to more restorative options.

- **Outcomes (reported annually, locally monitored more frequently):** Increase in staff representation of affected populations, retention, increase in worker satisfaction
- **Monitoring Data Source:** Job postings, OHA contract manager records, input from stakeholder groups
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 1 and 2
- **Responsible party or parties/key partners:** OHA, BPHC Ryan White Program, funded contractors, capacity building and training providers, MA professional licensure boards, academic partners, HIV/AIDS Surveillance Program, Division of STD Prevention, OHA, BPHC, community-based organizations, including LGBTQIA+ organizations, healthcare settings, including hospitals, community health centers, private physician practices, reproductive health settings, health care facilities in correctional settings, mobile units, AccessHealth MA, Mass League of CHCs, NEAETC, Ryan White Planning Council, OHA community engagement and population health advisory groups, Getting to Zero Coalition, and behavioral health providers
- **Potential funding sources:** State

OBJECTIVE E2: INCREASE RACIAL AND ETHNIC EQUITY IN THE HIV WORKFORCE

E.2.1 By December 31, 2026, the OHA, in collaboration with its funded capacity building providers, will identify training topics to improve staff retention and improve opportunities for career advancement, particularly for gay men, gay men of color, persons with history of addiction, Black, Latinx, and non-US born people, transgender, nonbinary, and gender expansive people, and people with HIV who are part of the workforce.
E.2.2 By December 31, 2026, the OHA and funded capacity building providers will ensure training plans for the workforce addresses integrated infectious disease testing, client-centered and culturally responsive

care, delivery of stigma-free sexual histories and behavioral health assessments, trauma-informed care, and referral to community resources for both at-risk and people with HIV and their partners.
E.2.3 Identify more providers with linguistic and cultural competency in Spanish, ideally creating a statewide Latino HIV serving organization.
E.2.4 Conduct more training for providers in Spanish.
E.2.5 Hire and professionalize peer navigators through integration with certification of community health workers.
E.2.6 Work to increase staff who are reflective of the community we are serving, including people with lived experience (rather than just degrees) as well as people who have experienced incarceration.
E.2.7 Provide more training on meeting people with intersectional identities, i.e., gay Black men, transgender, nonbinary, and gender expansive people of color.
E.2.8 Implement justice, equity, and inclusion metrics in procurements and monitor programs when funded

- **Outcomes (reported annually, locally monitored more frequently):** More diverse workforce at OHA, BPHC, and among those working in program manager, coordinator, and direct service settings
- **Monitoring Data Source:** Staffing demographic charts, provider staffing chart and service reports
- **Expected impact on the HIV Care Continuum:** Improvement across the HIV Care Continuum resulting from the delivery of tailored and culturally responsive services
- **Expected impact racial/ethnic and other inequities:** Reduce racial/ethnic disparities through greater trust of an invested HIV services workforce
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 1, 2, and 3, Objectives 2.7 and 3.6 of the MA EHE Plan for Suffolk County
- **Responsible party or parties/key partners:** OHA, BPHC Ryan White Program, funded contractors, capacity building and training providers, academic partners
- **Potential funding sources:** State, CDC, HRSA

OBJECTIVE E3: INCREASE EQUITY IN THE HIV WORKFORCE FOR THE TRANSGENDER, NONBINARY, AND GENDER EXPANSIVE COMMUNITIES

E.3.1 Assess and build capacity of providers to serve the transgender, nonbinary, and gender expansive communities.
E.3.2 Identify best practices or standards for providing culturally competent services for transgender, nonbinary, and gender expansive people.
E.3.3 Develop document on best practices or standards of care for HIV prevention and care services for transgender, nonbinary, and gender expansive diverse communities to build competency in transgender, nonbinary, and gender expansive care across the HIV workforce.
E.3.4 Support training and integration of transgender, nonbinary, and gender expansive staff into HIV service organizations.
E.3.5 Work with MassHealth specifically around competency and gender-affirming care in treating the transgender, nonbinary, and gender expansive community.

- **Outcomes (reported annually, locally monitored more frequently):** More diverse workforce at funded contractors across all program capacities
- **Monitoring Data Source:** Provider work plans, staffing charts, and service reports
- **Expected impact on the HIV Care Continuum:** Improvement across the HIV Care Continuum
- **Expected impact racial/ethnic and other inequities:** Create improved system of HIV care for transgender, nonbinary, and gender expansive people through greater trust of the HIV services workforce
- **Links to which goal/s of the NHAS and/or other previous plans:** NHAS Goals 1, 2, 3

- **Responsible party or parties/key partners:** OHA, BPHC Ryan White Program, funded subrecipients, capacity building and training providers, academic partners, community-based organizations working with transgender, nonbinary, and gender expansive people, and OHAs population health advisory groups, including the Transgender Advisory Group
- **Potential funding sources:** CDC, HRSA

SECTION VI: 2022-2026 INTEGRATED PLAN IMPLEMENTATION, MONITORING, AND JURISDICTIONAL FOLLOW UP

2022-2026 INTEGRATED PLANNING IMPLEMENTATION

The Integrated Plan includes a range of objectives, strategies, and associated activities. MDPH and BPHC are committed to deep collaboration with partners and community stakeholders to implement activities of the plan, frequent assessment of our progress in implementing planned strategies, and the extent to which these activities achieve our objectives. MDPH and BPHC have robust public health infrastructures and mechanisms to support the implementation, monitoring, evaluation, quality improvement, reporting and dissemination of the Integrated Plan's goals and objectives.

MDPH and BPHC staff are already responsible for oversight of HIV prevention, care, treatment, and community engagement activities, in addition to MDPH's oversight of the HIV/STD Surveillance Program. This, along with the existing robust capacity of the HIV prevention and care workforce in Massachusetts, will support the successful implementation of the Integrated Plan activities.

OFFICE OF HIV/AIDS

OHA is the division within BIDLS that is responsible for administering state and federal resources for HIV prevention, care, and treatment services. OHA works with medical and non-medical organizations, community-based programs, people with HIV/AIDS, and other stakeholders to advance HIV prevention and care services. This includes needs assessment, community engagement and HIV service planning, awarding contracts for services, capacity building assistance, and service monitoring and evaluation.

OHA funds a range of services in medical, non-medical, and community-based settings across the Commonwealth for persons living with or at risk for HIV infection. These services include prevention and risk reduction services; integrated testing for HIV, hepatitis C, sexually transmitted infections, and TB; and linkage to care and treatment; as well as opioid overdose education and naloxone distribution (OEND) activities, syringe services programs (SSP), non-occupational post-exposure prophylaxis (nPEP) and pre-exposure prophylaxis (PrEP). OHA funds a range of health promotion and disease prevention services for people living with HIV, with the aim of supporting engagement and retention in care and improving health outcomes. Medical case management programs assist in the coordination of medical care and support services, and either directly provide or coordinate access to HIV treatment, adherence counseling, health systems navigation, peer support, nutrition, housing search and advocacy, rental/utility assistance, legal services, and benefits counseling services.

Within OHA, the Behavioral Health and Infectious Disease Prevention unit is responsible for all stakeholder engagement and community advisory activities. This unit integrates behavioral health and infectious disease frameworks, and population health data to inform service models to better meet the needs of individuals disproportionately impacted by HIV. Public health interventions are planned and coordinated with stakeholders to effectively address complex health conditions to maximize outcomes in the OHA-contracted prevention and care service system. Coordination of community engagement and advisory activities are an integral component of this work. Staff within this unit routinely participate in several local and national meetings, as well as planning and advisory groups, including recent participation in the National Alliance of State and Territorial AIDS Director's Health Equity Regional Meeting during which the use of dashboards to track EHE efforts were discussed.

BOSTON PUBLIC HEALTH COMMISSION

BPHC, the local health department for the City of Boston, administers Ryan White Part A HIV funding to the Boston Eligible Metropolitan Area (EMA). The Boston EMA is home to 85% of persons with HIV in Massachusetts, and the work of BPHC supports delivery of responsive, highly effective services to people with HIV in Suffolk County. Awards from BPHC support the following services: medical case management, psychosocial support, medical transportation, housing search and advocacy, and nutritional programs. BPHC staff provides programmatic support to Ryan White-funded agencies in Suffolk County, including contract management, monitoring client demographics and service utilization data, and providing technical assistance on grant management and reporting requirements. BPHC also awards municipal funds within the City of Boston to support evidence-based interventions for HIV-negative individuals at high risk for HIV, HCV, and STI acquisition.

HIV/STD SURVEILLANCE

The Massachusetts HIV/AIDS Surveillance Program (MAHASP) is responsible for providing a comprehensive picture of the HIV/AIDS epidemic to support prevention and health service activities delivered by the MDPH and a statewide system of health care and social service organizations. Epidemiologists are responsible for the collection, analysis, and interpretation of adult and pediatric HIV/AIDS case data. HIV/AIDS Surveillance data are disseminated widely throughout the Commonwealth, to governmental agencies, public and private providers, advocacy groups and consumers. MAHASP staff work collaboratively with planning and policy groups, health care providers and other Bureaus within MDPH, providing surveillance information and assisting with assessment of resource distribution and ongoing planning to ensure that the needs of people living with or at risk for HIV infection are met. HIV Surveillance staff routinely perform analyses to identify increases in new HIV diagnoses in particular agencies, cities, regions, or populations, and are vigilant to the emergence of HIV infection clusters or potential outbreaks.

CAPACITY OF THE HIV PREVENTION AND CARE WORKFORCE

In Massachusetts, HIV prevention and care services are delivered in community based medical and non-medical agencies by a highly skilled and experienced workforce. The comprehensive healthcare system in Massachusetts provides people living with HIV, and those at elevated risk, with a wide range of access to medical providers, including internal medicine and specialty and sub-specialty providers; these providers are in community health centers, hospitals, academic medical centers, family planning agencies, substance use disorder treatment programs, and other community-based health and social service programs.

Programs include a range of clinical and non-clinical staff, including HIV testing and linkage providers, phlebotomists, medical case managers, behavioral health specialists, and peers with HIV. These individuals often work directly, or in collaboration with, registered nurses, nurse practitioners, infectious disease physicians, and primary care providers.

MPDH has a robust internal capacity building system to support the development of the HIV prevention and care workforce. Capacity building staff utilizes several different modalities to deliver trainings and provide technical assistance, including, individual agency and/or program level TA, coaching sessions, classroom trainings, and webinars. Capacity building and technical assistance efforts are supported by staff from the Office of Health Care Planning (OHCP). OHCP oversees capacity building activities for all the programs/divisions of BIDLS. OHCP offers trainings and other capacity building services to local partners in collaboration with OHA, the New England Prevention Training Center (PTC), and external TA providers such

as the New England AIDS Education and Training Center (NEATC) and others. Contracts with capacity building providers and technical assistance consultants will also be leveraged as necessary.

KEY DATA SOURCES FOR EVALUATION

Available data sources are described below, along with a description of the feasibility of collecting the required data for evaluation of the activities outlined in the Goals and Objectives section of this Integrated Plan. We do not anticipate any substantial barriers to collecting data for the outcomes outlined.

ELECTRONIC HEALTH RECORDS SUPPORT FOR PUBLIC HEALTH

Electronic Health Records Support for Public Health (ESP) uses specific case detection algorithms consisting of diagnosis codes, laboratory tests, prescriptions, and clinical indicators to accurately identify health conditions. Data sent to MDPH includes procedures, laboratory results, medications, clinical visits, missed appointments, as well as patient information such as demographics, insurance information, and housing status. BIDLS currently receives data through ESP on a variety of conditions including chlamydia, gonorrhea, syphilis, and acute hepatitis A, B, and C. ESP implementation will be incrementally expanded to include health care facilities funded by BIDLS for provision of integrated HIV, HCV, STI, and TB prevention, screening, linkage, and care coordination services.

Expansion of ESP will facilitate reporting of enhanced surveillance data including HIV treatment and health status (e.g., retention in care, sustained viral suppression). Importantly, expansion of ESP will enhance capacity for data to care activities; notably, it will facilitate streamlining identification of patients who are out of care or sub-optimally engaged in care, and thereby increase the timeliness and efficiency of public health intervention to re-engage patients in HIV medical care. Timely data from ESP provides a mechanism to measure and monitor disparities in health outcomes and will be a component of Integrated Planning efforts to identify and prioritize clinical interventions to optimize health outcomes.

COMMUNICABLE DISEASE SURVEILLANCE DATA

Surveillance data including case reports and laboratory results on all reportable infectious diseases, including HIV, STIs and HCV, are reported to MDPH and are managed through the Massachusetts Virtual Epidemiologic Network (MAVEN). MAVEN is a web-based disease surveillance and case management system that enables state and local health departments to collect and share public health, laboratory, clinical, and case management data securely over the Internet. Data generated from these sources include updated HIV epidemiologic and laboratory data that inform federal reporting via eHARS. These data will be important for efforts to characterize the incidence of HIV co-infections (e.g., HIV/syphilis, HIV/HCV, and HIV/TB in particular), to understand how co-infections affect populations, and to inform and refine prevention and care planning efforts.

OHA SERVICE UTILIZATION DATA

All OHA-supported providers of prevention, testing and linkage, medical case management, and care and treatment services submit data to OHA including client demographics, exposure mode category, and service utilization (e.g., testing, medical case management, treatment). Data are maintained in multiple databases. Testing and linkage services data are submitted by providers via electronic forms; data collected from these forms are uploaded into the secure testing and linkage to care database (TLC) for ongoing analysis and submission to federal funders. Data related to health education, materials distribution, and syringe services (e.g., number of syringes distributed and collected) are similarly submitted to MDPH by contracted agencies for entry into a dedicated database (i.e., the Risk Reduction Activities database). Direct

services delivered to persons diagnosed with HIV, including referrals made and confirmation of linkages are entered into a local installation of CAREWare (CAREWare Massachusetts), a client-level data collection system supported by HRSA to evaluate Ryan White- funded services that have been tailored to the Massachusetts services system.

Boston Public Health Commission: Service Data and Funding Streams Overview

Members of the Ryan White Part A Planning Council, as well as staff at the Boston Public Health Commission, contributed valuable information to the needs assessment process relative to HIV/AIDS services funded through RWHAP Part A funds and the City of Boston. This information includes an annual review of funding streams and the availability of HIV/AIDS services within the Boston Eligible Metropolitan Area (EMA). This review describes the types and amounts of federal, state, and local funds available for HIV-related services in the Boston EMA. Data for this assessment is collected using a survey completed by various HIV/AIDS payers and providers in the Boston EMA. BPHC collects service utilization data for people with HIV in the Boston EMA through a system called e2Boston, which generates analytic reports that will contribute to planning processes.

IMPLEMENTATION

In developing the Integrated Plan, goals/objectives were written based on input from community engagement and population-based advisory groups. This included the Massachusetts Integrated Plan Coordination Committee (MIPCC) and the Boston EMA Ryan White Services Planning Council. Previous goals/objectives from the 2020 EHE Plan for Suffolk County Massachusetts were then re-examined by OHA and BPHC and, where it made sense, incorporated into the Integrated Plans goals/objectives, and expanded to encompass the entirety of OHA's jurisdiction, the Commonwealth of Massachusetts and BPHC's Ryan White Division's jurisdiction, the Boston Eligible Metropolitan Area.

Once finalized, MDPH and BPHC will create an annual work plan based on the Integrated HIV Prevention and Care Plan outlined in Section V, and which will include detailed tasks, responsible party, timelines, and measurable outcomes. As part of the implementation approach, MDPH and BPHC will review and update as necessary the structure and process for collaboration between planning bodies, recipients, and contractors/subrecipients, including communication protocols to support implementation and mechanisms to share progress and challenges.

OHA and the BPHC Ryan White Program are committed to continuing the collaborative relationships established during the development of the EHE Plan for Suffolk County Massachusetts throughout the implementation of this Integrated Plan. This is especially important, as synergy is needed between this plan and the EHE plan, and the collaborative approach will continue beyond initial implementation through the monitoring, evaluation, and improvement of the Plan. After submission of the plan, both OHA and BPHC plan to develop processes to create collaboration between OHA and BPHC for the purpose of monitoring, evaluating, and improving the plan. This will help to ensure that what has been done to accomplish the EHE plan will be replicated in the Integrated Plan and expanded into the full geographic area covered by both entities (OHA and BPHC).

MDPH and BPHC will perform frequent assessment of Integrated Plan progress in implementing planned strategies. Successful implementation will include:

- Monitoring of programmatic investments;

- Ongoing community engagements with the Boston EMA Planning Council, OHAs Community Engagement and Population Health Advisory Groups and residents from impacted populations;
- Regular communications with existing and new partners;
- Timely review of service utilization and MDPH HIV Data Dashboard data; and
- Contract monitoring performance information.

MONITORING AND EVALUATION

MDPH and BPHC will monitor and evaluate the Integrated Plan based on the goals, objectives, activities, data indicators, timeline, and responsible parties, as outlined in Section V. These indicators alongside other variables provide a roadmap for monitoring and evaluating the Commonwealth's response to HIV, specifically the strategies and associated activities outlined in the Integrated Plan. MIPCC and the Boston EMA Planning Council will also provide input on the monitoring and evaluation plan.

This monitoring and evaluation process will articulate the data collection, management, and analytic resources, tools and processes needed to implement the monitoring and evaluation plan, including identification of gaps and opportunities for improvement (including HOWPA). Specific measurable outcomes associated with identified strategies and activities have been identified. In this way, implementation of the monitoring and evaluation plan will promote and facilitate provision of high-quality, evidence-based prevention, care, and treatment services for HIV.

This process will be the primary mechanism to monitor our coordinated efforts across multiple actors and initiatives, and to remain accountable to stakeholders for priority commitments to reduce the impacts of HIV infection in the Commonwealth. Ongoing assessment of progress will enable adjustments to program plans, including ramping up strategies that are proven effective and reducing or re-directing investments from those that do not meet expectations. Evaluation of the plan will occur on an annual basis to assess whether the process of implementation and monitoring calls for improvement to the Integrated Plan. This may include readjustment of goals, objectives, timelines, measures, data sources, parties responsible or other factors.

To create a participatory process for monitoring and evaluation, OHA and BPHC will integrate their primary Integrated Plan workgroups, MIPCC and the Boston EMA Planning Council, into the process through periodic updates and discussion regarding progress on the IP's goals/objectives. In addition, progress on specific goals and objectives will be reviewed and discussed with community engagement and population advisory groups as part of the process of collecting input for the purpose of monitoring and evaluating the Integrated Plan.

IMPROVEMENT

This Integrated Plan is a living document that will be updated annually to include new or revised goals, objectives, and key strategies and activities. MDPH and BPHC will seek input from our existing recipients, subrecipients, the Boston EMA Planning Council, and OHA's Community Engagement and Population Advisory Groups regarding the local-level issues and challenges impacting progress as well as strategies to refine and improve efforts to respond to HIV and other STDs.

REPORTING AND DISSEMINATION

MDPH and BPHC are committed to transparency and accountability, and vows to report regularly on its progress towards achieving the objectives presented in this plan. We will report to key stakeholders and

advisory bodies on progress toward implementing the Integrated Plan, achievement of benchmarks, challenges encountered, and changes to the plan.

We will work with the MDPH Media Office to prepare a press release and collaborate with the Boston Public Health Commission and the local health agencies on coordinated communications about the Integrated Plan. MDPH and BPHC will distribute this plan to BIDLS staff, the Boston EMA Planning Council, and members of OHAs Community Engagement and Population Health Advisory Groups. The Integrated Plan will be posted on both the MPDH website and the Boston EMA Planning Council website for all community stakeholders to read and/or download. Updates and progress will be shared through these same venues.

The Executive Summary of the Integrated HIV Prevention and Care Plan serves as a stand-alone summative document highlighting the depth and breadth of community engagement, the future of prevention and care services priorities. It will be disseminated to internal and external partners of MDPH and the BPHC, corrections and mental health partners, researchers, academic partners, and MassHealth (the State's Medicaid agency) as well as local public health departments, elected officials, and advocacy organizations.

CONTRIBUTORS

The Bureau of Infectious Disease and Laboratory Sciences (BIDLS), Office of HIV/AIDS (OHA), and the Bureau of Infectious Diseases, Ryan White Services Division, gratefully acknowledges the many advisors and contributors to this plan. Each member of the Massachusetts Integrated Prevention and Care Committee (MIPCC), Statewide Consumer Advisory Group, Ryan White Planning Council members and Consumer Committee, Getting to Zero Coalition, The EHE Steering Committee, BIDLS and OHA staff, and participants of population advisory groups brought a wealth of experience, recommendations, insights, passion, and commitment, directed the content, feedback, and value to this joint city and state plan.

SECTION VII: LETTERS OF CONCURRENCE

APPENDIX 1: CHECKLIST

Requirement:	New Material and/or Existing Material Used to Meet Requirement:	Document Title/File Name of Existing Material Attached to Meet Requirement	Page Number(s) Where Requirement is Addressed in Existing Material	Notes (If Applicable)
Section I: Executive Summary of Integrated Plan and SCSN				
1. Executive Summary of Integrated Plan and SCSN	New Material			
a. Approach	New Material			
b. Documents Submitted to Meet Requirements	New Material

APPENDIX 3: MASSACHUSETTS HIV FINANCIAL INVENTORY

FEDERAL GRANTS AND CONTRACTS FEDERAL FISCAL YEAR 2022

Funding Source	Funded Service Providers	Funded Services
Ryan White HIV/AIDS Program Part A	Resources are administered by the Boston Public Health Commission Resources support service contracts at community-based medical and non-medical agencies in the Boston EMA.	• Medical case management • Medical transportation • Nutrition programs • Client advocacy (legal services) • Peer services • Dental ombudsman
Ryan White HIV/AIDS Program Part B	Resources support health department personnel, direct service contracts with 22 agencies that provide HIV services, and a contract with 1 agency that operates the HIV Drug Assistance Program.	• HDAP: Coverage for the full cost of drugs for uninsured people with HIV; Health insurance premium assistance; HIV medication copayment assistance • HIV Drug Assistance Program • HIV Medical case management • HIV ARCH services (high-acuity MCM) • HIV Medical transportation • HIV Home-delivered meals • HIV Housing search and advocacy • HIV Legal services • HIV Peer support services • HIV dental ombudsperson services
Ryan White HIV/AIDS Program Part C	Resources support personnel and costs associated with the delivery of services at 16 community health center and hospital programs	• Early Intervention Services • Core medical services • Support services • Clinical quality management
Ryan White HIV/AIDS Program Part D	Resources support health department personnel, 3 direct service contracts, 1 contract to provide consumer activities, and 1 contract to provide training and technical assistance through the MassCARE Program. Services are for women, infants, children, and	• Medical case management • Peer support • Consumer activities • Training and technical assistance

Funding Source	Funded Service Providers	Funded Services
	youth. HRSA also directly awards funds for this population to 1 hospital and 2 community health centers in Massachusetts.	
Ryan White HIV/AIDS Program Part F	Resources support personnel and costs associated with administering direct awards to oral health service providers and the New England AIDS Education and Training Center (NEAETC).	• Dental reimbursement program • Community based dental partnership program • AIDS Education and Training Center programs
CDC High-Impact HIV Prevention Programs for Health Depts. (PS18-1802)	Resources support health department personnel, health communications, training and capacity building, and direct service contracts with 20 agencies.	• HIV/HCV/STI testing • Comprehensive prevention services for people living with HIV and at risk for HIV
EHE Funding (PS 20-2020)	Resources support health department personnel, health communications, training, technical assistance, and direct service contracts with 9 agencies to provide HIV services in Suffolk County.	• HIV, HCV, and STI testing and linkage services • HIV Housing search and advocacy • HIV Legal services • HIV Peer navigation/support
Housing Opportunities for Persons with HIV/AIDS (HOPWA)	Resources fund service delivery at 4 agencies.	• HIV Medical case management • HIV Housing search and advocacy
Bureau of Substance Addiction Services (BSAS) Block Grant	Resources fund service delivery at 11 agencies.	• Overdose Education/Naloxone Distribution (OEND)

Funding Source	Funded Service Providers	Funded Services
SAMHSA State Opioid Response (SOR)	Resources fund service delivery at 23 agencies.	• HIV/HCV/STI testing and linkage services • Overdose Education/Naloxone Distribution (OEND) • HCV and PrEP clinical capacity and health navigation • HIV/HCV Correctional Linkage to Care • HIV ARCH services • Housing search and advocacy • Legal services
Bureau of Substance Addiction Services (BSAS) CDC Overdose 2 Action (OD2A)	Resources fund service delivery at 4 agencies.	• HIV/HCV/STI testing and linkage services at substance use disorder treatment sites • Overdose Education/Naloxone Distribution (OEND) • Recovery Coaching

MASSACHUSETTS STATE PROGRAMS AND RESOURCES FISCAL YEAR 2023

Funding Source	Funded Service Providers	Funded Services
MassHealth (MA Medicaid)	MassHealth resources are managed by the Commonwealth of Massachusetts.	• Medical care and treatment services • Expanded access to Medicaid for non-disabled PLWH under 200% FPL under an 1115 Medicaid waiver
State Budget Appropriations	Resources support direct service contracts with medical and non-medical providers: - 40 contracts to provide HIV prevention and screening services - 27 contracts to provide Medical Case Management and health-related support services - One contract to administer the Infectious Disease Drug Assistance Program	• Integrated HIV, HCV, STI, TB testing and linkage to care and treatment • Drug user health services/harm reduction services • HIV/HCV Correctional Linkage to Care Services • HCV, TB, and PrEP Health Navigation • HIV Medical case management, HIV ARCH (high-acuity MCM), medical transportation, HIV/HCV home-delivered meals, housing search and advocacy, rental assistance (rental start-up, eviction prevention, and utilities assistance), legal services, and peer support services. • HIV Disease Drug Assistance Program
Retained Revenue	Resources fund 21 agencies to provide HIV services, and fund 1	• HDAP: Coverage for the full cost of drugs for uninsured people with HIV; Health insurance

Funding Source	Funded Service Providers	Funded Services
Account (Pharmaceutical manufacturer rebates)	agency to operates the HIV Drug Assistance Program (HDAP)	premium assistance; HIV medication copayment assistance • HIV Medical Case Management • HIV Home-delivered meals • HIV housing search and advocacy, • HIV legal services • HIV dental ombudsperson services • HIV peer support
Bureau of Substance Addiction Services (BSAS) State Line	Resources fund 12 agencies to provide HIV services	• Overdose Education/Naloxone Distribution (OEND)
Bureau of Substance Addiction Services (BSAS) Harm Reduction Line	Resources fund 3 agencies to provide HIV services.	• Overdose Education/Naloxone Distribution (OEND) • Syringe services • Clinical capacity and health navigation

APPENDIX 4: PEOPLE WITH HIV AND KEY STAKEHOLDER REPRESENTATION IN PLANNING

#	Key Stakeholder Group	Name/Agency/Affiliation	Involvement Mechanism
1	Health Department staff (RW Part A)	Eileen Merisola Greg Lanza	MIPCC, EHE Steering Committee (SC), and Boston PC, representing: Boston Public Health Commission (BPHC)
2	Health Department staff (RW Part B)	Dawn Fukuda Linda Goldman Annette Rockwell Barry Callis Emile Day Eduardo Nettle (Massachusetts) Cynthia Bell (New Hampshire)	MIPCC and EHE Steering Committee, representing: Massachusetts Department of Public Health (MDPH); Boston PC, representing: New Hampshire Department of Public Health
3	People with HIV, including members of a Federally recognized Indian tribe as represented in the population, and individuals co-diagnosed with hepatitis B or C	Yes (names excluded for confidentiality)	MIPCC, Boston PC, EHE Steering Committee, and OHA Population Health Advisory Groups
4	Populations at-risk or with HIV representing priority populations	Yes (names excluded for confidentiality)	MIPCC, Boston PC, EHE Steering Committee, and OHA Population Health Advisory Groups
5	Behavioral or social scientists	Brianne Olivieri Mui Oscar Mairena Serena Rajabiun	MIPCC, representing: Northeastern University, Harvard University Boston PC, representing: University of Massachusetts, Lowell
6	Epidemiologist(s), HIV Prevention and Surveillance	Betsey John Laura Kersanske	MIPCC, EHE SC, MDPH HIV/AIDS and STD Surveillance Program

#	Key Stakeholder Group	Name/Agency/Affiliation	Involvement Mechanism
7	HIV clinical care providers (can include those funded by RW)	Alysse Wurcel Jeffrey Schaffer Anthony Silva Helene Bednarsh Norm Deschaine-Bonfiglio Emily DeMartino Michael Swaney Susana Medeiros Glory Ruiz	MIPCC, representing: Tufts Medical Center, Outer Cape Health Center Dental Program, BPHC, Dental Health Consultant, Baystate Medical Center Transgender Health Program of Western Massachusetts, Family Health Services, Health Innovations, Boston Medical Center
8	RWHAP Part C recipient	Leah Ward Meelyn Wong Chris Furtek Norm Deschaine-Bonfiglio Cecilio Orta Sarah Dupont Michael Swaney	MIPCC, representing: Brockton Neighborhood Health Center UMASS Medical Center BayState Medical Center Holyoke Health Center Lowell CHC Greater New Bedford Community Health Center; Boston PC, representing: Family Health Center of Worcester
9	RWHAP Part D recipient	Margarita Diaz Mahara Pinheiro	MIPCC, representing: MDPH, Bureau of Family Health and Nutrition, MassCARE, Boston PC, representing: Boston Medical Center
10	RWHAP Part F recipient (AETC)	Vanessa Carson-Sasso Debra Winters Amanda Hart	MIPCC, EHE SC, and Boston PC, representing: New England AIDS Education and Training Center
11	STD clinics and programs	Catherine Weerts David Goudreau	Boston PC, representing: Massachusetts General Hospital Division of STD Prevention
12	Non-elected community leaders including faith community members and business/labor representatives	Paul Glass Shirley Royster Lea Ward Kim Wilson Darian Hendricks Oscar Mairena	MIPCC, EHE SC, representing: Community Leaders and Advocates; Boston PC, representing: Boston University

EXHIBIT B

Boston EMA Ryan White Part A

Integrated HIV Prevention and Care Plan 2017-2021

Contributions and Acknowledgements

The Boston EMA Integrated HIV Prevention and Care Plan stems from the work of the Boston EMA Planning Council and the Boston Public Health Commission (Ryan White Part A Recipient).

Special thanks to the Comprehensive Plan Working Group Members for their work and input that contributed to the development of the Integrated Plan:

Edward Rewolinski
Lorraine Anyango
Stephen Batchelder
Sarah McPhee
Erika Moreno
Rob Quinn
Allison Rogers
Shirley Royster
Darren Sack
Eric Thai
Kim Wilson

In addition, we would like to acknowledge the following organizations and groups who contributed their time, insights and commitment to developing an Integrated Plan for Massachusetts, New Hampshire and the Boston EMA:

- Massachusetts Integrated Prevention and Care Committee (MIPCC)
- Statewide Consumer Advisory Board (SWCAB)
- Massachusetts Department of Public Health, Office of HIV/AIDS
- New Hampshire Department of Health and Human Services
- New Hampshire HIV Planning Group

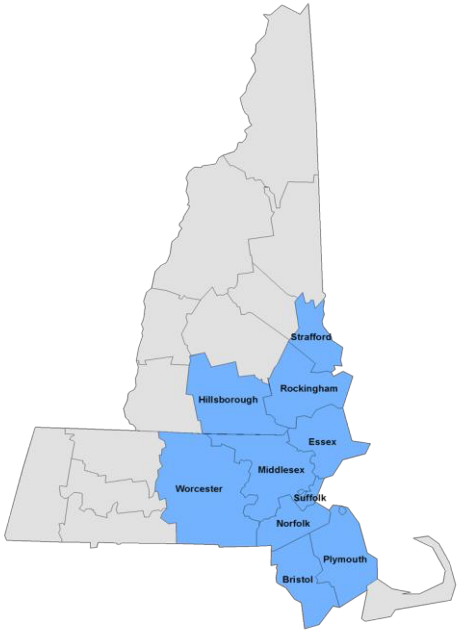
BOSTON EMA PART A INTEGRATED HIV PREVENTION AND CARE PLAN INTRODUCTION

In 2015, the Centers for Disease Control and Prevention (CDC) and the Health Resources and Services Administration (HRSA) released guidance to support the submission of an Integrated HIV Prevention and Care Plan (IHP), including the Statewide Coordinated Statement of Need (SCSN), a legislative requirement for Ryan White HIV/AIDS Program (RWHAP) Part A and B recipients. The IHP provides a roadmap for implementing the goals of the National HIV/AIDS Strategy, which has recently been updated up to 2020. The overarching NHAS goals include: 1.) preventing new HIV infections, 2.) increasing access to care and improving health outcomes, and 3.) reducing HIV-related health disparities.

Jurisdictions funded by the CDC's Division of HIV/AIDS Prevention (DHAP) and HRSA's HIV/AIDS Bureau (HAB) were charged with developing the IHP. A unique aspect of the guidance and the process to develop the plan is the option for jurisdictions to not only integrate previously separate HIV prevention and care services into one planning process, but also the potential for government agencies that served as funders of these services to better coordinate federal, state, and local funds to improve service delivery and health outcomes.

Unlike many other areas in the country, stakeholders in the Boston EMA have had a long history of collaboration. The Boston Public Health Commission (BPHC) works closely with the Boston EMA HIV Services Planning Council, including past work to develop a Part A Comprehensive Plan. Massachusetts Department of Public Health (MDPH) and New Hampshire Department of Health & Human Services (NH DHHS) have mandated seats on the Planning Council and are essential partners in designing and sustaining the region's HIV service delivery system. The three agencies are also national leaders in addressing the changing healthcare landscape through comprehensive health insurance coverage for all residents and a cleary focus on achieving and maintaining HIV viral suppression among PLWH.

In recognition of the longstanding role that MDPH and NH DHHS play in funding critical HIV prevention and care services, BPHC entered into the IHP process with the goal of supporting state health departments in their efforts to carry out the NHAS goals and collaboratively develop IHP workplans. This meant cross-participation in each agency's respective community planning groups/events, frequent communication on progress in developing the IHP, and demonstration of mutual support via letters of concurrence.



The Boston EMA Part A IHP represents a culmination of over a year of collaborative effort across government agencies and community planning group. It is a living document and will continually be updated to reflect the most current needs among PLWH in the EMA. This provides the best opportunity to achieve the NHAS goal of eliminating the HIV epidemic in the United States.

SECTION I: STATEWIDE COORDINATED STATEMENT OF NEED/NEEDS ASSESSMENT

A. Epidemiologic Overview

This section describes the geography of the Boston EMA and the demographic characteristics (socio-economic and ethnic composition) of both the overall general EMA region and its respective specific counties served by Part A funds.

Figure 1: Map of the Boston EMA

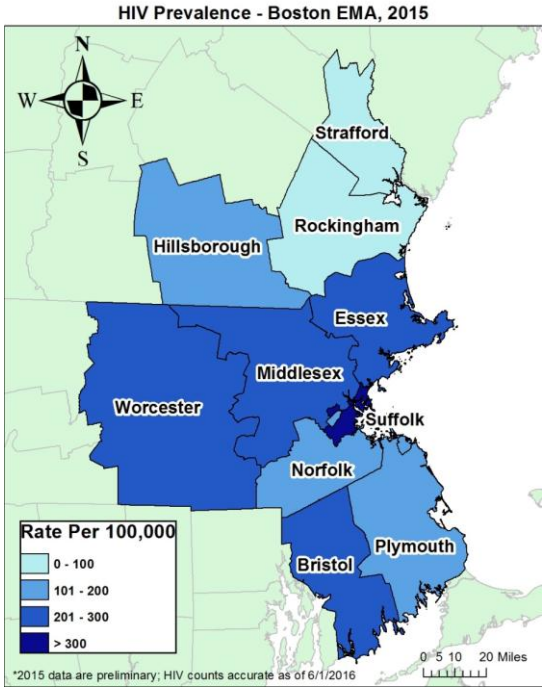
Geography

The Boston EMA includes ten counties: seven in Massachusetts (Bristol, Essex, Middlesex, Norfolk, Plymouth, Suffolk, and Worcester) and three in New Hampshire (Hillsborough, Rockingham, and Strafford). (Figure1). These ten counties in the Boston EMA cover an area of 6,451 square miles and a have total population of 6,411,521 [1] as of 2014.

Suffolk County is the smallest county, covering only 59 square miles; Worcester County is the largest county, covering 1,513 square miles. Despite being a small area, Suffolk County includes the city of Boston and is home to 747,928 [1] people, which constitutes a little over 11% of the total population of the Boston EMA. Middlesex County, MA has an area of 823 square miles, yet it has the largest population in the Boston EMA with 1,539,832 people. Strafford County has an area of 369 square miles and is home to 124,387 people, the smallest population in the Boston EMA.

Overview of HIV/AIDS in the Boston EMA

Data for this section were collected by MDPH and the NHDHHS, according to CDC surveillance criteria. De-identified data were then provided to the BPHC. BPHC also collects Ryan White Part A data through e2Boston, an electronic client level data system.



Prevalence and Incidence: As of December 31, 2014, there were 16,875 people living with HIV (PLWH) in the Boston EMA. This represents a 9% increase in PLWH from 2011 to 2014 [2] [3]. Among these PLWH, there were 9,397 individuals who also had an AIDS diagnosis, a 6% increase from 2011 to 2014. HIV incidence remained relatively stable from 2011 to 2013, with 604, 634, and 601 cases reported in 2011, 2012, and 2013, respectively. HIV incidence decreased from 2013 to 2014, dropping by over 5%. AIDS incidence also decreased from 379 cases in 2011 to 229 cases in 2014. In MA, the number of deaths among individuals reported with HIV/AIDS declined by 31%, from 333 in 2005 to 231 deaths in 2014 [4].

Table 1: Incident and Prevalent Cases – Boston EMA 2011-2014

	CY 2011		CY 2012		CY 2013		CY 2014	
	Inc.	Prev.*	Inc.	Prev.*	Inc.	Prev.*	Inc.	Prev.*
HIV	604	6,557	634	6,778	601	7,154	570	7,478
AIDS	379	8,902	344	9,077	309	9,310	229	9,397

Geographic concentrations by county: The majority of MA and NH HIV cases are located within the 10 counties that make up the Boston EMA. Eighty-one percent of all PLWH in MA live within the Boston EMA. Similarly, 69% of all PLWH in NH live in the Boston EMA [2] [3].

The burden of disease was highest in Suffolk County, where the prevalence rate was 883 PLWH per 100,000 people. This was substantially higher than Middlesex County, which has the second highest HIV prevalence rate at 238 PLWH per 100,000 people.

Characteristics of PLWH in the Boston EMA

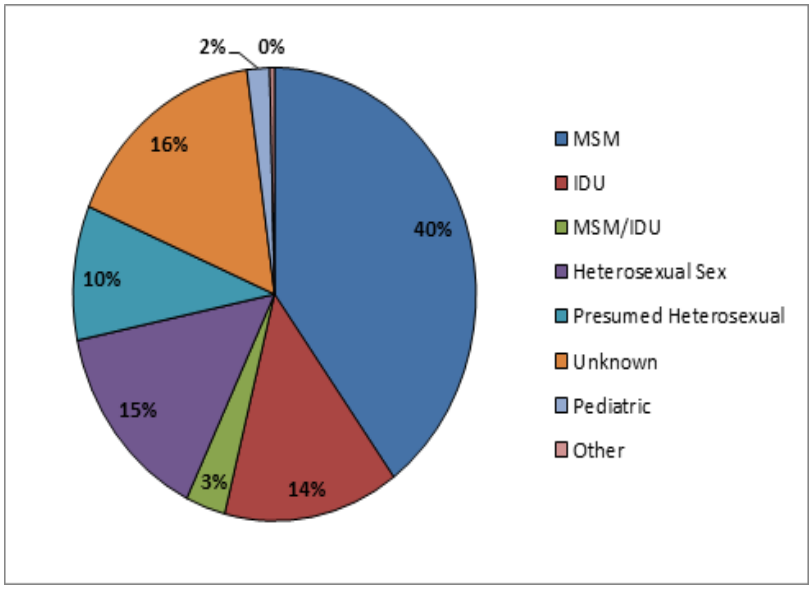
Non-US	**4,907**	29
Unknown	**29**	0



Race: HIV in the Boston EMA disproportionately affects Black and Latino residents. Though Black residents only make up 6% of the overall population of the Boston EMA, they represented 31% of PLWH in the same area in 2014 [2] [3]. This trend can also be seen in the most recent HIV diagnoses, where Black residents accounted for 36% of all cases diagnosed from 2011 to 2014. Similarly, Hispanic residents make up only 9% of the overall Boston EMA population, but accounted for 21% of PLWH in the same area in 2014. Hispanic residents represented an even larger proportion of recent HIV cases, accounting for 25% of all diagnoses from 2011 to 2014. Black and Hispanic residents were also more likely to be concurrently diagnosed with both HIV and AIDS from 2011 to 2014, a marker of lateness-to-care; 39% of those concurrently diagnosed from 2012 to 2014 were Black, and 26% were Hispanic, accounting for a combined 66% of total concurrent diagnoses in that time period.

Age: PLWH in the Boston EMA represent an aging population. As of 12/31/2014, 73% were ages 45 or older. This is in stark contrast to recent cases, where the majority (62%) of those reported in 2014 were diagnosed at ages 20 to 44 [2] [3].

Gender: Both nationally and in the Boston EMA, men account for a disproportionately large proportion of PLWH. In 2014, the majority (71%) of PLWH in the EMA were male and a similar proportion (75%) of new cases were men [2] [3].

Risk Exposure: A major reason for these gender disparities is due in large part to the fact that men who have sex with men (MSM) represent such a high risk group. In 2014, 40% of all PLWH in the Boston EMA identified MSM as a risk, more than any other risk group. MSM represented an even larger proportion of recent HIV cases, accounting for 45% of all cases diagnosed from 2011 to 2014 [2] [3]. The second most common risk group was those who were likely exposed through heterosexual sex (including presumed heterosexual), accounting for 25% of PLWH in the EMA. Fourteen percent were likely exposed through injection drug use, while 16% had unknown modes of exposure.

Figure 2: Percentage Distribution of PLWH by Risk Exposure

Among new cases reported in 2014, 30% had an unknown mode of exposure, a much larger proportion compared to 16% of all PLWH in the EMA. Another major difference in risk categories between PLWH and recent cases is that only 4% of cases reported in 2014 identified injecting drug use as a risk, whereas 14% of PLWH overall have this risk. This difference is probably due in large part to the success of needle exchange programs throughout the Boston EMA, and also may be due to shifting population networks among IDU.

Intersection of Risk Exposure, Gender and Race: White PLWH have historically accounted for the majority of MSM living with HIV in the Boston EMA, although more recent data indicate a demographic shift in this risk group. In 2014, 68% of all MSM living with HIV in the Boston EMA were White but a substantially smaller proportion (47%) of MSM diagnosed with HIV in 2014 were White [2] [3].

Twenty-eight percent of men diagnosed with HIV from 2011 to 2014 had an unknown mode of exposure. This represents the second largest risk category behind only MSM. Men exposed through injection drug use (IDU) represented 4% of all male cases during this time period, equal to the proportion exposed through heterosexual sex and through MSM/IDU. All other risk groups represented 3% or less of all male cases diagnosed from 2011 to 2014.

Table 3: Risk Exposure By Gender in the Boston EMA		
	N	%
Male Risk		
MSM	**6,732**	56
IDU	**1,487**	12
MSM/IDU	**544**	5
Heterosexual Sex	**746**	6
Presumed Heterosexual	**0**	0
Unknown	**2,240**	19
Pediatric	**160**	1
Other	**48**	0
Female Risk		
MSM	**0**	0
IDU	**939**	19
MSM/IDU	**0**	0
Heterosexual Sex	**1,752**	36
Presumed Heterosexual	**1,609**	33
Unknown	**448**	9
Pediatric	**151**	3
Other	**19**	0

For women, heterosexual sex is the primary mode of HIV exposure in the Boston EMA. Seventy-one percent of all women diagnosed from 2011 to 2014 fall into the heterosexual sex or presumed heterosexual sex risk groups. Black and Hispanic women account for the vast majority of these cases. In 2014, Black women accounted for 55% of new HIV cases in women, and the majority of these women were exposed to HIV through heterosexual contact. In 2014, Black women also represented nearly 14% of all PLWH in the Boston EMA, yet make up only 3% of the overall population of the Boston EMA [2] [3].

From 2011 to 2014, 18% of all women diagnosed with HIV in the Boston EMA had an unknown mode of exposure. While this constituted the second largest risk group for women behind heterosexual and presumed heterosexual sex, this was smaller than the proportion of men with an unknown risk during the same time period. Ten percent of the female cases from 2011 to 2014 were IDU, and no other risk group accounted for more than 1% of female cases from 2011 to 2014.

One risk group that has decreased substantially over the past couple of decades in the Boston EMA is IDU. Whereas 24% of all incident HIV cases were due to IDU in 1999, in 2014 this risk group accounted for only 4% of incident cases in the Boston EMA [2] [3]. This reduction is probably due in large part to the success of needle exchange programs throughout the Boston EMA, and also may be due to shifting population networks among IDU. Men made up the majority of IDU cases in 2014 at 60%.

Country of Origin: While most PLWH in the EMA were born in the United States or in U.S. territories, 29% were born outside of the United States. Foreign born individuals made up a larger proportion of recent cases, accounting for 38% of cases reported in 2014 [2] [3].

Concurrent Diagnosis: 126 of 553 (23%) new Boston EMA resident HIV cases in 2014 were concurrently diagnosed with AIDS. This means that these cases received both an HIV diagnosis and an AIDS diagnosis within 2 months of each other. Concurrent diagnoses may be a marker of late presentation to HIV care. This may be partly explained by new arrivals to the EMA from overseas who have an AIDS diagnoses when they arrive [2] [3].

*Data represents only Part A clients reported in e2Boston during March 1, 2015- February 29,2016. BPHC does not have income or insurance information of non-Part A clients.

Socioeconomic data: Based on 2014 census data, an estimated 11**%** of residents in the EMA are living below 100% FPL, 23.5% live below 200% FPL, and 36.7% live below 300% FPL [1]. Compared to the EMA population, e2Boston data show that majority of Part A clients (59%) live below 100% FPL, showing that Part A serves populations most in need [5].

Indicators of Risk for HIV Infection

MDPH and NHDHHS are responsible for collecting risk behavior data from behavioral risk factor surveillance, STD surveillance, Hepatitis C surveillance and substance use data. The following is a summary description of indicators of risk for HIV infection in MA and NH as described in the respective state plans [4] [6]:

MA

- Among 3,543 male and female respondents to the 2013 and 2014 MA Behavioral Risk Factor Surveillance System (BRFSS) surveys, 9% reported two or more sexual partners in the previous year, 69% reported one partner, and 22% reported no sexual partners. A larger proportion of men, as well as 18 to 24 year olds reported two or more partners in the previous year. All respondents were between 18–64 years of age,
- Of the 2,512 18–64 year old sexually active respondents to the 2013 and 2014 MA BRFSS, only 25% reported using a condom at last sexual encounter (27% of male respondents and 24% of female respondents).
- According to the Massachusetts Youth Risk Behavior Survey (MYRBS) collected in 2013, 58% of respondents reported condom use at last intercourse, 38% reported

ever having had sexual intercourse and 3% reported sexual intercourse before age 13. Nine percent reported four or more lifetime sexual partners. In addition, 28 % and 24% reported alcohol or drug use at last intercourse, respectively.

- MA publicly funded HIV Counseling, Testing and Referral (CTR) sites conducted 66,426 HIV tests of which 0.5% were positive. Testing identified 276 new diagnoses, representing 44% of individuals newly diagnosed with HIV infection (N=629) in the state.
- In MA state fiscal year 2014, 42% of 5,436 participants in state-funded Syringe Service Programs (SSP) reported being under age 20 years at first injection. Agencies providing SSP distributed over 650,000 syringes and collected over 640,000 syringes.
- The percentage of admissions to state-licensed substance abuse treatment programs for heroin addiction increased from 37% to 53% of total admissions, comparing state fiscal year 2006 to fiscal year 2015

NH

- 31% of NH adults have been tested for HIV test at some point compared to 34% of all US adults [7]. This lower percentage, indicates the need to increase HIV testing services in NH.
- An estimated 3% of adults in NH were at risk for HIV transmission in the 12 months prior to the BRFSS survey. Being "at risk for HIV transmission" included any of the following: used injection drugs in the past year; treated for an STD in the past year; had given or received money or drugs in exchange for sex in the past year; or had anal sex without a condom in the past year.
- STDs represent the highest burden for reportable diseases in NH. Rates of Chlamydia increased over the past decade from 140.7 per 100,000 in 2005 to 236.3 per 100,000 in 2013 (all rates are per 100,000). Over the same time period, gonorrhea incidence was ranging from a high of 13.7 in 2005 to a low of 7.6 in 2008. The rate was 8.9 in 2013 (the latest available year of data). Syphilis rates were also low (< 6 per 100,000), but increased slightly with rates of 5.4 and 5.7 in 2012 and 2013 respectively [6].
- Limited data were available to identify the scope of injection drug use in the general NH population or to describe the IDU population at risk for HIV. However, the NSDUH estimates show that from 2013 to 2014, 3.7% of NH residents 12 years or older and 2.6% of those 26 years and older reported using illicit drugs other than marijuana in the past month [8].

Information on these risk factors enables our state partners to implement effective HIV prevention strategies targeting those of highest risk. The Boston EMA Part A recipient also

utilizes this information to develop an action plan for its Early Identification of Individuals with HIV (EIIHA) strategies. As part of the Part A grant application, BPHC produces an EIIHA data table summarizing all HIV testing conducted at publically funded sites in the EMA (Table 5).

Table 5: EIIHA Data – Newly Diagnosed Test Events in the Boston EMA

Newly diagnosed positive HIV test events at Boston EMA publicly funded sites:							
	Between January 1, 2015 and June 30, 2015	Total	MSM	IDU	MSM/ IDU	Het. Sex (Women)	Unknown
(a)	Number of test events	20,961	3,035	3,135	152	4,419	10,220
(b)	Number of newly diagnosed positive test events	91	34	10	4	15	28
(c)	Number of newly diagnosed positive test events with client linked to HIV medical care	38	20	1	4	4	9
(d)	Number of newly diagnosed confirmed positive test events	68	33	5	4	9	17
(e)	Number of newly diagnosed confirmed positive test events with client interviewed for Partner Services	30	18	0	1	1	8
(f)	Number of newly diagnosed confirmed positive test events with client referred to prevention services	39	21	3	3	3	9
(g)	Total number of newly diagnosed confirmed positive test events who received CD4 cell count and viral load testing	81	36	6	2	16	21

The EIIHA data also identifies any services the newly diagnosed person may receive, such as linkage to medical care or partner notification services. Ensuring rapid engagement in care after initial diagnosis is one of many small steps to improve viral suppression in the EMA. The overarching goal of the EIIHA Plan is to reduce the number of undiagnosed and late diagnosed individuals and to ensure they are accessing HIV care and treatment.

Ryan White Part A Client Level Outcomes Information

Summary of Performance Measure Data: BPHC Quality Management staff conducted an in depth review of client level outcomes data following the conclusion of FY15. Outpatient ambulatory health services is not funded with Part A funds in the Boston EMA, so only primary achievements and characteristics among Part A medical case management clients and providers are listed below:

- 64% of clients indicated the presence of mental health issues (ranging from mild to severe)
- 94% had received a medical visit within 12 months of their most recent Part A service
- 54% are always able to attend HIV care visits
- 66% are stably housed, white the remaining 34% indicated need of some housing services

Many of the outcome scores of MCM clients were worse than clients who did not receive Part A funded MCM, presumably because clients active in Part A MCM have more initial needs. Trends will be monitoring in the future once more data is collected. JSI previously gathered outcomes data, but it is not possible to link the data sets.

Use of Data to Address Disparities: An in depth review of outcomes data from clients served in FY15 identified the following factors significantly associated with unsuppressed viral load in the EMA.

- Clients < 45 years old
- Unstably housed clients or those who need housing services
- Clients with non-MSM risk exposure
- Clients with reported mental health problems
- Black clients compared to other races
- Clients with no or a limited support network

These factors were identified through a multivariate regression analysis, using client level data from 92% of all clients served in FY15. Cross-sectional views of data continue to provide information about continuing disparities, such as the higher burden of HIV among Black and Hispanic communities in the EMA. The outcomes level data is already being used for an upcoming housing RFP and will be presented to the Planning Council later this year to assist with the allocations process.

Co-morbidities Affecting PLWH in the EMA:

BPHC specifically collects comorbidity information such as mental illness, substance abuse, sexually transmitted infections (STIs), hepatitis B (HBV), hepatitis C (HCV), and tuberculosis which greatly increase the cost and complexity of providing care to PLWH in the EMA. Many clients face multiple co-morbidities, particularly PLWH over the age of 45, requiring providers to prioritize and manage a number of conditions simultaneously.

Sexually Transmitted Infections: STI rates in the EMA are high, including PLWH. While Chlamydia remained by far the most common STI in the EMA in 2014, the incidence rate has decreased by 14% since 2012 [2] [3]. However, gonorrhea incidence rose sharply during this same time period, increasing by 41%. The incidence of primary and secondary (P&S) Syphilis increased by over 100% from 2012 to 2014. Despite this increase, case counts for Chlamydia and Gonorrhea still far exceeded those of P&S Syphilis, (18,449 and 3,432 vs. 567, respectively). The burden of STIs is not uniformly shared in the EMA, with MA counties of the EMA accounting for 89% of all reported STIs in the EMA in 2014. In 2014, Black residents represented only 6% of the EMA's population, but accounted for 14% of Chlamydia cases, 23% of Gonorrhea cases, and 15% of Syphilis cases. Also, Hispanic residents (only 9% of the EMA's population) accounted for nearly 19% of Syphilis cases.

Adolescents and young adults continue to be disproportionately impacted by Chlamydia, with the highest burden of disease reported in ages 15-24, while Gonorrhea mostly impacts a slightly older population. MSM accounted for 62% of reported Syphilis cases in the EMA in 2014. STIs are of particular concern due to the increased risk of HIV transmission. 32% of syphilis cases reported in 2014 were known to be co-infected with HIV, and another 17% did not know or declined to share their HIV status [2].

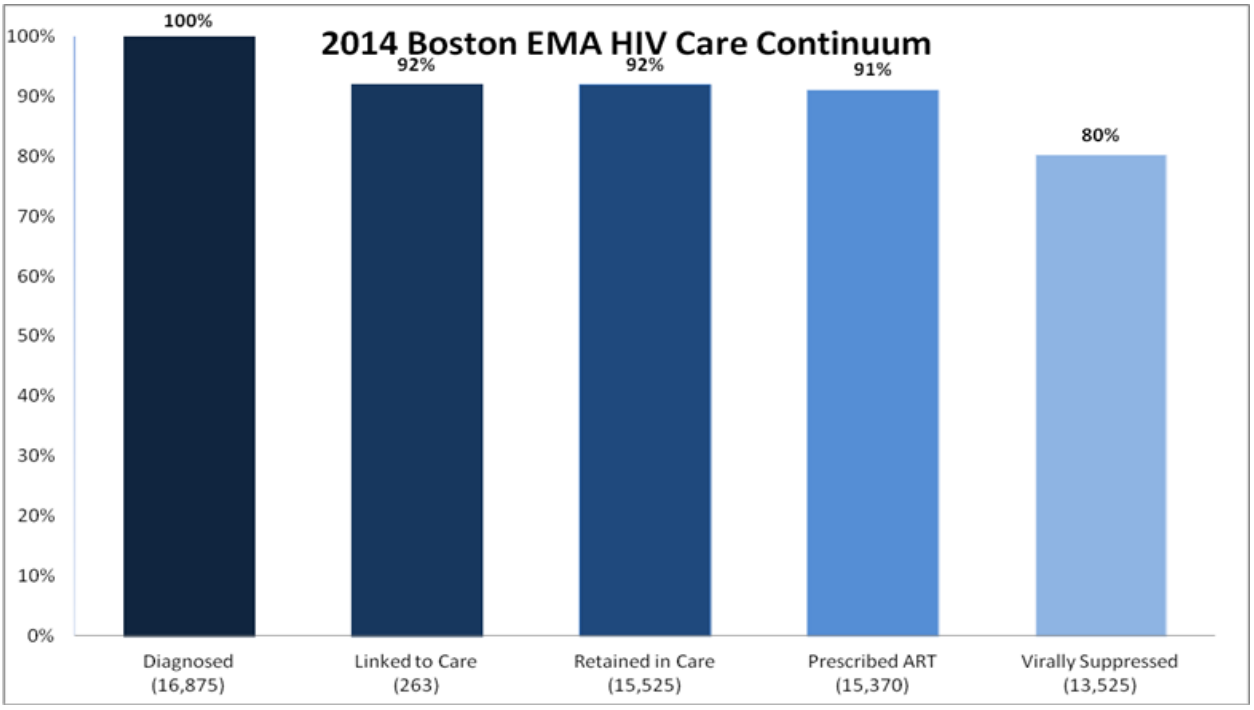
A recent John Snow, Inc. (JSI) Clinical Chart Review Project focuses on HAB Performance Measures and collects STI screening data [9]. In the most recent 2013 chart abstraction review year, the rates of STI screening among sampled PLWH at the 22 sites surveyed were as follows: Chlamydia 58%, Gonorrhea 58%, syphilis 63%, Pap or colposcopy 59% (Eligible populations varied by STI, but included about 1,000 people each, about 400 of whom were women eligible for a Pap smear).

Hepatitis: In 2014, there were 255 chronic cases of hepatitis B (HBV) reported in the Boston EMA, and 30 cases of acute HBV. The majority of chronic cases were reported in people 25 to 44 years old, with males accounting for slightly more cases than females. In the same time period, there were 4,613 cases of HCV confirmed in the MA counties of the EMA [2]. Case counts were highest in the 20-34 and 50-64 age ranges. In 2015, 65% of individuals (under 40 years) living with HIV and HCV co-infection in MA reported an IDU-related exposure mode, compared to only 7% among individuals infected with HIV only [4]. Shared transmission risk behaviors, such as unprotected sex and sharing of injection drug paraphernalia, have resulted in higher incidence of both HBV and HCV among PLWH than those not infected with HIV.

B. HIV Care Continuum

Using the diagnosis-based approach, the Boston EMA developed its HCC to identify barriers to achieving HIV viral suppression among PLWH in the Boston EMA. The surveillance data used to produce the HCC was obtained from MDPH and NH DHHS. In addition to these sources, the BPHC also uses e2Boston, a data system used to track demographic information and outcome measures for clients of Part A funded services, as well as information from the Clinical Chart Review (CCR), a report produced by John Snow Inc. The CCR project reviews a sample of HIV/AIDS clients receiving clinical care and/or case management among Part A and B funded clinics in MA. Figure 3 represents the HCC for all PLWH living in the Boston EMA in 2014. Table 6 explains how each stage is defined.

Figure 3: 2014 HIV Care Continuum in the Boston EMA



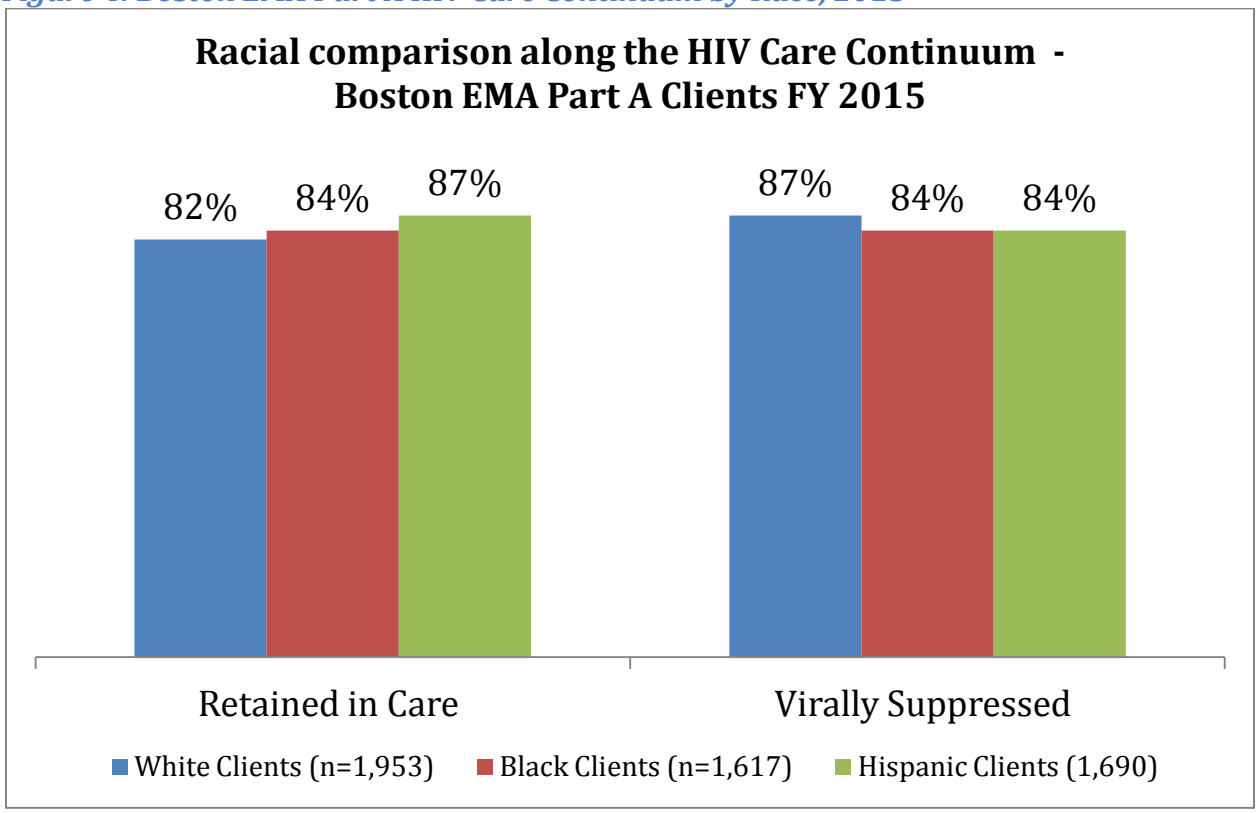


Table 5: HIV Care Continuum Narrative and Definitions	
Diagnosed:	16,875 estimated prevalent cases reside in the EMA. The diagnosed category represents the HIV prevalence in the Boston EMA as of December 31, 2014. MDPH and NHDHHS report the number of diagnosed individuals.
Linkage to Care:	This is defined as a medical visit within three months of their initial diagnosis (n=236). Linkage to care was identified through EIIHA data from MDPH and NHDHHS.
Retention in Care*:	According to the 2014 CCR, an estimated 15,525 PLWH had two or more medical visits at least 90 days apart during the measurement year.
Prescribed ART*:	An estimated 15,370 diagnosed PLWH were on ART in 2015. This measure was estimated with data from the 2014 CCR, which looked at presence of an ART prescription in medical records.
Virally Suppressed*:	An estimated 13,525 PLWH were virally suppressed in 2015. Viral suppression is defined as a viral load less than 200 copies/mL, data was used from the 2014 CCR.

* CCR data does not include PLWH living in the EMA counties of NH.

The Boston EMA HCC shows that 92% of PLWH who were diagnosed in 2014 are linked to care, 91% of those diagnosed are on ART, and 80% are virally suppressed. The Boston EMA has a higher percentage of PLWH who are linked to each stage of care in comparison to the national average. This may suggest that the Boston EMA's healthcare system has a greater capacity to support PLWH in comparison to other U.S. states and regions. However, significant barriers remain for many PLWH who are disproportionately affected by health disparities, which will be discussed under the *Assessing, Needs, Gaps, and Barriers* section.

*Disparities in Engagement among Key Populations along the HIV Care Continuum**

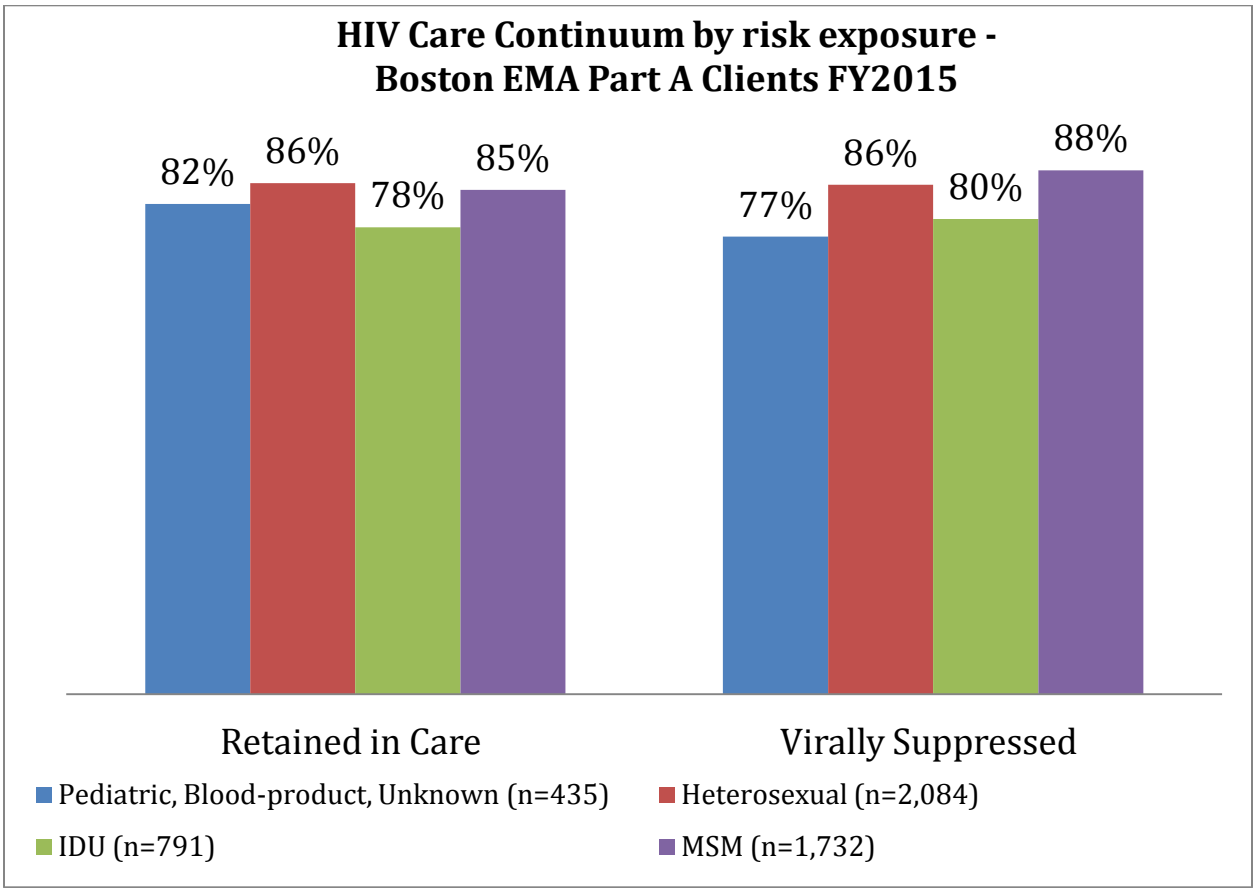

Figure 4: Boston EMA Part A HIV Care Continuum by Race, 2015

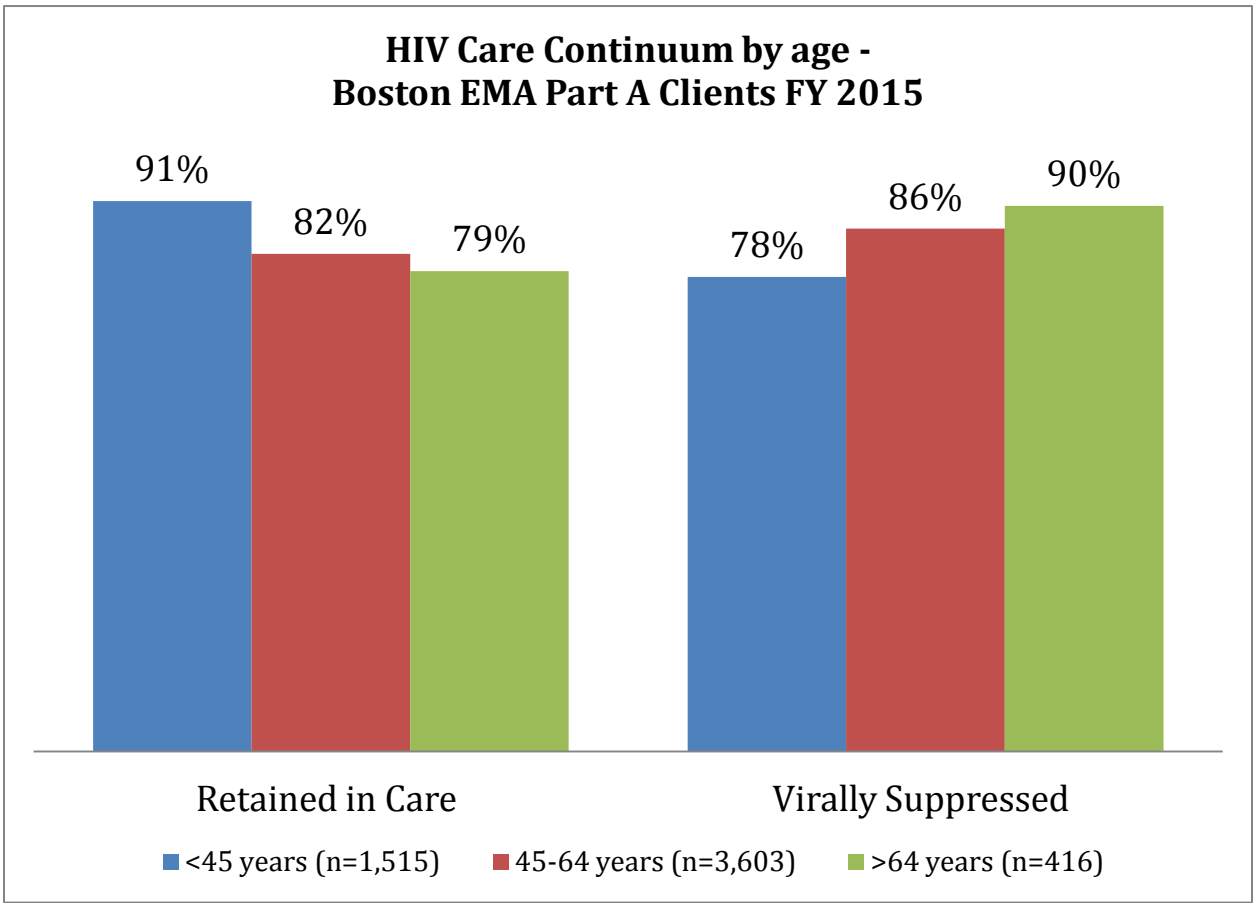
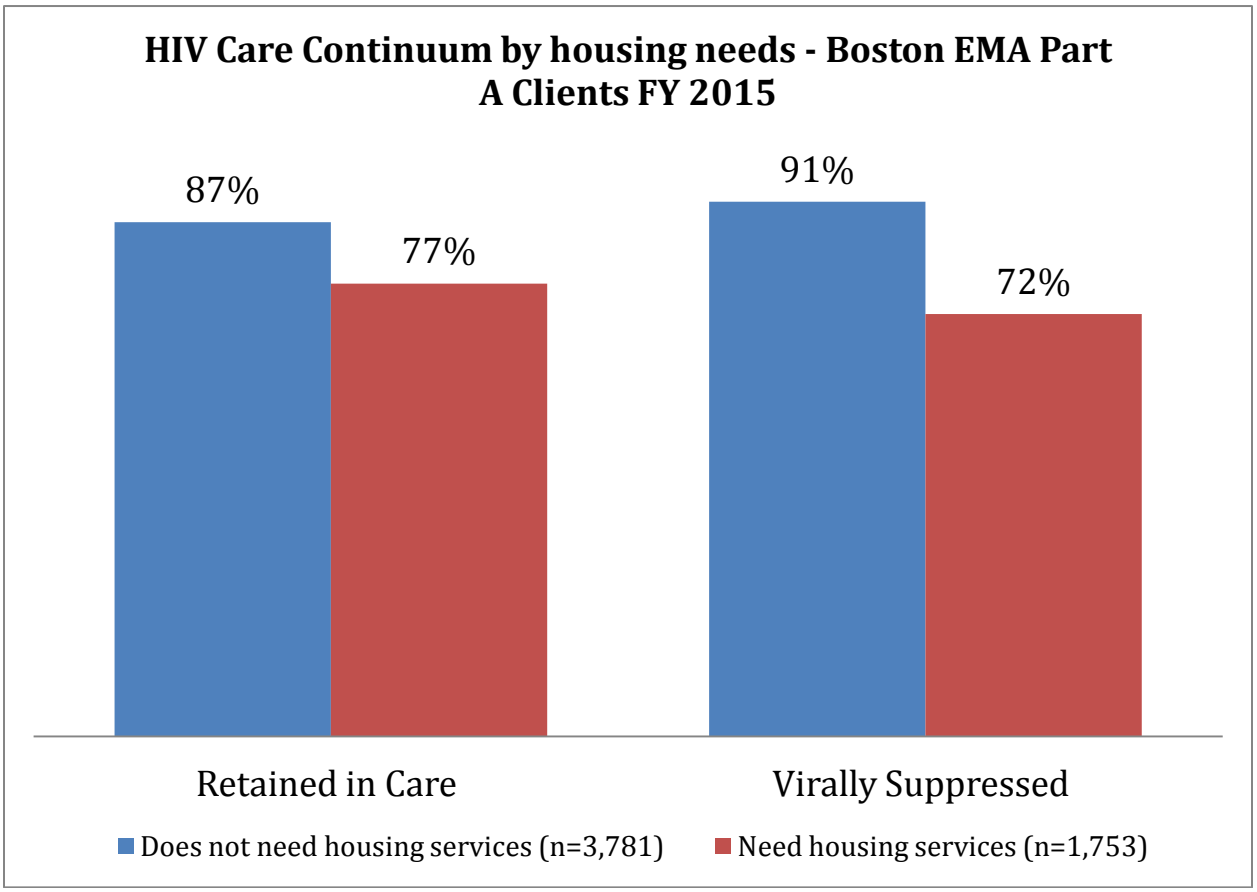
- More white clients were virally suppressed than retained in care
- An equal percentage of black clients were retained in care and virally suppressed
- Less Hispanic clients were virally suppressed than retained in care
- Retention in care is highest among Hispanic clients, and lowest among white clients
- Viral suppression is highest among white clients



**Figures 4-8 use a different definition for retention than the previous continuum. Retention in care is defined as having at least one medical visit within the last 12 months.*

Figure 5: Boston EMA Part A HIV Care Continuum by Risk Exposure, 2015



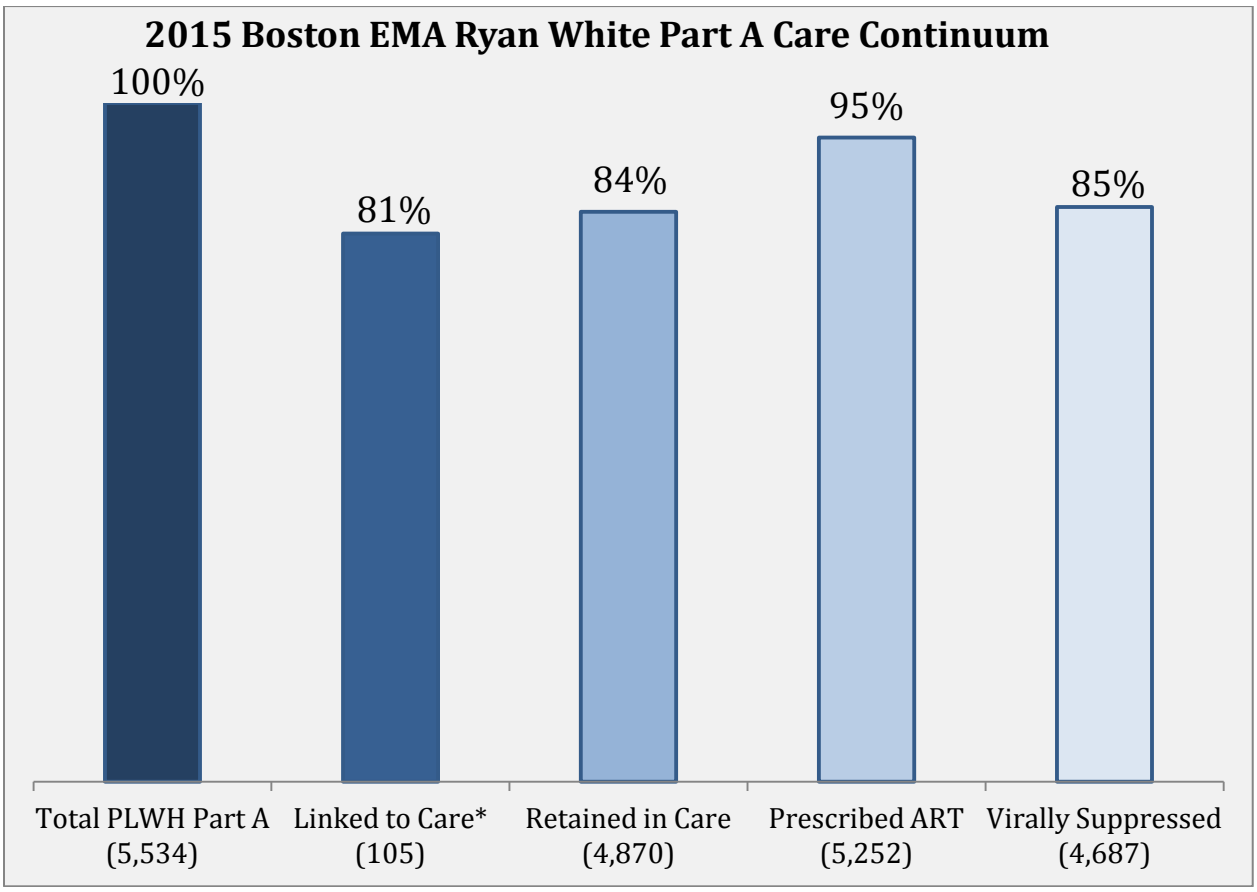
- Retention in care was highest among heterosexual clients
- Retention in care lowest among IDU clients
- Viral suppression was highest among MSM clients
- Viral suppression was lowest among pediatric/other risk exposed clients
- More clients were virally suppressed and not retained among MSM and IDU clients

Figure 6: Boston EMA Part A HIV Care Continuum by Age, 2015

- Retention in care was highest among clients less than 45 years old
- Viral suppression was highest among clients over 64 years old
- Older clients are less likely to be retained in care, but more likely to be virally suppressed
- Younger clients are more likely to be retained in care but less likely to be virally suppressed

Figure 7: Boston EMA Part A HIV Care Continuum by Housing Needs, 2015

Housing needs were determined by outcome reports submitted for clients, not by utilization data. In the outcome reports, providers were asked to report the clients housing status. Options included: stably housed, stably housed but need assistance, unstable housing, homeless/recently evicted.



- Clients that indicated no housing needs were more likely to be retained in care and virally suppressed than clients who have housing needs
- More clients without housing needs were virally suppressed than retained in care

More clients with housing needs were retained in care than virally suppressed

Utilizing the HIV Care Continuum in the Boston EMA

Figure 8 provides information on the HCC PLWH who are receiving Part A funded services, only using data from e2Boston. The figure shows 16% of clients are not retained in care, 5% are not on ART and 15% are not virally suppressed. This suggests the need to invest in more services that keep clients retained in care such as medical case management and psychosocial support.

Figure 8: HIV Care Continuum for PLWH Receiving Part A Funded Services

The Planning Council (PC) utilizes the Part A and broader EMA HCC in several ways. Since FY13, members have received a presentation on the national, MA, and NH care continuums as part of the National HIV/AIDS Strategy (NHAS). This information, part of data to care efforts, helps members prioritize and allocate funding towards key services to have PLWH achieve viral suppression. In addition to the information in the HCC, BPHC, in conjunction with the PC, has unpacked in greater depth factors associated with lack of viral suppression through the Unmet Need Project. This project identified homelessness, mental health and substance use disorder as major barriers to viral suppression.

C. Financial and Human Resources Inventory

PLWH in the Boston EMA utilize a range of HIV prevention and care services to ensure there are no gaps in services. There are many sources of funding for these services. The funding amounts reported in the table below are from an annual funding streams report conducted by BPHC and the Boston EMA Planning Council. The Funding Streams Report identifies funding for HIV services, particularly public funds available throughout the EMA. It describes federal, state and local resources available for HIV-related services. Data for this assessment are collected using a form completed by various HIV/AIDS payers and providers. The form requested a description of available services and funding information on their most recent fiscal year. This report also includes limited information on funding from the private and philanthropic sectors[1].

Table 7 lists all the (1) public and private funding sources for HIV prevention, care, and treatment services in the Boston EMA, (2) the dollar amount and the percentage of the total available funds in fiscal year 2015 for each funding source; (3) a description of services provided; and (4) impacted steps of the HIV Care Continuum. Supplemental information on funded agencies and service category funding are included in Appendices 1 and 2.

1 Most data consist of public funding; available private sources are limited.

Table 7: Boston EMA HIV Resource Inventory [10]

Funding Source	Direct Funding Allocation	Number of Provider Agencies*	Funded Services Delivered	Impacted Step of HIV Care Continuum
Ryan White Part A	$12,438,406	35	AIDS Drug Assistance Program (ADAP), Medical Case Management Medical Nutrition Therapy, Oral Health Care, Food Bank/Home-delivered Meals, Housing Services, Medical Transportation Services, Non-medical Case Management, Psychosocial Support Services, Substance Abuse Residential	Linkage to Care; Retained in Care; Antiretroviral Use; Viral Load Suppression
Ryan White Part B (MA&NH)	$14,006,000	MA: 57 NH: 21	ADAP, Early Intervention Services, Health Insurance Premium/ Cost-Sharing Assistance, Home Health Care, Medical Case Management, Mental Health Services, Oral Health Care. Outpatient/Ambulatory Medical Care, Substance Abuse Services – Outpatient	Diagnosed; Linkage to Care; Retained in Care; Antiretroviral Use; Viral Load Suppression
Ryan White Part C (MA&NH)	$5,244,451	MA: 16 NH: 1	Early Intervention Services, Medical Case Management, Medical Nutrition Therapy, Mental Health Services, Oral Health Care, Outpatient/Ambulatory Medical Care, Substance Abuse Services – Outpatient, Health Education/Risk Reduction, Legal Services, Linguistic Services, Medical Transportation Services, Non-Medical Case Management, Outreach Services, Psychosocial Support Services, Referral for Health Care/Supportive Services, Treatment Adherence Counseling	Diagnosed; Linkage to Care; Retained in Care; Antiretroviral Use; Viral Load Suppression
Ryan White Part D (MA &NH)	$1,731,342	MA: 4 NH: 1	Early Intervention Services, Medical Case Management, Mental Health Services, Oral Health Care, Outpatient/Ambulatory Medical Care, Emergency Financial Assistance, Food Bank/Home-delivered Meals, Health Education/Risk Reduction, Medical Transportation Services, Non-medical Case Management, Outreach Services, Psychosocial Support Services	Diagnosed; Linkage to Care; Retained in Care; Antiretroviral Use; Viral Load Suppression
Ryan White Part F (Dental, SPNS, AETC)	$1,078,892		Oral Health Services	Linkage to Care; Retained in Care; Viral Load Suppression
CDC Prevention	$2,366,491		Early Intervention Services	Diagnosed; Linkage to Care

Funding Source	Direct Funding Allocation	Number of Provider Agencies*	Funded Services Delivered	Impacted Step of HIV Care Continuum
Medicaid (Federal and State contributions)	$181,234,770	MA: 21,537 NH: 344	Home & Community-based Health Services, Home Health Care Hospice Services Medical Case Management Mental Health Services, Oral Health Care, Outpatient/Ambulatory Medical Care, Substance Abuse Services – Outpatient	Linkage to Care; Retained in Care; Antiretroviral Use; Viral Load Suppression
HUD/ Housing Opportunities for Persons with HIV/AIDS (HOPWA)	$7,097,201	MA: 11 NH: 4	Medical Case Management (MA and NH), Mental Health Services (MA and NH), Substance Abuse Services – Outpatient (MA and NH),, Emergency Financial Assistance (MA and NH), Employment Services* (MA and NH), Food Bank/Home-delivered Meals (MA) Health Education/Risk Reduction (MA), Housing Services (MA and NH), Linguistic Services (NH) Medical Transportation Services (MA and NH), Non-medical Case Management (MA), Referral for Health Care/ Supportive Services(MA and NH), Substance Abuse Services – Residential (MA)	Retained in Care; Antiretroviral Use; Viral Load Suppression
SAMHSA (BSAS and BDAS)	$312,213		Substance Abuse Services – Outpatient, Non-medical Case Management, Psychosocial Support Services, Substance Abuse Services – Residential	Retained in Care; Antiretroviral Use; Viral Load Suppression
MA State AIDS Line Item	$25,850,364		AIDS Drug Assistance Program (ADAP), Early Intervention Services, Medical Case Management, Oral Health Care, Food Bank/Home-delivered Meals, Housing Services, Psychosocial Support Services	Diagnosed; Linkage to Care; Retained in Care; Antiretroviral Use; Viral Load Suppression
Private Funds	$333,989		Early Intervention Services, Health Insurance Premium & Cost Sharing Assistance, Medical Nutrition Therapy, Outpatient Ambulatory Medical Care, Case Management, Non-medical, Emergency Financial Assistance, Food Bank/ Home Delivered Meals, Housing Services, Medical Transportation, Psychosocial Support (Peer Support), Referral for Health Care / Supportive Services	Diagnosed; Linkage to Care; Retained in Care; Antiretroviral Use; Viral Load Suppression

*Appendix 1 has the full list of provider agencies.

HIV Workforce Capacity

The comprehensive healthcare system in Massachusetts provides PLWH, and those at risk, with a wide range of access to medical providers located in community health centers, hospitals, academic medical centers, family planning agencies, substance abuse treatment programs, and other community-based health and social service programs. These programs include a range of clinical and non-clinical staff, including HIV testing counselors, phlebotomists, medical case managers, behavioral health providers, and HIV+ peers, all working in collaboration with, registered nurses, nurse practitioners, infectious disease physicians, and primary care providers. All MDPH-funded HIV service providers are required to comply with MDPH expectations to provide clinically and linguistically appropriate services (CLAS) [4].

NH DPHS developed a resource inventory describing the service providers available to PLWH in NH. The resource inventory includes HIV medical care providers, New Hampshire Ryan White CARE program information, AIDS Service Organizations (ASOs), and counseling and testing sites. Most HIV service providers are concentrated in the southern and eastern part of the state, which constitutes part of the Boston EMA [6].

A comprehensive workforce capacity assessment for MA has also been developed by the New England AIDS Education and Training Center (NEAETC), and is available in the MA IHP. The assessment cited specific findings from regional focus groups:

NEAETC Workforce Capacity Assessment Findings [11]	
MA	The knowledge gaps and training needs of providers include: • PrEP implementation in rural and urban settings, • Strategies to improve adherence to PrEP in the substance use population, • Sexual health history taking • Addressing cultural barriers
NH	Potential training topics based on perceived providers' needs: • Transgender issues and HIV • Transplant issues • Pregnancy and HIV • Aging with HIV • Cardiovascular disease • Prison issue • Treatment of pain and opioid users • Addiction issues with HIV • Non-alcoholic Hepatitis • PrEP The NH IHP recommends training around HIV, LGBTQ, and racial and ethnic minorities.

Coordination of HIV Prevention, Care, and Treatment Services

Coordination of resources and services between BPHC, the Planning Council, and other federal, state and local funders assures that Part A funds are used as the payer of last resort, that duplication of services is prevented and that the continuum of care meets the needs of PLWH. The Council tracks these funding sources as an annual activity related to resource reallocation. A Funding Streams expo took place on December 9, 2015 to introduce Planning Council members to major sources of public funding for HIV services including, Ryan White Parts A, B, C, D, and F, MA and NH Office of Medicaid, New Hampshire Bureau of Drug and Alcohol Services (NH BDAS), Massachusetts Bureau of substance Abuse Services (MA BSAS), Housing Opportunities for Persons with HIV/AIDS (HOPWA), Centers for Disease Prevention and Control (CDC), Special Projects of National Significance (SPNS), and AIDS Education and Training Centers (AETCs). A survey was also sent out to all funders and funded agencies to provide up-to-date information on programs and services within their respective funding streams. In the FY15-16 funding streams report, Ryan White funding in the EMA included information from the following:

- 2 Part B programs (MA and NH, including ADAP funding)
- 17 Part C programs,
- 5 Part D programs,
- 3 Part F Dental Reimbursement programs,
- 1 AIDS Education and Training Center, and
- 1 Special Projects of National Significance (SPNS).

Ryan White funding accounted for only 13% of funding for HIV services in the EMA [10]. Other federal and state resources, such as Medicaid, BSAS, BDAS, HOPWA, and Boston Housing Authority (BHA) made up a majority of payers for services for PLWH in the EMA. The funding streams report also sought funding information from Medicare, Department of Veterans Affairs (VA), and non-public funding sources (including foundation grants and private insurance). However, there was limited success in obtaining funding information from these organizations and agencies. Only $333,989 that directly supported HIV services was identified. Many institutions were reluctant to release any fiscal information.

Needed Resources and Services

Mental health has consistently been raised as a needed service, with clients and providers both citing lack of access and a limited number of providers. However, many mental health services are reimbursable by third parties and thus not eligible for Part A funds. In response, the Planning Council designates funds for non-traditional mental health services under Psychosocial Support. These services are non-traditional in that they are intended to serve clients in agencies and settings that are not certified to bill third party payers such as

Medicaid or other insurers. The Planning Council also does not allocate any funds to Early Intervention Services due to availability of funding from other sources with respect to HIV testing and referrals. The Council recognizes the importance of these services and they remain part of our full list of prioritized services within the Boston EMA.

D. Assessing Needs, Gaps, and Barriers

For this Integrated Plan, the Planning Council, along with the help of the PCS staff, utilized five resources to understand the needs of PLWH and groups that are at risk of HIV infection:

1.) ***2015 Unmet Need Project:*** This project utilized focus groups with PLWH (N=35) and surveys that were completed by infectious disease physicians who provided HIV care (N=23) to identify service gaps and barriers among PLWH who were out of care.
   a. Focus groups were held in different geographic regions of the EMA, and included sites where a variety of services were provided such as food banks, homeless shelters, substance abuse treatment sites, and a corrections facility
   b. The anonymous physician survey was sent electronically and asked participants to prioritize common barriers and identify services that would address unmet needs among their at-risk patients living with HIV

2.) ***2015-2016 Boston EMA Client Outcome Report:*** During FY15, Ryan White Part A funded agencies served 5,534 clients through 12 service categories and 34 unique agencies. Client level outcome data was collected through e2Boston, a data system used by all Part A funded providers in the Boston EMA. The report analyzes a sub-population of clients on outcome measures such as their viral suppression, housing status, mental health status, and medical visits.

3.) ***Needs Assessment data published by MDPH and NHDHHS:*** Since Ryan White Part A does not fund or track information about prevention efforts, data on risk populations were gathered from our Ryan White Part B partners.

4.) ***2016 Priority Setting Exercise:*** The Planning Council conducts a priority setting exercise each year to establish top service priorities. Members identify these priorities based on presentations and reports provided by PCS staff, and their personal experiences as PLWH, HIV service providers, and other stakeholders.

Populations at Risk for HIV Infection- Service Needs and Gaps

According to the MDPH, groups that have a higher risk of HIV infection include MSM, racial and ethnic minorities, non-US born immigrants and refugees, persons who inject drugs, and transgender individuals. Common service gaps among these groups include a lack of

service capacity (e.g. agency closures or insufficient resources), lack of culturally and linguistically appropriate services (e.g. low knowledge of risk group or lack of translation services), lack of access to behavioral and mental health services, and insufficient access to PrEP.

People Living with HIV- Service Needs and Service Gaps

Housing

Part A data suggest there is a need for housing services within the EMA, as 29% of reported FY2015 clients indicated a housing related need. These needs ranged from financial assistance for rent or utilities to housing search and advocacy. In addition, focus group participants within the Unmet Need Project indicated the need for more housing options as well as services to help them find housing, enroll in subsidized housing, and obtain vouchers. Planning Council members ranked housing services as the third most important service need during the 2016 Priority Setting exercise.

Mental Health

Part A data show that 54% of Part A clients reported having mental health problems. Of those clients, 41% were not receiving mental health services. Focus group respondents identified the need for more therapists, and in particular therapists who were bilingual and empathetic. Among physicians, access to mental health services and lack of mental health resources was the most frequently reported service need to address the challenges among their highest risk and non-adherent patients.

HIV Education

Focus group participants in the Unmet Need Project overwhelmingly reported the need for more HIV education for various groups including:

a.) PLWH: Participants expressed needing more information on how their body is affected by missing a medication dosage and substance use while taking ART. They also wanted to learn about pregnancy and reducing risk of vertical transmission, as well as nutrition guidelines for PLWH.

b.) HIV Providers: Some focus group participants felt that providers needed basic HIV information as well as empathy training.

c.) General Public: Participants mentioned the need to educate students, older adults, and immigrants on safe sex practices, HIV testing, and STIs to prevent future transmission and reduce stigma.

Transportation

The Unmet Need Project Focus group respondents felt that transportation services were needed specifically for PLWH to get to their medical appointments. Based on an

assessment of need among PLWH in NH, transportation to get to medical appointments was cited as the most common challenge among a sample of HIV positive survey participants. Despite Part A funding medical transportation services, the need for transportation may be an indication that PLWH may not know how to access or qualify for medical transportation services.

ADAP and Medical Case Management were ranked as the two most important services for PLWH based on the Priority Setting exercise done by the Planning Council. There are no data suggesting an unmet need for these categories, which may indicate that PLWH are able to obtain the services.

Barriers to HIV Prevention and Care

Evidence provided by the 2015 Boston EMA Ryan White Part A HCC (Figure 8) suggests that approximately 26% of PLWH in the Boston EMA experience barriers that prevent them from engaging in continuous HIV care. In addition, an estimated 5% of PLWH are not taking ART, and 15% are not virally suppressed in the Boston EMA. Below is a list of common barriers that contribute to gaps in the continuum of care:

Social and Structural Barriers

Poverty- During FY15, 59% of newly diagnosed Part A clients reported living at or below 100% FPL, 81% reported living below 200% FPL, and 88% lived below 300% FPL [5]. These data continue to demonstrate that many PLWH are challenged by economic and societal stresses. As a result, healthcare, including that for HIV, competes with needs such as housing, food, transportation, and clothing. Provision of care to this population is complex, as providers must address these tangible needs and assist clients in navigating the system of benefits and entitlements to keep them engaged in care.

Stigma- Stigma and public misperceptions of HIV can have a severely negative impact on PLWH. Focus group participants discussed various types of stigma that prevented them from seeking HIV care including stigma associated with substance abuse, immigration status, and fear of a partner finding out about their HIV status. In addition, 93% of physicians agreed that HIV stigma is a barrier to care with at least some of their clients.

Homelessness and Housing Instability – Homelessness in the EMA is driven by some of the highest housing costs in the nation, accompanied by low rental vacancy rates and a large share of renting households paying more than 30% of their income toward rent [12] [13]. The prevalence of homelessness is high among PLWH; an estimated 40% to 60% will experience homelessness at least once in their lifetime [14]. During FY14, 11% of Part A clients were non-permanently housed, reflecting the high prevalence of housing instability

among PLWH BPHC [5]. Homelessness was a constant concern raised by all respondents in the Unmet Need Project. For PLWH who experience homelessness, the lack of storage space created challenges with taking medication. In addition, going to medical appointments became problematic if the time of the appointment conflicted with the time they needed to be at a shelter to secure a bed for the night. When PLWH are focusing on securing basic needs such as a place to live or sleep for the night, their HIV care becomes a lower priority.

Service Provider Barriers

Service Provider Capacity - Lack of access to mental health services and inadequate mental health services were a frequently reported concern in the Unmet Need Project. Respondents reported long wait times for intake appointments and follow-up visits, as well as high turnover among mental health providers. Mental health service locations and eligibility requirements also limited clients' access to services. Respondents also reported a lack of system capacity for both inpatient and outpatient substance abuse facilities. Addressing these system capacity concerns will be critical for successful HIV treatment.

Client Barriers

Substance Use- According to data provided through the Drug and Alcohol Services Information System, in 2014 there were 84,719 new enrollments to substance abuse treatment services, or approximately 1.3 new enrollments per 100 MA residents [15]. In 2014, 218 Part A clients accessed substance abuse services [5]. Substance use disorder was frequently cited as a barrier to HIV care in the Unmet Need Project. Prioritization of substance use over HIV care was a common theme among focus group participants. Eighty-two percent of physicians providing HIV care also cited substance use as a common barrier to care for PLWH and that patients with substance use issues were less likely to respond to phone calls or emails from providers.

Other reported barriers from the Unmet Need Project include having a negative experience with a provider, being in denial about or not wanting to deal with their HIV, and fear of others finding out about their HIV status.

E. Data: Access, Sources, and Systems

Main Sources of Data

Table 8 outlines the data sources and data systems used to conduct the needs assessment and develop the HIV Care Continuum

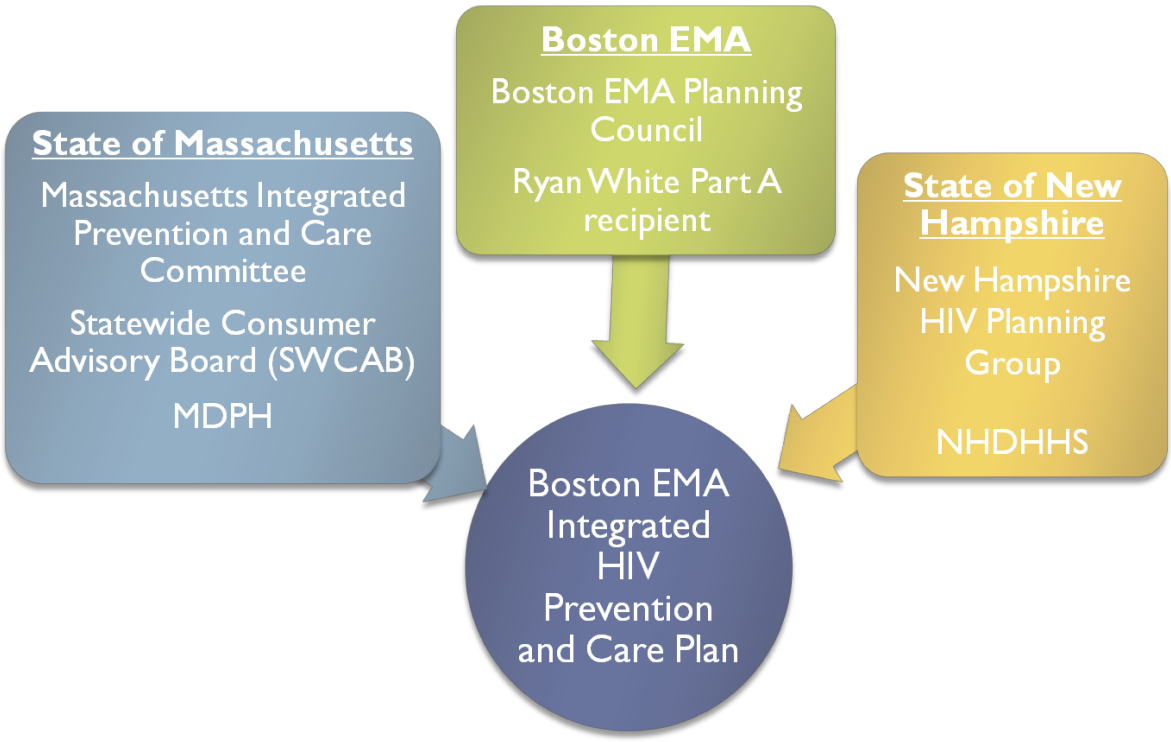
Table 8: Data Sources and Data Systems

Data Systems/Data Source	Data
e2Boston	Client demographics, Service Utilization and Outcomes
Clinical Chart Review	Client demographics, Service Utilization and Outcomes
2015 Unmet Need Project (Focus Groups, Surveys, Emergency Department Data)	Needs, Gaps and Barriers
MDPH HIV Surveillance	Prevalence, Incidence, Viral Load Monitoring and HIV Testing data
NHenhanced HIV/AIDS Reporting System (eHARS) database (2005-2014) (Surveillance Data)	HIV Infections, HIV diagnoses, HIV prevalence, including by transmission status, race/ethnicity, gender, country of origin; HIV Care Continuum
NH 2014 and 2015 Quantitative Survey of Assessment of Need, Gaps, and Barriers	Needs, Gaps and Barriers
NH 2014 Qualitative Focus Groups	Needs, Gaps and Barriers

Data Policies

The Boston EMA relies on its state partners, MDPH and NHDHHS to provide HIV surveillance data. Release of this information is usually delayed.

Obtaining New Sources of Data



Direct access to HIV data for analysis is not available to BPHC. Access to the HIV surveillance dataset would allow BPHC to perform additional analyses of interest without having to burden MDPH and NHDHHS.

In addition, both the Boston EMA Unmet Need Project and the NH Needs Assessment study had low numbers of participants who were not in care. BPHC and the Planning Council are currently conducting a new study to identify barriers that prevent PLWH both in and out of care from receiving needed services or from continuing in care, including an assessment of unmet needs for PLWH who know their HIV status but are not in care and strategies to reach out to those unaware of their status. This new study is targeting a higher sample size of participants and should provide more current information on the needs of the Boston EMA population.

Section II: Integrated HIV Prevention and Care Plan

A. Integrated HIV Prevention and Care Plan

As a directly funded agency with a jurisdiction overlapping two states, the Part A IHP represents a combination of three distinct jurisdictions: MA, NH and the Boston EMA. Representatives from the Planning Council and BPHC attended planning meetings convened between 2015 – 2016 by the NH Integrated HIV Prevention and Care Work Group (IHW) and MDPH OHA to develop and prioritize the goals and objectives of the state plans. The Planning Council also convened its own Comprehensive Plan working group which consisted of key stakeholders such as members of the MDPH Statewide Consumer Advisory Board, representatives from MDPH and NHDHHS, a representative from BPHC, the City of Boston's Mayor's representative, and Planning Council members, including PLWH, to examine progress on previous Comprehensive Plans and adapt them for an EMA-specific IHP.

Based on these state planning meetings and community planning process, the Boston EMA developed an Integrated Care and Prevention Plan that compliments the two state plans while highlighting specific EMA objectives that can address the unique needs of EMA residents. Table 9 (included under the Section III: Monitoring & Improvement) provides the Boston EMA goals and objectives along with corresponding strategies, activities, target populations, responsible parties and metrics to monitor progress. Copies of MA and NH IHP workplans are included in Appendix 3 and 4.

Boston EMA Part A Integrated HIV Prevention and Care Plan – Goals and Objectives

The 2017 – 2021 IHP includes at least three strategies in each objective. Each objective utilizes a SMART format that identifies the timeframe, responsible parties, activity/action step, target population or stakeholder, and data indicators. As a Part A jurisdiction, the EMA's IHP identifies numerous projects that involve the Planning Council and particularly its consumer membership.

The plan also features short and long-term strategies and activities that allow more complicated, intensive initiatives to be completed and evaluated closer towards 2021. Conversely, short term activities allow BPHC to update the Planning Council on current goals to implementing the IHP. Similarly, new strategies and activities may be adopted in collaboration with MDPH and NH DHHS based on lessons learned from implementation of their state plans.

A workplan with all goals, SMART objectives, and strategies is included in Section III.

IHP Goal 1: Reduce New HIV Infections

Objective A: By 2021, ensure 100% of all Part A funded sites provide internal linkages to comprehensive HIV services for PLWH and their significant contacts or can demonstrate appropriate linkages in the community

Strategies and activities include:

- Complete a comprehensive needs assessment on current HIV positive prevention and care needs of PLWH residents in the Boston EMA, comprising a literature review, consumer survey, focus groups, and interviews with healthcare providers and case managers
- Implement contract language to require comprehensive HIV services to be made available to PLWH accessing Part A case management & peer support programs and ensure access to a range of "treatment as prevention" services, including access to partner notification services, family & reproductive health services, and risk/harm reduction services
- Re-procure all Part A service categories and incorporate language in contracts that require providers to directly deliver or make available through linkages access to comprehensive HIV services for PLWH and their significant contacts.

Objective B: By 2021, expand entry points or specialized staffing that serve individuals at high-risk for HIV infection or those that do not know their status.

Strategies and activities include:

- Submit an application to HRSA requesting a Syringe Services Program (SSP) Waiver to utilize Part A funds to support engagement of PLWH affected by substance abuse, particularly those at risk for co-occurring Hepatitis C infection and opiate overdose
- Expand collaboration with partners, including embedding and integration with existing Part A program sites, to identify newly diagnosed individuals who may be seeking care for HIV, TB, HCV and other STI's
- Develop a coalition/network of providers and government agencies dedicated to expanding the presence and awareness of comprehensive HIV services for chronically homeless individuals seen at homeless/transitional shelters, drop-in centers, and environments where they can be engaged for services
- Implement a training program to expand the number of community health workers in the EMA with expertise in providing comprehensive HIV services targeting PLWH and high-risk negatives, particularly in developing community-based needs assessments, home-based service delivery, and linkage to primary care services

IHP Goal 2: Increase access to care and improve health outcomes for PLWH

Objective A: By 2021, improve viral suppression rates from 85% to 90% for PLWH who currently utilize Part A services in the Boston EMA.

Strategies and activities include:

- Utilize case managers, peer advocates, and community health workers targeting virally non-suppressed PLWH for community-based services, including those delivered in the home, such as directly observed therapy, accompaniment to medical appointments, and other support
- Expand funding for high acuity case manager positions at agencies with >10% virally unsuppressed client populations to improve PLWH utilization of essential services that improve viral suppression
- Expand services that address persistent challenges to viral suppression, such as mental health, substance abuse, and homelessness, including usage of community health workers; referrals to syringe exchange/recovery services; housing search & advocacy

Objective B: By 2021, improve percentage of Part A clients who have health insurance from 92% to 97%.

Strategies and activities include:

- Ensure all funded Medical Case Management (MCM) and (Peer Support) PS staff are trained and consistently providing health insurance enrollment and recertification activities to any RW eligible PLWH
- Ensure uninsured or under-insured PLWH are aware, referred, and enrolled in health insurance premium and co-pay assistance services funded by MA and NH Part B

- Reduce number of clients that have lapses in coverage due to failure to recertify or payment of insurance premiums

IHP Goal 3: Reducing HIV related disparities and health inequities

Objective A: By 2021, reduce the gap in viral suppression rates among White (87%) versus non-Hispanic Black (84%) and Hispanic (84%) PLWH who currently utilize Part A services in the Boston EMA.

Strategies and activities include:

- Design training and capacity building activities that utilize current viral suppression data for Black and Hispanic PLWH to improve providers' abilities to deliver high quality, culturally competent HIV services to virally non-suppressed PLWH
- Support the NH anti-stigma campaign, which will focus on communities of color
- Invest in high acuity case management and peer support services that target Black and/or Hispanic PLWH through Part A MAI funding, including funding at least one new agency/program targeting an area with high HIV incidence among Black and/or Hispanic PLWH
- Implement data-to-care quality improvement activities for agencies and programs with >10% virally unsuppressed Black and/or Hispanic PLWH

Objective B: By 2021, decrease the percentage of Part A clients who need housing services from 34% to 29%.

Strategies and activities include:

- Conduct annual priority setting and resource allocation processes that identify new HRSA service categories that can be added to the EMA's list of funded categories in order to address housing needs among PLWH EMA residents.
- Invest in comprehensive housing services that successfully place PLWH into permanent housing, including funding additional housing search & advocacy programs
- Provide ongoing support for PLWH in maintaining their housing, including case management and emergency assistance.
- Improve collaboration with HUD HOPWA grantees in the region to:
    - Better maximize federal resources that provide housing subsidies for PLWH
    - Identify PLWH that require RW assistance as a result of not meeting HUD HOPWA-defined 80% area median income (AMI) limit.
    - Identify new service components that can be delivered in residential settings that enhance viral suppression among PLWH

Anticipated Challenges in Implementing the Plan

Since BPHC only receives Part A funding and is not directly funded by CDC for HIV prevention, developing objectives that meet the NHAS goal of reducing new infections must be constructed in a manner that does not utilize Part A funds for HIV uninfected individuals. This is one major reason why collaboration with state health departments receiving Part B and CDC prevention funds is so critical when developing the region's IHP. Through the states' own IHP strategies, actvities are able to simultaneously reach PLWH and uninfected individuals through concurrent activities that seek to reduce disease burden for highest risk communities and individuals, while addressing factors that place all residents at risk for infection potentially contributing to lateness to care.

Due to funding limitations, BPHC is utilizing the IHP as a way to initiate system change through a variety of structural interventions and quality improvement activities that allow Part A funds to support many non-HIV-specific environments where PLWH may access services. This includes bridging gaps and silos that have existed between traditional HIV service settings and providers with those that serve residents that experience highest HIV risk. Successful implementation must involve better collaboration and integration with homeless/transitional shelters, substance abuse recovery programs, mental health providers, and housing assistance resources.

Many of these non-HIV-specific settings and providers have access to PLWH who are unlikely to access services at RW funded sites. However, PLWH at some of these sites would benefit from infusion of new resources brought by Parts A and B. BPHC has a demonstrated track record in expanding availability of Part A services and resources into these types of settings.

For example, no RW funded services were available for TB/HIV co-infected individuals receiving care at a state run hospital in Boston where inpatient TB care and aftercare is provided. Many of these co-infected individuals were struggling with substance use disorder, mental illness, and homelessness. BPHC recruited an existing Part A MCM provider and successfully negotiated with the hospital in 2015 to embed case managers at the hospital to assist physicians in providing high acuity case management services post-discharge. As of September 2016, 20 PLWH continue to be followed for primary care and case management services at the facility.

B. Collaborations, Partnerships, and Stakeholder Involvement

The Boston EMA IHP represents the collaborative work of two states and one Part A jurisdiction. Each Ryan White recipient has their own community planning bodies that assisted and guided the development of plans. Groups, such as the Planning Council (Boston EMA Part A), MIPCC (MA Part B), and NH HPG (NH Part B) were also previously involved in developing multi-year Comprehensive Plans and the related Statewide Coordinated Statements of Need (SCSN). Components of those previous major undertakings, such as a comprehensive needs assessment and resource inventory, are essential components of the IHP. Rather than entirely reinventing the system of care or approaches to HIV service delivery, developers of the IHP were sensitive to retain the strengths and assets previously identified through activities, such as comprehensive planning, and incorporating NHAS directives and goals in order to provide the most modern, science-based and data-driven plan to reduce the impact of HIV in the two-state region.

For Part A, the Planning Council and PCS staff took the leadership role in starting the IHP development process. A special Comprehensive Working Group was formed to utilize the historic and institutional knowledge of community members, current and former Planning Council members, and representatives from health departments. Members of this committee also had cross-membership with MIPCC/SWCAB and NH HPG that were responsible for state IHP development activities. These cross-participants were able to report at committee meetings on MA and NH's progress in completing and submitting their plans. The committee met monthly until July 2016 to work on key components of the IHP, including special/emerging populations for a needs assessment, the HIV resource inventory, and the IHP workplan. The group successfully completed their work in time for a presentation at the September 2016 Council meeting to review the proposed goals and objectives for the Part A IHP.

MDPH worked in tandem with Part A through their two main community planning bodies, MIPCC and SWCAB. MIPCC is an integrated planning group, which existed prior to the release of the IHP guidance; SWCAB is a consumer-led advisory body, which also participated in MIPCC. Membership within these groups includes PLWH, advocates, funded providers, and other advisors from across the state. Through its meetings between September 2015 and February 2016, MDPH convened three separate meetings to identify planning priorities, outline service needs, and identify gaps and barriers. In June 2016, the final results of the Integrated SCSN/Needs Assessment were reviewed and confirmed with the members of the MIPCC and SWCAB. MDPH also held a special statewide meeting, convening 172 attendees to review the state's current progress in developing the MA IHP and solicit feedback on critical areas of focus for the state vision and strategy to end the

HIV epidemic.

NH DHHS operated on a smaller scale compared to MA and worked very intimately with their existing NH HPG, a group historically involved in prioritizing both HIV prevention and care services, and formed a special Integrated HIV Work Group (IHW). Membership within this group included NH health department officials, HIV medical providers, ASO's, and PLWH; JSI Research & Training Institute was contracted to assist the planning process and to generate the final report to submit to HRSA and CDC. The NH IHW met regularly for four months to develop and prioritize the goals and objectives for the NH IHP. They reviewed results from the 2013 NH Comprehensive Needs Assessment, developed priority areas and strategies for the plan, and created objectives and activities for the workplan.

Engagement of Stakeholders

It would be helpful to bridge the non-HIV-specific payers that have historically been under-recognized as significant contributors to the HIV care system. While a Medicaid representative is and has been an extremely active participant on the Planning Council, not as much is understood regarding the role of Medicare, particularly as the Boston EMA's aging PLWBH population being increasingly more likely to be dual-eligible Medicare recipients. As this is likely to be an issue not just in MA and NH, support from HRSA would be beneficial.

Similarly, the changing healthcare landscape requires more information and participation from the private insurance industry. The Blue Cross Blue Shield Foundation contributes to frequent special reports on private insurance trends in MA, but little else tends to be available on the impact of private insurance for PLWH. This will become more relevant over time as younger PLWH and those who are working are more likely to be covered under employer-based private health insurance plans, which are affected by changes to the Affordable Care Act and any future national legislation on healthcare access.

SAMHSA and HUD/HOPWA are two major funders of services utilized by PLWH in the EMA. However, there is no representation from either office on the current Planning Council. Substance abuse and the associated opiate epidemic has gained prominence in recent years; HUD also provides a major housing infrastructure through its HOPWA housing subsidies, an essential resource in the Greater Boston region where rental prices are significantly above national averages. As outlined in the IHP workplan, BPHC and the Planning Council are committed to furthering relationships with the two federal agencies and better coordinate with agencies that receiving SAMSHA and HOPWA funding.

Letters of Concurrence

BPHC has received a letter from the Planning Council for the Part A IHP based on a vote of concurrence occurring on September 8, 2016. MDPH received support from their state planning bodies through a letter of concurrence following their MIPCC on September 15, 2016. NH DHHS received their letter of concurrence from the NH HPG following their final planning group before the summer of 2016. In addition, the Chair of the Boston EMA Planning Council reviewed the IHP workplans for both MA and NH and provided letters of concurrence supporting the state plans. Copies of letters are included within Appendix 4.

C. People Living With HIV (PLWH) and Community Engagement

The Comprehensive Plan Working Group (CPWG) was the primary group initially developing the Part A IHP. Based on EMA epidemiological data, the working group's composition met the reflectiveness of the HIV/AIDS epidemic. The group consisted of 10 members, 80% of which were PLWH. The group was 50%male, 50% people of color, and included three MSM. The current Planning Council, which reviewed and approved the IHP goals and objectives, is similarly reflective of the EMA epidemiological profile and has the HRSA-mandated 33% PLWH representation.

The CPWG met monthly to review progress made on the 2012-2015 Comprehensive Plan, discuss emerging consumer needs and specific populations of interest, and brainstorm relevant goals and objectives for the IHP. After the plan is submitted, members of the working group will then continue the community planning process by also updating the previous Comprehensive Plan. Council members felt that while the IHP provides a good five-year roadmap on the integrated prevention and care needs, many elements of the Comprehensive Plan, including examination of special PLWH populations (e.g. long-term HIV survivors) should be updated. This work will also be synthesized into the annual updates and adjustments to the Part A IHP over the next five years.

Engaging PLWH and Impacted Communities

BPHC and the Planning Council place significant value on the involvement of PLWH in all of its work. The goal-setting processes for the IHP could not have been completed without the aid of consumers of HIV services who personally understand the impact of funding on the quality of care they receive. Their input validates the need for strong epidemiologic data that accurately identifies areas and communities most disproportionately affected, and including information on how disparities in healthcare have an impact on health outcomes, especially viral suppression.

As one of the original first Title I grantees funded by HRSA in the 1990's, the Boston EMA has been fortunate to have many longtime PLWH advocates that remain committed to having their consumer voices heard by government officials and policymakers. Many working group members have passionately discussed the acute and emerging needs of long-term survivors and the service gaps experienced due to the current Ryan White HIV/AIDS Program model. At the same time, the group also is aware of the need to adjust to changes in the epidemic as HIV incidence in the EMA skews significantly and disproportionately towards young MSM of color, and new infections due to IDU and perinatal transmission continue to decline.

Section III: Monitoring and Improvement

Process of Updating the Boston EMA Part A IHP

BPHC will report back to the Planning Council on progress towards achieving the IHP objectives. This will be accomplished through annual presentations conducted during one of the monthly meetings during the Council year to review the workplan, implemented activities, and observable outcomes seen. Viral suppression data, which is an indicator identified for two of IHP goals, are regularly reported in Council documents and presentations. Similarly, racial/ethnicity health disparities are identified by reviewing client demographic and outcomes data to show any potential gaps in viral suppression between different PLWH served via Part A programs.

In addition, BPHC will introduce the IHP at the FY 2017 Annual Provider Training, outlining the EMA's workplan and how agencies are contributing to the overall plan. Many of the special initiatives described in the plan, such as expansion of community health workers in RW settings, will present major opportunities for providers to gain new or additional resources that will ultimately help their clients achieve viral suppression and address persistent challenges, such as homelessness, mental illness, or substance abuse. In subsequent years, BPHC will review progress with providers at future provider gatherings and through smaller work groups to collaborate more intimately with agencies to address regional or local issues or concerns.

Depending on priorities and available resources, the Council may also decide to maintain the Comprehensive Plan Work Group as an ongoing activity to monitor and evaluate the IHP. It is unique from the Council's other committees in that non-Council members, such as community advocates, RW providers, and other consumers, can volunteer and participate in the group's activities. The group proved to be highly productive in assisting in the creation of the IHP workplan and many of the members were interested in potential opportunities to continue their volunteer work.

Both MDPH and NH DHHS have already planned on reconvening with their community planning bodies to review their respective workplans. BPHC and the Planning Council have been invited to participate in those meetings as guests and partners. There is the potential to host joint meetings in upcoming years, where members of the various planning bodies can engage in cross-conversations about the separate IHP's and how additional opportunities for collaboration can be facilitated by BPHC, MDPH, and NH DHHS. The Planning Council remains to be the central place, where Part B representatives can update on IHP implementation through dedicated time on the agenda allotted at every monthly meeting.

Monitoring and Evaluation of the Boston EMA Part A IHP

As BPHC/Planning Council, MDPH, and NH DHHS individually submit their IHP to HRSA and CDC, all recipients/grantees will re-convene with their community planning bodies to report back. Full copies of the plans will be available for planning body members and posted online for all community stakeholders to read and/or download.

BPHC, MDPH, and NH DHHS will meet shortly after their respective plans are submitted to identify overlaps within the workplans and discuss how to properly track and report progress in achieving the range of long and short term objectives and activities proposed in the plans. Each goal of the Part A IHP has at least one objective which overlaps with the objective, strategies, and activities from either state plan. This intentional overlap will also encourage cross-participating members of the planning bodies to communicate and collaborate across the groups to accomplish shared goals and objectives.

For the development of the IHP, all three government agencies focused and prioritized in-person participation in order to maximize opportunity to gather feedback to develop the plans. Moving forward, webinars and conference calls will be used as an additional method to include individuals that may not participated in the previous planning process and bring new voices into the conversation. The Part A IHP features many 1-2 year activities that also offer opportunities for interested individuals to become involved for a shorter time duration and see incremental accomplishments, which contribute the overall vision and goals as put forth by the various plans.

Table 9: Boston EMA Integrated HIV Prevention and Care Plan – Goals and Objectives

Goal 1: Reducing New HIV Infections				
Timeframe	**Responsible parties**	**Activity**	**Target Population or Stakeholder**	**Data Indicators**
Objective 1A: By 2021, ensure 100% of all Part A funded sites provide internal linkages to comprehensive HIV services for PLWH and their significant contacts or can demonstrate appropriate linkages in the community				
2016 - 2018:	Boston EMA Planning Council	Complete a comprehensive needs assessment on current HIV positive prevention and care needs of PLWH residents in the Boston EMA, comprising a literature review, consumer survey, focus groups, and interviews with healthcare providers and case managers	• PLWH currently receiving a Part A service • PLWH currently out of care • HIV service providers located in the EMA	• Representativeness of the sample of of PLWH reached for consumer survey • Number of consumers, providers, and experts interviewed
2016 - 2018:	BPHC HASD	Implement contract language to require comprehensive HIV services to be made available to PLWH accessing Part A case management & peer support programs and ensure access to a range of "treatment as prevention" services, including access to partner notification services, family & reproductive health services, and risk/harm reduction services	Part A sub-recipients funded to deliver MCM & PS services	Number of programs that demonstrate internal and/or external linkages to comprehensive HIV services
By the end of 2021:	BPHC HASD	Re-procure all Part A service categories and incorporate language in contracts that require providers to directly deliver or make available through linkages access to comprehensive HIV services for PLWH and their significant contacts.	All sub-recipients of Part A funds	Number of agencies that demonstrate internal and/or external linkages to comprehensive HIV services

Objective 1B: By 2021, expand entry points or specialized staffing that serve individuals at high-risk for HIV infection or those that do not know their status				
2017 – 2018:	• Boston EMA Planning Council • BPHC HASD	Submit an application to HRSA requesting a Syringe Services Program (SSP) Waiver to utilize Part A funds to support engagement of PLWH affected by substance abuse, particularly those at risk for co-occurring Hepatitis C infection and opiate overdose	• PLWH affected by substance abuse, including those at high risk for opiate overdose • PLWH co-infected with HCV • Program sites involved with delivering potential SSP services	• Number of Part A clients accessing substance abuse treatment services • Number of new SSP sites receiving Part A funds
2016 – 2018:	• BPHC • MDPH • NH DHHS	Expand collaboration with partners, including embedding and integration with existing Part A program sites, to identify newly diagnosed individuals who may be seeking care for HIV, TB, HCV and other STI's	• Newly diagnosed PLWH and their contacts • Part A sub-recipients funded to deliver MCM and PS services	• Number of PLWH reached at non-HIV specific settings • Percentage of PLWH linked to MCM, primary care, or ADAP
By the end of 2018:	• BPHC HASD • HOPWA funded agencies in the EMA	Develop a coalition/network of providers and government agencies dedicated to expanding the presence and awareness of comprehensive HIV services for chronically homeless individuals seen at homeless/transitional shelters, drop-in centers, and environments where they can be engaged for services	• Homeless or unstably housed PLWH in the Boston EMA • Homeless/transitional shelter programs • HOPWA funded agencies • Part A sub-recipients that have >25% client population that are homeless/unstably housed	• Percentage of Part A clients reported as homeless or unstably housed • Number of PLWH served through programs funded by HOPWA and other housing services • Number of new sites that offer HIV services not currently receiving Part A funding
By the end of 2019	• BPHC HASD • BPHC Comm. Health Education Center	Implement a training program to expand the number of community health workers in the EMA with expertise in providing comprehensive HIV services targeting PLWH and high-risk negatives, particularly in developing community-based needs assessments, home-based service delivery, and linkage to primary care services	• Agencies with existing community health worker staff or those desiring to create such positions	• Number of new community health workers trained • Number of new community health worker positions funded by Part A

Goal 2: Increasing Access to Care and Improving Health Outcomes for PLWH				
Timeframe	**Responsible parties**	**Activity**	**Target Population or Stakeholder**	**Data Indicators**
Objective 2A: By 2021, improve viral suppression rates from 85% to 90% for PLWH who currently utilize Part A services in the Boston EMA.				
2016 - 2018:	• BPHC HASD • Part A funded MCM and PS programs	Utilize case managers, peer advocates, and community health workers targeting virally non-suppressed PLWH for community-based services, including those delivered in the home, such as directly observed therapy, accompaniment to medical appointments, and other support	• Part A client reported as virally non-suppressed during the last 6 months from most recent service	• Percentage of PLWH with an undetectable VL
By the end of 2018:	BPHC HASD	Expand funding for high acuity case manager positions at agencies with >10% virally unsuppressed client populations to improve PLWH utilization of essential services that improve viral suppression	• Part A client reported as virally non-suppressed during the last 6 months from most recent service	• Number of agencies with a client population with >10% virally unsuppressed clients • Percentage of PLWH with an undetectable VL
By the end of 2021:	BPHC HASD	Expand services that address persistent challenges to viral suppression, such as mental health, substance abuse, and homelessness, including usage of community health workers; referrals to syringe exchange/recovery services; housing search & advocacy	• PLWH identified during intake & assessment as needing mental health, substance abuse, and/or housing services	• Number of Part A clients accessing substance abuse treatment services • Percentage of Part A clients with a reported mental health status requiring referral to counseling • Percentage of Part A clients reported as homeless or unstably housed

Objective 2B: By 2021, improve percentage of Part A clients who have health insurance from 92% to 97%.				
By the end of 2018:	• BPHC HASD • Part A funded MCM & PS programs	Ensure all funded Medical Case Management (MCM) and (Peer Support) PS staff are trained and consistently providing health insurance enrollment and recertification activities to any RW eligible PLWH	Uninsured PLWH or those requiring assistance with recertification	• Percentage of uninsured PLWH or those with unknown insurance status
By the end of 2018:	• BPHC HASD • MDPH • NH DHHS	Ensure uninsured or under-insured PLWH are aware, referred, and enrolled in health insurance premium and co-pay assistance services funded by MA and NH Part B	Uninsured PLWH that are ineligible for Medicaid or have inadequate insurance coverage	• Percentage of uninsured PLWH • Number of EMA PLWH currently accessing Part B ADAP/HDAP services
By the end of 2021:	BPHC HASD	Reduce number of clients that have lapses in coverage due to failure to recertify or payment of insurance premiums	PLWH currently enrolled in Medicaid, private insurance, or Part B sponsored health insurance	• Percentage of insured PLWH

Goal 3: Reducing HIV Related Disparities and Health Inequities				
Timeframe	**Responsible parties**	**Activity**	**Target Population or Stakeholder**	**Data Indicators**
Objective 3A: By 2021, reduce the gap in viral suppression rates among White (87%) versus non-Hispanic Black (84%) and Hispanic (84%) PLWH who currently utilize Part A services in the Boston EMA.				
By the end of 2017:	BPHC	Design training and capacity building activities that utilize current viral suppression data for Black and Hispanic PLWH to improve providers' abilities to deliver high quality, culturally competent HIV services to virally non-suppressed PLWH	• Part A sub-recipients funded to deliver MCM and PS services	• Number of trainings delivered • Number of case managers and peer advocates trained
2017 – 2018:	• Boston EMA Planning Council • BPHC	Support the NH anti-stigma campaign, which will focus on communities of color	• Black and/or Hispanic PLWH residents in NH EMA • Part A sub-recipients in NH	• Social media metrics related to stigma campaign (views, likes, shares)
By the end of 2019:	BPHC HASD	Invest in high acuity case management and peer support services that target Black and/or Hispanic PLWH through Part A MAI funding, including funding at least one new agency/program targeting an area with high HIV incidence among Black and/or Hispanic PLWH	• Black and Hispanic PLWH currently utilizing at least one Part A service reported as virally unsuppressed • Out of care Black and/or Hispanic PLWH	• Percentage of virally suppressed Black PLWH that received a Part A service • Number of face-to-face encounters delivered by MCM and PS providers
By the end of 2021:	BPHC HASD	Implement data-to-care quality improvement activities for agencies and programs with >10% virally unsuppressed Black and/or Hispanic PLWH	• Virally unsuppressed Black and/or Hispanic PLWH currently receiving a Part A service	• Percentage of virally suppressed Black and/or Hispanic PLWH that received a Part A service • Number of agencies with a client population with >10% virally unsuppressed Black PLWH

Objective 3B. By 2021, decrease the percentage of Part A clients who need housing services from 34% to 29%.				
2016- 2018:	• Boston EMA Planning Council • BPHC HASD	Conduct annual priority setting and resource allocation processes that identify new HRSA service categories that can be added to the EMA's list of funded categories in order to address housing needs among PLWH EMA residents.	Homeless or unstably housed PLWH in the Boston EMA	Percentage of Part A clients reported as homeless or unstably housed
By the end of 2018:	BPHC HASD	Invest in comprehensive housing services that successfully place PLWH into permanent housing, including funding additional housing search & advocacy programs	Homeless or unstably housed PLWH in the Boston EMA	Percentage of Part A clients reported as homeless or unstably housed
By the end of 2018:	BPHC HASD	Provide ongoing support for PLWH in maintaining their housing, including case management and emergency assistance.	Homeless or unstably housed PLWH in the Boston EMA	Percentage of Part A clients reported as homeless or unstably housed
By the end of 2021:	• Boston EMA Planning Council • BPHC HASD • HOPWA funded agencies in the EMA	Improve collaboration with HUD HOPWA grantees in the region to: • Better maximize federal resources that provide housing subsidies for PLWH • Identify PLWH that require RW assistance as a result of not meeting HUD HOPWA-defined 80% area median income (AMI) limit. • Identify new service components that can be delivered in residential settings that enhance viral suppression among PLWH	• Homeless or unstably housed PLWH in the Boston EMA • PLWH that are above 80% of HUD HOPWA-defined area median income limit and therefore ineligible for HOPWA services	• Percentage of Part A clients reported as homeless or unstably housed • Number of PLWH served through programs funded by HOPWA and other housing services • Number of HOPWA funded agencies and programs

Assessing Outcomes Along the HIV Care Continuum

BPHC and MPDH collaboratively fund a clinical chart review project conducted by JSI. Since neither MPDH nor BPHC directly uses RW funds for Outpatient Ambulatory Health Services, this project provides essential information on quality of medical care and most current clinical practices for HIV patients at selected sites. The majority of the sites are health centers and hospitals that also receive Parts C and D funding and JSI reviews on average about 1,200 records per cycle at over 30 sites. With increased emphasis on collection of health outcome data for the IHP, BPHC has already added two additional BPHC sites to the chart review project.

State regulations require that HIV viral load results be reported to MDPH. The state health department uses this information to provide feedback to selected healthcare sites on whether a PLWH seen at that site has had a laboratory result reported within six month. Those without a lab result are assumed to be lost to care. That information is given to the healthcare site using a line list that is periodically sent. Providers, including those funded by Part A, have found this service incredibly useful as a way to determine if a client is lost to care. Since these line lists are automatically generated for sites based on the patients they have previously reported to surveillance, primary care staff can then apply the lists towards their routine care planning within the site's primary care team to contact patients that have been seen and to schedule appointments. Although this service is not available to all providers in the state at this point, there is significant potential to enhance efforts to improve retention in care and viral load monitoring efforts if more providers are able to access the line list.

Internally, BPHC will monitor and evaluate progress within its Contract Management and Quality Management units. A majority of the data indicators, including viral suppression data, are tracked using the e2Boston system. Contract Management will review at agency level progress related to achievement and maintenance of viral suppression. The Quality Management unit will also assist in the development of agency level continuua of care, an exciting way (and highly requested by providers) to highlight successes and challenges faced by providers in meeting NHAS goals. Similarly, Quality Management will also create an HIV Continuum of Care model using Part A data for all clients served and continue to present the data annually to the Planning Council.

Appendix 1: List of Provider Agencies within the Boston EMA

Boston EMA– HIV Service Inventory
(Sorted alphabetically by Service Category funded by the Boston EMA Planning Council)

Types of Funders:

Ryan White	**Other Federal:**	**State Funding:**
Ryan White Part A	Medicaid (MassHealth & NH Medicaid)	Medicaid (MassHealth & NH Medicaid)
Ryan White Part B	Medicare	MA Bureau of Substance Abuse
Ryan White Part C	HOPWA	NH Bureau of Drug, Alcohol, & Substances
Ryan White Part D	SAMSHA	MA State AIDS Line
Ryan White Part F		
HRSA SPNS		

Core Medical Services Available	**Providers**	**Funding Source**
AIDS Drug Assistance Program	Community Research Initiative of New England	Ryan White Part A, B, & MA State AIDS Line
	NH Department of Health and Human Services (NH DHHS)	Ryan White Part A, B
Early Intervention Services	Cambridge Health Alliance	Ryan White Part C
	Beth Israel Deaconess Hospital-Plymouth	Ryan White Part C
	Boston Health Care for the Homeless	Ryan White Part C
	Brockton Neighborhood Health Center, Inc.	Ryan White Part C
	Dartmouth-Hitchcock (NH)	Ryan White Part C
	Dimock Community Health Center	Ryan White Part C
	East Boston Neighborhood Health Center	Ryan White Part C
	Family Health Center Of Worcester, Inc.	Ryan White Part C
	Fenway Community Health Center	Ryan White Part C
	Greater Lawrence Family Health Center, Inc.	Ryan White Part C
	Greater New Bedford Community Health Center	Ryan White Part C
	Harbor Health Services, Inc.	Ryan White Part C
	Lynn Community Health Center	Ryan White Part C
	University Of Massachusetts - Medical	Ryan White Part C
Medical Case Management, including treatment adherence services	AIDS Project Worcester	Ryan White Part B
	AIDS Response Seacoast	Ryan White Part A, B
	Beth Israel Deaconess Hospital-Plymouth	Ryan White Part A, B
	Boston Medical Center – Pediatric AIDS Program	Ryan White Part A
	Boston Health Care for the Homeless	Ryan White Part A
	Boston Medical Center	Ryan White Part B
	BPHC – Homeless Services/ Safe Harbor	Ryan White Part A
	Brockton Area Multi-Services	Ryan White Part B
	Brockton Neighborhood Health Center, Inc.	Ryan White Part B
	Cambridge Health Alliance	Ryan White Part A
	Catholic Charitable Bureau of the Archdiocese of Boston	Ryan White Part A
	Commonwealth Land Trust	Ryan White Part B

	Community Counseling of Bristol County	Ryan White Part B
	Community Health Link	Ryan White Part B
	Dimock Community Health Center	Ryan White Part A
	Dorchester House Multi Service Center	Ryan White Part A
	East Boston Neighborhood Health Center	Ryan White Part A
	Edward M. Kennedy Community Health Center	Ryan White Part A
	Father Bill's Place / Mainspring	Ryan White Part A
	Fenway Community Health Center	Ryan White Part A
	Greater Lawrence Family Health Center, Inc.	Ryan White Part A
	Greater New Bedford Community Health Center	Ryan White Part B
	Harbor Health Services, Inc.	Ryan White Part A
	Justice Resource Institute	Ryan White Part B
	Lowell Community Health Center	Ryan White Part B
	Lynn Community Health Center	Ryan White Part A
	Massachusetts Alliance of Portuguese Speakers	Ryan White Part A, B
	Merrimack Valley Assistance Program	Ryan White Part A, B
	MetroWest Medical Center	Ryan White Part B
	MGH Chelsea Healthcare Center	Ryan White Part A
	Montachusett Opportunity Council	Ryan White Part A
	Pine Street Inn/Paul Sullivan Housing	Ryan White Part B
	Seven Hills Behavioral Health	Ryan White Part B
	South Middlesex Opportunity Council	Ryan White Part B
	Southern NH HIV/AIDS Task Force	Ryan White Part A, B
	Stanley Street Treatment & Resources	Ryan White Part B
	Steppingstone, Inc.	Ryan White Part B

Appendix 3 - Massachusetts Integrated HIV Prevention and Care Plan Goals and Objectives

Goal 1: Reduce the Impact of HIV

Objectives

- By 2021, reduce newly diagnosed HIV infections among MSM by 30%
- By 2021, eliminate newly diagnosed HIV infections among PWID
- By 2021, eliminate perinatal HIV transmission
- By 2021, Achieve a reduction in the proportion of cases reported to Massachusetts HIV Surveillance Program with No Identified Risk (NIR), from 25% to 15% of all reported cases
- By 2021, establish a baseline understanding of new infections among transgender-identified individuals, and set health outcomes benchmarks to improve the quality and effectiveness of prevention and care services

Goal 2: Improve Health Outcomes For Persons Living With HIV

Objectives

- By 2021, 90% of newly diagnosed HIV+ individuals will be successfully linked to care within 45 days of the date of diagnosis
- By 2021, improve Massachusetts HIV Care Continuum outcomes to 90/90/90 (90% diagnosed; 90% retained in care; and 90% of PLWH virally suppressed)
- By 2021, eliminate progression to AIDS among PLWH.
- By 2021, reduce HIV related mortality among PLWH by 10%
- By 2021, 90% of individuals co-infected with HIV and HCV will be linked to HCV treatment
- By 2021, l00% of clients diagnosed with acute HIV infection will be linked to care within 72 hours
- By 2021, improve the rates of STD testing among sexually active PLWH

Goal 3: Reduce Persistent HIV-Related Health Disparities

Objectives

- By 2021, reduce the disparity in relative rates of new HIV infection diagnoses between black (non-Hispanic) and white (non-Hispanic) residents by 20%.
- By 2021, reduce the disparity in relative rates of new HIV infection diagnoses between Hispanic/Latino and white (non-Hispanic) residents by 25%.
- By 2021, improve rates of viral suppression for racial/ethnic minorities to be equivalent to rates in white (non-Hispanic) populations
- By 2021, reduce rates of new HIV diagnoses among young MSM (under age 30) by 50%

Appendix 4 – New Hampshire Integrated Prevention and Care Plan

New Hampshire Integrated HIV Prevention and Care Plan					
Goal 1: Reducing New HIV Infections					
	Activities (Strategies only)	**Time Phased Resources**	**Responsible Entity**	**Target Population**	**Metrics**
Objective 1A: By 2021, lower the new AIDS/Concurrent diagnoses by 5%					
Strategy a) Expand the availability of routine HIV testing of all patients between 15 and 65 who seek primary or urgent care, based on CDC recommendations.	- Promote increased awareness of CDC recommendations - Assess and address perceived barriers to routine HIV testing	Federal HIV Prevention program (add new FOA time period)	DPHS	- Adult population 15-65 y/o - Routine and emergency medical care sites	Number of HIV tests performed
Strategy b) By 2021, establish a syringe-exchange program in the state with an HIV/referral/testing service component.	- Identify potential entities willing to establish syringe exchange program - Identify resources to support HIV/referral/testing service component	Other funds, Public funds as allowed 2017-2021	HPG, in coordination with CBO/ other funders	- Syringe using adults	Number of HIV tests performed
Strategy c) Develop a comprehensive HIV service provider training program/series/plan, utilizing multiple learning modalities (web portal, public health detailing, conferences, meetings).	- Review existing training programs - Identify best modalities for delivering training - Identify resources for implementing training - Implement training	Adapt ANAC or other existing module MPH Intern 2016-2018	DPHS, AETC, HPG	- HIV Service Providers	Number of HIV tests performed
Strategy d) Expand 4th generation testing to help identify recent infections.	- Promote increased use of 4th generation testing - Identify resources to support use of 4th generation test if needed	Federal HIV Prevention funds (add new FOA time period)	DPHS	- HIV Testing/Counseling Programs	Number of HIV tests performed
Objective 1B: By 2021, increase access to PrEP for all people in NH who meet the CDC guidelines by identifying 5-10 new prescribing providers/organizations					
Strategy a) By 2018, improve access to PrEP in	- Review current information about providers who see at-risk populations - Identify which	HRSA CDC	DPHS AETC	HIV medical providers in Hillsborough County	Number of providers that

New Hampshire Integrated HIV Prevention and Care Plan					
Hillsborough County through identification of additional prescribing providers/organizations or a new PrEP clinic.	providers might benefit from additional education/training with respect to PrEP - Promote use of PrEP for eligible clients among providers receiving additional education/training	CBA 2016-2018	HPG		prescribe PrEP
Strategy b) Identify performance metrics for PrEP utilization by 2018.	- Review possible options for tracking prescribing and or utilization of PrEP - Identify which option provides the most efficient and effective data source for monitoring PrEP uptake	NASTAD 2016-2018	DPHS & HPG	Individuals at risk for HIV/AIDS	Metric TBD
Strategy c) Assess barriers to uptake of and adherence to PrEP	- Include questions regarding barrier to PrEP utilization on next needs assessment	NASTAD 2018-2021	DPHS	Individuals potentially eligible for PrEP	Number of people taking PrEP
Goal 2: Increasing Access to Care and Improving Health Outcomes for People Living with HIV					
	Activities (Strategies only)	**Time Phased Resources**	**Responsible Entity**	**Target Population**	**Metrics**
Objective 2A: By 2021, increase viral suppression from 87% to 92%.					
Strategy a) Link new cases to care within 90 days.	- Train providers to follow the International Association of Physicians in AIDS Care guidelines for improving entry into care for persons with HIV (brief strengths-based case management interventions, intensive outreach for individuals not engaged in care within six months of a new HIV diagnosis, and use of peer patient navigators)	ID Care Coordinators 2016-2021	DPHS Medical Advisory Board	Newly identified individuals with HIV diagnosis; HIV medical providers	Number linked to medical care
Strategy b) Ensure access to ART For NH CARE Program clients.	- Screen all CARE program clients for access to ART on a periodic basis (i.e. every 6 months) - Work with clients and case managers to select insurance plans that include comprehensive ART Coverage	NH Ryan White CARE Program 2016-2021	DPHS	NH CARE Program clients	ART among persons in HIV medical care
Strategy c) Identify an available measure of HIV medication adherence for RW Care program clients	- Review existing quality indicators for adherence	NH CARE Program 2017-2018	DPHS	HIV CARE Program clients	Measure identified
Objective 2B: By 2021, reduce the number of people on the unmet need/out of care list in NH by 20%.					

New Hampshire Integrated HIV Prevention and Care Plan					
Strategy a) Build upon Care Engagement Program to improve understanding of those out of care.	- Analyze data from Care Engagement Program to develop strategies to target those out of care	Care Engagement Program 2016-2017	DPHS	Out of care list	Percentage of persons with an HIV diagnosis retained in medical care
Strategy b) Assess strategies to include peer to peer options to identify out of care individuals.	- Utilize peer mentors to identify and engage out of care individuals	Dartmouth-Hitchcock 2016-2021	DHMC	Consumers in care	Percentage of persons with an HIV diagnosis retained in medical care
Strategy c) Assess HIV medical provider workforce and develop plan to increase the number of providers	- Survey providers for HIV service capacity - Survey existing HIV service provider current capacity to take additional clients, when going to retire - Develop plan to increase number of providers	AETC 2016-2018	HPG	Medical providers	Percentage of persons with an HIV diagnosis retained in medical care
Objective 2C: By 2021, increase utilization of dental, mental health and substance abuse services of NH CARE Program clients.					
Strategy a) Expand list of contracted dental providers for NH CARE Program clients in geographically underserved areas.	- Update at least annually and maintain list of contracted dental providers on the CARE Program website - Engage and contract with additional dental providers	NH CARE Program 2016-2021	DPHS DHMC	Dental providers in NH	Number of contract providers Number of total dental visits
Strategy b) Identify mechanism to assess need, referral and utilization of mental health and substance abuse services among CARE Program clients.	- Conduct consumer based assessment of mental health and substance abuse service's needs, barriers, and utilization - Develop recommendations based on the assessment - Utilize CAREWare to collect referral information	NH CARE Program 2017-2018	HIV CARE program	HIV CARE Program clients	Number of total mental health and substance abuse services visits
Goal 3: Reducing HIV-Related Disparities and Health Inequities					
	Activities (Strategies only)	**Time Phased Resources**	**Responsible Entity**	**Target Population**	**Metrics**
Objective 3A: By 2021, reduce disparities in prevalence rates of HIV between non-hispanic white and non-white individuals by 5%.					
Strategy a) Research & adopt an anti-stigma messaging campaign	- Research the demographic most affected and specific issues to tailor media outlets to have the broadest reach - Select campaign, social media campaign, print media materials or other	DPHS 2016-2018	HPG DPHS	- PLWHA - Providers - Public (depends on campaign)	Number of HIV tests

New Hampshire Integrated HIV Prevention and Care Plan					
Strategy b) Develop resource for community by identifying LGBTQ-friendly providers	- Create web resource on HPG website	Rhode Island web template 2017-2021	DPHS HPG	- HIV/AIDS service providers	Number of HIV tests Number of newly diagnosed
Strategy c) Assess use of quality management data to monitor/track disparities and increase ability of providers to collect racial/ethnicity and linguistic data accurately and consistently.	- Survey providers for capacity to monitor/track disparities - Survey providers for capacity on collecting racial/ethnic and linguistic data - Develop plan to increase number of providers who monitor/track disparities/data	NH Health and Equity Partnership 2017	DPHS	- HIV/AIDS service providers	Rate of diagnosis by race and ethnicity
Objective 3B: Reduce geographically based disparities of care by providing more support services to PLWHA living north of Concord, NH by 2021.					
Strategy a) By 2018, establish a pilot tele-medicine site in NH to link hard-to-reach HIV+ clients to care.	- Identify tele-medicine partners - Identify location of need for pilot - Identify tele-medicine model to be piloted	Dartmouth-Hitchcock 2018	HPG	- PLWHA outside of urban areas	Number of tele-medicine visits for HIV medical care
Strategy b) By 2021, assess and map service needs and gaps in NH.	- Use results of future needs assessment and mapping of services to identify areas of need	DPHS Surveillance Mapping Software 2021	DPHS	- PLWHA outside of urban areas - HIV/AIDS service providers	Number medical visits Number of visits to ASOs
Strategy c) By 2021, disseminate information on available resources by region.	- Use results of mapping to disseminate resources by region - Create web resource on HPG website - Promote resources through the ASOs	DPHS Surveillance Mapping Software 2021	HPG DPHS	- PLWHA outside of urban areas - HIV/AIDS service providers	Number medical visits Number of visits to ASOs

Steven Young, Director
Division of Metropolitan HIV/AIDS Programs
HIV/AIDS Bureau, HRSA
5600 Fishers Lane
Rockville, Maryland 20857

Dear Mr. Young:

The Boston Eligible Metropolitan Area (EMA) Planning Council ***concurs*** with the following submission by the Boston Public Health Commission (BPHC) in response to the guidance set forth for health departments and HIV planning groups funded by the CDC's Division of HIV/AIDS Prevention (DHAP) and HRSA's HIV/AIDS Bureau (HAB) for the development of an Integrated HIV Prevention and Care Plan (IHP). The Council serves as the mandated community planning body overseeing the priority setting and resource allocation process for Ryan White Part A funding for people living with HIV (PLWH) in the EMA. In partnership with the Boston Public Health Commission (BPHC), the Council has worked with various stakeholders, including the Massachusetts Department of Public Health (MDPH) and the New Hampshire Department of Public Health, to develop coordinated IHP workplans that outline the needs of PLWH residents in our region.

A representative from BPHC serves as a mandated member serving as the Ryan White Part A recipient. During the last year, BPHC has worked collaboratively with Planning Council Support (PCS) staff to develop the IHP. Updates were given on a monthly basis during the monthly Council and Executive Committee meetings on progress in developing and the plan to submit the IHP by the September 30th deadline. Members of the Planning Council also serve as members of state planning bodies that worked on MA and NH IHP development and reported back to the Council periodically on the states' progress.

The Council also created an ad-hoc committee called the Comprehensive Plan Work Group (CPWG), which was responsible for drafting the Boston EMA's Part A IHP with support from PCS staff and BPHC. The group met every month between January and August 2016 to review the HRSA/CDC guidance and focus on essential components that relate to the Council's role and involvement of PLWH. In the September 2016 meeting, an overview of the Part A IHP goals and objectives were presented and the Council proceeded to vote in support of the proposed plan.

The Planning Council concurs that the Boston EMA Part A Integrated HIV Prevention and Care Plan submission fulfills the requirements put forth by the Funding Opportunity Announcement PS12-1201 and the Ryan White HIV/AIDS Program legislation and program guidance.

I hereby provide this letter of concurrence of the Planning Council with the Boston EMA's Part A Integrated HIV Prevention and Care Plan.

Sincerely,

Darren Sack
2016-2017 Boston EMA HIV Health Services Planning Council Chair

Amy Griffin,
Division of Metropolitan HIV/AIDS Programs
HIV/AIDS Bureau, HRSA
5600 Fishers Lane
Rockville, Maryland 20857

Dear Ms. Griffin:

The Boston EMA HIV Health Services Planning Council concurs with the following submission by the Massachusetts Department of Public Health in response to the guidance set forth for health departments and HIV planning groups funded by the CDC's Division of HIV/AIDS Prevention (DHAP) and HRSA's HIV/AIDS Bureau (HAB) for the development of an Integrated HIV Prevention and Care Plan (IHP). The Council serves as the mandated community planning body overseeing the priority setting and resource allocation process for Ryan White Part A funding for people living with HIV (PLWH) in the EMA. In partnership with the Boston Public Health Commission (BPHC), the Council has worked with various stakeholders, including Massachusetts Department of Public Health, to develop coordinated IHP workplans that outline the needs of PLWH in our region.

A representative from Massachusetts Department of Public Health serves as a mandated member representing state health departments and as a Ryan White Part B recipient. During the last year, updates were given on a monthly basis on progress in developing and the plan to submit the IHP by the September 30th deadline.

Between August and September 2016, Massachusetts Department of Public Health also shared drafts with BPHC and the Council's Comprehensive Plan Work Group, which was responsible for drafting the Boston EMA's Part A IHP. On September 8, 2016, the Council received a presentation outlining coordinated efforts between shared goals and objectives in the jurisdictions respective plans and proceeded to vote in support of the proposed plan. The Planning Council will continue to work collaboratively with MDPH to implement the plan and review progress on tasks.

The Planning Council concurs that the MA Integrated HIV Prevention and Care Plan submission fulfills the requirements put forth by the Funding Opportunity Announcement PS12-1201 and the Ryan White HIV/AIDS Program legislation and program guidance.

I hereby provide this letter of concurrence of the Planning Council with the Massachusetts Integrated HIV Prevention and Care Plan.

Sincerely,

Darren Sack

Dear Ms. Hampton:

The Boston EMA HIV Health Services Planning Council concurs with the following submission by the New Hampshire Department of Health and Human Services in response to the guidance set forth for health departments and HIV planning groups funded by the CDC's Division of HIV/AIDS Prevention (DHAP) and HRSA's HIV/AIDS Bureau (HAB) for the development of an Integrated HIV Prevention and Care Plan (IHP). The Council serves as the mandated community planning body overseeing the priority setting and resource allocation process for Ryan White Part A funding for people living with HIV (PLWH) in the EMA. In partnership with the Boston Public Health Commission (BPHC), the Council has worked with various stakeholders, including New Hampshire Department of Health and Human Services, to develop coordinated IHP workplans that outline the needs of PLWH in our region.

A representative from New Hampshire Department of Health and Human Services serves as a mandated member representing state health departments and as a Ryan White Part B recipient. During the last year, updates were given on a monthly basis on progress in developing and the plan to submit the IHP by the September 30th deadline.

Between August and September 2016, New Hampshire Department of Health and Human Services also shared drafts with BPHC and the Council's Comprehensive Plan Work Group, which was responsible for drafting the Boston EMA's Part A IHP. On September 8, 2016, the Council received a presentation outlining coordinated efforts between shared goals and objectives in the jurisdictions respective plans and proceeded to vote in support of the proposed plan. The Planning Council will continue to work collaboratively with the NH IHP working group to implement the plan and review progress on tasks.

The Planning Council concurs that the NH Integrated HIV Prevention and Care Plan submission fulfills the requirements put forth by the Funding Opportunity Announcement PS12-1201 and the Ryan White HIV/AIDS Program legislation and program guidance.

I hereby provide this letter of concurrence of the Planning Council with the New Hampshire Integrated HIV Prevention and Care Plan.

Sincerely,

Darren Sack
2016-2017 Boston EMA HIV Health Services Planning Council Chair

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF MASSACHUSETTS

AMERICAN ACADEMY OF HIV MEDICINE; HIV MEDICINE ASSOCIATION of the INFECTIOUS DISEASES SOCIETY OF AMERICA; INTERNATIONAL ASSOCIATION OF PROVIDERS OF AIDS CARE; JENNIFER K. BRODY, MD; and CHRISTOPHER B. FOX, NP, *Plaintiffs*, v. HEALTH RESOURCES AND SERVICES ADMINISTRATION; THOMAS J. ENGELS, in his official capacity as the Administrator of the Health Resources and Services Administration; U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES; and ROBERT F. KENNEDY, JR., in his official capacity as Secretary of the U.S. Department of Health and Human Services, *Defendants*.	Case No.

DECLARATION OF MICHELLE COLLINS-OGLE, MD

I, Michelle Collins-Ogle, MD, hereby declare and state as follows:

1. I am over 18 years of age, of sound mind, and in all respects competent to testify.

2. I have personal knowledge of the facts set forth in this declaration and would testify competently to those facts if called to do so.

3. I am offering this declaration as a member of the American Academy of HIV Medicine, the International Association of Providers of AIDS Care, and the HIV Medicine Association, which are bringing claims on behalf of their members, like me, and on behalf of the transgender patients of their members, like mine.

4. I submit this declaration in support of Plaintiffs' Motion for Preliminary Relief under 5 U.S.C. § 705 and for a Preliminary Injunction, which seeks to prevent Defendants from giving effect to certain conditions relating to transgender people and gender-affirming medical care set forth in Ryan White HIV/AIDS Program ("Ryan White Program" or "RWHAP") Notices of Funding Opportunity issued or forecasted to be issued in 2026 and the 2026 Updated HRSA General Terms and Conditions, issued on March 11, 2026 (collectively, "the Challenged Conditions").

5. I am a longtime HIV provider who directs a Ryan White-funded HIV clinic serving medically underserved rural communities in North Carolina. The clinic relies on Ryan White to provide integrated HIV care. I have been providing services under Ryan White since the program began in 1990. Ryan White has evolved into a comprehensive "wraparound" model designed to address co-occurring medical and social needs that affect HIV outcomes and retention in care, particularly for medically underserved populations. Integrated gender-affirming medical care and affirming treatment environments are critical to maintaining patient trust, adherence to antiretroviral therapy, retention in care, and sustained viral suppression among transgender patients living with HIV. Further, in rural communities like the ones my clinic serves, patients often have no realistic alternative source of affirming HIV care or gender-affirming medical care because of provider shortages, transportation barriers, poverty, stigma, and geographic isolation. The Challenged Conditions would disrupt this integrated care model, cause patients to disengage from care, increase reliance on unsafe or informal treatment sources, worsen health outcomes, undermine public health efforts to control HIV transmission, and threaten the continued operation of Ryan White-supported HIV programs in rural communities.

I. Background

6. I am a physician specializing in infectious diseases and HIV care. I serve as the Medical Director of the Warren Vance Community Health Center, Inc. ("the Clinic") in rural North Carolina. I have held this position for approximately twenty-five years.

7. I also hold an administrative role in my clinic. I am the clinic's Ryan White Part C Principal Investigator. In this role, I oversee all administrative Ryan White grant responsibilities.

8. I split my time as Medical Director of the Warren Vance Community Health Center, Inc. with my role as the Director of the MAYS Specialty Care Clinic at The Children's Hospital at Montefiore in New York, where I provide care to infants, children and adolescents living with HIV/AIDS.

9. I have over thirty years of experience providing HIV care, beginning in the early years of the epidemic in the late 1980s, including treating infants and pediatric patients. Since 2008, I have also provided comprehensive gender-affirming medical care, including hormone therapy, to my transgender patients as part of my clinical practice.

10. The Warren Vance Community Health Center, Inc. was the first clinic in North Carolina to integrate gender-affirming healthcare services including hormone therapy into an HIV care program in 2008. Ryan White Part B funding was and is used to provide medically necessary gender-affirming treatment for transgender women with HIV. Transgender women, like all other patients receiving Ryan White Program services receive their primary care in our programs. This integration arose out of medical necessity and patient need.

11. The Clinic primarily serves communities that are medically underserved. We serve 241 individuals. 87% of my patients are Black, 13% are White and a significant portion are low-income with 2% being unhoused. Approximately 3% of my patients at the Clinic are transgender,

all of whom are Black women. At the Clinic, our patient population is largely composed of adults living with HIV, many of whom are over the age of twenty-four.

12. At present, the Clinic receives funds under Ryan White Parts B and C, as well Supplemental Part B.

II. The Ryan White Program

12. I have specialized in HIV/AIDS care and have treated patients who received funding under Ryan White since the program's inception. The Ryan White Program was established in 1990 to provide services to individuals and families living with HIV, particularly those who lacked access to adequate care.

13. When the program was first created and I was providing services under it, effective HIV medications were limited and patients required extensive supportive services. In the early years of the epidemic—before the advent of effective antiretroviral therapy—care was often focused on hospice, palliative care, and supporting patients and their families through serious illness and death. The Ryan White CARE Act became a critical safety net, particularly for under-resourced communities, ensuring equitable access to care and helping communities and families cope with the devastating impact of the HIV/AIDS epidemic.

14. Over time, the program evolved to meet the needs of the epidemic. As effective antiretroviral therapy emerged in the mid-1990s, the focus of the program shifted from end-of-life care to long-term disease management, with an emphasis on helping patients access and adhere to life-saving medications. The program expanded to include prescription drug assistance, most notably through ADAP, and increasingly prioritized retention in care and viral suppression.

15. In the decades since and as HIV treatment advanced, the Ryan White Program further evolved to include a deliberate expansion beyond traditional medical care for HIV to a

holistic, "wraparound" model that addresses the full range of needs affecting health outcomes of patients with HIV. As such, the program now funds not only HIV treatment and medications, but also treatment for co-occurring conditions as well as a broad array of supportive services, including case management, mental health care, substance use treatment, housing support, and transportation, recognizing that social and structural factors directly affect a patient's ability to access and remain in care, especially populations most disproportionately impacted by HIV.

16. Ryan White programs are the "Gold Standard" other healthcare programs use to provide chronic medical care. The Ryan White Program is the first model for the "Medical Home" which ensures patients receive comprehensive care related to their primary disease. Patients with HIV have other co-morbidities, some associated with the virus and others not, and experience side effects of the medications they take through their lifespan. Transgender people are no different. They too have complications from the medications we prescribe and co-morbidities. Providing transgender patients with HIV with gender-affirming hormone therapy when medically indicated ensures they remain in care and monitored closely as we do for all of our patients.

17. This integrated approach reflects the understanding that successful HIV treatment requires more than prescribing HIV-related medications. It depends on addressing the social determinants of health and maintaining sustained engagement in care, particularly for low-income and medically underserved populations.

18. The Ryan White Program is widely regarded in the medical community as a model for integrated healthcare delivery. Other areas of medicine, including oncology and community health center systems, have adopted aspects of its approach. In my view, the program has been nothing short of a success story. Having witnessed its evolution over the decades, I have seen firsthand how its effectiveness is rooted in core public health principles: prioritizing access,

continuity of care, and addressing the social determinants that shape health outcomes, which has enabled it to achieve remarkable success in improving the health and longevity of people living with HIV. HIV is no longer a death sentence but rather a manageable disease.

19. Today, the Ryan White Program serves as a payer of last resort, filling gaps for uninsured and underinsured patients and ensuring access to services that other payors do not cover.

III. The Clinic's Use of Ryan White Funds

20. My clinic receives funding under Parts B, B Supplemental, and C of the Ryan White Program, which we use to provide holistic HIV care.

21. Part B and its supplemental funding provides access to medications and other critical services, including diagnostic testing and specialty care.

22. Part C funding supports the provision of comprehensive outpatient medical care for people living with HIV, including clinical services and support staff such as Physicians, Nurse Practitioners, Physician Assistants, Nurses, case managers, and behavioral health professionals.

23. Together, Parts B and C allow us to provide holistic, integrated care to all our HIV patients, including those who are transgender. For example, Part C supports clinical visits and mental health services, while Part B enables access to medications and additional services not otherwise covered.

24. In reliance on Ryan White's longstanding directives and funding structure prioritizing this integrated healthcare model, we have intentionally developed and structured our model of care to meet the needs of transgender and gender-diverse people living with HIV, including gender-affirming healthcare.

25. We carefully track and allocate staff time and services through established systems, including CAREWare, to ensure compliance with Ryan White requirements.

IV. Importance of Affirming HIV Care and Gender-Affirming Treatment for Our Transgender Patients with HIV

26. Gender-affirming medical care is healthcare that is medically necessary for many our transgender patients and that is essential to ensuring adherence to effective HIV treatment as well as addressing the health needs and wellbeing of our transgender patients living with HIV.

27. In my experience, providing comprehensive gender-affirming medical care improves patient retention in care, treatment of co-morbidities, and adherence to HIV medications. Similarly, being able to acknowledge, affirm, and respect the identity of a transgender patient is crucial to patient retention in care, treatment of co-morbidities, and adherence to HIV medications. This builds trust between patients and providers and reduces mental health barriers, including depression, dysphoria, and suicidality.

28. My experience integrating comprehensive gender-affirming medical care into HIV treatment arose from clinical and medical necessity. I first began treating transgender women with HIV who presented with advanced disease and had delayed seeking care due to lack of access to affirming providers. Before the Ryan White Program covered gender-affirming medical care and medication, many of my patients faced significant barriers to obtaining such care through the formal healthcare system, including lack of insurance coverage, cost, lack of understanding how to provide medical care for transgender people, and discrimination.

29. In my professional experience, when patients are unable to access gender-affirming medical care through licensed providers, some turn to non-prescribed or informal sources of hormones, including online or underground markets, in order to meet their basic healthcare needs. These alternatives are often medically unsupervised and can carry significant health risks, but patients may nonetheless pursue them because the alternative is going without care altogether.

These underground markets had limited access to medical supplies, which lead to needle sharing, thus increasing the risk of HIV transmission.

30. In my professional experience, prohibiting access to gender-affirming medical care as well as prohibiting acknowledgement, affirmation, and respect of the identities of transgender patients are not neutral actions; they each actively drive patients away from the healthcare system or into unsafe pathways, further delaying engagement in HIV care and worsening clinical outcomes requiring hospitalization which increase financial burden on the healthcare system which is already strained.

31. By affirming and respecting my transgender patients and providing gender-affirming medical care within the HIV treatment setting, I built trust, reduced unsafe practices, and improved health outcomes of patients, including achieving sustained viral suppression. In my clinical experience, patients explicitly linked their willingness to engage in HIV care to whether they feel seen, respected, and affirmed in their gender identity. For example, patients told me that they avoided or delayed care in the past because providers dismissed or stigmatized their gender identity, but that they felt safe returning to our clinic once they could receive gender-affirming medical services in the same setting.

32. Our Clinic tracks engagement in care, including appointment adherence, retention in treatment, and viral suppression rates. Consistent with broader clinical experience, I observed that patients who begin receiving gender-affirming medical care alongside HIV treatment are more likely to attend appointments, adhere to their medications, and remain engaged in care over time. In our clinical practice, all our transgender patients remain consistently engaged in their care, sustain viral suppression, reduced unsafe practices which would put them at risk for other types of infections and co-morbidities like Hepatitis C.

33. Conversely, when gender-affirming medical care is unavailable or disrupted, patients are more likely to miss appointments, disengage from care, or seek services outside the healthcare system. Integrating these services is therefore not ancillary; it is a critical component of effective HIV treatment for many transgender patients.

34. In my opinion, as informed by my clinical experience, treating the "whole person," including providing gender-affirming medical care, is essential to effective HIV care as it is for all people receiving Ryan White services.

V. Impact of the Challenged Conditions on Our Transgender Patients

35. By prohibiting acknowledgement, affirmation, and respect of the identities of our transgender patients as well as prohibiting provision of gender-affirming medical care using Ryan White-supported services, the Challenged Conditions will have severe consequences for our Clinic and our patients.

36. As noted, it is likely that many transgender patients will disengage from HIV care if they cannot receive HIV care that is affirming and cannot access gender-affirming medical care as part of their care. Many of our transgender patients come regularly as needed to treat their HIV only because they receive comprehensive care for all their medical needs, including gender-affirming hormone therapy and treatment for other co-morbidities, at our Clinic. For many patients, even a short disruption can result in missed appointments, loss of trust, medication non-adherence, and lack of follow-up. Once that occurs, it can be difficult to reverse.

37. This disengagement will—likely result in reduced adherence to HIV medications, which leads to increased viremia which over time progresses to AIDS. It also leads to worsening mental health, including depression and suicidality.

38. All people with HIV are at increased risk for cardiovascular disease, diabetes, and kidney disease which result from not only living with a chronic viral infection but results from the medications they must take through out their lifespan. Transgender people are no different. For transgender people with HIV, managing their medical treatment may actually decrease their risks for some of these diseases. For example, providing appropriate medical treatment allows for better monitoring of heart disease, and for some transgender women less likelihood of early cardiovascular complications.

39. Disengagement with care is particularly dangerous in the context of HIV care because interruptions in antiretroviral therapy can lead to viral rebound, immune decline, and clinical progression to AIDS. Federal HIV treatment guidelines recognize that stopping or interrupting antiretroviral therapy may result in viral rebound, immune decompensation, and clinical progression to AIDS, and studies show that viral rebound often occurs within weeks after treatment interruption.

40. This issue is particularly acute for rural areas. Patients in our practice have extremely limited, and often nonexistent, alternatives for obtaining gender-affirming medical care if it is not available through my clinic. In rural areas, providers with experience delivering gender-affirming medical care are scarce. In states such as North Carolina, most providers offering gender-affirming medical care are concentrated in large metropolitan areas, leaving rural patients with HIV without meaningful local access.

41. For our patients, there are no metropolitan areas within a 60-mile radius of the Clinic's location. Many lack reliable transportation, cannot afford the cost of travel, or are unable to take time away from work or caregiving responsibilities. In our rural community, there is no public transportation coupled with a paucity of providers with the clinical skills to provide gender

affirming medical care for transgender people with HIV. Others face housing instability or live in circumstances that make long-distance travel logistically impossible. In addition, the stigma and discrimination that transgender patients frequently encounter in unfamiliar healthcare settings create further barriers to seeking care outside of a trusted provider-patient relationship.

42. As a result, if gender-affirming medical care is not available within our Clinic for transgender people with HIV who require Ryan White medical services, many of our patients will not be able to obtain care at all. In my clinical judgment, this lack of access would lead to delays in care, reliance on unsafe or informal alternatives, or complete disengagement from the healthcare system altogether.

43. Such a policy would set comprehensive HIV care back decades, undoing progress made in engaging and retaining vulnerable populations in care and in turn reducing the human, social, and financial impact of HIV on the larger community.

44. Patients who cannot access medically necessary gender-affirming hormone therapy may again turn to informal and unsafe sources, including shared needle networks, increasing the risk of HIV and other infections, namely endocarditis.

45. Gender-affirming medical care is grounded in established medical science. Removing access to this care destabilizes the entire treatment framework for transgender patients with HIV who rely on Ryan White funding.

VI. The Challenged Conditions' Impact on Our Ability to Provide Comprehensive Care for People with HIV

46. Prohibitions on acknowledgement, affirmation, and respect for the identities of our transgender patients and the provision of gender-affirming medical care using Ryan White funds would place me and colleagues at the Clinic in an untenable position as physicians and healthcare providers.

47. We would be forced to deny medically necessary care to our patients and go against our clinical judgment in ways that conflict with accepted standards of care, including the ethical obligations of the medical profession and the clinical guidance set forth by the American Academy of HIV Medicine.

48. This would create a profound ethical conflict, as we would be unable to fulfill our duty to provide appropriate medical treatment.

49. Our relationships with patients are built on trust developed over many years. Being forced to deny care or to refuse to acknowledge and respect our patients' identities would undermine that trust and permanently damage those relationships. It would also have concrete consequences for patient engagement and retention into medical care. Many of our transgender patients seek care at the Clinic specifically because they trust that their identities and medical needs, including gender-affirming hormone therapy, will be respected and treated as legitimate. If we are no longer able to provide such care, some patients will reasonably perceive that we are unwilling to meet their full medical needs, which will erode that trust.

50. As a result, I expect that some patients would reduce or altogether stop coming to the Clinic, including for HIV treatment. Others may delay care, miss appointments, or become less adherent to HIV treatment. In my experience, once that trust is damaged, particularly for patients who have previously experienced stigma or discrimination in healthcare settings, it is difficult to rebuild, and patients may disengage from care entirely rather than seek services in settings they do not perceive as affirming or safe.

51. As a provider, I have a professional and ethical obligation to treat all aspects of my patients' health. Being prohibited from doing so would be deeply distressing and inconsistent with my oath as a physician.

VII. Financial and Programmatic Impact of the Challenged Conditions on the Clinic

52. The Clinic relies heavily on Ryan White funding to sustain its HIV care program and the broader services that support our patients. A substantial portion of our patients are uninsured or underinsured, and Ryan White funding allows us to provide care that would otherwise not be reimbursed, including medications, clinical services, and critical support services such as case management, outreach, and care coordination. Without this funding, we would not be able to maintain the current scope of services we provide.

53. Our clinic and our transgender patients also rely on Ryan White to continue to cover gender-affirming medical care as it has done for years.

54. Combined, Ryan White Parts B and C provide over 70% of our Clinic's HIV directed funding. The combined funding streams allows us to provide medical care for all people with HIV including those with co-morbidities that are a result of taking medications for decades like cardiovascular disease, renal dysfunction as well as infections like Hepatitis C. Medications used to treat these chronic diseases are provided with funding through Ryan White Part B. Transgender people with HIV suffer from these same chronic diseases making it germane to the integration of their gender-affirming medical care.

55. If Ryan White funding were reduced or lost, the impact on our Clinic would be immediate and severe and impact patients who rely on us to treat other co-morbidities as well. We would be forced to scale back services, reduce staffing, and limit the number of patients we are able to serve. In a rural setting like mine, there are no alternative funding sources or providers that could absorb this loss. As a result, all patients would lose access to care, and the Clinic's ability to continue operating its HIV program would be significantly threatened.

56. The loss of transgender patients from care would reduce patient volume and negatively impact funding tied to Ryan White program participation. Ryan White funding is distributed through federal grants to states, local jurisdictions, and clinics based in part on the number of people living with HIV who are served and retained in care, as well as demonstrated service needs. As a result, reductions in patient engagement and retention can directly affect the level of funding a clinic or jurisdiction receives or is able to sustain over time.

57. This would result in reduced funding, staff layoffs, and cuts to essential services. Ryan White funds support not only medical care, but also the staffing, infrastructure, and support services necessary to maintain patient engagement and achieve viral suppression. If patient volume declines, our Clinic would lose financial capacity to maintain these services, leading to reductions in clinical staff, case management, and other critical programs that are necessary to keep patients in care.

58. These impacts would be particularly severe in rural communities like mine, where Ryan White programs often serve as the primary, and sometimes only, source of HIV care. For the Clinic, based in North Carolina, there are limited alternative funding streams to replace lost Ryan White resources, and clinics like ours operate with thin margins, making them especially vulnerable to reductions in patient volume and associated funding.

59. In North Carolina, a significant portion of people living with HIV reside in rural areas – including all of our patients – making the Ryan White Program a critical lifeline.

VIII. The Public Health Impact of the Challenged Conditions

60. Limiting access to gender-affirming medical care and prohibiting affirming HIV care would have particularly severe public health consequences in rural areas like the communities

we serve. In these settings, HIV care infrastructure is limited, and a small number of providers and clinics are responsible for treating large geographic regions.

61. Because of this limited infrastructure, maintaining consistent patient engagement is essential. When patients disengage from care in rural areas, there are often no alternative providers or systems to bring them back into treatment. As a result, even small disruptions in care can have outsized and lasting effects on population health.

62. Based on my experience leading the American Academy of HIV Medicine's Southeast Region committee and working extensively with rural clinics, these harms would be especially acute in rural communities, where HIV providers are limited and often serve as the sole source of comprehensive care.

63. Integrated care models supported by the Ryan White Program are especially critical in rural settings, where patients face significant barriers including transportation challenges, provider shortages, and stigma. These models are designed to keep patients connected to care over time. Disrupting one component of that model, such as access to gender-affirming hormone therapy, can destabilize the entire system of care for this vulnerable population.

64. At the population level, reduced engagement in care leads to lower rates of viral suppression, which in turn increases the likelihood of HIV transmission within the community. In rural areas, where healthcare resources are already constrained, increases in untreated or poorly managed HIV place additional strain on limited medical infrastructure and public health systems.

65. Over time, these effects would undermine efforts to control the HIV epidemic in rural regions and reverse progress made through decades of targeted public health interventions. In my clinical judgment, the loss of integrated, accessible care in rural communities would have

immediate and compounding consequences for both individual patients and the broader public health system.

IX. Conclusion

66. Based on my decades of clinical experience in providing comprehensive HIV care, as well as my training and familiarity with the research and medical literature pertaining to HIV care, being able to care for my transgender patients with HIV in an affirming manner and to provide them with gender-affirming medical care when so indicated is essential to my ability to effectively treat patients living with HIV.

67. Prohibiting such care would harm my patients, undermine public health, and prevent me from fulfilling my obligations as a physician.

I declare under penalty of perjury that the foregoing is true and correct.

Dated: June 9, 2026

Michelle Collins-Ogle

Michelle Collins-Ogle, MD

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF MASSACHUSETTS

AMERICAN ACADEMY OF HIV MEDICINE; HIV MEDICINE ASSOCIATION, a division of the INFECTIOUS DISEASES SOCIETY OF AMERICA; INTERNATIONAL ASSOCIATION OF PROVIDERS OF AIDS CARE; JENNIFER K. BRODY, MD; and CHRISTOPHER B. FOX, NP, *Plaintiffs*, v. HEALTH RESOURCES AND SERVICES ADMINISTRATION; THOMAS J. ENGELS, in his official capacity as the Administrator of the Health Resources and Services Administration; U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES; and ROBERT F. KENNEDY, JR., in his official capacity as Secretary of the U.S. Department of Health and Human Services, *Defendants*.	Case No.

DECLARATION OF RACHEL ROE, MD

I, Rachel Roe, MD, hereby declare and state as follows:

1. I am over 18 years of age, of sound mind, and in all respects competent to testify.

2. I have personal knowledge of the facts set forth in this declaration and would testify competently to those facts if called to do so.

3. I am offering this declaration as a member of the HIV Medicine Association, which are bringing claims on behalf of their members like me and on behalf of the transgender patients of their members like mine.

4. Rachel Roe is a pseudonym. I am submitting this declaration under a pseudonym to protect my privacy and to protect my family and me from harassment, violence, and retaliation.

5. I submit this declaration in support of Plaintiffs' Motion for Preliminary Relief under 5 U.S.C. § 705 and for a Preliminary Injunction, which seeks to prevent Defendants from giving effect to certain conditions relating to transgender people and gender-affirming medical care set forth in Ryan White HIV/AIDS Program ("Ryan White Program") Notices of Funding Opportunity issued or forecasted to be issued in 2026 and the 2026 Updated HRSA General Terms and Conditions, issued on March 11, 2026 (collectively, "the Challenged Conditions").

6. I also submit this declaration in support of Plaintiffs' Motion for Leave to Submit Pseudonymous Declarations and for a Protective Order.

7. I am HIV physician practicing in Tennessee and my Ryan White funded clinic serves more than one thousand patients. The clinic relies on Ryan White funding to provide integrated HIV care, including clinical treatment, mental health services, case management, substance use services, and gender-affirming medical care. Integrated and affirming care is essential to maintaining trust, retention in care, treatment adherence, and viral suppression among transgender patients living with HIV. In Tennessee, a non-Medicaid expansion state, Ryan White often serves as the only realistic source of healthcare for low-income people living with HIV, making integrated care particularly critical. The challenged conditions would prevent me from offering affirming HIV care and gender-affirming medical care, causing our patients to disengage from treatment, lose viral suppression, experience worsening physical and mental health outcomes, and increase HIV transmission risk to the community. The challenged conditions would also create significant operational and financial harms for my clinic, undermine longstanding provider-patient

relationships, and threaten the viability of HIV care programs serving medically vulnerable communities.

I. Background and Professional Experience

8. I am a physician and clinical provider licensed to practice medicine in Tennessee. I have more than fifteen years of experience providing care for people living with HIV and providing gender-affirming medical care.

9. My clinic serves more than a thousand patients. Our patient population includes many low-income people, people of color, gay and bisexual men, cisgender women, transgender people, immigrants, and migrants. More than half of our patients rely on the Ryan White HIV/AIDS Program for some part of their care.

10. I am a member of the HIV Medicine Association.

11. My Ryan White clinic currently provides gender-affirming medical care to more than 50 patients.

II. Need for Pseudonymity

12. I am submitting this declaration under a pseudonym because I fear that disclosure of my identity would subject me and my patients to a substantial risk of harm, harassment, and retaliation.

13. I practice in Tennessee, where there is significant hostility toward transgender people as well as providers who offer affirming care to transgender individuals. In my experience, transgender people, including some of my patients, are subject to inordinate and disproportionate amounts of harassment and discrimination.[1] I am thus aware of the rise in anti-transgender violence

[1] James, S.E., Herman, J.L., Durso, L.E., & Heng-Lehtinen, R. (2024). Early Insights: A Report of the 2022 U.S. Transgender Survey. National Center for Transgender Equality, Washington, DC.

and harassment in the South.[2]

14. As a result, there has been a significant rise in harassment against those who care for and support transgender people, including in Tennessee. Based on media reports, I am aware of targeted online harassment, doxxing, and even bomb threats targeting gender-affirming care providers. Indeed, I am aware of media reports documenting how medical groups have urged the U.S. Department of Justice "to investigate the organizations, individuals, and entities coordinating, provoking, and carrying out bomb threats and threats of personal violence" against hospitals and physicians who provide gender-affirming care to transgender people and have been targeted as a result.[3]

15. Accordingly, I am concerned that public identification would endanger my safety as well as the safety of my family, my colleagues, and my patients.

16. Furthermore, I am concerned that public identification could expose me to retaliation that would disrupt my ability to provide care, including potential scrutiny from federal and state officials, loss of institutional support, or interference with my clinical practice. Based on media reports, I am aware that the current federal administration has targeted those who support transgender care or oppose their priorities. For example, media reports document efforts to

pressure medical organizations to change their positions on gender-affirming care and retaliation against those who have opposed the administration's priorities.[4]

17. It would also risk drawing unwanted attention to my patients, which, as noted, are already vulnerable and might potentially deter them from seeking care or further expose them to discrimination, stigmatization, and harm.

18. I am willing to disclose my identity to the Court as directed under a protective order.

III. The Role of the Ryan White Program in Patient Care

19. The Ryan White Program is lifesaving for our patients. In Tennessee, which has not expanded Medicaid, many low-income adults living with HIV have no realistic alternative source of comprehensive care. For those patients, the Ryan White Program is not one option among many; it is often the last stop before no care at all.

20. My clinic receives Ryan White funding through Parts A, B, C, D, and F. That funding supports clinical care and the staffing infrastructure needed to provide comprehensive HIV services. In practice, Ryan White helps pay for the providers, case managers, social workers, mental-health providers, substance-use specialists, and other staff who make HIV care possible for patients who are uninsured, underinsured, poor, or medically vulnerable.

21. Ryan White funding allows us to provide holistic integrated care. Our patients do not come to us only for antiretroviral prescriptions; they come to us for primary care, HIV specialty care, sexual health care, counseling, mental-health support, medication monitoring, and assistance addressing social determinants of health such as transportation barriers, food insecurity, and

housing instability. For our transgender adult patients, this also includes access to treatment for their gender dysphoria (also known as "gender-affirming medical care").

IV. Integration of Gender-Affirming Medical Care and HIV Treatment

22. Gender-affirming medical care is a critical part of that integrated model for transgender patients living with HIV in my practice. While the Ryan White formulary in my state does not include medications specifically for gender-affirming treatment, our clinic nonetheless provides essential gender-affirming medical care as part of comprehensive HIV services. In my practice, this includes counseling patients regarding gender identity and transition-related goals, conducting clinical assessments, providing referrals to appropriate specialists, coordinating care with outside providers, supporting medication management where available through other coverage, and ensuring that care is delivered in an affirming and culturally competent environment.

23. Ryan White supports the clinical infrastructure, including provider time and care coordination, through which this care is delivered. Ryan White pays both for the care our patients receive and pays a significant percentage of the salary for my staff.

24. For my transgender patients living with HIV, gender-affirming medical care is not separate from HIV care. It is a core part of how I am able to provide effective medical treatment. In my experience, patients often come to my clinic precisely because they know they can receive both affirming HIV care and gender-affirming medical care in a single, trusted setting. Without that integration, many would not seek care at all.

25. Providing gender-affirming medical care, as well as being able to acknowledge and affirm my transgender patients' identities, is essential to building trust with transgender patients, many of whom have experienced stigma, discrimination, or mistreatment in healthcare settings. When I am able to affirm a patient's gender identity and provide care that recognizes them as a

whole person, it creates the foundation for an ongoing therapeutic relationship. That trust is what allows me to engage patients in conversations about HIV treatment, adherence, and long-term health.

26. That trust directly affects whether my patients remain in care. When patients feel safe and respected, they are far more likely to attend appointments, follow up regularly, and remain engaged in treatment over time. Conversely, when care is not affirming and gender-affirming medical care is withheld or denied, transgender patients are likely to disengage, miss appointments, or stop seeking care altogether.

27. Many of my transgender patients face profound and overlapping barriers to care, including poverty, lack of reliable transportation, unstable housing, inflexible or low-wage employment, caregiving responsibilities, and prior experiences of stigma or discrimination in healthcare settings. For example, I regularly treat patients who have issues affording even a $2.00 bus fare to attend an appointment, who must choose between missing work and seeking care, or who rely on inconsistent public transit systems that make traveling across a metropolitan area difficult or impossible.

28. Because of these constraints, it is not feasible to require my patients to obtain different aspects of their care from multiple providers across different locations and at different times. Each additional appointment creates another logistical hurdle, another day off work, another transportation cost, another opportunity for something to go wrong. For many of my patients, even one missed bus, one unexpected expense, or one scheduling conflict can mean that an appointment is missed and not rescheduled.

29. In my experience, requiring my low-income patients to navigate multiple, disconnected systems of care effectively denies them access to care altogether. Many of my

patients do not have the time, financial resources, or stability to coordinate visits across different providers for HIV care, primary care, mental health services, and gender-affirming medical care. When HIV care is not centralized and coordinated by one clinic, patients are often forced to prioritize one need over another or to forgo care entirely.

30. Integrated care in a single, trusted setting is essential. By providing multiple services in one place, during the same visit or within the same care team, we reduce the number of barriers a patient must overcome to receive care. Patients are able to address multiple health needs in one trip, with providers who understand their medical history and social circumstances. This model is particularly critical for low-income patients, for whom even small logistical burdens can become insurmountable.

31. For transgender patients in particular, access to affirming, integrated care is often the reason they remain engaged in treatment. When patients are able to receive HIV care and gender-affirming care from providers they trust, in a single setting, they are far more likely to stay in care, attend appointments, and adhere to treatment. When that integration is disrupted, patients may disengage entirely, with serious consequences for their health and for public health.

V. The Challenged Conditions' Harms to My Patients

32. If the restrictions set forth in the Challenged Conditions take effect, in my clinical experience, many transgender patients will disengage from HIV care. This disengagement will lead to missed appointments, interruptions in HIV treatment, loss of viral suppression, and worsening health outcomes.

33. My patients who fall out of care will face increased risk of opportunistic infections, hospitalization, and long-term health complications. They may also develop drug resistance if treatment is interrupted.

34. Loss of viral suppression has serious public health consequences. When patients are not virally suppressed, the risk of HIV transmission increases, including transmission of drug resistant virus strains to the community.

35. The restrictions would also undermine my patients' mental health and the trust that is essential to effective medical care. Many of my transgender patients have spent years building trust with me and with our clinic, often after prior experiences of stigma, discrimination, or mistreatment in healthcare settings. That trust is not easily earned. In some cases, it has taken years before a patient felt safe enough to fully engage in care, accept examinations, or consistently follow treatment recommendations.

36. If I am forced to discriminate against my patients or to withdraw gender-affirming medical care they need, patients are likely to experience that change as a profound betrayal. From their perspective, it communicates that their identity is not respected and that their care is conditional. That perception can be deeply destabilizing, particularly for patients who already face high rates of depression, anxiety, trauma, and social marginalization.

37. The resulting harms are both immediate and long-term. Patients who disengage from care may experience worsening mental health, including increased depression, anxiety, and suicidality. At the same time, they may interrupt or stop HIV treatment, leading to loss of viral suppression and deterioration in their physical health. These harms reinforce each other, making it more difficult for patients to re-engage in care in the future.

VI. Unique Harms in Non-Medicaid Expansion States

38. Tennessee has not expanded Medicaid, which means that there is no coverage pathway for most low-income adults. For those who do qualify, eligibility is extremely limited. For example, adults with dependent children generally must have incomes at or below

approximately 100–105% of the federal poverty level, about $15,650 annually (or roughly $1,300 per month). For adults without dependent children, there is effectively no Medicaid eligibility category at all unless they meet strict disability criteria. Even for those qualifying under disability-based programs, income limits can be as low as approximately $994 per month for an individual.

39. As a result, many of my patients fall into a "coverage gap"—they earn too much to qualify under Tennessee's extremely restrictive Medicaid categories, but far too little to afford private insurance or out of pocket care. For these patients, the Ryan White Program is their only reliable source of HIV care and, indeed, any healthcare at all.

40. In this context, restricting gender-affirming care within the Ryan White Program effectively eliminates access to that care altogether. It forces my patients to choose between receiving HIV care without affirmation or disengaging from care entirely. In my experience I believe many of my patients will choose the latter.

VII. The Challenged Conditions' Harms to Providers and Public Health

41. The restrictions set forth in the Challenged Conditions would harm me as a physician by preventing me from providing medically necessary care consistent with my clinical judgment and ethical obligations. I would be placed in the untenable position of knowing what care my patients need that is integral to their overall health while being prohibited from providing it. This is directly contrary to the standards of care I am trained to follow and to my ethical duty to do no harm.

42. The restrictions would also create significant operational disruptions within my clinic. Our model of care is built around integration: providing HIV care, primary care, behavioral health, and gender-affirming medical care in a coordinated, patient-centered way. If the restrictions take effect, we may be forced to restructure how care is delivered. This could include revising

clinical protocols, retraining staff, determining which services can be provided under which funding streams, and attempting to separate services that are currently delivered together in a single visit. That process would be complex, time-consuming, and disruptive to both providers and patients.

43. My clinic relies on Ryan White funding for a substantial portion of its operating budget, including provider salaries, clinical services, and the infrastructure necessary to deliver comprehensive HIV care. In Tennessee, there is no meaningful alternative funding stream that could replace Ryan White.

44. If my clinic were found to be out of compliance with Ryan White restrictions, we could face loss of funding. The loss of that funding would be devastating. It would require reductions in staffing, elimination of services, and potentially limiting the number of patients we are able to serve.

45. Even if funding is not immediately terminated, a restriction on gender-affirming care using Ryan White funds or being able to provide affirming HIV care by prohibiting us from acknowledging, affirming, or respecting our transgender patients would itself have financial consequences. If transgender patients disengage from care because they can no longer receive integrated services, the clinic would lose the associated Ryan White-supported encounters and programmatic funding tied to patient care. At the same time, we would face increased costs associated with attempting to retain patients, redesign care systems, and manage the fallout from disrupted care.

46. If my patients disengage from care, the clinic will face increased uncompensated care and greater strain on limited resources. Patients who fall out of routine care often return only when they are acutely ill, requiring more intensive, complex, and expensive interventions. These

episodes of care are significantly more resource-intensive than routine outpatient management and are often not fully reimbursed.

47. At a broader level, the restriction would undermine efforts to control the HIV epidemic. By disrupting engagement in care and reducing viral suppression rates, the policy would increase the likelihood of HIV transmission in the community. This reverses decades of progress made through sustained investment in evidence-based, integrated HIV care models like Ryan White.

48. The harms described above are immediate and irreparable. Loss of patient trust cannot easily be restored, and the disruption of longstanding provider-patient relationships has lasting consequences. Interruptions in HIV treatment can lead to viral rebound, drug resistance, and permanent deterioration in a patient's health.

49. Patients who disengage from care may not return. In my experience, once patients fall out of care it can take years for them to re-engage, if they return at all. During that time, their health will significantly decline, and the risk of transmission to others increases. These are harms that cannot be undone through later intervention.

VIII. Conclusion

50. If the restrictions set forth in the Challenged Conditions are enjoined, I will be able to continue providing integrated, medically appropriate affirming care to my patients. If they are not enjoined, my patients in Tennessee and those in other non-Medicaid expansion states will suffer severe and irreparable harm.

I declare under penalty of perjury that the foregoing is true and correct.

FOR THE DISTRICT OF MASSACHUSETTS

AMERICAN ACADEMY OF HIV MEDICINE, et al., *Plaintiffs*, v. HEALTH RESOURCES AND SERVICES ADMINISTRATION, et al., *Defendants*.	Case No. 1:26-cv-12638-WGY

DECLARATION OF JOSE ABRIGO

I, Jose Abrigo, hereby state and declare as follows:

1. I am a Senior Attorney at Lambda Legal Defense and Education Fund and counsel for Plaintiffs in the above-referenced litigation. I am admitted to practice in the State of New York and have applied for admission *pro hac vice* in this matter, which remains pending.

2. I have personal knowledge of the matters stated herein and am competent to testify thereto.

3. I submit this Declaration in support of Plaintiffs' Motion for a Preliminary Injunction.

4. Attached hereto as **Exhibit A** is a true and correct copy of the Centers for Disease Control and Prevention's ("CDC") guidance titled *Sexually Transmitted Infections Treatment Guidelines: Transgender and Gender Diverse Persons* (2021), available at https://tinyurl.com/jcjskthp [https://perma.cc/PLX2-H25M].

5. Attached hereto as **Exhibit B** is a true and correct copy of the "FY 2026 HRSA General Terms and Conditions," issued by the Health Resources and Services Administration

("HRSA") on March 11, 2026 (hereafter "**Updated FY2026 General Terms**"), and available at https://www.hrsa.gov/sites/default/files/hrsa/grants/manage/fy2026-hrsa-general-terms-and-conditions-2026-03-11-update.pdf [https://perma.cc/GK9K-2FZ4].

6. Attached hereto as **Exhibit C** is a true and correct copy of HRSA's priorities webpage titled "Advancing HRSA's Mission Through Focused, Accountable Action," available at https://tinyurl.com/2j65ckdv [https://perma.cc/5TS2-8LE2] ("**HRSA Priorities**").

7. Attached hereto as **Exhibit D** is a true and correct copy of the *Notice of Funding Opportunity, AIDS Drug Assistance Program (ADAP) Emergency Relief Funds (ERF)*, Opportunity No. HRSA-26-012, issued by HRSA on November 3, 2025 (hereafter "**ADAP NOFO"**).

8. Attached hereto as **Exhibit E** is a true and correct copy of Executive Order No. 14168, *Defending Women From Gender Ideology Extremism and Restoring Biological Truth to the Federal Government*, 90 Fed. Reg. 8615 (Jan. 20, 2025) (hereafter "**Gender Order**").

EXHIBIT A

Per a court order, HHS is required to restore this website to its version as of 12:00 AM on January 29, 2025. Information on this page may be modified and/or removed in the future subject to the terms of the court's order and implemented consistent with applicable law. Any information on this page promoting gender ideology is extremely inaccurate and disconnected from truth. The Trump Administration rejects gender ideology due to the harms and divisiveness it causes. This page does not reflect reality and therefore the Administration and this Department reject it.

Transgender and Gender Diverse Persons

Transgender persons often experience high rates of stigma and socioeconomic and structural barriers to care that negatively affect health care usage and increase susceptibility to HIV and STIs (*326–332*). Persons who are transgender have a gender identity that differs from the sex that they were assigned at birth (*333*,*334*). Transgender women (also known as trans women, transfeminine persons, or women of transgender experience) are women who were assigned male sex at birth (born with male anatomy). Transgender men (also known as trans men, transmasculine persons, or men of transgender experience) are men who were assigned female sex at birth (i.e., born with female anatomy). In addition, certain persons might identify outside the gender binary of male or female or move back and forth between different gender identities and use such terms as "gender nonbinary," "genderqueer," or "gender fluid" to describe themselves. Persons who use terms such as "agender" or "null gender" do not identify with having any gender. The term "cisgender" is used to describe persons who identify with their assigned sex at birth. Prevalence studies of transgender persons among the overall population have been limited and often are based on small convenience samples.

Gender identity is independent of sexual orientation. Sexual orientation identities among transgender persons are diverse. Persons who are transgender or gender diverse might have sex with cisgender men, cisgender women, or other transgender or gender nonbinary persons.

Clinical Environment Assessment

Providers should create welcoming environments that facilitate disclosure of gender identity and sexual orientation. Clinics should document gender identity and sex assigned at birth for all patients to improve sexual health care for transgender and gender nonbinary persons. Assessment of gender identity and sex assigned at birth has been validated among diverse populations, has been reported to be acceptable (*335*,*336*), and might result in increased patients identifying as transgender (*337*).

Lack of medical provider knowledge and other barriers to care (e.g., discrimination in health care settings or denial of services) often result in transgender and gender nonbinary persons avoiding or delaying preventive care services (*338–340*) and incurring missed opportunities for HIV and STI prevention services. Gender-inclusive and trauma-guided health care might increase the number of transgender patients who seek sexual health services, including STI testing (*341*), because transgender persons are at high risk for sexual violence (*342*).

Primary care providers should take a comprehensive sexual history, including a discussion of STI screening, HIV PrEP and PEP, behavioral health, and social determinants of sexual health. Clinicians can improve the experience of sexual health screening and counseling for transgender persons by asking for their choice of terminology or modifying language (e.g., asking patients their gender pronouns) to be used during clinic visits and history taking and examination (*343*). Options for fertility preservation, pregnancy potential, and contraception options should also be discussed, if indicated. For transgender persons who retain a uterus and ovaries, ovulation might continue in the presence of testosterone therapy, and pregnancy potential exists (https://transcare.ucsf.edu).

Transgender Women

Doxy PEP as an STI Prevention Strategy – Guidelines on the use of doxycycline post-exposure prophylaxis (doxy PEP) to prevent some bacterial STIs.

A systematic review and meta-analysis of HIV infection among transgender women estimated that HIV prevalence in the United States is 14% among transgender women, with the highest prevalence among Black (44%) and Hispanic (26%) transgender women (*344*). Data also demonstrate high rates of HIV infection among transgender women worldwide (*345*). Bacterial STI prevalence varies among transgender women and is based largely on convenience samples. Despite limited data, international and U.S. studies have indicated elevated incidence and prevalence of gonorrhea and chlamydia among transgender women similar to rates among cisgender MSM (*346–348*). A recent study using data from the STD Surveillance Network revealed that the proportions of transgender women with extragenital chlamydial or gonococcal infections were similar to those of cisgender MSM (*349*).

Providers caring for transgender women should have knowledge of their patients' current anatomy and patterns of sexual behavior before counseling them about STI and HIV prevention. The majority of transgender women have not undergone genital-affirmation surgery and therefore might retain a functional penis; in these instances, they might engage in insertive oral, vaginal, or anal sex as well as receptive oral or anal sex. In the U.S. Transgender Survey, 12% of transgender women had undergone vaginoplasty surgery, and approximately 50% more were considering surgical intervention (*350*). Providers should have knowledge about the type of tissue used to construct the neovagina, which can affect future STI and HIV preventive care and screening recommendations. The majority of vaginoplasty surgeries conducted in the United States use penile and scrotal tissue to create the neovagina (*351*). Other surgical techniques use intestinal tissue (e.g., sigmoid colon graft) or split-skin grafts (*352*). Although these surgeries involve penectomy and orchiectomy, the prostate remains intact. Transgender women who have had a vaginoplasty might engage in receptive vaginal, oral, or anal sex.

Neovaginal STIs have infrequently been reported in the literature and include HSV and HPV/genital warts in penile-inversion vaginoplasty, *C. trachomatis* in procedures that involved penile skin and grafts with urethra mucosa or abdominal peritoneal lining (*353*), and *N. gonorrhoeae* in both penile-inversion and colovaginoplasty (*354–359*). If the vaginoplasty used an intestinal graft, a risk also exists for bowel-related disease (e.g., adenocarcinoma, inflammatory bowel disease, diversion colitis, and polyps) (*360–362*).

Transgender Men

The few studies of HIV prevalence among transgender men indicated that they have a lower prevalence of HIV infection than transgender women. A recent estimate of HIV prevalence among transgender men was 2% (*344*). However, transgender men who have sex with cisgender men might be at elevated risk for HIV infection (*332*,*363*,*364*). Data are limited regarding STI prevalence among transgender men, and the majority of studies have used clinic-based data or convenience sampling. Recent data from the STD Surveillance Network demonstrated higher prevalence of gonorrhea and chlamydia among transgender men, similar to rates reported among cisgender MSM (*365*).

The U.S. Transgender Survey indicated that the proportion of transgender men and gender diverse persons assigned female sex at birth who have undergone gender-affirmation genital surgery is low. Providers should consider the anatomic diversity among transgender men because a person can undergo a metoidioplasty (a procedure to increase the length of the clitoris), with or without urethral lengthening, and might not have a hysterectomy and oophorectomy and therefore be at risk for bacterial STIs, HPV, HSV, HIV, and cervical cancer (*366*). For transgender men using gender-affirming hormone therapy, the decrease in estradiol levels caused by exogenous testosterone can lead to vaginal atrophy (*367*,*368*) and is associated with a high prevalence of unsatisfactory sample acquisition (*369*). The impact of these hormonal changes on mucosal susceptibility to HIV and STIs is unknown.

Transgender men who have not chosen to undergo hysterectomy with removal of the cervix remain at risk for cervical cancer. These persons often avoid cervical cancer screening because of multiple factors, including discomfort with medical examinations and fear of discrimination (*338*,*370*). Providers should be aware that conducting a speculum examination can

be technically difficult after metoidioplasty surgery because of narrowing of the introitus. In these situations, high-risk HPV testing using a swab can be considered; self-collected swabs for high-risk HPV testing has been reported to be an acceptable option for transgender men (*371*).

Screening Recommendations

The following are screening recommendations for transgender and gender diverse persons:

- Because of the diversity of transgender persons regarding surgical gender-affirming procedures, hormone use, and their patterns of sexual behavior, providers should remain aware of symptoms consistent with common STIs and screen for asymptomatic infections on the basis of the patient's sexual practices and anatomy.
- Gender-based screening recommendations should be adapted on the basis of anatomy (e.g., routine screening for *trachomatis* and *N. gonorrhoeae)* as recommended for all sexually active females aged <25 years on an annual basis and should be extended to transgender men and nonbinary persons with a cervix among this age group.
- HIV screening should be discussed and offered to all transgender persons. Frequency of repeat screenings should be based on level of risk.
- For transgender persons with HIV infection who have sex with cisgender men and transgender women, STI screening should be conducted at least annually, including syphilis serology, HCV testing, and urogenital and extragenital NAAT for gonorrhea and chlamydia.
- Transgender women who have had vaginoplasty surgery should undergo routine STI screening for all exposed sites (e.g., oral, anal, or vaginal). No data are available regarding the optimal screening method (urine or vaginal swab) for bacterial STIs of the neovagina. The usual techniques for creating a neovagina do not result in a cervix; therefore, no rationale exists for cervical cancer screening (*368*).
- If transgender men have undergone metoidioplasty surgery with urethral lengthening and have not had a vaginectomy, assessment of genital bacterial STIs should include a cervical swab because a urine specimen will be inadequate for detecting cervical infections.
- Cervical cancer screening for transgender men and nonbinary persons with a cervix should follow current screening guidelines (see Human Papillomavirus Infections).

EXHIBIT B

March 11, 2026

FY 2026 HRSA General Terms and Conditions

These terms and conditions apply to all discretionary awards with funds and award modifications with funds made on or after March 11, 2026.

Compliance with Court Orders: Any term or condition in this Notice of Award (NOA), including those incorporated by reference, that HHS is enjoined by court order from imposing or enforcing shall not apply or be enforced as to any recipient or subrecipient to which that court order applies and while that court order is in effect.

1. Administrative Requirements

You must comply with the laws, policies, and terms and conditions included in your Notice of Award (NOA).

This includes:

- Requirements of the authorizing statutes and implementing regulations for the programs under which your award is funded.
- Appropriations acts provisions.
- Terms and conditions included in the HHS Grants Policy Statement (HHS GPS), which HHS revised with an effective date of October 01, 2025.This includes the requirements of applicable HHS regulations and the Uniform Administrative Requirements, Cost Principles and Audit Requirements for Federal Awards codified at 2 CFR 200 and any successor regulations, policies and requirements.
    - The HHS GPS applies to monetary actions only, including non-competing continuation awards and award modifications that add funding made on or after October 01, 2025. This includes supplements to awards, competing and non-competing continuations. The GPS applies to all HRSA discretionary awards and the requirements flow down to subrecipients.
    - Until a monetary action is processed, the July 24, 2025 GPS applies to your award.
- The HHS Administrative and National Policy Requirements (Appendix D, revised to ensure consistency with all administration policies.
- Requirements included in the Notice of Funding Opportunity (NOFO); and
- Policies specific to the award.

Applicable Regulatory Provisions. This award is subject to any applicable provisions of 2 CFR 200 and 2 CFR 300.

In case of conflicting or inconsistent requirements, follow the order of precedence indicated in the HHS Administrative and National Policy Requirements. This document provides statutory, regulatory, and executive requirements that apply to HHS awards.

We may list exceptions to individual requirements stated above in the NOA.

Use of the terms “federal award,” “award,” and “grant” refers collectively and separately to federal assistance awards, grants, and cooperative agreements, unless otherwise indicated.

Per 2 CFR 25, SAM.gov and Unique Entity Identifier (UEI) registration are required throughout the lifecycle of all HRSA awards.

a. Termination

This award is subject to the termination provisions at 2 CFR 200.340. Pursuant to 2 CFR 200.340, the recipient agrees by accepting this award that continued funding for the award is contingent upon the availability of appropriated funds, recipient satisfactory performance, compliance with the Terms and Conditions of the award, and to the extent authorized by law, a decision by the agency that the award continues to effectuate program goals or agency priorities.

b. Appeals

HRSA affords appeal rights for remedies for non-compliance, including terminations for compliance reasons. See 2 CFR 200.342 for opportunities to object, hearings, and appeals.

c. Subrecipients and Recipients (Pass-Through Entities) Responsibilities

The recipient is the entity that receives a federal award directly from HRSA.

The recipient can give a portion of the direct award to other organizations, called subrecipients, to accomplish the goals and objectives of the award.

In this case, the recipient becomes a pass-through entity and the subrecipient's award is called a subaward.

As a recipient, you must ensure the applicable general terms and conditions stated in this document flow down to subrecipients. See the HHS Administrative and National Policy Requirements.

d. Prior Approval

You must get prior approval for certain items, as stated in 2 CFR 200.308 and 2 CFR 200.407. Examples of items requiring prior approval include:

- Significant rebudgeting of project costs. Significant budget changes require prior approval when:
    - The award exceeds the simplified acquisition threshold (currently $350,000), and
    - The cumulative amount of the transfer exceeds 25 percent of the total budget, including cost share, of the most recent approved award (budget period).
        - Due to programmatic need, HRSA is using the 25 percent threshold for prior approval, instead of the 10 percent threshold cited in the HHS GPS Section 3.1.2.2 (Significant Budget Changes)
- Change of scope. A change in scope can occur when a recipient makes a budget change that cause a project to change substantially.
    - If you are not sure your budget change is beyond the scope, contact your Grants Management Specialist (GMS).
- Rebudgeting funding into a direct cost category not previously requested.

We do not automatically authorize prior approvals under 2 CFR 200.308(g) or 2 CFR 200.308(h):

- We do not waive cost-related or administrative prior approvals unless specifically stated in your NOA. You must submit these as a Prior Approval action via HRSA Electronic Handbooks (EHBs) or GrantSolutions (when HRSA transitions to GrantSolutions).
- Only responses to prior approval requests signed by the Grants Management Officer (GMO) are valid.

If you act based on responses from other officials, you do so at your own risk. We do not consider these responses binding.

f. Funding Restrictions

See your NOA and the HHS Administrative and National Policy Requirements for funding restrictions such as:

- Salary Cap (also see Salary Rate Limitation)
- Gun control
- Anti-lobbying
- Restrictions on abortion
- Ban on funding embryo research
- Limitation on use of funds for promotion of legalization of controlled substances
- Restriction of pornography on computer networks
- Restriction on the purchase of sterile needles
- Prohibition on certain telecommunications and video surveillance services or equipment.

g. Roles and Responsibilities.

To see the roles and responsibilities of the GMS and the Program Official (PO) for your award, visit Manage Your Grant - Administrative Management.

i. Antidiscrimination Laws and Requirements Compliance Certification

By applying for or accepting federal funds from HHS, recipients certify compliance with all federal antidiscrimination laws and these requirements and that complying with those laws is a material condition of receiving federal funding streams. Recipients are responsible for ensuring subrecipients, contractors, and partners also comply.

2. Policy Requirements

The HHS Administrative and National Policy Requirements provide a list of requirements applicable to HHS awards.

a. Conflict of Interest

See the HRSA Federal Financial Assistance Conflict of Interest Policy (COI Policy)

3. Financial Requirements

a. Salary rate limitation (SRL)

See the Salary Cap Summary Table for the latest salary rate limitation.

The HHS salary rate limitation applies to both direct and indirect costs for all applicable HHS awards.

b. Payments

Grant funds must be drawn and Federal Financial Reports (FFR) filed using the HHS Payment Management System (PMS).

The Division of Payment Management, Financial Management Services, Program Support Center, manages PMS and has instructions for obtaining payments.

Submit direct inquiries about payments:
ONE-DHHS Help Desk for PMS Support at 1-877-614-5533 or PMSSupport@psc.hhs.gov.

If you do not have access, complete a PMS Access Form (PMS/FFR Form). If you have any questions about accessing PMS, contact the PMS Liaison Accountant.

c. Program income

Per 2 CFR 200.307, HRSA awards use the additive method for program income earned from your award.

Program income requirements for for-profit recipients are governed by 2 CFR 300.318.

4. Reporting Requirements

Review your NOA, HHS Administrative and National Policy Requirements, and HRSA Manage Your Grant for required reports and method of submission.

a. General Reports may include:

- Federal Financial Reports (FFR)
- Noncompeting Continuation (NCC) Progress Reports
- Tangible Personal Property Report (SF-428) for Equipment and Supplies
- Real Property Report (SF-429)
- Subaward Reporting under the Federal Funding Accountability and Transparency Act (FFATA) reporting at SAM.gov.
- Recipient integrity and performance

b. Audit Reports

- If your organization is a nonprofit organization and is required to have audits in accordance with 2 CFR 200, Subpart F (See 2 CFR 200.501) because it spends $1,000,000 or more in federal funds in one fiscal year, submit the audit reports to the Federal Audit Clearinghouse.
- For-profit organizations required to have audits should submit the audit reports directly to HRSA.

c. Reporting Fraud, Waste, Abuse, and Mismanagement

- The HHS Office of the Inspector General (OIG) maintains a toll-free number (1-800- HHS-TIPS [1-800-447-8477]; TTY: 1-800-377-4950) and website for receiving information concerning fraud, waste, abuse, and mismanagement under HHS programs.

  Additionally, information may be submitted by mail to:

  Office of the Inspector General
  Department of Health and Human Services
  Attn: HOTLINE
  330 Independence Ave., SW
  Washington DC 20201

- Such reports are treated as sensitive material. You can decline to give your name if you choose to remain anonymous.

5. Alignment with HRSA funding priorities

a. General Alignment with HRSA Mission and Strategic Priorities

As a condition of this award, you must ensure that all activities funded under this award are implemented in a manner consistent with HRSA's mission and strategic priorities as authorized by law.

Funded activities must advance HRSA's mission of protecting and improving the health and well-being of Americans. The particular focus is on those who are underserved, medically vulnerable, or live in areas with limited access to care. HRSA's duty is to serve wisely, effectively, and with measurable results that justify every taxpayer dollar invested.

Consistent with HRSA's priorities, in carrying out any funded project, the recipient must adhere to the following principles, where they are consistent with the authority and scope of the award and its activities:

- **Gold Standard Science:** Design and deliver services using gold standard evidence-based and evidence-informed approaches, establish measurable performance goals, and use data to monitor outcomes and drive continuous improvement.
- **Program Integrity and Fiscal Stewardship:** Administer all funds in accordance with applicable federal statutes, regulations, and award conditions. You must maintain strong internal controls to prevent waste, fraud, abuse, and mismanagement of taxpayer dollars.
- **Partnership and Local Leadership:** Coordinate with state, tribal, territorial, local, and community partners to ensure services are tailored to community-identified needs while respecting local decision-making authority.

b. Alignment with Administration Objectives

Recipients must manage any awarded project in accordance with the following objectives in programs authorized to advance them:

Make America Healthy Again (MAHA): HRSA prioritizes the health and well-being of all Americans by supporting common-sense, evidence-based health policies that promote:

- Personal responsibility.
- Strong families and communities.
- Proper nutrition.
- The prevention and management of chronic disease, while ensuring access to high-quality, affordable physical and mental health care.

Child protections, biological integrity, parental rights, and lawful use of funds: HRSA prioritizes safeguarding children's health and safety by:

- Not supporting medical interventions for gender dysphoria in minors that lack a strong evidence base.
- Applying sex-based definitions grounded in biological reality.
- Supporting parental authority, transparency, and choice in education, including school-based health centers that respect parental rights and religious upbringing.
- Ensuring taxpayer funds are not used to promote or support elective abortions, consistent with federal law and the Hyde Amendment.

Advancing evidence-based, merit-driven, and ethically grounded health care: HRSA will prioritize unbiased, transparent science; merit-based workforce opportunities; and programs that demonstrate measurable outcomes, while deprioritizing organizations with:

- Conflicts of interest.
- Ineffective "harm reduction" models.
- Housing-first approaches lacking accountability.
- Activities that facilitate illegal drug use or unsafe medical practices.

Promoting public safety, lawful use of federal funds, and national health priorities: To the extent permitted by law, HRSA will align funding with administration priorities by:

- Supporting ending the HIV epidemic through authorized, evidence-based care.
- Reserving benefits for eligible individuals.
- Discouraging illegal immigration and unsafe community practices.
- Prioritizing recipients that enforce public safety, address serious mental illness and substance use through treatment and recovery, and reduce homelessness responsibly.

c. Enforcement Standards

To the extent permitted by law, HRSA gives priority to states and municipalities for programs to:

- Enforce prohibitions on open illicit drug use.
- Enforce prohibitions on urban camping and loitering.
- Enforce prohibitions on urban squatting.
- Enforce, and where necessary, adopt, standards that address individuals who are a danger to themselves or others and suffer from serious mental illness or substance use disorder, or who are living on the streets and cannot care for themselves. The approach must be through assisted outpatient treatment or by moving them into treatment centers or other appropriate facilities through civil commitment or other available means, to the maximum extent permitted by law.

d. Compliance, Monitoring, and Termination

HRSA will implement these priorities consistent with applicable laws, regulations, court orders, and any required procedures.

- **Ongoing Compliance:** You must demonstrate continuous alignment with these priorities through program design, implementation, reporting, and evaluation throughout the period of performance.
- **Corrective Action:** Failure to meaningfully align funded activities with these requirements may result in the imposition of specific award conditions, additional reporting requirements, or corrective action plans.
- **Termination:** In accordance with 2 CFR § 200.340(a)(4), HRSA may terminate this award in whole or in part, to the extent permitted by law, if it determines that the award no longer effectuates the program goals or agency priorities outlined in these terms.

EXHIBIT C

Advancing HRSA's Mission Through Focused, Accountable Action

As stewards of federal resources, the Health Resources and Services Administration (HRSA) remains firmly committed to protecting and improving the health and well-being of Americans, particularly those who are medically vulnerable, or live in areas where access to care is limited. Our duty is not just to serve, but to serve wisely, effectively, and with measurable results that justify every taxpayer dollar invested.

In alignment with the current administration's focus on outcomes-driven governance and responsible spending, HRSA is emphasizing targeted investments that strengthen the nation's core healthcare infrastructure, address pressing health challenges, and deliver real results for communities across the country.

HRSA is committed to prioritizing gold-standard science and the mission outlined in the *Make America Healthy Again Commission Report* to deliver better health outcomes. Through its critical public health and workforce programs, HRSA intends to address the nation's most pressing health challenges, including the chronic disease epidemic, the mental health crisis, obesity, nutritional deficiencies, exposure to chemical and environmental toxins, and overreliance on medical interventions.

HRSA is committed to supporting programs and initiatives that will focus on the underlying causes of disease, including lifestyle modifications and other modalities that are shown to be effective in improving health outcomes. HRSA will preference programs, partnerships, grants, cooperative agreements, contracts, and other funding mech[illegible] that prioritize these objectives.

By narrowing our focus to high-impact, data-supported interventions, HRSA is reinforcing the programs that work, cutting inefficiencies, and directing resources to areas of greatest need. From rural towns to tribal nations, and from health centers to home visiting programs, our goal is clear: improve health outcomes while honoring the trust placed in us by the American people.

Our strategy is rooted in time-tested principles: responsible governance, fiscal restraint, local empowerment, and accountability. Through stronger oversight, partnerships with community-based providers, and support for innovation in care delivery, HRSA is advancing its mission while ensuring that federal dollars are not wasted, misdirected, or overextended.

We understand that taxpayer dollars are not unlimited. Every investment must be justified by results. By focusing on measurable outcomes, emphasizing efficiency, and ensuring transparency at every level of operations, HRSA is fulfilling its charge not only to improve healthcare access, but to do so in a way that reflects respect for American taxpayers and the limits of federal responsibility.

This commitment to focused, accountable action drives every policy we craft, every program we fund, and every reform we implement. We are proud to serve the American people and equally proud to do so with discipline, integrity, and impact.

Thomas J. Engels
Administrator, HRSA

About the Health Resources and Services Administration

HRSA, an agency of the U.S. Department of Health and Human Services, plays a vital role in improving access to care for Americans who are uninsured, isolated, or medically underserved. With a focus on strengthening local healthcare capacity, HRSA funds community health centers, supports health workforce development, invests in maternal and child health programs, sustains HIV/AIDS care, and promotes rural and telehealth services.

HRSA's goal is to support and empower existing healthcare systems, helping communities serve their own people with long-term, cost-effective solutions. Our programs are designed not to expand bureaucracy but to reinforce self-sufficiency, resilience, and responsible stewardship of public health resources. To learn more, visit www.hrsa.gov.

HRSA's Strategic Priority Areas

This document has been prepared in furtherance of the HRSA Administrator's responsibility to provide the overall direction of HRSA, to establish and implement general policies respecting the management and operation of programs and activities, and to coordinate and oversee the operation of the agency's bureaus and offices. Several HRSA's authorities permit HRSA to exercise a certain level of discretion and judgment in making federal financial assistance awards. This document is intended to clarify HRSA's Strategic Priority Areas in areas subject to HRSA's discretion.

HRSA is prioritizing the following areas:

- We believe the health and safety of children must be the highest priority. HHS released a comprehensive review (PDF - 68 KB) of the evidence and best practices for promoting the health of children and adolescents with gender dysphoria. This review, informed by an evidence-based medicine approach, found medical interventions, such as puberty blockers, cross-sex hormones, and surgeries, that attempt to transition minors away from their sex are supported by extremely weak evidence base and have an unfavorable risk/benefit profile. It is a HRSA priority to protect children from these practices, and, to the extent allowable by law. HRSA programs will deprioritize programs that engage in these practices. HRSA funds will also not support the costs of such practices where not required by law or relevant court order. On March 6, 2025, a letter was issued (PDF - 285 KB) outlining that HRSA may begin taking steps to update its policies in order to strengthen protections for children against harmful chemical and surgical interventions.
- HHS released guidance (PDF - 232 KB) promulgating sex-based definitions rooted in biological truth. It is a HRSA priority to recognize that a person's sex as either male or female is unchangeable and determined by objective biology, and to ensure its programs accurately reflect science, including the biological reality of sex.

- Where permitted by law, HRSA will deprioritize unlawful diversity, equity, and inclusion initiatives, which prioritize group identity over individual merit. We believe opportunities should be based on character, effort, and ability, not race or other group identity. HRSA is committed to restoring merit-based opportunities and removing unlawful discriminatory practices (including unlawful proxies for racial discrimination), including in HRSA's health care workforce programs.

HRSA believes parents are the primary decision-makers in their children's education and should have full authority over what their children are taught. School policies should include transparency and choice, and curricula should emphasize knowledge, critical thinking, and civic responsibility, without imposing ideas that may conflict with parents' political, religious, or social beliefs. To the extent allowable by law, HRSA will also prioritize School Based Health Centers that respect parental rights and authority to direct the religious upbringing of their children.

Make America Healthy Again is a call to prioritize the well-being of all Americans through common-sense health policies, personal responsibility, and strong community support. HRSA believes in empowering individuals and families to take charge of their physical and mental health, with a focus on proper nutrition and the prevention and management of chronic diseases, while ensuring access to high-quality, affordable care.

The public must know that unbiased science—evaluated through a transparent process and insulated from conflicts of interest—guides the recommendations of our health agencies, and HRSA-funded programs and activities carried out by HRSA's partners. HRSA will deprioritize organizations which present conflicts of interest or otherwise compromise their objectivity or integrity in carrying out HRSA-funded programs.

HRSA supports the President's Ending the HIV Epidemic in the US initiative and will not provide funding under the Ryan-White HIV/AIDS Program (RWHAP) for purposes unrelated to the statute, including for medications that are used without proper authorization or outside of approved medical guidelines. Public resources should support safe, evidence-based care, ensuring that treatments are used appropriately and responsibly to protect patient health and public trust. In a letter dated April 7, 2025, the Trump Administration reaffirmed its commitment to 'Make America Healthy Again (PDF - 322 KB),' calling on RWHAP recipients and subrecipients to align with this vision while emphasizing training, technical assistance, and culturally competent care to strengthen antiretroviral adherence and viral suppression in the fight to end HIV.

Federal law prohibits the use of HHS funds for elective abortions. Accordingly, HRSA programs will not use taxpayer funds to promote elective abortions. Taxpayer dollars should be used to protect life and support alternatives to abortion that honor the dignity of every mother and unborn child. Our commitment is to uphold the values of life and, consistent with the Hyde Amendment, ensure public funds are not used for elective abortions.

It is a priority of HRSA to ensure that federal public benefits are reserved for American citizens and qualified aliens, in compliance with the Personal Responsibility and Work Opportunity Reconciliation Act and other federal laws. Consistent with applicable law, Federal funds should not be used to encourage or support illegal immigration. HRSA will prioritize programs that further the administration's priority to end illegal immigration.

HRSA grants will prioritize evidence-based programs and not fund programs that fail to achieve adequate outcomes, including so-called "harm reduction" or "safe consumption" efforts that only facilitate illegal drug use and its attendant harm. HRSA funds will not be used to support poorly defined so-called "harm reduction" activities, consistent with guidance on July 29, 2025 published by the Substance Abuse and Mental Health Services Administration (SAMHSA) (PDF - 272 KB).

It is a priority of HRSA to end support for "housing first" policies that deprioritize accountability and fail to promote treatment, recovery, and self-sufficiency. Where applicable, HRSA will increase competition among grantees through broadening the applicant pool and hold grantees to higher standards of effectiveness in reducing homelessness and increasing public safety. HRSA will ensure that Federal funds for Federally Qualified Health Centers reduce rather than promote homelessness by supporting, to the maximum extent permitted by law, comprehensive services for individuals with serious mental illness and substance use disorder, including crisis intervention services.

It is a priority of HRSA not to support programs that subsidize drug injection sites for illegal drugs or so-called "safe consumption sites," knowingly distribute drug paraphernalia, or permit use or distribution of illegal drugs on property under their control.

To the extent allowable by law, HRSA will give priority to grantees in States and municipalities that actively meet the below criteria: (i) enforce prohibitions on open illicit

drug use; (ii) enforce prohibitions on urban camping and loitering; (iii) enforce prohibitions on urban squatting; (iv) enforce, and where necessary, adopt, standards that address individuals who are a danger to themselves or others and suffer from serious mental illness or substance use disorder, or who are living on the streets and cannot care for themselves, through assisted outpatient treatment or by moving them into treatment centers or other appropriate facilities via civil commitment or other available means, to the maximum extent permitted by law; or (v) substantially implement and comply with, to the extent required, the registration and notification obligations of the Sex Offender Registry and Notification Act, particularly in the case of registered sex offenders with no fixed address, including by adequately mapping and checking the location of homeless sex offenders.

HRSA will implement these priorities consistent with applicable laws, regulations, court orders, and any required procedures.

Before you begin

If you believe you are a good candidate for this funding opportunity, secure your SAM.gov and Grants.gov registrations now. If you are already registered, make sure your registrations are active and up-to-date.

SAM.gov registration (this can take several weeks)

You must have an active account with SAM.gov. This includes having a Unique Entity Identifier (UEI).

See Step 2: Get Ready to Apply

Grants.gov registration (this can take several days)

You must have an active Grants.gov registration. Doing so requires a Login.gov registration as well.

See Step 2: Get Ready to Apply

Apply by the application due date

Applications are due by 11:59 p.m. Eastern Time on Monday, November 3, 2025.

To help you find what you need, this NOFO uses internal links. In Adobe Reader, you can go back to where you were by pressing Alt + Left Arrow (Windows) or Command + Left Arrow (Mac) on your keyboard.

Basic information

Health Resources and Services Administration (HRSA)

HIV/AIDS Bureau

Division of State HIV/AIDS Programs

Summary

The purpose of the AIDS Drug Assistance Program (ADAP) Emergency Relief Funds (ERF) is to provide funding to states/territories to prevent, reduce, or eliminate ADAP waiting lists or to address shortfalls in ADAP funding for medications and/or the purchase of health care coverage. Recipients will use these funds along with the Ryan White HIV/AIDS Program (RWHAP) Part B ADAP base award.

Funding details

Application Types: Competing continuation, New

Expected total available funding in FY 2026: $75,000,000

Expected number and type of awards: Up to 25 grants

Funding range per award: $100,000 to $10,000,000

- If you have a current ADAP waiting list, you may apply for up to $10,000,000. If you do not have a waiting list, you may apply for up to $7,000,000. The minimum award amount is $100,000.

We plan to fund awards in one 12-month budget period from April 1, 2026, to March 31, 2027.

The program and awards depend on the appropriation of funds and are subject to change based on the availability and amount of appropriations.

Federal assistance listing: 93.917

Key dates

NOFO issue date: October 2, 2025

Informational webinar: October 15, 2025

Application deadline: November 3, 2025

Expected award date is by: April 1, 2026

Expected start date: April 1, 2026

See other submissions for other time frames that may apply to this NOFO.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 8 of 54

Eligibility

Who can apply

You can only apply if you are a state/territory that receives RWHAP Part B funding and needs additional funding to:

- Reduce or eliminate an existing ADAP waiting list.
- Actively prevent an ADAP waiting list.
- Address a reduction in available resources to fund ADAP.
- Address a current or projected increase in treatment needs to end the HIV epidemic in the U.S.
- Address other increases in the number of clients in the program due to new diagnosis, re-engagement in care, loss of income, and/or loss of health care coverage.

Types of eligible organizations

These types of domestic* organizations may apply:

- State governments, including the District of Columbia, domestic territories, and freely associated states.

* “Domestic” means the 50 states, the District of Columbia, the Commonwealth of Puerto Rico, the Northern Mariana Islands, American Samoa, Guam, the U.S. Virgin Islands, the Federated States of Micronesia, the Republic of the Marshall Islands, and the Republic of Palau.

Tribes and tribal organizations are not eligible for this funding. Individuals are not eligible for this funding.

Completeness and responsiveness criteria

We will review your application to make sure it meets these basic requirements to move forward in the competition.

We will not consider an application that:

- Is from an organization that does not meet all eligibility criteria.
- Requests funding above the award ceiling shown in the funding range.
- Is submitted after the deadline.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 9 of 54

Application limits

You may not submit more than one application. If you submit more than one application, we will only accept the last on-time submission.

Cost sharing

This program has no cost-sharing requirement. If you choose to share in the costs of the project, we will not consider it during merit review. We will hold you accountable for any funds you add, including through reporting

Post-award requirements

Before you apply, make sure you understand the requirements that come with an award.

See Step 6: Learn What Happens After Award for information on regulations that apply, reporting, and more.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 10 of 54

Program description

Purpose

This notice announces the opportunity to apply for funding under the Ryan White HIV/AIDS Program (RWHAP) Part B AIDS Drug Assistance Program (ADAP) Emergency Relief Funds (ERF).

ADAP ERF awards are intended for states/territories that need additional resources to prevent, reduce, or eliminate ADAP waiting lists or to address shortfalls in ADAP funding for medications or health care coverage. HRSA will base ADAP ERF awards upon your ability to successfully demonstrate the need for additional funding.

At the time of this NOFO publication, there are no ADAP waiting lists. States/territories that establish a waiting list after this NOFO is published must report the waiting list to HRSA immediately and use funding awarded under this NOFO to remove clients from the waiting list.

HRSA anticipates increases in clients who need ADAP services due to reductions in program income or rebates, loss of health care coverage among people with HIV, and increased case finding. States/territories may use ERF funds to address current or projected increases in treatment needs aligned with ending the HIV epidemic in the U.S. or other increases in the number of clients in their ADAP.

Background

ADAPs ensure access to medication to treat HIV for eligible clients by directly purchasing medication and covering the costs of health care coverage premiums, deductibles, co-payments, and co-insurance. The state/territory determines client eligibility and ADAPs are expected to confirm client eligibility on a timely basis. Eligibility criteria include documented diagnosis of HIV, financial eligibility, and residence eligibility.

The Ryan White HIV/AIDS Program

The HRSA Ryan White HIV/AIDS Program has five statutory funding parts that provide a comprehensive system of medical care, support, and medications for low-income people with HIV. The goal is to improve health outcomes and to prevent HIV transmission.

The HIV care continuum is a key strategy to meet the goals of the program. It shows the journey of someone with HIV from diagnosis to effective treatment, leading to viral

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 11 of 54

suppression. Achieving viral suppression boosts the individual's quality of life and prevents HIV transmission.

This continuum also helps programs and planners measure progress and use resources effectively. We require you to assess your outcomes and work with your community and public health partners to improve outcomes across the HIV care continuum. To assess your program, review HRSA's Performance Measure Portfolio.

Expanding the effort

There have been significant accomplishments:

- From 2010 to 2023, HIV viral suppression among RWHAP clients improved from 87.1% to 90.6%. For more, see the 2023 Ryan White Services Report (RSR).
- In 2020, the Ending the HIV Epidemic in the U.S. (EHE) initiative launched to further expand federal efforts to reduce HIV transmission. For the RWHAP, the EHE initiative expands the program's ability to meet the needs of clients, specifically focusing on linking people with HIV who are either newly diagnosed, diagnosed but currently not in care, or are diagnosed and in care but not yet virally suppressed, to the essential HIV care, treatment, and support services needed to help them reach viral suppression.

Program requirements and expectations

The steady growth in the number of eligible clients combined with rising costs of complex HIV treatments can result in states/territories experiencing greater demand for ADAP services than available resources can cover. As a last resort, a state/territory may implement an ADAP waiting list when available funding cannot provide medications to all eligible people requesting enrollment in their ADAP and after they have used all other feasible cost-containment strategies.

HRSA HAB defines a waiting list as a register of individuals who have applied for and been deemed eligible for a state's/territory's ADAP, but whom the state cannot immediately serve due to insufficient resources. If an ADAP is proposing to implement a waiting list, the ADAP must be able to clearly demonstrate to HRSA HAB the need for the list before they establish one.

An ADAP must have written policies and procedures for managing a waiting list that include:

- Fair and equitable criteria.
- Compliance with relevant state/territory laws and regulations.
- A means for public input and communication to the public.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 12 of 54

- Methods for monitoring the waiting list to make sure that policies and procedures are consistently followed across the state/territory.
- A revisions and appeals process.

An ADAP must assess each applicant for ADAP eligibility before putting them on the waiting list. The ADAP must confirm eligibility according to a pre-established schedule outlined in a waiting list policy and procedure. An ADAP must prioritize individuals by predetermined criteria and bring clients into the program as soon as funding becomes available. Clients on waiting lists should be given information about:

- Why a waiting list is necessary.
- Waiting list criteria.
- The estimated length of time they might remain on the waiting list.
- Options for getting their medications in the meantime, including:
  - Recommendations or requirements for clients to work with a case manager.
  - Patient Assistance Programs (PAPs) applications and help applying.
  - Other available options, such as the RWHAP Part A Local Pharmacy Assistance Program (LPAP).
  - Continuous assistance applying and re-applying for other programs, as needed.

We strongly discourage the use of a waiting list to contain costs, unless absolutely necessary. If you establish a waiting list, the DSHAP project officer will monitor the RWHAP Part B grant more closely, and you will need to report waiting list data to us.Statutory authority

Statutory authority:

42 U.S.C. §§ 243(c) and 300ff-26 (§§ 311(c) and 2616 of the Public Health Service Act)

Award information

Funding policies and limitations

Changes in HHS regulations

As of October 1, 2025, HHS will adopt 2 CFR 200, with some modifications included in 2 CFR 300. These regulations replace those in 45 CFR 75.

Policies

- We will only make awards if this program receives funding. If Congress appropriates funds for this purpose, we will move forward with the review and award process.
- Award amounts are subject to demonstrated need and the availability of funds. Total cost includes both direct and indirect costs per year.
- HAB will base the amount of your award on your showing the need for funding to:
  - Reduce or eliminate an existing ADAP waiting list.
  - Actively prevent implementing an ADAP waiting list.
  - Address a reduction in available resources to fund ADAP.
  - Address a current or projected increase in treatment needs aligned with ending the HIV epidemic in the U.S.
  - Address other increases in the number of clients in the program due to new diagnosis, re-engagement in care, loss of income, and/or loss of health care coverage.
- HRSA will base funding decisions on review by an external merit review panel (MRP) review and scoring of the criteria listed in the merit review section of this notice.
- HRSA places significant importance on eliminating waiting lists, so:
  - We will use the MRP scores to establish the rank order for awarding funds.
  - If sufficient funding is available, we will make awards to all applicants that request funds to address an existing waiting list, as long as the MRP recommends them for an award based on their MRP score. See the funding preference section.
  - After we provide funds to address existing waiting lists, we will award funds to remaining applicants that the MRP recommends for an award based on their MRP scores.

ADAPs are required to secure the best price available for all products on their ADAP formularies to achieve maximum results with these funds. As covered entities, ADAPs are eligible to participate in the 340B Drug Pricing Program under Section 340B of the PHS Act. Rebates and program income generated from these funds must be applied to the RWHAP Part B program, with priority given to ADAP (see Policy Clarification Notices 15-03 and 15-04 for more information).

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 14 of 54

General limitations

- For guidance on some types of costs we do not allow or restrict, see Project Budget Information in Section 3.1.4 of the Application Guide. You can also see 2 CFR Part 200 Subpart E - General Provisions for Selected Items of Cost ..
- You cannot earn profit from the federal award. See 2 CFR 200.400(g)..
- Congress's current appropriations act includes a salary limitation, which applies to this program. As of January 2025, the salary rate limitation is $225,700. This limitation may be updated. You may pay salaries at a rate higher than Executive Level II if the amount beyond the salary rate limit is paid with non-HHS funds not associated with the HHS awarded project.

Program-specific statutory or regulatory limitations

As outlined under applicable statute, regulation, or policy, you cannot use funds under this notice for the following purposes:

- Any costs unallowable under the ADAP service category (as defined in PCN 16-02: RWHAP Services Eligible Individuals and Allowable Uses of Funds).
- Payment for any item or service to the extent that payment has been made (or reasonably can be expected to be made), with respect to that item or service, under any state compensation program, insurance policy, federal or state benefits program, or any entity that provides health services on a prepaid basis (except for a program administered by or providing the services of the Indian Health Service).
- Planning and evaluation activities as defined by the RWHAP Part B.
- Cash payments to intended recipients of RWHAP services.
- Clinical quality management.
- International travel.
- Construction. (Minor alterations and renovations to an existing facility to make it more suitable for the purposes of the award program are allowable with prior HRSA approval.)
- Syringe Services Programs (SSPs). Some aspects of SSPs are allowable with HRSA's prior approval and in compliance with HHS and HRSA policy.
- Development of materials designed to directly promote or encourage intravenous drug use or sexual activity, whether homosexual or heterosexual.
- Pre-exposure prophylaxis (PrEP) medications and related medical services or post-exposure prophylaxis (PEP), as the person using PrEP or PEP is not diagnosed with HIV and therefore is not eligible for RWHAP-funded medication.

See Manage Your Grant for other information on costs and financial management.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 15 of 54

Indirect costs

Indirect costs are costs you charge across more than one project that cannot be easily separated by project. For example, this could include utilities for a building that supports multiple projects.

To charge indirect costs you can select one of two methods:

Method 1 – Approved rate. You currently have an indirect cost rate approved by your cognizant federal agency at the time of award.

Method 2 – *De minimis* rate. Per 2 CFR 200.414(f), if you have never received a negotiated indirect cost rate, you may elect to charge a *de minimis* rate. If you choose this method, costs included in the indirect cost pool must not be charged as direct costs.

This rate is up to 15% of modified total direct costs (MTDC). See 2 CFR 200.1 for the definition of MTDC. You can use this rate indefinitely for all your federal awards or until you choose to receive a negotiated rate.

Consider your indirect costs when developing your budget.

Program income and rebates

Program income is money earned as a result of your award-supported project activities. You must use any program income you generate from awarded funds for allowable project-related activities. Find more about program income at 2 CFR 200.307. Rebates generated because of awarded funds must be used for the statutorily permitted purposes under the RWHAP Part B with a priority for ADAP.

Per 2 CFR 200.305(b)(5), to the extent available, you must disburse funds available from program income and rebates before requesting grant funds. Please see HAB PCNs 15-03: Clarifications Regarding the Ryan White HIV/AIDS Program and Program Income and 15-04: Utilization and Reporting of Pharmaceutical Rebates for more information.

Step 2:
Get Ready to Apply

In this step

Get registered	16
Find the application package	16
Application writing help	16

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 17 of 54

Get registered

SAM.gov

You must have an active account with SAM.gov to apply. This includes having a Unique Entity Identifier (UEI). SAM.gov registration can take several weeks. Begin that process today.

To register, go to SAM.gov Entity Registration and select Get Started. From the same page, you can also select the Entity Registration Checklist to find out what you'll need to register.

When you register or update your SAM.gov registration, you must agree to the financial assistance general certifications and representations. You must agree to those for grants specifically, as opposed to contracts, because the two sets of agreements are different. You will have to maintain your registration throughout the life of any award.

Grants.gov

You must also have an active account with Grants.gov. You can see step-by-step instructions at the Grants.gov Quick Start Guide for Applicants.

Find the application package

The application package has all the forms you need to apply. You can find it online. Go to Grants Search at Grants.gov and search for opportunity number HRSA-26-012.

After you select the opportunity, we recommend that you click the Subscribe button to get updates.

Application writing help

Visit HHS Tips for Preparing Grant Proposals.

Visit HRSA's How to Prepare Your Application page for more guidance.

See Apply for a Grant for other help and resources.

Join the webinar

For more information about this opportunity, join the webinar on Wednesday, October 15, 2025 at 2 PM ET.

Step 3:
Build Your Application

In this step

Application checklist 19
Application contents and format 20

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 20 of 54

Application checklist

Make sure that you have everything you need to apply:

Narratives

Component		Included in page limit*?
☐ Project narrative	Use the Project Narrative Attachment form.	Yes
☐ Budget narrative	Use the Budget Narrative Attachment form.	Yes

Attachments

Insert each in the Attachments Form in this order.

Component	Included in page limit*?
☐ 1. Work plan	Yes
☐ 2. Agreement Compliance Assurances	Yes
☐ 3. ADAP Organizational Chart	Yes
☐ 4. ADAP Funding Utilization Summary for FY 2024	Yes

Other required forms

Upload using each required form in Grants.gov.

Component	Included in page limit*?
☐ Application for Federal Assistance (SF-424)	No

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 21 of 54

☐ Budget Information for Non-Construction Programs (SF-424A)	No
☐ Project Abstract Summary Form	No
☐ Disclosure of Lobbying Activities (SF-LLL), optional	No
☐ Project/Performance Site Location(s)	No
☐ Grants.gov Lobbying Form	No
☐ Key Contacts	No

*Only what you attach in these forms counts toward the page limit. The forms themselves do not count.

Application contents and format

Applications include 5 main components. This section includes guidance on each.

Application page limit: 40 pages.

Submit your information in English and express whole number budget figures using U.S. dollars.

Required format

You must format your narratives and attachments using our required formats for fonts, size, color, format, and margins. See the formatting guidelines in Section 3.2 of the Application Guide.

Project narrative

In this section, you will describe all aspects of your project.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 22 of 54

Use the section headers and the order listed.

Introduction

See merit review criterion 1: Need

Briefly describe the purpose of your project.

Need

See merit review criterion 1: Need

The purpose of this section is to show that you need additional resources to meet the projected ADAP client service needs for FY 2026. Provide the following information to show that you are eligible for this award and explain the structure, functions, and operational processes of the ADAP and its clients.

State/territory's ADAP profile

ADAP funding and utilization summary for FY 2024

In table format, please list:

- All the following sources of funding for ADAP (1 through 12),
- The amount received.
- The amount expended.
- The amount of unspent funds and unobligated balances during the FY 2024 period of performance (April 1, 2024 through March 31, 2025)
- The estimated number of unduplicated clients served with each funding source.

If you did not receive funding from one or more of the categories listed below, please list the source and enter zero. Please include the table as **Attachment 4**. A sample table format is provided in **Appendix B**.

The funding sources are:

1. ADAP base
2. ADAP supplemental
3. RWHAP Part B Base Contribution to ADAP
4. RWHAP Part B Supplemental Contribution to ADAP
5. ADAP ERF Award
6. RWHAP Part A Contribution to ADAP
7. State funds
8. Pharmaceutical rebates
9. Carryover

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 23 of 54

10. Program income
11. Other sources (describe)
12. Total ADAP funding

Cost-cutting measures for FY 2024 and FY 2025

Please identify which, if any, of the following cost-cutting measures you were using or began using in FY 2024 and FY 2025 for your ADAP:

- Enrollment cap—specify the maximum number of enrollees.
- Capped number of prescriptions per month—specify the cap.
- Capped expenditure—specify the amount and timeframe.
- Drug-specific enrollment caps for antiretroviral medication—specify the cap.
- Reduction in formulary—specify the reduction.
- Decrease in financial eligibility criteria—specify the decrease.
- Other—please specify.

Cost-Saving Measures for FY 2024 and FY 2025

Please identify which, if any, of the following cost-saving measures you were using or began using in FY 2024 and FY 2025 for your ADAP:

- Expansion of health care coverage assistance—specify the services you currently offer.
- Enrolling eligible clients in health care coverage—specify how many were enrolled and how they were enrolled.
- Enrolling eligible clients into Medicaid.
- Improved client eligibility confirmation processes—specify improvements.
- Decrease in administrative expenditures—specify decreases.
- Other—please specify.

Factors affecting state/territory ADAP capacity to meet need

Provide a detailed description of any key factors affecting the ADAP's need for additional resources for the approved purposes. Describe:

- Why the ADAP cannot meet the need with existing resources.
- Any anticipated funding shortfalls for ADAP.
- The cost-cutting measures you would take if your ADAP was not awarded additional funding.

If you reported any unspent funds or unobligated balances in the ADAP Funding Summary for FY 2024, please explain why you need emergency funds, given these other available resources.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 24 of 54

Examples of factors that could create need for additional resources include, but are not limited to:

- Trends or changes in the HIV disease prevalence over the past two calendar years (January 1, 2023, through December 31, 2024) have affected the ADAP.
- Increases in clients engaged in care.
- Changes to the state/territory's service delivery system may increase client need or administrative burden as a result of the changing health care landscape.
- Changes in client population or demographics over the last two calendar years, including:
  - More eligible clients.
  - Higher percentage of eligible clients below 100% of the FPL.
  - High unemployment rates.
  - Increased co-morbidities, such as substance use disorder.
  - Increased number of out-of-care clients seeking treatment.
- Increased program costs, including the cost of ADAP medications or cost to ADAP for health care coverage premiums, deductibles, or cost sharing.
- Decreased or level funding from state or RWHAP resources for ADAP and/or HIV services.
- Decreased program income or pharmaceutical rebates.

You should include data sources when discussing trends and changes (including environmental changes) that have resulted in this need.

Approach

See merit review criterion 2: Response

ADAP average annual client costs and forecasting

Calculate the projected average cost per client for medication assistance and/or health care coverage for the FY 2026 ADAP ERF period of performance (April 1, 2026, to March 31, 2027). Important note: You only need to provide average costs for clients for the types of assistance you are requesting funding for.

Determine the average cost per client through your own calculations, or through the formula in **Appendix A**. Whichever method you use, provide the step-by-step calculations you used to find the average cost per client. Use this calculation to develop the proposed budget for the ADAP ERF funds. Show how you multiplied the average cost per client by the projected number of clients to be served to determine the budget request for medication assistance and/or health care coverage assistance.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 25 of 54

ADAP average annual client costs

- If you are requesting funding for **medication costs**, please provide current projected annual average medication cost per client and all calculations used to determine the cost.
- If you are requesting funding for **health care coverage**, please provide current projected annual average health care coverage assistance cost per client and all calculations used to determine the cost.

Forecasting

- If you have an existing ADAP waiting list, provide the current number of people on the list.
- Describe the projected impact of ADAP ERF and any other projected resources in addressing any of these:
  - Your projected/potential ADAP waiting list.
  - Your current waiting list.
  - Your other increases in the number of clients in the program.

High-level work plan

See merit review criteria 2: Response and 4: Impact

Work plan

Provide a workplan, uploaded as **Attachment 1,** that lists each planned ADAP ERF service—for example, purchase of ADAP medications, purchase of health care coverage premiums, or payment of medication co-payments, deductibles, or co-insurance. Only costs allowed under the ADAP service category (as defined in PCN 16-02 RWHAP Services Eligible Individuals and Allowables Uses of Funds) can be funded through ADAP ERF. If you have any unallowable costs in your proposed budget, we will deduct them before award.

HRSA encourages you to use a table format with the following sections:

- **Planned Expenditures Summary** listing the amount budgeted by service category and recipient administrative costs.
- **Planned Expenditures by Service Category** with columns for Planned Service, Service Unit Description, Number of Service Units, Number of Clients, and amount budgeted for each service.
- **Service Unit Description** with the definition of the unit of service for the planned service category.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 26 of 54

Work plan narrative

Provide a narrative that describes the following for each planned service and recipient administrative cost identified in the work plan:

- How you will ensure that you will spend funds allocated for each service/activity within the 12-month period of performance.
- If you have an existing ADAP waiting list, how the services/activities will reduce the number of people on the waiting list.
- If you do not have an existing waiting list, how the services/activities will prevent an ADAP waiting list in FY 2026, address a reduction in available resources to fund ADAP, or address a current or projected increase in treatment needs or in the number of clients in the program.

Anticipated impact of ADAP ERF

Briefly describe the anticipated impact of the proposed ADAP ERF-funded planned service(s).

- Describe how you'll monitor progress toward meeting the goals and objectives of the proposed project.
- Describe how these activities will support the continued function of the ADAP.
- Describe the anticipated outcomes resulting from ADAP ERF supported activities.

Monitoring

Briefly describe your methods to monitor and assess the effectiveness of the activities proposed on the ADAP ERF work plan. Describe how the ADAP will measure and monitor progress on outcomes and address problems identified through monitoring.

Important note: We expect you to use your current RWHAP Part B clinical quality management program when implementing services funded through the ADAP ERF award.

Resolving challenges

See merit review criterion 2: Response

State/territory actions to address ADAP challenges

Please describe for each of the following sections how the program has addressed the specific challenges and barriers facing the ADAP through cost-cutting and/or cost-saving strategies in FY 2024 and FY 2025. Support each section with data showing how these strategies benefit the ADAP.

Program efficiencies:

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 27 of 54

Please describe any challenges regarding program efficiencies and how your program has addressed challenges, including by using ADAP ERF funding or improving operations to reduce costs and improve efficiency. Support your decision with data showing how the improved operational efficiencies will benefit ADAP.

Ability to enroll clients in other payor sources

Please describe any challenges enrolling clients in other payor sources, and how your program has addressed challenges by improving systems to increase enrollment in Medicare Part D, Medicaid, and other health care coverage options. Be sure to support your decision with data showing how improved enrollment in other payor sources will benefit your ADAP.

Reallocation of ADAP resources

Please describe any challenges or limits with ADAP resources, and whether or how you have reallocated funds to address ADAP challenges. Be sure to indicate whether this reallocation is a one-time augmentation to the program or an expected long-term, sustainable reallocation of funds.

Generation and collection of rebates and program income

Please describe any challenges generating or collecting rebates and program income. Include how your ADAP has modified its processes or monitoring of processes to ensure that you purchase drugs at the best possible cost and/or that you fully collect rebates or program income and apply them back to the RWHAP Part B program, with priority given to ADAP.

Sustainability

See merit review criterion 4: Impact

We expect you to sustain key project elements that improve practices and outcomes for the target population. Propose a plan for project sustainability after the period of federal funding ends.

- Highlight key elements of your projects. Examples include training methods or strategies that have been effective in improving practices.
- Describe the actions you'll take to obtain future sources of funding.
- Determine the timing to become self-sufficient.
- Discuss challenges that you'll likely encounter in sustaining the program. Include how you will resolve these challenges.

Organizational information

See merit review criterion 5: Resources and capabilities

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 28 of 54

ADAP oversight and administration

Provide a brief narrative that describes the organizational structure and resources that help the ADAP maintain compliance with legislative requirements and program expectations, including those of ADAP ERF funding. Include an organizational chart for the ADAP as **Attachment 3**.

Compliance with reporting requirements

Describe how you will meet reporting requirements by tracking and reporting ADAP ERF specific expenditures and client utilization.

Budget and budget narrative

See merit review criterion 6: Support requested

Your **budget** should follow the instructions in Section 3.1.4 Project Budget Information – Non-Construction Programs (SF-424A) of the Application Guide and the instructions listed in this section. Your budget should show a well-organized plan.

HHS now uses the definitions for equipment and supply in 2 CFR 200.1. The new definitions change the threshold for equipment to the lesser of the recipient's capitalization level or $10,000 and the threshold for supplies to below that amount.

The total project or program costs are all allowable (direct and indirect) costs used for the HRSA award activity or project. This includes costs charged to the award and non-federal funds used to satisfy a matching or cost-sharing requirement (which may include maintenance of effort, if applicable).

The **budget narrative** supports the information you provide in Standard Form 424-A. See other required forms. It includes an itemized breakdown and a clear justification of the costs you request. The merit review committee reviews both.

As you develop your budget, consider:

- If the costs are reasonable and consistent with your project's purpose and activities.
- The restrictions on spending funds. See funding policies and limitations.

ADAP ERF applicants must also consider the following:

- **Caps on expenses:** Administrative costs for ADAP ERF funding recipients may not exceed 10% of the total grant award. For further guidance , see PCN 15-01: Treatment of Costs under the 10% Administrative Cap for Ryan White HIV/AIDS Program Part A, B, C, and D.
- **Staffing:** Due to the emergent nature of this award, if you need any additional personnel to administer this award, their salaries must fit within the

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 29 of 54

administrative cost cap. Usual and ordinary expenses for salaries associated with RWHAP awards must be allocated to the RWHAP Part B award and therefore cannot be allocated to this award.

- **Payor of last resort:** Charges that are billable to third-party payors are unallowable. Third-party payors include Medicaid, Children's Health Insurance Programs (CHIP), Medicare (including Medicare Part D), basic health plans, and private insurance, including those purchased through the Health Insurance Marketplace. The RWHAP is the payor of last resort, and recipients must vigorously pursue alternate sources of payments. HRSA expects recipients to determine eligibility for all clients and to confirm eligibility on a timely basis (please see HAB PCN 21-02: Determining Client Eligibility & Payor of Last Resort in the Ryan White HIV/AIDS Program). Recipients are required to use effective strategies to coordinate with third-party payers that are ultimately responsible for covering the cost of services provided to eligible or covered people.

To create your budget narrative, see detailed instructions in Section 3.1.5 of the Application Guide.

Attachments

See Section 3.2.6 of the Application Guide.

Place your attachments in this order in the Attachments Form. See application checklist to determine if they count toward the page limit.

Attachment 1: Work plan

Attach the project's work plan. Make sure it includes everything required in the work plan section of the project narrative.

Attachment 2: Agreement and compliance assurances

Please complete and include **Appendix D**: Agreements and compliance assurances.

Attachment 3: ADAP organizational chart

Provide a one-page diagram that shows the project's organizational structure.

Attachment 4: ADAP funding and utilization summary for FY 2024

In table format, please provide all information requested in the Need section of the project narrative. A sample table format is provided in **Appendix B**.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 30 of 54

Other required forms

You will need to complete some other forms. Upload the following forms at Grants.gov. You can find them in the NOFO application package or review them and any available instructions at Grants.gov Forms.

Component	Included in page limit*?
☐ Application for Federal Assistance (SF-424)	No
☐ Budget Information for Non-Construction Programs (SF-424A)	No
☐ Project Abstract Summary Form	No
☐ Disclosure of Lobbying Activities (SF-LLL), optional	No
☐ Project/Performance Site Location(s)	No
☐ Grants.gov Lobbying Form	No
☐ Key Contacts	No

Form instructions

Follow the instructions for Application for Federal Assistance in section 3.1 of the Application Guide and any additional instructions provided here.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 31 of 54

Project abstract summary form instructions. Complete the information in the Project Abstract Summary form. Include a short description of your proposed project. Include the needs you plan to address, the proposed services, and the population groups you plan to serve. In addition, provide brief up-to-date information, in this order:

- Brief description of the state ADAP and key environmental factors impacting the program.
- Description of the need for additional resources to:
- Prevent, reduce, or eliminate an ADAP waiting list.
- Address a reduction in available resources to fund ADAP.
- Address a current or projected increase in treatment needs aligned with ending the HIV epidemic in the U.S.
- Address other increases in the number of clients in the program due to new diagnosis, re-engagement in care, loss of income, and/or loss of health care coverage.
- Description of how you plan to use the ADAP ERF, if awarded.

For more information, see Section 3.1.2 of the Application Guide.

Important: public information

When filling out your SF-424 form, pay attention to Box 15: Descriptive Title of Applicant's Project.

We share what you put there with USAspending. This is where the public goes to learn how the federal government spends their money.

Instead of just a title, insert a short description of your project and what it will do.

See instructions and examples.

Case 1:26-cv-12638-WGY Document 13-4 Filed 08/10/26 Page 32 of 54

Step 4: Understand Review, Selection, and Award Application review

In this step

Selection process	36
Award notices	37

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 33 of 54

Initial review

We will review your application to make sure that it meets eligibility criteria, including the completeness and responsiveness criteria. If your application does not meet these criteria, it will not be funded.

We will not review any pages that exceed the page limit.

Merit review

A panel reviews all applications that pass the initial review. The members use these criteria.

Criterion	Total number of points = 100
1. Need	50 points
2. Response	25 points
3. Impact	10 points
4. Resources and capabilities	5 points
5. Support requested	10 points

Criterion 1: Need

50 points

See the project narrative Introduction and Need sections.

The panel will review your application for how well it:

- Demonstrates the need for additional resources to prevent, reduce, or eliminate a waiting list, to address a reduction in available resources to fund ADAP, or to address a current or projected increase in treatment needs aligned with ending the HIV epidemic in the U.S. or other increases in the number of clients in the program due to new diagnosis, re-engagement in care, loss of income, and/or loss of health care coverage.

Introduction (5 points)

- Describes a feasible plan for how the state/territory will use RWHAP ADAP ERF to prevent, reduce, or eliminate a waiting list, address a reduction in available resources to fund ADAP, or address a current or projected increase in treatment needs or the number of clients in the program.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 34 of 54

State/territory's ADAP profile (20 points)

- Provides a strong, complete, and clear ADAP profile.
- Provides a strong, clear demonstration of need for additional resources by presenting data, including the complete use of available resources, the implementation of cost-cutting and/or cost-saving measures, and/or an increase in clients utilizing the ADAP.

Factors affecting the state/territory ADAP capacity to meet need (25 points)

- Provides a strong, clear narrative (and supporting data) describing the demonstrated need for additional resources to prevent, reduce, or eliminate a waiting list, address a reduction in available resources to fund ADAP, or address a current or projected increase in treatment needs or the number of clients in the program. **(10 points)**
- Provides a strong, clear description of why the ADAP cannot meet the need with existing resources (especially if you report any unobligated or unspent funds), any anticipated funding shortfalls for ADAP, and the cost-cutting measures you would need to implement if you do not receive additional funding. **(15 points)**

Criterion 2: Response

25 points

See the project narrative Approach, High-level work plan, and Resolving challenges sections.

ADAP average annual client costs and forecasting (5 points)

The panel will review your application for the extent to which it provides clear, complete, and compelling descriptions of the following:

- A step-by-step methodology for calculating average cost per client for medication assistance and/or health care coverage assistance, depending on the type of assistance requested.
- Accurate calculations of annual client costs, reflected in your plan and budget.
- The impact of the requested funding on preventing, reducing, or eliminating a waiting list or addressing a current or projected increase in treatment needs or in the number of clients in the program.

Note: If the calculations are incorrect, we will note the error along with its impact on your average client cost calculations and budget request.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 35 of 54

Work plan and work plan narrative (10 points)

The panel will review your application for the extent to which it provides strong and feasible descriptions of:

- The proposed services and projected expenditures to address the problem and align with the project objectives
- Evidence that funds allocated for each service/activity will be spent within the 12-month period of performance.
- For applicants with an ADAP waiting list, proposed services/activities to reduce the number of persons on the waiting list:
  - Proposed services/activities to improve ADAP operations and maximize ADAP resources.
  - Proposed services/activities to prevent a waiting list in FY 2026.

State/territory actions to address ADAP challenges (10 points)

The panel will review your application for the extent to which it provides:

- A strong, clear description of the challenges facing the ADAP in the following areas:
  - Program efficiencies.
  - The ability to enroll clients in other payor sources.
  - Reallocation of ADAP resources.
  - Generation or collection of rebates and program income.
- A strong, clear description of the cost-cutting or cost-saving strategies you have taken in response to these challenges and the extent to which they could achieve program objectives.
- Data demonstrating how these strategies benefit the ADAP.

Criterion 3: Impact

10 points

See the project narrative High-level work plan and Sustainability sections.

The panel will review your application for the extent to which the application provides strong and feasible descriptions of:

- The methods in place to monitor and assess the effectiveness of the activities proposed on the ADAP ERF work plan.
- How the applicant will monitor progress toward meeting the proposed goals and objectives.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 36 of 54

- How the proposed activities support the continued function of the ADAP.
- The anticipated outcomes of the ADAP ERF.

Criterion 4: Resources and capabilities

5 points

See the project narrative Organizational information and Performance reporting and evaluation sections.

The panel will review your application to determine the extent to which it provides a strong and complete description of your ability to implement the ADAP ERF, as evidenced by:

- The organizational structure and resources that administer the ADAP to maintain compliance with legislative requirements and program expectations, including those of ADAP ERF funding.
- The organizational chart for the ADAP in **Attachment 3**.

Criterion 5: Support requested

10 points

See the Budget and budget narrative section.

The panel will review your application to determine:

- How reasonable the proposed budget is for the one-year period of performance.
- How reasonable costs are and how well they align with the project's scope.
- Whether key staff have allotted sufficient time to spend on the project to achieve project objectives.

We do not consider **voluntary** cost sharing during merit review.

Risk review

Before making an award, we review your award history to assess risk. We need to ensure all prior awards were managed well and demonstrated sound business practices. We:

- Review any applicable past performance.
- Review audit reports and findings.
- Analyze the budget.
- Assess your management systems.
- Ensure you continue to be eligible.
- Make sure you comply with any public policies.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 37 of 54

We may ask you to submit additional information.

As part of this review, we use SAM.gov Entity Information Responsibility/Qualification to check your history for all awards likely to be more than $250,000 over the period of performance. You can comment on your organization's information in SAM.gov. We'll consider your comments before making a decision about your level of risk.

If we find a significant risk, we may choose not to fund your application or to place specific conditions on the award.

For more details, see 2 CFR 200.206.

Selection process

When making funding decisions, we consider:

- The amount of available funds.
- Assessed risk.
- Merit review results. These are key in making decisions but are not the only factor.
- The larger portfolio of HRSA-funded projects, project types and geographic distribution.
- The funding preference listed.

We may:

- Fund out of rank order.
- Fund applications in whole or in part.
- Fund applications at a lower amount than requested.
- Decide not to allow a recipient to subaward if they may not be able to monitor and manage subrecipients properly.
- Choose to fund no applications under this NOFO.

Funding preferences

This program includes an ADAP waiting list funding preferences if you demonstrate within the application that you have a current ADAP waiting list, or if you notify the director of DSHAP in writing via EHBs that you have started a waiting list by January 15, 2026. If DSHAP determines that your application meets these criteria, we will move it up in our ranking of fundable applications. Qualifying for a funding preference does not guarantee that you will receive funding.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 38 of 54

Award notices

We issue Notices of Award (NOA) on or around the start date listed in the NOFO. See Section 4 of the Application Guide for more information.

By drawing down funds, you accept the terms and conditions of the award.

Case 1:26-cv-12638-WGY Document 19-4 Filed 05/10/26 Page 39 of 54

Step 5: Submit Your Application

In this step

Application submission and deadlines 39

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 40 of 54

Application submission and deadlines

Your organization's authorized official must certify your application. See the section on finding the application package to make sure you have everything you need.

Make sure you are current with SAM.gov and UEI requirements. When you register or update your SAM.gov registration, you must agree to the financial assistance general certifications and representations, and specifically with regard to grants.

Make sure that your SAM.gov registration is accurate for both contracts and grants, as these registrations differ. See information on getting registered. You will have to maintain your registration throughout the life of any award.

Application Deadlines

You must submit your application by November 3, 2025, at 11:59 p.m. ET.

Grants.gov creates a date and time record when it receives applications.

Submission method

Grants.gov

You must submit your application through Grants.gov. You may do so using Grants.gov Workspace. This is the preferred method. For alternative online methods, see Applicant System-to-System.

For instructions on how to submit in Grants.gov, see the Quick Start Guide for Applicants. Make sure that your application passes the Grants.gov validation checks, or we may not get it. Do not encrypt, zip, or password protect any files.

Have questions? Go to Contacts and Support.

Intergovernmental review

This NOFO is not subject to Executive Order 12372, Intergovernmental Review of Federal Programs. No action is needed.

Case 1:26-cv-12638-WGY Document 13-4 Filed 08/10/26 Page 41 of 54

Step 6: Learn What Happens After Award

In this step

Post-award requirements and administration 41
Reporting 42

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 42 of 54

Post-award requirements and administration

Administrative and national policy requirements

There are important rules you need to know if you get an award. You must follow:

- All terms and conditions in the Notice of Award (NOA). We incorporate this NOFO by reference.
- The regulations at 2 CFR 200, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for HHS Awards, modifications at 2 CFR 300, and any superseding regulations.
- The HHS Grants Policy Statement (GPS) [PDF]. Your NOA will reference this document. If there are any exceptions to the GPS, they'll be listed in your NOA.
- All federal statutes and regulations relevant to federal financial assistance, including those highlighted in HHS Administrative and National Policy Requirements.
- The requirements for performance management in 2 CFR 200.301 (before October 1, 2025: 45 CFR 75.301).
- HRSA reminds States that therapeutics funded under the ADAP may only be provided "to treat HIV/AIDS or prevent the serious deterioration of health arising from HIV/AIDS in eligible individuals, including measures for the prevention and treatment of opportunistic infections." Section 2616(a) of the Public Health Service (PHS) Act (42 U.S.C. § 300ff–26 (a)). For example, if an ADAP provides sex hormones, it may only allow such hormones to be dispensed to treat HIV/AIDS or prevent the serious deterioration of health arising from HIV/AIDS, rather than for non-statutory purposes such as specified sex-trait modification procedures. HRSA will prioritize funding to States that require clinical documentation and the use of a prior authorization process before sex hormones, are approved for dispensing to ADAP clients.
- HRSA also reminds States that the RWHAP legislation states: "A State shall ensure that any drug rebates received on drugs purchased from funds provided pursuant to this section [ADAP] are applied to activities supported under this subpart [RWHAP Part B], with priority given to activities described under this section [ADAP]." Section 2616(g) of the PHS Act (42 U.S.C. § 300ff–26(g)). As such, all 340B rebates directly generated by a federal dollar are subject to HRSA HAB's rebate policies and rules for expenditure. All rebates generated through ADAP must be

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 43 of 54

used for RWHAP Part B activities, with priority given to ADAP, rather than diverted for unsupported activities that exceed the RWHAP's limited statutory purpose, such as for specified sex-trait modification procedures.

Cybersecurity

If awarded, you must develop plans and procedures, modeled after the NIST Cybersecurity framework, to protect HHS systems and data. See details here.

Reporting

If you are funded, you will have to follow the reporting requirements in Section 4 of the Application Guide. The NOA will provide specific details.

You must also follow these program-specific reporting requirements:

- Progress reports semi-annually.
- Other required reports and/or products.
  - **ADAP Data Report (ADR).** If you accept this award, you are indicating that you will comply with data requirements of the ADR and will require that your contractors and subcontractors also comply. The ADR captures information necessary to demonstrate program performance and accountability. Further information will be available in the NOA.
  - **Program Terms Report.** You must submit a Program Terms Report using the format provided in that system. Further information will be available in the NOA.

Appendices

Appendix A: Model for calculating average client costs

Calculate your projected average cost per client for medication assistance and/or health care coverage assistance for the FY 2026 ADAP ERF period of performance (April 1, 2026, to March 31, 2027). **Important Note:** You only need to provide average costs for clients for the types of assistance you are requesting funding for.

Determine the average cost per client through your own calculations or through the cost calculation template here. Use this calculation to develop your proposed budget for the ADAP ERF funds and/or to project the impact of proposed cost-containment measures. **States/territories must provide the step-by-step calculations and clearly identify all data elements used to complete the calculations, not just the resulting average client cost.**

Due to the timing of this NOFO, the calculations in this model are based on client utilization and ADAP cost data for the January 1, 2025, to June 30, 2025, period. The calculations should include all clients who received at least one medication through ADAP during this period, including clients who were enrolled in ADAP temporarily or for part of the year (for example, because they experienced changes in their health care coverage, moved out of state, or died).

Average cost per client to provide medications

Step 1: Baseline average annual client medication cost

Determine the total amount spent to purchase prescription medications (not health care coverage) from January 1, 2025, to June 30, 2025, period. Divide this amount by the total number of ADAP clients who received at least one prescription medication in that period. Multiply that amount by two to determine the ADAP's baseline average annual medication cost per client.

$$\left(\frac{Total\ amount\ spent\ on\ prescription\ medications\ from\ January\ 1\ to\ June\ 30,\ 2025}{Number\ of\ ADAP\ clients\ who\ received\ at\ least\ 1\ prescription\ medication}\right) \times 2$$

Step 2: Average Annual Client Rebate Reduction:

Determine the total amount of rebate income received by the state/territory.

- If you operate a 340B Rebate State ADAP, this includes all 340B rebates and other negotiated rebates (e.g., ADAP Crisis Task Force rebates) you received in the January 1, 2025 to June 30, 2025 period.

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 48 of 54

- If you operate a 340B State Direct Purchase ADAP, this includes all negotiated rebates (e.g., ADAP Crisis Task Force rebates) you received in the January 1, 2025, to June 30, 2025, period.

Divide the total amount of rebate income by the total number of ADAP clients that received at least one prescription medication in the January 1, 2025, to June 30, 2025, period. Multiply that amount by two to determine the average rebate reduction per client.

Note: The health care coverage section below addresses the impact of rebates for health care coverage deductibles and co-payments.

Step 3: Adjusted Average Client Medication Cost:

Subtract the Average Annual Client Rebate Reduction amount determined in Step 2 from the Baseline Average Annual Client Medication Cost determined in Step 1.

Step 4: Average Annual Client Dispensing Fee:

Determine the total number of prescriptions filled in the January 1, 2025, to June 30, 2025, period. Multiply that number by the dispensing fee for a single pharmacy prescription in the January 1, 2025, to June 30, 2025, period. Divide the resulting product by the total number of ADAP clients that received at least one prescription in the same period. Multiply that amount by two for the average annual dispensing fee cost per client.

Step 5: Average Annual Medication Cost per Client:

Add the Average Annual Client Dispensing Fee cost determined in Step 4 to the Adjusted Average Annual Medication Cost calculated in Step 3. The sum of these two amounts will be your State's Average Medication Cost per Client.

Example:

Step	Description	Calculation	Result
Step 1	In the January 1, 2025, to June 30, 2025, period, the ADAP spent a total of $7,410,000 for prescription drugs; a total of 1,000 clients received at least one prescription medication.	$7,410,000 ÷ 1,000 = $7,410 $7,410 × 2 = $14,820	Baseline Average 6-Month Client Medication Cost Baseline Average Annual Client Medication Cost
Step 2	In that same period, the ADAP received $555,000 in total 340B rebates and $100,000 in negotiated rebates.	$555,000 + $100,000 = $655,000 $655,000 ÷ 1,000 = $655 $655 × 2 = $1,310	Total Rebates Received by the ADAP Average 6-Month Client Rebate Reduction

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 49 of 54

Step	Description	Calculation	Result
			Average Annual Client Rebate Reduction
Step 3	Adjusted Average Annual Cost per Client: Baseline Average Annual Client Medication Cost minus Average Annual Client Rebate Reduction	$14,820 – $1,310 = $13,510	Adjusted Average Annual Cost per Client
Step 4	The ADAP filled 10,000 prescriptions in the January 1, 2025, to June 30, 2025, period of CY 2025 and the dispensing fee per prescription was $10; 1,000 ADAP clients received at least 1 ADAP prescription.	$10 × 10,000 = $100,000 $100,000 ÷ 1,000 = $100 $100 × 2 = $200	Total Dispensing Fee Expenditures Average 6-Month Client Dispensing Fee Average Annual Client Dispensing Fee
Step 5	Add amount calculated in Step 3 to amount calculated in Step 4.	$13,510 + $200 = $13,710	Average Annual Medication Cost per Client

Note: For States/Territories with Hybrid/Dual ADAPs:

Step 1: *Determine the number and percentage of clients who received medications through the 340B Rebate model and the number and percentage who received medications through the 340B Direct Purchase model.*

Step 2: *For each cohort of clients, determine the total amount spent to provide medications for that cohort.*

Step 3: *Determine the average client costs for the rebate cohort, follow the instructions above in Steps 2 through 5. For the direct purchase cohort, follow the instructions above in Steps 2 through 5.*

II. Average Cost per Client to Provide Health Care Coverage Assistance

All ADAPs providing access to prescription medications through health care coverage assistance must provide step-by-step calculations of average costs per client, making sure all required data elements for each calculation are clearly identified.

Step 1: Total Health Care Coverage Expenditures:

Add the total amount spent on health care coverage premiums, deductibles, and co-payments/co-insurance in the January 1, 2025, to June 30, 2025, period. This includes

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 50 of 54

amounts spent for ADAP eligible clients who are also eligible for Medicare Part D, including payments for Part D premiums, deductibles, and co-payments.

Step 2: Rebate Reduction:

Determine the total amount of manufacturer's rebates received in the January 1, 2025, to June 30, 2025, period on health care coverage deductibles and co-payments/co-insurance expenditures.

Step 3: Adjusted 6-Month Total Insurance Cost:

Subtract the total amount of manufacturers' rebates received from the Total Health Care Coverage Expenditures calculated in Step 1. This is your Adjusted 6-Month Total Health Care Coverage Cost.

Step 4: Average Annual Cost per Client for Health Care Coverage Assistance (including COBRA, High Risk Health Insurance Pools, private insurance, State-sponsored insurance, and Medicare Part D):

Divide results from Step 3 by the total number of clients on whose behalf the ADAP paid at least one premium, co-payment/co-insurance or deductible in the January 1, 2025, to June 30, 2025, period. Multiply by two for average annual cost per client for health care coverage assistance.

Example:

The ADAP spent $1,500,000 in the January 1, 2025, to June 30, 2025, period to pay for health care coverage premiums and $300,000 on co-payments/co-insurance and deductibles, providing assistance to 300 ADAP eligible clients.

Step	Description	Calculation	Result
Step 1	Add health care coverage premiums expenditures to expenditures for co-payments/ co-insurance, and deductibles.	$1,500,000 + $300,000 = **$1,800,000**	Total 6-Month Health Care Coverage Expenditures
Step 2	Determine the total amount of rebates received by adding the manufacturers rebates received from January 1, 2025 to June 30, 2025 on health care coverage co-payments/co-insurance/deductibles.	**$50,000**	Total 6-Month Rebates Received
Step 3	Total 6-Month Health Care Coverage Expenditures minus Total 6-Month Rebates Received	$1,800,000 - $50,000 = **$1,750,000**	Adjusted Total Health Care Coverage Cost

Case 1:26-cv-12638-WGY Document 19-4 Filed 06/10/26 Page 51 of 54

Step	Description	Calculation	Result
Step 4	Divide Adjusted Total Health Care Coverage Cost by total clients served. Multiply the Average 6-Month Cost per Client by two to calculate the Average Annual Cost per Client.	$1,750,000 / 300 = $5,833 $5,833 × 2 = **$11,666**	Average 6-Month Cost Per Client Health Care Coverage Assistance Average Annual Cost Per Client for Health Care Coverage Assistance

FY 2026 Ryan White HIV/AIDS Program ADAP Emergency Relief Funds Awards agreements and compliance assurances

I, the Governor of the State or Territory or his/her official designee for the Ryan White HIV/AIDS Part B Program Grant, _____, pursuant to Title XXVI of the Public Health Service Act as amended by the Ryan White HIV/AIDS Treatment Extension Act of 2009, hereby certify that:

Pursuant to §§ 2616 and 311 of the PHS Act, these funds will be used specifically for the provision of medications and the purchase of health care coverage to prevent, reduce, or eliminate an ADAP waiting list or to address shortfalls in ADAP funding for medications and/or the purchase of health care coverage in the State or Territory.

These funds and services will be allocated and administered in accordance with the *FY 2026 Part B Ryan White HIV/AIDS Program Agreements and Compliance Assurances* submitted to the Health Resources and Services Administration.

SIGNED: _____ **Title:** _____

Governor or Official Designee

Date: _____

Presidential Documents

Executive Order 14168 of January 20, 2025

Defending Women From Gender Ideology Extremism and Restoring Biological Truth to the Federal Government

By the authority vested in me as President by the Constitution and the laws of the United States of America, including section 7301 of title 5, United States Code, it is hereby ordered:

Section 1. *Purpose.* Across the country, ideologues who deny the biological reality of sex have increasingly used legal and other socially coercive means to permit men to self-identify as women and gain access to intimate single-sex spaces and activities designed for women, from women's domestic abuse shelters to women's workplace showers. This is wrong. Efforts to eradicate the biological reality of sex fundamentally attack women by depriving them of their dignity, safety, and well-being. The erasure of sex in language and policy has a corrosive impact not just on women but on the validity of the entire American system. Basing Federal policy on truth is critical to scientific inquiry, public safety, morale, and trust in government itself.

This unhealthy road is paved by an ongoing and purposeful attack against the ordinary and longstanding use and understanding of biological and scientific terms, replacing the immutable biological reality of sex with an internal, fluid, and subjective sense of self unmoored from biological facts. Invalidating the true and biological category of ''woman'' improperly transforms laws and policies designed to protect sex-based opportunities into laws and policies that undermine them, replacing longstanding, cherished legal rights and values with an identity-based, inchoate social concept.

Accordingly, my Administration will defend women's rights and protect freedom of conscience by using clear and accurate language and policies that recognize women are biologically female, and men are biologically male.

Sec. 2. *Policy and Definitions.* It is the policy of the United States to recognize two sexes, male and female. These sexes are not changeable and are grounded in fundamental and incontrovertible reality. Under my direction, the Executive Branch will enforce all sex-protective laws to promote this reality, and the following definitions shall govern all Executive interpretation of and application of Federal law and administration policy:

(a) ''Sex'' shall refer to an individual's immutable biological classification as either male or female. ''Sex'' is not a synonym for and does not include the concept of ''gender identity.''

(b) ''Women'' or ''woman'' and ''girls'' or ''girl'' shall mean adult and juvenile human females, respectively.

(c) ''Men'' or ''man'' and ''boys'' or ''boy'' shall mean adult and juvenile human males, respectively.

(d) ''Female'' means a person belonging, at conception, to the sex that produces the large reproductive cell.

(e) ''Male'' means a person belonging, at conception, to the sex that produces the small reproductive cell.

(f) ''Gender ideology'' replaces the biological category of sex with an ever-shifting concept of self-assessed gender identity, permitting the false claim that males can identify as and thus become women and vice versa, and requiring all institutions of society to regard this false claim as true.

Gender ideology includes the idea that there is a vast spectrum of genders that are disconnected from one's sex. Gender ideology is internally inconsistent, in that it diminishes sex as an identifiable or useful category but nevertheless maintains that it is possible for a person to be born in the wrong sexed body.

(g) ''Gender identity'' reflects a fully internal and subjective sense of self, disconnected from biological reality and sex and existing on an infinite continuum, that does not provide a meaningful basis for identification and cannot be recognized as a replacement for sex.

Sec. 3. *Recognizing Women Are Biologically Distinct From Men.* (a) Within 30 days of the date of this order, the Secretary of Health and Human Services shall provide to the U.S. Government, external partners, and the public clear guidance expanding on the sex-based definitions set forth in this order.

(b) Each agency and all Federal employees shall enforce laws governing sex-based rights, protections, opportunities, and accommodations to protect men and women as biologically distinct sexes. Each agency should therefore give the terms ''sex'', ''male'', ''female'', ''men'', ''women'', ''boys'' and ''girls'' the meanings set forth in section 2 of this order when interpreting or applying statutes, regulations, or guidance and in all other official agency business, documents, and communications.

(c) When administering or enforcing sex-based distinctions, every agency and all Federal employees acting in an official capacity on behalf of their agency shall use the term ''sex'' and not ''gender'' in all applicable Federal policies and documents.

(d) The Secretaries of State and Homeland Security, and the Director of the Office of Personnel Management, shall implement changes to require that government-issued identification documents, including passports, visas, and Global Entry cards, accurately reflect the holder's sex, as defined under section 2 of this order; and the Director of the Office of Personnel Management shall ensure that applicable personnel records accurately report Federal employees' sex, as defined by section 2 of this order.

(e) Agencies shall remove all statements, policies, regulations, forms, communications, or other internal and external messages that promote or otherwise inculcate gender ideology, and shall cease issuing such statements, policies, regulations, forms, communications or other messages. Agency forms that require an individual's sex shall list male or female, and shall not request gender identity. Agencies shall take all necessary steps, as permitted by law, to end the Federal funding of gender ideology.

(f) The prior Administration argued that the Supreme Court's decision in *Bostock* v. *Clayton County* (2020), which addressed Title VII of the Civil Rights Act of 1964, requires gender identity-based access to single-sex spaces under, for example, Title IX of the Educational Amendments Act. This position is legally untenable and has harmed women. The Attorney General shall therefore immediately issue guidance to agencies to correct the misapplication of the Supreme Court's decision in *Bostock* v. *Clayton County* (2020) to sex-based distinctions in agency activities. In addition, the Attorney General shall issue guidance and assist agencies in protecting sex-based distinctions, which are explicitly permitted under Constitutional and statutory precedent.

(g) Federal funds shall not be used to promote gender ideology. Each agency shall assess grant conditions and grantee preferences and ensure grant funds do not promote gender ideology.

Sec. 4. *Privacy in Intimate Spaces.* (a) The Attorney General and Secretary of Homeland Security shall ensure that males are not detained in women's prisons or housed in women's detention centers, including through amendment, as necessary, of Part 115.41 of title 28, Code of Federal Regulations and interpretation guidance regarding the Americans with Disabilities Act.

(b) The Secretary of Housing and Urban Development shall prepare and submit for notice and comment rulemaking a policy to rescind the final rule entitled ''Equal Access in Accordance with an Individual's Gender Identity in Community Planning and Development Programs'' of September 21, 2016, 81 FR 64763, and shall submit for public comment a policy protecting women seeking single-sex rape shelters.

(c) The Attorney General shall ensure that the Bureau of Prisons revises its policies concerning medical care to be consistent with this order, and shall ensure that no Federal funds are expended for any medical procedure, treatment, or drug for the purpose of conforming an inmate's appearance to that of the opposite sex.

(d) Agencies shall effectuate this policy by taking appropriate action to ensure that intimate spaces designated for women, girls, or females (or for men, boys, or males) are designated by sex and not identity.

Sec. 5. *Protecting Rights.* The Attorney General shall issue guidance to ensure the freedom to express the binary nature of sex and the right to single-sex spaces in workplaces and federally funded entities covered by the Civil Rights Act of 1964. In accordance with that guidance, the Attorney General, the Secretary of Labor, the General Counsel and Chair of the Equal Employment Opportunity Commission, and each other agency head with enforcement responsibilities under the Civil Rights Act shall prioritize investigations and litigation to enforce the rights and freedoms identified.

Sec. 6. *Bill Text.* Within 30 days of the date of this order, the Assistant to the President for Legislative Affairs shall present to the President proposed bill text to codify the definitions in this order.

Sec. 7. *Agency Implementation and Reporting.* (a) Within 120 days of the date of this order, each agency head shall submit an update on implementation of this order to the President, through the Director of the Office of Management and Budget. That update shall address:

(i) changes to agency documents, including regulations, guidance, forms, and communications, made to comply with this order; and

(ii) agency-imposed requirements on federally funded entities, including contractors, to achieve the policy of this order.

(b) The requirements of this order supersede conflicting provisions in any previous Executive Orders or Presidential Memoranda, including but not limited to Executive Orders 13988 of January 20, 2021, 14004 of January 25, 2021, 14020 and 14021 of March 8, 2021, and 14075 of June 15, 2022. These Executive Orders are hereby rescinded, and the White House Gender Policy Council established by Executive Order 14020 is dissolved.

(c) Each agency head shall promptly rescind all guidance documents inconsistent with the requirements of this order or the Attorney General's guidance issued pursuant to this order, or rescind such parts of such documents that are inconsistent in such manner. Such documents include, but are not limited to:

(i) ''The White House Toolkit on Transgender Equality'';

(ii) the Department of Education's guidance documents including:

(A) ''2024 Title IX Regulations: Pointers for Implementation'' (July 2024);

(B) ''U.S. Department of Education Toolkit: Creating Inclusive and Nondiscriminatory School Environments for LGBTQI+ Students'';

(C) ''U.S. Department of Education Supporting LGBTQI+ Youth and Families in School'' (June 21, 2023);

(D) ''Departamento de Educación de EE.UU. Apoyar a los jóvenes y familias LGBTQI+ en la escuela'' (June 21, 2023);

(E) ''Supporting Intersex Students: A Resource for Students, Families, and Educators'' (October 2021);

(F) ''Supporting Transgender Youth in School'' (June 2021);

(G) ''Letter to Educators on Title IX's 49th Anniversary'' (June 23, 2021);

(H) ''Confronting Anti-LGBTQI+ Harassment in Schools: A Resource for Students and Families'' (June 2021);

(I) ''Enforcement of Title IX of the Education Amendments of 1972 With Respect to Discrimination Based on Sexual Orientation and Gender Identity in Light of Bostock v. Clayton County'' (June 22, 2021);

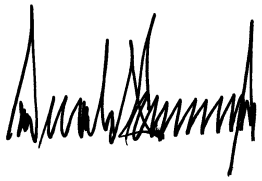
(J) ''Education in a Pandemic: The Disparate Impacts of COVID–19 on America's Students'' (June 9, 2021); and

(K) ''Back-to-School Message for Transgender Students from the U.S. Depts of Justice, Education, and HHS'' (Aug. 17, 2021);

(iii) the Attorney General's Memorandum of March 26, 2021 entitled ''Application of *Bostock* v. *Clayton County* to Title IX of the Education Amendments of 1972''; and

(iv) the Equal Employment Opportunity Commission's ''Enforcement Guidance on Harassment in the Workplace'' (April 29, 2024).

Sec. 8. *General Provisions.* (a) Nothing in this order shall be construed to impair or otherwise affect:



(i) the authority granted by law to an executive department or agency, or the head thereof; or

(ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

(d) If any provision of this order, or the application of any provision to any person or circumstance, is held to be invalid, the remainder of this order and the application of its provisions to any other persons or circumstances shall not be affected thereby.

TRANSGENDER

Medical Association Statements in Support of Health Care for Transgender People and Youth

By **GLAAD** - June 26, 2024 23 Mins Read

Transgender Flag, Getty

Original article posted June 21,2023

Every major medical association and leading world health authority supports health care for transgender people and youth. They are also increasingly speaking out against the disinformation being spread by opponents of this care. Below are excerpts from 30+ organizations' statements.

Reporters covering state bills and other discussions about this care have an obligation to note that every major medical association supports health care for transgender people and youth as safe and lifesaving.

The following have issued statements in support of health care for transgender people and youth:

American Academy of Child and Adolescent Psychiatry

American Academy of Dermatology

American Academy of Pediatrics

American Academy of Physician Assistants

American Medical Association

American Nurses Association

American Association of Clinical Endocrinology

American Association of Geriatric Psychiatry

American College Health Association

American College of Nurse-Midwives

American College of Obstetricians and Gynecologists

American College of Physicians

American Counseling Association

American Heart Association

American Medical Student Association

American Psychiatric Association

American Psychological Association

American Society of Plastic Surgeons

American Society for Reproductive Medicine

American Urological Association

Endocrine Society

Federation of Pediatric Organizations

GLMA: Health Professionals Advancing LGBTQ Equality

The Journal of the American Medical Association

National Association of Nurse Practitioners in Women's Health

National Association of Social Workers

Ohio Children's Hospital

Pediatric Endocrine Society

Pediatrics (Journal of the American Academy of Pediatrics) and Seattle Children's Hospital

Texas Medical Association

Texas Pediatric Society

United States Professional Association for Transgender Health (USPATH)

World Health Organization (WHO)

World Medical Association

World Professional Association for Transgender Health

In the December 23 issue of the journal Pediatrics, doctors from Seattle Children's Hospital published an article that describes bans on care for transgender youth as a form of child abuse.

In *"Prohibition of Gender-Affirming Care as a Form of Child Maltreatment: Reframing the Discussion,"* the authors write: "These legislative efforts operate under the guise of protecting children. In reality, they punish caregivers and physicians when they choose to support children. They deny children access to routine health care that has been shown to decrease dramatically high rates of suicide and depression for TGD (transgender and gender diverse) youth. They fuel discriminatory rhetoric, which negatively impacts the mental health of TGD children and imperils their safety."

Ohio Children's Hospital submitted testimony to the Ohio state Senate in December 2023 in defense of transgender health care for youth and against Ohio's HB68, which sought to ban it:

"It is so unfathomable to hear the statements made regarding what pediatric providers do and don't do when treating youth who are expressing a conflict between the sex they were assigned at birth and the gender with which they identify. This false narrative is intended to incite fear in order to take away parental rights and restrict health care," wrote Associate Chief Medical Officer for Behavioral Health at Ohio Children's Hospital-Dayton, Kelly Blankenship.

"At Dayton Children's Hospital, all service lines within our hospital follow national standards of care to ensure quality, safety, and deliver best outcomes," Blankenship continued. "All care delivered is age-appropriate, and aligned with clinical practice guidelines based on research… Our health care providers evaluate all symptoms, and patients are screened and evaluated for all comorbid mental health conditions before determining if treatment is needed. We seek to ensure that the decision of each parent is informed by medically sound information and is free from coercion or undue influence. Again, Dayton Children's does not perform hysterectomies, or any genital surgeries, as part of gender affirming medical care. The care provided by the medical and mental health professionals at Dayton Children's is all evidence-based. We believe all young people should have access to comprehensive, developmentally appropriate, mental health care

and gender-affirming health care provided in a safe and inclusive environment. Transgender children, adolescents, and their families deserve care that is grounded in science, compassion and ethics."

Nick Lashutka, President and CEO of the Ohio Children's Hospital, submitted additional testimony in May 2023: "The allegations made against children's hospitals by supporters of HB 68 are deeply offensive and disappointing. Children's hospitals across Ohio are filled with pediatric experts who have dedicated their lives to caring for kids."

"Here are the facts." Lashutka continued, "1. Children's hospitals in Ohio have responded to a need in the community to serve a very small, but complex population. 2. All medical gender dysphoria treatment requires parental consent. It is supported by a multi-disciplinary team of professionals, including pediatric specialists in psychiatry, adolescent medicine, and endocrinology. 3. Again, we DO NOT perform surgeries on minors for the condition of gender dysphoria. 4. Individuals diagnosed with gender dysphoria are consistent, persistent, and insistent for a lengthy period of time. The notion that kids declare a feeling and are immediately medicated at one of our clinics is false. 5. Patients do not self-diagnose their gender dysphoria; they present with symptoms of gender dysphoria. Their health care providers evaluate these symptoms, and only their health care providers make diagnoses. 6. All comorbid mental health conditions are screened and evaluated before determining if additional treatment is needed. 7. Patients do not receive blockers or hormones at their first appointment."

On June 12, 2023, The American Medical Association passed a resolution drafted by The Endocrine Society to protect access to evidence-based care for transgender and gender-diverse youth, noting "it is the responsibility of the medical community to speak out in support of evidence-based care. Medical decisions should be made by patients, their relatives and health care providers, not politicians."

The resolution was cosponsored by:

- The American Academy of Pediatrics
- The American College of Obstetricians and Gynecologists
- The American Urological Association
- The American Society for Reproductive Medicine
- The American College of Physicians

- The American Association of Clinical Endocrinology
- GLMA: Health Professionals Advancing LGBTQ+ Equality
- the AMA's Medical Student Section

The resolution stated the widespread misinformation and bans on care "do not reflect the research landscape. More than 2,000 scientific studies have examined aspects of gender-affirming care since 1975, including more than 260 studies cited in the Endocrine Society's Clinical Practice Guideline."

Additional excerpts from organization statements:

American Academy of Child and Adolescent Psychiatry: "The AAP's 2018 policy statement 'Ensuring Comprehensive Care and Support for Transgender and Gender-Diverse Children and Adolescents' defines gender affirmation as developmentally appropriate, nonjudgmental, supportive care provided in a safe clinical space. The policy states that pediatric providers, often the first medical professionals to discover a child's gender identity concerns, have a special role in caring for these patients who have a high risk of depression, anxiety and suicide. The care model is not one-size-fits-all, said Brittany Allen, M.D., FAAP, a member of the AAP Section on LGBTQ Executive Committee. It recognizes the wide spectrum of normal, healthy gender identities." *(January 6, 2022)*

American Academy of Child and Adolescent Psychiatry: "(AACAP) supports the use of current evidence-based clinical care with minors. AACAP strongly opposes any efforts – legal, legislative, and otherwise – to block access to these recognized interventions. Blocking access to timely care has been shown to increase youths' risk for suicidal ideation and other negative mental health outcomes. Consistent with AACAP's policy against conversion therapy, AACAP recommends that youth and their families formulate an individualized treatment plan with their clinician that addresses the youth's unique mental health needs under the premise that all gender identities and expressions are not inherently pathological." *(November 8, 2019)*

American Academy of Dermatology: "The AADA recognizes the dignity and identity of transgender individuals and advocates for dermatologists' ability to provide therapy and procedures that help the mental and physical well-being of these and all patients. Transgender and gender-diverse individuals can benefit greatly from medical and surgical gender-affirming treatments. These treatments are often medically necessary for the health and well-being of

these patients and are not to be considered as cosmetic or elective. Decisions about care should remain within the confines of the physician-patient relationship, guided by strong medical evidence and the best interests of the individual patient." *(June 1, 2021)*

American Medical Association: "Empirical evidence has demonstrated that trans and non-binary gender identities are normal variations of human identity and expression. For gender diverse individuals, standards of care and accepted medically necessary services that affirm gender or treat gender dysphoria may include mental health counseling, non-medical social transition, gender-affirming hormone therapy, and/or gender-affirming surgeries. Clinical guidelines established by professional medical organizations for the care of minors promote these supportive interventions based on the current evidence and that enable young people to explore and live the gender that they choose. Every major medical association in the United States recognizes the medical necessity of transition-related care for improving the physical and mental health of transgender people." *(April 26, 2021)*

The American Medical Association passed a resolution drafted by The Endocrine Society to protect access to evidence-based gender-affirming care for transgender and gender-diverse youth. *(June 12, 2023)*

American Nurses Association: "The American Nurses Association strongly opposes any legislation or policy action that places restrictions on transgender health care and that criminalizes gender-affirming care. Due to recent state legislative efforts, transgender and gender-diverse youth and their parents or guardians who choose to access gender-affirming care may come under legal assault in many states. Health care professionals, including nurses and advanced practice registered nurses (APRNs) who provide gender-affirming care, may also be subject to judicial process or other legal action. These restrictive laws interfere with the trust and confidentiality between patients, parents or guardians, and clinicians in the delivery of evidence-based care. The legislative intent and medical claims behind these laws are not grounded in reputable science and conflict with the nurse's obligation to promote, advocate, and protect the rights, health, and safety of patients. ANA's Position Statement Nursing Advocacy for LGBTQ+ Populations (2018) underlines the mandate that nurses "must deliver culturally congruent care and advocate for lesbian, gay, bisexual, transgender, queer, or questioning (LGBTQ+) populations." *(October 26, 2022)*

American Academy of Pediatrics*:* "There is strong consensus among the most prominent medical organizations worldwide that evidence-based, gender-affirming care for transgender

children and adolescents is medically necessary and appropriate. It can even be lifesaving. The decision of whether and when to start gender-affirming treatment, which does not necessarily lead to hormone therapy or surgery, is personal and involves careful consideration by each patient and their family." *(August 10, 2022)*

American Academy of Pediatrics: "The American Academy of Pediatrics recommends that youth who identify as transgender have access to comprehensive, gender-affirming, and developmentally appropriate health care that is provided in a safe and inclusive clinical space. We also recommend that playing on sports teams helps youth develop self-esteem, correlates positively with overall mental health, and appears to have a protective effect against suicide. These bills not only ignore these recommendations, they undermine them." *(March 16, 2021)*

American Academy of Physician Assistants*:* "All the undersigned associations have adopted policies or otherwise support addressing the specific health concerns of LGBTQ people, including opposition to discrimination in health care and insurance coverage based on an individual's sexual orientation or gender identity. As part of that commitment, our organizations support public and private health insurance coverage for the treatment of gender dysphoria when medically necessary." *(Signatories: American Academy of Nursing, American Academy of PAs, American Academy of Pediatrics, American Academy of Psychiatry and The Law American Association for Geriatric Psychiatry, American College Health Association, American College of Physicians, American Medical Association, American Medical Student Association, American Medical Women's Association, American Nurses Association, American Pediatric Surgical Association) (May 24, 2019)*

American Association of Clinical Endocrinology: "Transgender and gender diverse people represent a sizable and growing segment of the U.S. and world Population. It is estimated that over 1 million people in the U.S. alone are transgender or gender diverse. Many transgender and gender diverse people seek hormone therapy under the supervision of an endocrinologist or other medically trained health care professional to better align their bodies with their gender identities. Being transgender is widely accepted to require medical treatment for those patients who seek it. Medical treatment may include behavioral assessment, hormone therapy, and surgery. These treatments are well established in the relevant established, international professional society guidelines including those from the Endocrine Society co-sponsored by the American Association of Clinical Endocrinology (AACE) and the World Professional Association for Transgender Health (WPATH)." *(March 7, 2022)*

American Association of Geriatric Psychiatry: "With the overarching goals of improving the healthcare of older transgender individuals and of inspiring pertinent clinical research, a session at the 2017 American Association for Geriatric Psychiatry Annual Meeting focused on an interdisciplinary approach to transgender aging. The older the transgender adult, the more likely the individual grew up in a historical context when there was greater social stigma towards their gender identity, even among mental health professionals... In spite of notable health disparities, some evidence points to resilience among transgender older adults. The mental health professional often serves as the first contact for a patient who is struggling with gender identity." *(February 7, 2018)*

American College Health Association: "As a society, we have made significant strides in removing barriers and improving health care and outcomes for transgender and gender diverse patients. Individuals feel more comfortable disclosing their authentic gender and are doing so at younger ages. Health care services should be made universal to all and should not discriminate in any way, whether this be on age; race/ethnicity, sex; sexual orientation; gender (including gender identity); marital status; physical size; religious, spiritual or cultural identity; psychological/physical/learning disability; socioeconomic status; or veteran status. This is consistent with the long-held values of cultural inclusion, respect, equality, and equity that ACHA has advocated for. Therefore, ACHA opposes any legislation, both state or federal, that would restrict or limit access to gender-related medically necessary services for transgender youth and adults." *(February 8, 2023)*

American College of Nurse-Midwives: The American College of Nurse-Midwives (ACNM) supports efforts to provide transgender and gender non-binary (TGNB) people with access to safe, comprehensive, culturally-responsive, and respectful health care. ACNM is committed to taking the following actions: Incorporating gender-inclusive language into ACNM documents. Offering educational opportunities to members of the midwifery community on how to care for TGNB people. Advancing legislation and policies that prohibit discrimination based on gender expression and/or identity. Supporting measures to ensure TGNB people have comprehensive and unrestricted access to health insurance coverage. *(March 2021)*

American College of Obstetricians and Gynecologists: "The American College of Obstetricians and Gynecologists opposes discrimination on the basis of gender identity, urges public and private health insurance plans to cover necessary services for individuals with gender dysphoria, and advocates for inclusive, thoughtful, and affirming care for transgender individuals." *(January 2017)*

American College of Physicians*:* "A growing number of states are banning gender-affirming health care and pursuing anti-LGBTQ+ legislation, contrary to ACP policy, which urges non-discrimination in health care. ACP opposes these restrictions on health care for transgender individuals, who already may face extreme barriers to accessing care, and strongly objects to any unnecessary government interference with any health care services." *(April 24, 2023)*

American Counseling Association: "The American Counseling Association (ACA) is committed to nondiscrimination and prevention of harassment in all forms (verbal, physical, sexual, emotional, and psychological), including protections for all diverse groups including protections for transgender and nonbinary individuals. ACA recognizes the stress and psychological impact of discrimination and is committed to helping counselors advocate for nondiscrimination policies and practices in their schools, colleges/universities, clinical mental health settings, communities, and in the nation." *(March 29, 2019)*

American Heart Association: The AHA opposed the repeal of transgender-specific protections under Section 1557 of the Affordable Care Act noting: "Transgender people also face a high degree of insurance discrimination. Historically, many plans have used transgender-specific exclusions to deny transgender people coverage for medically necessary care—including hormone therapy, mental health counseling, and surgeries—even though the same services are routinely covered for non-transgender individuals... These experiences of healthcare and health insurance discrimination contribute to significant health disparities." *(September 2019)*

American Medical Student Association: "AMSA adamantly opposes treatment policies that discriminate against patients based on their sexual orientation and gender identity, or that inhibit their access to quality care. Health care for transgender people should be individualized, holistic, and comprehensive – including, but not limited to surgical treatment– and transgender persons in the military should be allowed to openly undergo gender transition and be eligible for the equitable benefits and rights afforded to cisgender service personnel, including health care." *(August 2017)*

American Medical Women's Association: The American Medical Women's Association (AMWA) supports the US Department of Health and Human Services adopting revisions to Section 1557 of the Affordable Care Act that codify protections for LGBTQ+ people from mistreatment by physicians, other clinicians, and insurers. Adopting this rule will restore and strengthen protections for LGBTQ+ people by clarifying that the definition of "sex" discrimination applies to discrimination based on sex characteristics, intersex traits, and pregnancy and pregnancy

termination, and aligns with federal court decisions prohibiting discrimination based on gender identity and sexual orientation. AMWA urges adoption of these crucial protections.

American Psychiatric Association: "Our organizations, which represent nearly 600,000 physicians and medical students, oppose any laws and regulations that discriminate against transgender and gender-diverse individuals or interfere in the confidential relationship between a patient and their physician. That confidentiality is critical to allow patients to trust physicians to properly counsel, diagnose and treat. Our organizations are strongly opposed to any legislation or regulation that would interfere with the provision of evidence-based patient care for any patient, affirming our commitment to patient safety. We recognize health as a basic human right for every person, regardless of gender identity or sexual orientation." *(Joint statement with the American Academy of Family Physicians, American Academy of Pediatrics, American College of Physicians, American College of Obstetricians and Gynecologists, American Osteopathic Association; April 2, 2021)*

American Society of Plastic Surgeons: "The delivery of gender affirming care is not a political issue, but rather a health care issue – Gender dysphoria is a medical diagnosis, not a political choice. ASPS firmly believes that plastic surgery services can help gender dysphoria patients align their bodies with whom they know themselves to be and improve their overall mental health and well-being. The Society will continue its efforts to advocate for full access to medically necessary transition care and stand up to those who oppose it – from the board rooms of big tech to Capitol Hill." *(June 22, 2021)*

American Urological Association: "The AUA is committed to the principle that medical decision-making for transgender children is the responsibility of parents acting in their child's best interest to ensure their physical and mental health, safety and well-being, and that consultation with medical professionals and education via medically safe (respected, peer-reviewed) resources must not be legislated or criminalized."

Federation of Pediatric Organizations: "We stand with pediatricians who partner with families every day to make the best possible decision for each individual child based on available research and evidence pertinent to that child's care. Transgender and gender-diverse children and youth deserve to lead safe, healthy lives in environments that allow them to be their authentic selves. That can only happen if physicians are allowed to treat these children in the same manner, and with the same respect, that we expect them to treat every other child. Our

mission to advance child health will succeed only if we work to improve health outcomes for all children." *(March 28, 2022*)

GLMA: Health Professionals Advancing LGBTQ Equality: Many but not all transgender people experience gender dysphoria, a medical condition defined by the American Psychiatric Association as a "conflict between a person's physical or assigned gender and the gender with which he/she/they identify." Standards of care and accepted medically necessary services that affirm gender or treat gender dysphoria may include but are not limited to mental health counseling, non-medical social transition, gender-affirming hormone therapy, and/or gender-affirming surgeries. Every major medical association in the United States recognizes the medical necessity of transition-related care for improving the physical and mental health of transgender people and has called for health insurance coverage for treatment of gender dysphoria." *(March 2019)*

The Journal of the American Medical Association: "Transgender and gender diverse patients should receive nonjudgmental care from appropriately trained health care professionals. Gender-affirming primary care includes preventive care, mental health and substance use disorder screening, hormone therapy, and education about nonmedical/nonsurgical gender-affirming interventions. *(September 15, 2022)*

National Association of Nurse Practitioners in Women's Health: "The National Association of Nurse Practitioners in Women's Health (NPWH) affirms each individual's right to quality, evidence-based sexual and reproductive healthcare and celebrates diversity of sexuality, gender identity, and gender expression. NPWH is committed to providing quality sexual and reproductive healthcare to all individuals, regardless of gender identity or expression... Transgender and Gender Diverse individuals have a right to care that aligns with and affirms their gender identity." *(May 2022)*

National Association of Social Workers: Gender-Affirming Health Care Saves Lives: "The National Association of Social Workers (NASW) asserts that discrimination and prejudice directed against any individuals on the basis of gender identity or expression are damaging to the social, emotional, psychological, physical and economic well-being of transgender and gender diverse (TGD) people and society as a whole. The unprecedented increase in legislation focused on TGD youth seeking affirming health care, the professionals who provide their medical care, and the families and social supports that offer resources to them is an unfortunate indicator of the lack of understanding and misinformation that currently exists... NASW will work to repeal

discriminatory legislation and regulations that do not honor someone's self-identified gender identity, transgender-inclusive health care access, health insurance options, or use of language promoting health equity and inclusive communication."

Pediatric Endocrine Society: "Bills that threaten the health of transgender and gender diverse (TGD) youth have been introduced in multiple state legislatures across the United States. These bills undermine medical recommendations and seek to criminalize health care professionals who provide gender-affirming care such as puberty suppressing medications and gender-affirming hormone therapy. We caution legislators and the public that the support and implementation of these bills will worsen mental health, increase the risk of suicide, and contribute to poorer overall health in our TGD patients. Such bills contradict evidence-based Standards of Care recommendations from the Pediatric Endocrine Society as well as Position Statements from several national and international medical associations with expertise in the care of TGD youth, such as the American Academy of Pediatrics, the Endocrine Society, the American Academy of Child and Adolescent Psychiatry, the American Psychiatric Association and the World Professional Association for Transgender Health. The Pediatric Endocrine Society recommends an affirmative model of care that supports one's gender identity, and follows a multidisciplinary approach that includes involvement of mental health professionals, patients and their families. Puberty suppression and/or gender-affirming hormone therapy is recommended within this evidence-based approach on a case-by-case basis as medically necessary and is potentially lifesaving. The implementation of these recommendations has been demonstrated to improve the psychological health and well-being of TGD youth." *(April 2021)*

Texas Medical Association: "filed friend-of-the-court brief in the case in support of medically necessary, gender-affirming care, and opposing the criminalization of such treatment... TMA's brief addresses "the acceptance and medical necessity of gender-affirming care for adolescents with gender dysphoria" and raises concerns the state actions "will create barriers in access to care for transgender adolescents, a vulnerable population that already faces barriers in access to care. The full range of evidence and the current recommendations developed by the American Academy of Pediatrics, and affirmed by every major American medical association, supports the medical necessity and appropriateness of providing gender-affirming support and care to transgender youth and adolescents. Medical care for transgender youth and adolescents is evidence-based and has proven effectiveness." *(March 10, 2022)*

Texas Pediatric Society: Statement opposing Actions in Texas Threatening Health of Transgender Youth: **"**TPS has long-advocated against prohibitions on gender-affirming care in

Texas. For young people who identify as transgender, studies show that gender-affirming care can reduce emotional distress, improve their sense of well-being and reduce the risk of suicide. "Evidence-based medical care for transgender and gender diverse children is a complex issue that pediatricians are uniquely qualified to provide. This directive undermines the physician-patient-family relationship and will cause undue harm to children in Texas. TPS opposes the criminalization of evidence-based, gender-affirming care for transgender youth and adolescents. We urge the prioritization of the health and well-being of all youth, including transgender youth."

United States Professional Association for Transgender Health (USPATH): "USPATH and the World Professional Association for Transgender Health (WPATH) denounces the emergency regulation halting gender-affirming healthcare for transgender and gender diverse (TGD) children and adolescents issued by Missouri Attorney General Andrew Bailey as lacking scientific grounding. The WPATH Standards of Care for the Health of Transgender and Gender Diverse People, now in its 8th version (SOC8), is the foremost evidence-based guideline for the provision of TGD healthcare. SOC8 is based on the best available science with input from over 100 global medical professionals and experts and represents best-practice guidelines for the provision of gender-affirming healthcare. Gender-affirming interventions are based on decades of clinical experience and research and are not considered experimental. Gender affirming hormone therapy (GAHT) is a component of widely accepted medically necessary care for TGD people." *(March 22, 2023)*

World Health Organization (WHO): "WHO's role, to promote health for all, means it is committed to inclusive healthcare and equitable access for trans, gender diverse and all other people... Our fight is for #HealthForAll" (28), demonstrating WHO's highest level commitment to support countries to attend to the health needs of transgender and gender diverse people."

World Medical Association: "The WMA emphasizes that everyone has the right to determine one's own gender and recognizes the diversity of possibilities in this respect. The WMA calls for physicians to uphold each individual's right to self-identification with regard to gender. The WMA asserts that gender incongruence is not in itself a mental disorder; however, it can lead to discomfort or distress, which is referred to as gender dysphoria (DSM-5). The WMA affirms that, in general, any health-related procedure or treatment related to an individual's transgender status, e.g. surgical interventions, hormone therapy or psychotherapy, requires the freely given informed and explicit consent of the patient. The WMA urges that every effort be made to make individualized, multi-professional, interdisciplinary and affordable transgender healthcare (including speech therapy, hormonal treatment, surgical interventions and mental healthcare)

available to all people who experience gender incongruence in order to reduce or to prevent pronounced gender dysphoria." *(October 2015)*

World Professional Association for Transgender Health: "Both the World Professional Association for Transgender Health (WPATH) and the US affiliate, the United States Professional Association for Transgender Health (USPATH), vehemently oppose the broad and sweeping legislation being introduced and ratified in states across the country to ban access to gender-affirming health care to transgender and gender diverse (TGD) people. WPATH's long-standing Standards of Care for Transgender and Gender Diverse People, now in its eighth version (SOC8), explain in detail the science- and evidence-based benefits of gender affirming care for TGD people. Any legislation that restricts or prohibits access to this care is against best practice medical standards and is condemned by WPATH and USPATH." (March 8, 2023)

Medical Organization Statements

Leading medical groups recognize the medical necessity of treatments for gender dysphoria and endorse such treatments. Most of these groups have also explicitly rejected insurance exclusions for transgender-related care.

Expand all Collapse all

American Academy of Child and Adolescent Psychiatry

About the organization:

The mission of the 9,600-member American Academy of Child and Adolescent Psychiatry is to promote the healthy development of children, adolescents, and families through advocacy, education, and research, and to meet the professional needs of child and adolescent psychiatrists throughout their careers.

Statements:

- **Florida's "Don't Say Gay or Trans" Law Stigmatizes LGBTQ+ Youth and Families**

  "Harmful legislation like the 'Don't Say Gay or Trans' bill not only endangers the LGBTQ+ community, but it also jeopardizes their ability to reach their full potential. This action sends a dangerous message that certain voices don't deserve to be heard. Additionally, this bill is a big step backwards for all marginalized communities, their families, and for the appreciation and understanding of diversity."

  "AACAP opposes policies that stigmatize normal and healthy expressions of sexual and gender identity... This bill exacerbates the stigma that many LGBTQ+ youth already experience and paves the way for other groups to similarly be targeted... This law grossly undermines the basic tenets of education policy by denying students

access to and support from some of the most important and influential adults in their lives. This regressive approach to education and development will have devastating consequences for all, especially for LGBTQ+ youth and families."

Date: March 18, 2022

- **AACAP Statement Opposing Actions in Texas Threatening the Health, Mental Health and Well-Being of Transgender and Gender Diverse Youth and Their Families**

  "The American Academy of Child and Adolescent Psychiatry (AACAP) supports the healthy development of all children, adolescents, and their families, including transgender and gender-diverse youth and families. Recent state attacks on gender-affirming support and care for transgender and gender-diverse youth endanger the welfare of many young people across the country. These attacks undermine the right of parents and caregivers to access evidence-based and developmentally appropriate treatment"

  Date: March 1, 2022

- **AACAP Statement Responding to Efforts to ban Evidence-Based Care for Transgender and Gender Diverse Youth**

  "The American Academy of Child and Adolescent Psychiatry (AACAP) supports the use of current evidence-based clinical care with minors. AACAP strongly opposes any efforts – legal, legislative, and otherwise – to block access to these recognized interventions. Blocking access to timely care has been shown to increase youths' risk for suicidal ideation and other negative mental health outcomes. Consistent with AACAP's policy against conversion therapy (2), AACAP recommends that youth and their families formulate an individualized treatment plan with their clinician that addresses the youth's unique mental health needs under the premise that all gender identities and expressions are not inherently pathological."

- **Practice Parameter on Gay, Lesbian, or Bisexual Sexual Orientation, Gender Nonconformity, and Gender Discordance in Children and Adolescents**

  Stewart L. Adelson & American Academy of Child and Adolescent Psychiatry Committee on Quality Issues, Practice parameter on gay, lesbian, or bisexual sexual orientation, gender nonconformity, and gender discordance in children and adolescents, 51 J. Am. Acad. of Child & Adolesc. Psychiatry 957 (2012).

  "Children and adolescents who are growing up gay, lesbian, bisexual, gender nonconforming, or gender discordant experience unique developmental challenges.

They are at risk for certain mental health problems, many of which are significantly correlated with stigma and prejudice. Mental health professionals have an important role to play in fostering healthy development in this population. Influences on sexual orientation, gender nonconformity, and gender discordance, and their developmental relationships to each other, are reviewed. Practice principles and related issues of cultural competence, research needs, and ethics are discussed."

Date: Sept. 1, 2012

American Academy of Dermatology

About the organization:

The American Academy of Dermatology, founded in 1938, is the largest, most influential, and most representative of all dermatologic associations. With a membership of more than 20,500 physicians worldwide, the AAD is committed to: advancing the diagnosis and medical, surgical, and cosmetic treatment of the skin, hair, and nails; advocating high standards in clinical practice, education, and research in dermatology; and supporting and enhancing patient care for a lifetime of healthier skin, hair, and nails.

Statements:

- **American Academy of Dermatology Association statement on legislative interference in health care for transgender patients**

  The American Academy of Dermatology

  - Strongly opposes recent efforts by state legislatures to restrict physicians' ability to provide care to transgender youths.
  - Recognizes the dignity and identity of transgender individuals and advocates for dermatologists' ability to provide therapy and procedures that help the mental and physical well-being of these and all patients.

  "Evidence has shown that transgender individuals who are forced to forgo gender-affirming care face an increased risk of mental health disorders including substance

abuse disorders, and have higher rates of suicide. Transgender and gender-diverse individuals can benefit greatly from medical and surgical gender-affirming treatments. Treatments are often medically necessary for the health and well-being of these patients and are not to be considered as cosmetic or elective."

Date: June 1, 2021

- **Position Statement on Sexual and Gender Minority Health in Dermatology**

  The American Academy of Dermatology

  - "Recognizes that transgender and gender diverse individuals can benefit greatly from medical and surgical gender-affirming treatments.
  - Supports evidence-based coverage of all gender-affirming therapy and procedures which help the mental and physical well-being of gender diverse individuals.
  - Recognizes that gender-affirming procedures and treatments are not “cosmetic” or “elective” or for the mere convenience of the patient. These procedures are not optional in any meaningful sense, but are understood to be medically necessary for the health and well-being of the individual.
  - Advocates for removal of barriers to care and supports both public and private health insurance coverage of gender transition treatment."

  Date: March 4, 2019

American Academy of Family Physicians

About the organization:

Founded in 1947, the American Academy of Family Physicians represents 136,700 physicians and medical students nationwide. It is the only medical society devoted solely to primary care.

Statements:

- **NCCL Delegates Concern for Anti-Transgender Legislation**

  "The reference committee heard strong support for a resolution to oppose state legislation banning adolescent transgender care and to offer an advocacy toolkit on the subject, which delegates adopted.

  Member testimony noted the sharp increase in anti-transgender legislation across the states and discussed how these bills are a direct interference in evidence-based care, and the denial of gender-affirming care is linked to adverse outcomes," the committee reported. Members expressed particular concern that some of the bills "seek to penalize and criminalize physicians for medically necessary care."

  Date: 2021

- **Frontline Physicians Oppose Legislation That Interferes in or Penalizes Patient Care**

  AAFP joined the American Academy of Pediatrics, The American College of Obstetricians and Gynecologists, the American College of Physicians, the American Osteopathic Association, and the American Psychiatric Association in opposing legislation that interferes in or penalizes patient care for transgender individuals.

  "Our organizations, which represent nearly 600,000 physicians and medical students, oppose any laws and regulations that discriminate against transgender and gender-diverse individuals or interfere in the confidential relationship between a patient and their physician. That confidentiality is critical to allow patients to trust physicians to properly counsel, diagnose and treat.

  Our organizations are strongly opposed to any legislation or regulation that would interfere with the provision of evidence-based patient care for any patient, affirming our commitment to patient safety. We recognize health as a basic human right for every person, regardless of gender identity or sexual orientation. For gender-diverse individuals, including children and adolescents, this means access to gender-affirming care that is part of comprehensive primary care.

  Further, we strongly oppose any effort to criminalize or penalize physicians for providing necessary care for their patients. Physicians must be able to practice medicine that is informed by their years of medical education, training, experience, and the available evidence, freely and without threat of punishment. Patients and their physicians, not policymakers, should be the ones to make decisions together about what care is best for them."

  Date: April 2, 2021

- **Policy: Discrimination, Patient**

"The AAFP opposes all discrimination in any form, including but not limited to, on the basis of actual or perceived race, color, religion, gender, sexual orientation, gender identity, ethnic affiliation, health, age, disability, economic status, body habitus or national origin."

Date: 2020

- **Coverage Equity for Drugs, Testing, Procedure, Preventive Services, and Reproductive Technologies**

  "Employers and health plans should not discriminate by the patient's birth gender, sexual orientation, or marital status in the provision of health care benefits including a) prescription drugs and devices, b) elective sterilization procedures, c) diagnostic testing, d) medically indicated surgical procedures, and e) assisted reproductive technologies. These benefits should be covered under the same terms and conditions as other prescription drugs, devices, elective surgeries, diagnostic testing, and medically indicated surgical procedures.

  Coverage should include medically appropriate services for individuals requiring transition or transgender care as determined by best practice standards, the patient, and the attending physician. Further, this coverage should extend to the medically-appropriate, sex-specific recommended preventive services determined appropriate by the patient's primary care physician."

  Date: 2018

American Academy of Nursing

About the organization:

The American Academy of Nursing serves the public and the nursing profession by advancing health policy and practice through the generation, synthesis, and dissemination of nursing knowledge. The Academy's more than 2,800 fellows are nursing's most accomplished leaders in policy, research, administration, practice, and academia.

Statements:

- **Health Care Services for Transgender Individuals: Position Statement**

  Carol A. Sedlak & Carol J. Boyd, Health Care Services for Transgender Individuals: Position Statement, 64 Nursing Outlook 510-12 (Sept./Oct. 2016).

  "The American Academy of Nursing supports initiatives to address the health needs of transgender individuals (TI) and supports policy initiatives that reduce the heath care barriers that most TI encounter. There is a great need for the development of strategies and policies to eliminate the health care disparities of approximately 700,000 TI in the United States."

  Date: 2016

- **AAN Comments HHS Sec 1557 Nondiscrimination Proposed Rule**

  The AAN opposed the repeal of transgender-specific protections under Section 1557 of the Affordable Care Act noting: "The proposed rule would eliminate the definition of sex discrimination from the Section 1557 regulation, inviting insurers to deny treatment to transgender and gender nonconforming patients, including the denial of treatments such as hormone therapy, counseling and surgery that are essential to transgender patients, as they see fit. ... Since the implementation of Section 1557, 18 states have implemented affirmative coverage protocols in their respective Medicaid programs to ensure coverage of medically necessary transition-related care. These coverage improvements and any future progress will be in jeopardy if this rule is finalized as proposed."

  Date: 2019

- **Amicus Brief to Call for VA Support of Surgical Treatment for Transgender Veterans with Gender Dysphoria**

  AAN joined an amicus brief in Fulcher v. Secretary of Veterans Affairs, which challenged the U.S. Department of Veterans Affairs' refusal to engage in rulemaking to reconsider its ban on providing transgender-related surgery to veterans.

  Date: 2017

American Academy of Pediatrics

About the organization:

The American Academy of Pediatrics (AAP), a non-profit professional organization of 67,000 primary care pediatricians, pediatric medical subspecialists, and pediatric surgical specialists dedicated to the health, safety and well-being of infants, children, adolescents, and young adults,

Statements:

- **AAP SAHM Comments on Nondiscrimination in Health and Health Education Programs or Activities**

  The AAP opposed the repeal of transgender-specific protections under Section 1557 of the Affordable Care Act noting: "The proposal would also eliminate the provision that prohibits a health plan from categorically or automatically excluding or limiting coverage for health services related to gender transition. The rollback of these protections could have a devastating impact on access to medically necessary services for youth who identify as TGD and adversely affect self-esteem and contribute to the perception that they are undervalued by society and the health care system. Furthermore, insurance denials can reinforce a socioeconomic divide between those who can finance the high costs of uncovered care and those who cannot."

  Date: 2019

- **Ensuring Comprehensive Care and Support for Transgender and Gender-Diverse Children and Adolescents**

  Jason Rafferty et al., Ensuring Comprehensive Care and Support for Transgender and Gender-Diverse Children and Adolescents, 142 Pediatrics e20182162 (2018).

  The AAP works toward all children and adolescents, regardless of gender identity or expression, receiving care to promote optimal physical, mental, and social well-being. Any discrimination based on gender identity or expression, real or perceived, is damaging to the socioemotional health of children, families, and society.

  The AAP recommends that youth who identify as transgender and gender diverse have access to comprehensive, gender-affirming, and developmentally appropriate health care that is provided in a safe and inclusive clinical space and that insurance plans offer coverage for health care that is specific to the needs of youth

who identify as transgender and gender diverse, including coverage for medical, psychological, and, when indicated, surgical gender-affirming interventions.

Date: 2018

American Academy of Physician Assistants

About the organization:

Founded in 1968, the American Academy of Physician Assistants is the national professional society for PAs. It represents a profession of more than 140,000 PAs across all medical and surgical specialties in all 50 states, the District of Columbia, U.S. territories, and the uniformed services.

Statements:

- **Letter Opposing Changes to Section 1557 Regulation**

  All the undersigned associations have adopted policies or otherwise support addressing the specific health concerns of LGBTQ people, including opposition to discrimination in health care and insurance coverage based on an individual's sexual orientation or gender identity. As part of that commitment, our organizations support public and private health insurance coverage for treatment of gender dysphoria when medically necessary.

  Date: 2019

- **Guidelines for Ethical Conduct for the PA Profession**

  PAs should not discriminate against classes or categories of patients in the delivery of needed healthcare. Such classes and categories include gender, color, creed, race, religion, age, ethnic or national origin, political beliefs, nature of illness, disability, socioeconomic status, physical stature, body size, gender identity, marital status, or sexual orientation.

  Date: 2018

- **Amicus Brief to Call for VA Support of Surgical Treatment for Transgender Veterans with Gender Dysphoria**

The Lesbian Bisexual Gay & Transgender PA (LBGT PA) Caucus joined an amicus brief in Fulcher v. Secretary of Veterans Affairs, which challenged the U.S. Department of Veterans Affairs' refusal to engage in rulemaking to reconsider its ban on providing transgender-related surgery to veterans.

Date: 2017

American College Health Association

About the organization:

Since 1920, the American College Health Association (ACHA) has served as the voice for student health and wellness. Through advocacy, research and education, ACHA stands at the forefront of issues that impact the health and wellness of our college students. ACHA represents over 1,100 institutions of higher education, representing the collective health and wellness needs of 10 million college students. ACHA serves nearly 3,000 individual college health and wellness professionals and leaders of all disciplines united together to advance the health and wellness of college students.

Statements:

- **Statement on Legislation Affecting Medically Necessary Services for Transgender Patients**

  "As a society, we have made significant strides in removing barriers and improving health care and outcomes for transgender and gender diverse patients. Individuals feel more comfortable disclosing their authentic gender and are doing so at younger ages. Health care services should be made universal to all and should not discriminate in any way, whether this be on age; race/ethnicity, sex; sexual orientation; gender (including gender identity); marital status; physical size; religious, spiritual or cultural identity; psychological/physical/learning disability; socioeconomic status; or veteran status. This is consistent with the long held values of cultural inclusion, respect, equality, and equity that ACHA has advocated for.

  Therefore, ACHA opposes any legislation, both state or federal, that would restrict or limit access to gender-related medically necessary services for transgender youth and adults."

  Date: 2020

- **Non-Discrimination Policy**

  ACHA rejects all forms of discriminatory conduct with respect to: age; race/ethnicity; sex; sexual orientation; gender, including gender identity and expression; marital status; physical size; psychological/physical/learning ability; religious, spiritual or cultural identity; socioeconomic status; or veteran status.

  Date: 2019

American College of Nurse-Midwives

About the organization:

The American College of Nurse-Midwives (ACNM) is the professional association that represents certified nurse-midwives (CNMs) and certified midwives (CMs) in the United States.

Statements:

- **American College of Nurse-Midwives Strongly Opposes Reversal of Gender Identity and Sexual Orientation Protections in Health Care**

  "The American College of Nurse-Midwives (ACNM) strongly opposes the U.S. Department of Health and Human Services' (HHS) recent decision to finalize a rule removing non-discrimination protections established under the Affordable Care Act for LGBTQ people when it comes to health care providers and health insurance coverage. ACNM champions access to comprehensive sexual and reproductive health care services for every person, and as midwives we believe everyone has the right to make choices that meet their individual needs. Every person has the right to safe, supportive, and affirming health care in which providers demonstrate respect for human dignity."

  Date: June 19, 2020

- **Health Care for Transgender and Gender Non-Binary People**

  It is the position of ACNM that midwives should:

  ● Respect transgender and gender non-binary (TGNB) people. This includes becoming familiar with terminology related to gender identities and expression and endeavoring to use correct names, pronouns, and preferred anatomical language.

● Understand TGNB identity as a normal human variation rather than pathology.

● Be knowledgeable about the health care needs of TGNB people, including the individual and systematic barriers to care, as well as the options and benefits of gender-affirming treatment within a framework of shared decision-making and harm reduction.

● Provide or identify appropriate referral for reproductive and sexual health and primary care, including gender-affirming hormone therapy. Match treatment approaches to the specific needs of TGNB people, particularly their goals for gender affirmation and expression.

● Provide resources and referrals to support and advocate for patients within their families and communities (eg, schools, workplaces, and other settings).

● Advocate for, and work to create welcoming and inclusive health care settings for TGNB people (eg, gender-neutral bathrooms and gender inclusive forms, signage, education materials, and electronic health records).

Date: 2021

American College of Obstetricians and Gynecologists —

About the organization:

The American College of Obstetricians and Gynecologists is the nation's leading group of professionals providing health care for women.

Statements:

- **Committee Opinion No. 512: Health Care for Transgender Individuals, 118 Obstet Gynecol 1454 (2011).**

  "Within the medical community, transgender individuals face significant barriers to health care. This includes the failure of most health insurance plans to cover the cost of mental health services, cross-sex hormone therapy, or gender affirmation surgery. This barrier exists despite evidence that such treatments are safe and effective and that cross-gender behavior and gender identity issues are not an issue of choice for the individual and cannot be reversed with psychiatric treatment."

"The American College of Obstetricians and Gynecologists, therefore, urges public and private health insurance plans to cover the treatment of gender identity disorder."

Date: 2011

- **Committee Opinion No. 685: Care for Transgender Adolescents**

  American College of Obstetricians and Gynecologists, Committee Opinion No. 685: Care for transgender adolescents, 129 Obstet Gynecol e11 (2017).

  Date: 2017

American College of Physicians

About the organization:

The American College of Physicians recommends that public and private health benefit plans include comprehensive transgender health care services and provide all covered services to transgender persons as they would all other beneficiaries.

Statements:

  Hilary Daniel & Renee Butkus, for the Health and Public Policy Committee of the American College of Physicians, Lesbian, Gay, Bisexual, and Transgender Health Disparities: Executive Summary of a Policy Position Paper From the American College of Physicians, 163 Annals of Internal Medicine 135 (2015).

  Date: 2015

- **Amicus Brief to Call for VA Support of Surgical Treatment for Transgender Veterans with Gender Dysphoria**

  ACP joined an amicus brief in Fulcher v. Secretary of Veterans Affairs, which challenged the U.S. Department of Veterans Affairs' refusal to engage in rulemaking to reconsider its ban on providing transgender-related surgery to veterans.

Date: 2017

American Counseling Association

About the organization:

The American Counseling Association is a not-for-profit, professional and educational organization that is dedicated to the growth and enhancement of the counseling profession. Founded in 1952, ACA is the world's largest association exclusively representing professional counselors in various practice settings.

Statements:

- **Competencies for Counseling Transgender Clients**

  The American Counseling Association's Association of Lesbian, Gay, Bisexual, and Transgender Issues in Counseling has issued competencies for counseling transgender clients that include "affirm[ing] transgender mental and medical health care (e.g., hormone therapies, sexual reassignment surgery, safe and trans-positive general medical services) through the entire lifespan."

  Date: Nov. 7, 2011

- **Nondiscrimination: Position Statement**

  The American Counseling Association is committed to nondiscrimination and to the prevention of harassment in all forms—verbal, physical, sexual, emotional, and psychological—including protections for transgender, gender non-conforming, and LGBTQ+ individuals.

  Date: Undated

American Heart Association

About the organization:

The American Heart Association (AHA) is a nonprofit and nonpartisan organization that represents more than 100 million patients with cardiovascular disease (CVD) and includes more than 33 million volunteers and supporters committed to our goal of improving the cardiovascular health of all human beings. As the nation's oldest and largest voluntary organization dedicated to building healthier lives free from cardiovascular disease and stroke, the AHA has long advocated for health equity, access to quality health insurance coverage, and evidence-based medical services and treatment for all individuals.

Statements:

- **AHA Comments on Proposed Rule on Nondiscrimination in Health and Health Education Programs or Activities**

  The AHA opposed the repeal of transgender-specific protections under Section 1557 of the Affordable Care Act noting: "Transgender people also face a high degree of insurance discrimination. Historically, many plans have used transgender-specific exclusions to deny transgender people coverage for medically necessary care—including hormone therapy, mental health counseling, and surgeries—even though the same services are routinely covered for non-transgender individuals. While the 2016 rule resulted in the elimination of transgender-specific exclusions from many private health insurance policies, transgender people continue to face a high number of denials for transition-related care. ...

  This discrimination is not limited to transition-related care and, rather, affects all health care access for transgender people. ... These experiences of health care and health insurance discrimination contribute to significant health disparities. The LGBTQI community faces higher rates of substance use, including tobacco; higher rates of mental health issues; a higher risk of HIV and other sexually transmitted diseases; and a higher risk of certain types of cancer (due in part to reduced access to cancer screening). Relative to heterosexual people, lesbian, gay, and bisexual individuals are more likely to rate their overall and cardiovascular health as poor, have more chronic health conditions, have higher prevalence and earlier onset of disabilities, and have a heightened risk for CVD."

  Date: 2019

American Medical Association

About the organization:

The American Medical Association, the largest association of physicians and medical students in the United States, articulates in H-185.950 that an "established body of medical research" shows both the medical effectiveness and necessity of "mental health care, hormone therapy, and sex reassignment surgery" in treating gender dysphoria. The AMA has resolved "[t]hat our American Medical Association support public and private health insurance coverage for treatment of gender identity disorder as recommended by the patient's physician."

Statements:

- **Clarification of Evidence-Based Gender-Affirming Care**

  The AMA:

  - Recognizes that treatments for gender dysphoria and gender incongruence are medically necessary
  - Will work with stakeholders to advocate for laws and policies that protect access to care, oppose laws and policies that impede the provision of care, support protections against liability for physicians and institutions who provide care and patients who seek it, and communicate about the importance of gender-affirming care
  - Will advocate for coverage of gender-affirming care by public and private health insurer

  Date: 2023

- **AMA opposes effort to allow discrimination against patients**

  "This proposal marks the rare occasion in which a federal agency seeks to remove civil rights protections. It legitimizes unequal treatment of patients by not only providers, health care organizations, and insurers, but also by the government itself—and it will harm patients. Such policy should not be permitted by the U.S. government, let alone proposed by it."

  Date: June 12, 2020

- **AMA statement on U.S. Supreme Court's ruling on Title VII cases**

"As physicians, and as leaders in medicine, we believe that LGBTQ+ individuals must be protected from workplace discrimination in order to prevent negative health outcomes. The AMA supports everyone's access to quality, evidence-based health care regardless of gender or sexual orientation, and will continue to work diligently at the state and federal levels to expand access to medical services, reduce stigma in treating patients with unique needs and break down discriminatory barriers to care."

Date: June 15, 2020

- **Transgender prisoners have fundamental right to appropriate care**

  "Prisoners have a fundamental right to access necessary and effective medical care, and that includes the full range of treatments for gender dysphoria. So argues a strongly worded friend-of-the-court brief filed by the AMA and other medical and mental health professional organizations."

  Date: May 2019

- **Health Insurance Coverage for Gender-Affirming Care of Transgender Patients**

  "The AMA opposes any discrimination based on an individual's sex, sexual orientation or gender identity, opposes the denial of health insurance on the basis of sexual orientation or gender identity, and supports public and private health insurance coverage for treatment of gender dysphoria as recommended by the patient's physician."

  Date: 2019

- **Removing Financial Barriers to Care for Transgender Patients H-185.950**

  "Our AMA supports public and private health insurance coverage for treatment of gender dysphoria as recommended by the patient's physician."

  Date: 2016

American Medical Student Association

About the organization:

The American Medical Student Association is the oldest and largest independent association of physicians-in-training in the United States. Founded in 1950, AMSA is a student-governed, non-profit organization committed to representing the concerns of physicians-in-training.

Statements:

- **AMSA Joins Amicus Brief to Call for VA Support of Surgical Treatment for Transgender Veterans with Gender Dysphoria**

  "AMSA adamantly opposes treatment policies that discriminate against patients based on their sexual orientation and gender identity, or that inhibit their access to quality care. Health care for transgender people should be individualized, holistic, and comprehensive – including, but not limited to surgical treatment– and transgender persons in the military should be allowed to openly undergo gender transition and be eligible for the equitable benefits and rights afforded to cisgendered service personnel, including health care."

  Date: 2017

American Nurses Association

About the organization:

"The American Nurses Association (ANA) is the premier organization representing the interests of the nation's 4 million registered nurses. ANA is at the forefront of improving the quality of health care for all. Founded in 1896, and with members in all 50 states and U.S. territories, ANA is the strongest voice for the profession."

Statements:

- **ANA Comment Letter to HHS on 1557 Revisions**

  The ANA opposed the repeal of transgender-specific protections under Section 1557 of the Affordable Care Act noting: "The proposed rule would substantially alter HHS' current approach to discrimination in health care, removing a number of safeguards built into the 2016 regulations. Among the significant revisions proposed, HHS seeks to eliminate provisions clarifying the health care rights of LGBTQ+ individuals. If

finalized, the rule's definition of sex discrimination under Section 1557 would no longer include discrimination based on gender identity or sex-stereotyping. Additionally, there would be no prohibition to insurance plans denying or limiting health care coverage based on gender identity. Without these protections, providers and payers can deny care to transgender persons and to other LGBTQ+ patients based on sex-stereotyping."

Date: 2019

- **Nursing Advocacy for LGBTQ+ Populations**

  "ANA is committed to the elimination of health disparities and discrimination based on sexual orientation, gender identity, and/or expression within health care. LGBTQ+ populations face significant obstacles accessing care such as stigma, discrimination, inequity in health insurance, and denial of care because of an individual's sexual orientation or gender identity. ...

  ANA condemns any discrimination based on sexual orientation, gender identity, and/or gender expression in access to or provision of health care."

  Date: 2018

- **Amicus Brief to Call for VA Support of Surgical Treatment for Transgender Veterans with Gender Dysphoria**

  ANA joined an amicus brief in Fulcher v. Secretary of Veterans Affairs, which challenged the U.S. Department of Veterans Affairs' refusal to engage in rulemaking to reconsider its ban on providing transgender-related surgery to veterans.

  Date: 2017

American Osteopathic Association

About the organization:

The American Osteopathic Association represents more than 137,000 osteopathic physicians and medical students, promotes public health and serves as the primary certifying body for DOs.

Statements:

- **American Osteopathic Association policy compendium H445-A/15 Gender Identity Non-Discrimination**

  "The American Osteopathic Association supports the provision of adequate and medically necessary treatment for transgender and gender-variant people and opposes discrimination on the basis of gender identity."

  Date: 2015

American Psychiatric Association

About the organization:

The American Psychiatric Association is the world's largest psychiatric organization and publisher of the Diagnostic and Statistical Manual.

Statements:

- **APA Official Actions: Position Statement on Access to Care for Transgender and Gender Variant Individuals**

  Jack Drescher, M.D., Ellen Haller, M.D., APA Caucus of Lesbian, Gay and Bisexual Psychiatrists. Revised 2017 Eric Yarbrough, M.D., APA Caucus of LGBTQ Psychiatrists and the Council on Minority Mental Health and Health Disparities, APA Official Actions: Position Statement on Access to Care for Transgender and Gender Variant Individuals (2018).

  "Significant and long-standing medical and psychiatric literature exists that demonstrates clear benefits of medical and surgical interventions to assist gender variant individuals seeking transition. ... Access to medical care (both medical and surgical) positively impacts the mental health of transgender and gender variant individuals," and states the following:

  1. Recognizes that appropriately evaluated transgender and gender variant individuals can benefit greatly from medical and surgical gender transition treatments.

2. Advocates for removal of barriers to care and supports both public and private health insurance coverage for gender transition treatment.
3. Opposes categorical exclusions of coverage for such medically necessary treatment when prescribed by a physician.
4. Supports evidence-based coverage of all gender-affirming procedures which would help the mental well-being of gender diverse individuals"

Date: 2018

American Psychological Association

About the organization:

The American Psychological Association is the largest association of psychologists worldwide.

Statements:

- **APA Policy Statement on Affirming Evidence-Based Inclusive Care for Transgender, Gender Diverse, and Nonbinary Individuals, Addressing Misinformation, and the Role of Psychological Practice and Science**

  “This policy statement affirms APA’s support for unobstructed access to healthcare and evidence-based clinical care for transgender, gender-diverse, and nonbinary children, adolescents, and adults.

  Furthermore, this policy statement addresses the spread of misleading and unfounded narratives that mischaracterize gender dysphoria and affirming care, likely resulting in further stigmatization, marginalization, and lack of access to psychological and medical supports for transgender, gender-diverse, and nonbinary individuals.”

  Date: February 2024

- **APA adopts resolution opposing biased or coercive efforts to change individuals’ gender identity**

  "The American Psychological Association has adopted a resolution opposing efforts to change people’s gender identity, citing scientific research showing that such actions may be harmful.

The resolution, adopted by APA's governing Council of Representatives on Feb. 26, aligns with the association's stance against similar efforts aimed at changing people's sexual orientation.

"There is a growing body of research that shows that transgender or nonbinary gender identities are normal variations in human expression of gender," said APA President Jennifer F. Kelly, PhD. "Attempts to force people to conform with rigid gender identities can be harmful to their mental health and well-being."

The Resolution on Gender Identity Change Efforts (PDF, 105KB) emphasizes that "individuals who have experienced pressure or coercion to conform to their sex assigned at birth or therapy that was biased toward conformity to one's assigned sex at birth have reported harm resulting from these experiences, such as emotional distress, loss of relationships, and low self-worth."

At the same meeting, the council also adopted an updated Resolution on Sexual Orientation Change Efforts (PDF, 222KB), which reiterates APA's opposition to using nonscientific explanations to frame same-gender and multiple-gender orientations as unhealthy. APA adopted its first resolution discouraging efforts to change people's sexual orientation in 1997 and a second in 2009, when it also issued a task force report with a systematic review of research on the topic. The new resolution now specifically opposes those efforts."

Date: March 2021

- **APA RESOLUTION on Gender Identity Change Efforts**

  "WHEREAS APA opposes discrimination on the basis of gender identity, gender expression, and transgender and gender nonbinary identities, and actively opposes the adoption of discriminatory legislation (APA, 2008) .... BE IT FURTHER RESOLVED that the APA opposes the dissemination of inaccurate information about gender identity, gender expression, and the efficacy of GICE, including the claim that gender identity can be changed through treatment, the characterization of transgender or gender nonbinary identity as a mental disorder and the promotion of treatments that prescribe gender identity or expression consistent with one's birth-assigned sex as effective for clients with gender dysphoria..."

  Date: February 2021

- **APA Comments on Nondiscrimination in Health and Health Education Programs or Activities**

  The APA opposed the repeal of transgender-specific protections under Section 1557 of the Affordable Care Act noting: "We are especially concerned about the discrimination many transgender people experience in the healthcare system

because the proposed rule eliminates the general prohibition of discrimination based on gender identity, as well as specific health insurance coverage protections for transgender people. ...

APA practice guidelines recognize that care for transgender persons can include assessment, psychotherapy or surgery." Even though these treatments may be clinically necessary, providers or insurance plans under the proposed rule may refuse to provide or pay for them. ...

Additionally, after publication of the rule implementing Section 1557, one study showed that over 95% of insurers removed exclusions for gender dysphoria treatments from their 2017 plans, ensuring that a greater number of transgender consumers can have access to treatment. If the proposed rule were implemented, positive gains made in improving transgender health outcomes in recent years would be lost."

Date: 2019

- **Transgender, Gender Identity & Gender Expression Non-Discrimination**

  Anton, B. S., Proceedings of the American Psychological Association for the legislative year 2008: Minutes of the annual meeting of the Council of Representatives. American Psychologist, 64, 372–453 (2009).

  "Therefore be it resolved that APA opposes all public and private discrimination on the basis of actual or perceived gender identity and expression and urges the repeal of discriminatory laws and policies; ...

  Therefore be it further resolved that APA calls upon psychologists in their professional roles to provide appropriate, nondiscriminatory treatment to transgender and gender variant individuals and encourages psychologists to take a leadership role in working against discrimination towards transgender and gender variant individuals; ...

  Therefore be it further resolved that APA supports the provision of adequate and necessary mental and medical health care treatment for transgender and gender variant individuals;

  Therefore be it further resolved that APA recognizes the efficacy, benefit and medical necessity of gender transition treatments for appropriately evaluated individuals and calls upon public and private insurers to cover these medically necessary treatments;

  Therefore be it further resolved that APA supports access to appropriate treatment in institutional settings for people of all gender identities and expressions; including access to appropriate health care services including gender transition therapies; ..."

American Society of Plastic Surgeons

About the organization:

The American Society of Plastic Surgeons (ASPS) is the world's largest organization of board-certified plastic surgeons. Representing more than 7,000 Member Surgeons, the Society is recognized as a leading authority and information source on aesthetic and reconstructive plastic surgery. ASPS comprises more than 94 percent of all board-certified plastic surgeons in the United States. Founded in 1931, the Society represents physicians certified by The American Board of Plastic Surgery or The Royal College of Physicians and Surgeons of Canada. ASPS advances quality care to plastic surgery patients by encouraging high standards of training, ethics, physician practice and research in plastic surgery.

  American Society of Plastic Surgeons to Seema Verma, Comment Letter on Proposed Rule on Medicare Program; Hospital Inpatient Prospective Payment System for Acute Care Hospitals and the Long-Term Care Hospital Prospective Payment System and Proposed Policy Changes and Fiscal Year 2018 Rates (June 13, 2017).

  "We would be remiss to not also ask the Agency to review current policy for breast implant placement for trans females. As we are sure you are aware, in the typical patient, estrogen therapy alone does not result in what would be considered adequate growth of breast tissue. Augmentation procedures are necessary, and should be included as a reimbursable service.

  We would encourage CMS to review the nuances of CPT coding for breast prosthesis, and adjust existing policy that excludes augmentation mammoplasty (CPT 19325) as a covered service for MtF patients undergoing gender confirmation surgery."

  Date: June 13, 2017

Endocrine Society

About the organization:

Founded in 1916, The Endocrine Society is the world's oldest, largest, and most active organization devoted to research on hormones and the clinical practice of endocrinology. They have published clinical guidelines, Endocrine Treatment of Gender-Dysphoric/Gender-Incongruent Persons: An Endocrine Society Clinical Practice Guideline. The Guideline is co-sponsored by the American Association of Clinical Endocrinologists, American Society of Andrology, European Society for Pediatric Endocrinology, European Society of Endocrinology, Pediatric Endocrine Society, and World Professional Association for Transgender Health.

Statements:

- **Transgender Health Position Statement**
    - "There is a durable biological underpinning to gender identity that should be considered in policy determinations.
    - Medical intervention for transgender youth and adults (including puberty suppression, hormone therapy and medically indicated surgery) is effective, relatively safe (when appropriately monitored), and has been established as the standard of care. Federal and private insurers should cover such interventions as prescribed by a physician as well as the appropriate medical screenings that are recommended for all body tissues that a person may have.
    - Increased funding for national pediatric and adult transgender health research programs is needed to close the gaps in knowledge regarding transgender medical care and should be made a priority."

Federation of Pediatric Organizations

About the organization:

The Federation of Pediatric Organizations (FOPO) is an umbrella organization made up of the leadership of the Academic Pediatric Association, the American Academy of Pediatrics, the American Board of Pediatrics, the American Pediatric Society, the Association of Medical School Pediatric Department Chairs, the Association of Pediatric Program Directors, and the Society for Pediatric Research. The purpose of the Federation of Pediatric Organizations (FOPO) is to promote optimal health for children by building on the efforts and expertise of the member organizations, and on the relationships between the member organizations to accomplish shared goals.

Statements:

- **Statement in Support of Transgender Children and Youth, their Families, and Health Care Providers**

  "We stand with pediatricians who partner with families every day to make the best possible decision for each individual child based on available research and evidence pertinent to that child's care. Transgender and gender diverse children and youth deserve to lead safe, healthy lives in environments that allow them to be their

authentic selves. That can only happen if physicians are allowed to treat these children in the same manner, and with the same respect, that we expect them to treat every other child. Our mission to advance child health will succeed only if we work to improve health outcomes for all children."

Date: March 28, 2022

GLMA: Health Professionals Advancing LGBTQ Equality

About the organization:

GLMA is a national organization committed to ensuring health equity for lesbian, gay, bisexual, transgender, queer (LGBTQ) and all sexual and gender minority (SGM) individuals, and equality for LGBTQ/SGM health professionals in their work and learning environments. To achieve this mission, GLMA utilizes the scientific expertise of its diverse multidisciplinary membership to inform and drive advocacy, education, and research.

Statements:

- **GLMA 127-18-101: Transgender Healthcare**

  "Therapeutic treatment, including hormone therapy, mental health therapy and gender affirming surgeries, are medically necessary for the treatment of gender dysphoria. These gender-affirming medical and surgical treatments should be covered by all public and private insurance plans."

National Association of Nurse Practitioners in Women's Health

About the organization:

The National Association of Nurse Practitioners in Women's Health's (NPWH) mission is to ensure the provision of quality primary and specialty healthcare to women of all ages by women's-health and women's-health-focused nurse practitioners.

Statements:

- **Healthcare for Transgender and Gender Non-Conforming Individuals**

  "NPWH encourages all NPs who provide sexual and reproductive healthcare to seek out learning opportunities to improve their ability to provide evidence-based, culturally competent care for transgender and GNC individuals. NPWH supports the role of NPs in providing gender-affirming hormone therapy and pre- and post-gender-affirming surgery care for individuals who desire such treatment."

  Date: Oct. 2017

National Association of Social Workers

About the organization:

Founded in 1955, the National Association of Social Workers (NASW) is the largest membership organization of professional social workers in the world, with more than 120,000 members. NASW works to enhance the professional growth and development of its members, to create and maintain professional standards, and to advance sound social policies.

Statements:

- **Transgender and Gender Identity Issues**

  National Association of Social Workers, Transgender and Gender Identity Issues, in Social Work Speaks: National Association of Social Workers Policy Statements 2009-2012, 347 (8th ed. 2009).

  NASW "supports the rights of all individuals to receive health insurance and other health coverage without discrimination on the basis of gender identity, and specifically without exclusion of services related to transgender or transsexual transition (or sex change), to receive medical and mental health services through their primary care physician and the appropriate referrals to medical specialists, which may include hormone replacement therapy, surgical interventions, prosthetic devices, and other medical procedures."

  Note: the current version can be found in Social Work Speaks: National Association of Social Workers Policy Statements 2018–2020 (11th ed. 2018).

  Date: 2009

National Commission on Correctional Health Care

About the organization:

The mission of the National Commission on Correctional Health Care is to improve the quality of health care in jails, prisons and juvenile confinement facilities. NCCHC establishes standards for health services in correctional facilities, operates a voluntary accreditation program for institutions that meet those standards, produces resource publications, conducts educational conferences and offers certification for correctional health professionals. NCCHC is supported by the major national organizations representing the fields of health, mental health, law and corrections. Each supporting organization has named a liaison to the NCCHC board of directors to create a robust, multidisciplinary governing structure that reflects the complexities of correctional health care.

Statements:

- **Transgender, Transsexual, and Gender Nonconforming Health Care in Correctional Settings**

  "Because jails, prisons, and juvenile confinement facilities have a responsibility to ensure the physical and mental health and well-being of inmates in their custody, correctional health staff should manage transgender patients in a manner that respects their biomedical and psychological needs. The National Commission on Correctional Health Care recommends that the following principles guide correctional health professionals in addressing the needs of transgender patients: ...

  1. Because transgender patients may be under different stages of care prior to incarceration, there should be no blanket administrative or other policies that restrict specific medical treatments. Policies that make treatments available only to those who received them prior to incarceration or that limit transition and/or maintenance are inappropriate and out of step with medical standards and should be avoided. ...
  2. Accepted treatments for gender dysphoria should be made available to people with gender dysphoria. Providing mental health care, while necessary, is not sufficient. ...
  3. When determined to be medically necessary for a particular patient, hormone therapy should be initiated and regular laboratory monitoring should be conducted according to community medical standards.
  4. Sex reassignment surgery should be considered on a case-by-case basis and provided when determined to be medically necessary for a patient."

  Date: 2015

Pediatric Endocrine Society

About the organization:

The Pediatric Endocrine Society (PES) is the leading professional society for this specialty in the United States. The mission of PES is to advance and promote the endocrine health and

well-being of children and adolescents. The PES has over 1,400 members representing the multiple disciplines of Pediatric Endocrinology.

The PES Transgender and Gender Non-Conforming Youth Special Interest Group is dedicated to providing safe, comprehensive and evidence based medical care to transgender and gender nonconforming youth.

Statements:

- **Transgender Health Position Statement**

  "Medical intervention for transgender youth and adults (including puberty suppression, hormone therapy and medically indicated surgery) is effective, relatively safe (when appropriately monitored), and has been established as the standard of care. - **PES Statement Promoting Safety of Transgender Youth**

"The Pediatric Endocrine Society (PES), the leading professional society for this specialty in the United States, strongly opposes the guidance issued on February 22, 2017, by the Departments of Justice and Education, which eliminates protection of the rights of transgender youth."

Date: March 2017

Society for Adolescent Health and Medicine

About the organization:

Founded in 1968, the Society for Adolescent Health and Medicine (SAHM) is a multidisciplinary organization committed to improving the physical and psychosocial health and well-being of all adolescents through advocacy, clinical care, health promotion, health service delivery, professional development and research.

Statements:

- **AAP SAHM Comments on Nondiscrimination in Health and Health Education Programs or Activities**

  SAHM opposed the repeal of transgender-specific protections under Section 1557 of the Affordable Care Act noting: "The proposal would also eliminate the provision that prohibits a health plan from categorically or automatically excluding or limiting coverage for health services related to gender transition. The rollback of these protections could have a devastating impact on access to medically necessary services for youth who identify as TGD [transgender and gender diverse] and adversely affect self-esteem and contribute to the perception that they are undervalued by society and the health care system. Furthermore, insurance denials can reinforce a socioeconomic divide between those who can finance the high costs of uncovered care and those who cannot."

  Date: 2019

World Medical Association

About the organization:

The World Medical Association (WMA) is an international organization representing physicians. The organization was created to ensure the independence of physicians, and to work for the highest possible standards of ethical behavior and care by physicians, at all times. Membership consists of 114 National Medical Associations.

Statements:

- **Statement on Transgender People**

  The WMA recommends, among other things, the following:

  1. "The WMA emphasises that everyone has the right to determine one's own gender and recognises the diversity of possibilities in this respect. The WMA calls for physicians to uphold each individual's right to self-identification with regards to gender.
  2. The WMA asserts that gender incongruence is not in itself a mental disorder; however it can lead to discomfort or distress, which is referred to as gender dysphoria (DSM-5).
  3. The WMA affirms that, in general, any health-related procedure or treatment related to an individual's transgender status, e.g. surgical interventions, hormone therapy or psychotherapy, requires the freely given informed and explicit consent of the patient.
  4. The WMA urges that every effort be made to make individualised, multi-professional, interdisciplinary and affordable transgender healthcare (including speech therapy, hormonal treatment, surgical interventions and mental healthcare) available to all people who experience gender incongruence in order to reduce or to prevent pronounced gender dysphoria. [...]"

  Date: Oct. 2015

World Professional Association for Transgender Health

About the organization:

The World Professional Association for Transgender Health (WPATH) is an international, interdisciplinary, professional association devoted to the understanding and treatment of individuals with Gender Dysphoria (GD). Founded in 1979, and currently with over 1500 medical, mental health, social scientist, and legal professional members, all of whom are engaged in clinical practice and/or research that affects the lives of transgender and transsexual people, WPATH is the oldest professional association in the world that continuously has been concerned with this clinical specialty.

Recognized by the American Medical Association as "leading international, interdisciplinary professional organization devoted to the understanding and treatment of gender identity disorders," WPATH issues the widely followed Standards of Care for the Health of Transsexual, Transgender, and Gender Nonconforming People.

Making a Statement

Positions of Professional Medical Organizations Towards Gender-Affirming Care

Myles N. LaValley, BS, Danielle J. Eble, MD,† William M. Kuzon Jr, MD, PhD,‡ Blair R. Peters, MD,§ Alexander J. Skokan, MD,†‖ Russell E. Ettinger, MD,† and Shane D. Morrison, MD, MS†‖✉*

Objective: Despite politically charged media coverage and legislation surrounding gender-affirming care (GAC), many organizations have released position statements to provide scientifically backed clinical practice standards, combat misinformation, and inform medicolegal policies. The purpose of this study is to objectively assess the availability and the content of the official position statements of relevant medical professional organizations regarding GAC.

Summary Background Data: A list of US medical professional organizations with likely involvement in GAC based on medical or surgical specialties was compiled.

Methods: For included organizations, we evaluated the availability, content, and publication year of positions on GAC through October 2023. When available, formal positions were categorized as supportive or unsupportive.

Results: A total of 314 professional medical organizations were screened for our study based on specialty, relevance to GAC, and issuance of patient guidelines or position statements. Inclusion criteria were met by 55 organizations. Most organizations (35, 63.6%) had formal position statements on GAC. Support for GAC was described in 97.1% (n = 34). Further, 94.2% (n = 33) of available statements explicitly addressed GAC in individuals less than 18 years old and were largely supportive (96.9%, n = 32).

Conclusions: This cross-sectional analysis demonstrates that a majority of multidisciplinary professional medical organizations with relevance to GAC have issued formal position statements on the topic. Available positions were overwhelmingly supportive of individualized access to gender-affirming therapies in adult and adolescent populations. However, silence from some organizations continues to represent a modifiable disparity in the provision of GAC.

Keywords: gender affirmation, position statements, gender affirming surgery

DOI: 10.1097/SLA.0000000000006342

BACKGROUND

Based on the body of available evidence, there is consensus among medical professionals that gender-affirming care is medically necessary and effective.[1] Many organizations have released supportive position statements to provide scientifically backed clinical practice standards, combat misinformation, and inform medicolegal policies.[2,3] Despite this concordance, treatment has become politically charged in both media coverage and legislation advocating for restrictions or criminal penalties on the provision of care.[4] As consequences escalate, US hospitals and physicians now endure increased harassment and targeted threats.[5,6] The purpose of this study is to objectively assess the availability and the content of the official position statements of relevant medical professional organizations regarding gender-affirming care (GAC).

METHODS

A list of US medical professional organizations with likely involvement in GAC based on medical or surgical specialties was compiled. Eligible disciplines included endocrinology, psychiatry, gynecology, urology, otolaryngology, oral and maxillofacial surgery, plastic surgery, pediatrics, and speech-language pathology. Umbrella nursing, medicine, and surgical organizations were also included for overarching context. Organizations meeting inclusion criteria encompassed those focused on specialties involved in GAC that issue position statements or clinical guidelines on any topic within their scope of practice. For included organizations, we evaluated the availability, content, and publication year of positions on GAC through October 2023 using an online search and direct email inquiry. Those with educational materials surrounding GAS without explicitly delineating the organization's stance were also noted. If ambiguities arose, materials were reviewed independently by 2 authors (M.N.L. and D.J.E.). When available, formal positions were categorized as supportive or unsupportive. The largest organizations in each field were identified based on reported membership size. Results were analyzed using Pearson χ^2 tests performed with John Macintosh Project, version 16.0 (SAS Institute Inc., Cary, NC), and a significance level of $P < 0.5$.

RESULTS

A total of 314 professional medical organizations were screened for our study based on specialty, relevance to GAC, and issuance of patient guidelines or position statements (Fig. 1). Inclusion criteria were met by 55 organizations. Most organizations (35, 63.6%) had formal position statements

Case 1:26-cv-12638-WGY Document 19-8 Filed 06/10/26 Page 3 of 3

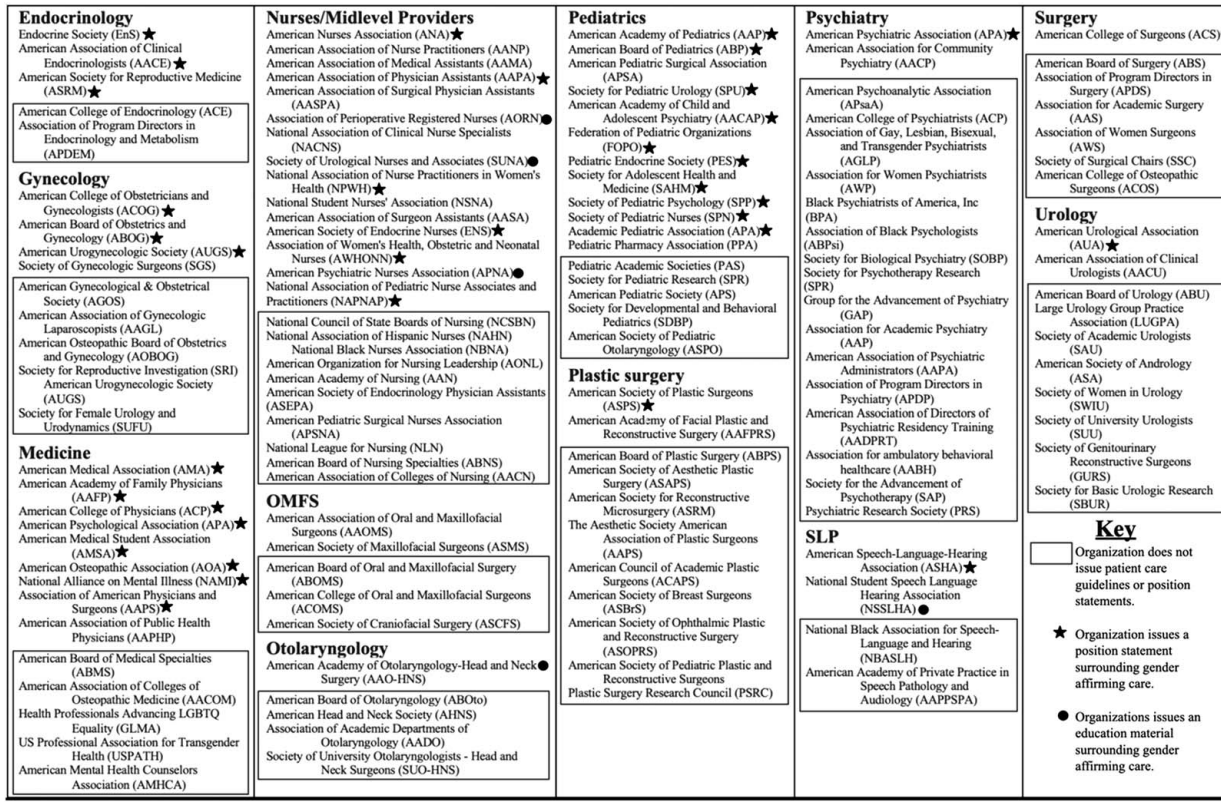

FIGURE 1. Included US medical professional organizations. For each specialty or field, the first organization listed comprises the largest membership size within that field.

on GAC (Supplemental Figure 1, Supplemental Digital Content 1, http://links.lww.com/SLA/F110). An additional 6 (10.9%) organizations provided educational materials without offering a formal position. Available positions were published between 2016 and 2023, with the greatest number issued in 2022 (n = 11, 31.4%). Support for GAC was described in 97.1% (n = 34). Further, 94.2% (n = 33) of available statements explicitly addressed GAC in individuals less than 18 years old and were largely supportive (96.9%, n = 32). There was no statistically significant correlation observed between the issuance of positional statements and organization size ($P = 0.31$) or specialty ($P = 0.18$), but the single largest organization in each field provided a position statement except for the American College of Surgeons (ACS), American Academy of Otolaryngology-Head and Neck Surgery (AAO-HNS), and the American Association of Oral and Maxillofacial Surgeons (AAOMS).

DISCUSSION

This cross-sectional analysis demonstrates that a majority of multidisciplinary professional medical organizations with relevance to GAC have issued formal position statements on the topic. Available positions were overwhelmingly supportive of individualized access to gender-affirming therapies in adult and adolescent populations. However, the most influential bodies representing fields of surgery, otolaryngology, and oral and maxillofacial surgery are silent despite the routine issuance of guidelines on other topics, which may highlight a modifiable disparity in the provision of GAC as consistent medical recommendations provide more reliable standards. Limitations of our study include the potential bias of unblinded organization material review and a limited representation of the varying degrees of statement visibility as well as discrepancies across organization communications or fluctuating dissent among members. Furthermore, we have not captured actions taken in accordance with voiced positions, including opposing anti-trans legislation and condemning provider harassment. Given the risks posed to patient and provider safety, future studies should expound on current statements to further improve their quality and impact on professional guidance.

HIV/AIDS Bureau

Division of State HIV/AIDS Program (DSHAP)

Providing additional funding for HIV/AIDS programs.

Summary

The purpose of the Ryan White HIV/AIDS Program Part B States/Territories Supplemental Grant Program is to provide funding for HIV/AIDS care. Specifically, it adds to formula-based funding provided through the HIV Care Grant Program – RWHAP Part B States/Territories Formula, AIDS Drug Assistance Program (ADAP) Formula, and the ADAP Supplemental Awards Notice of Funding Opportunity (HRSA-22-033).

Funding details

Application types: Competing continuation, New

Expected total available funding in FY 2026: $48,000,000

Expected number and type of awards: 30 grants

Funding range per award: $500,000 to $9,000,000

We plan to fund awards in one 12-month budget period for a total one-year period of performance from September 30, 2026, to September 29, 2027.

The program and awards depend on the appropriation of funds and are subject to change based on the availability and amount of appropriations.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 8 of 51

Eligibility

Who can apply

You can apply if you are a state government, including the District of Columbia, domestic territories, and the Freely Associated States, unless your state/territory had an unobligated balance (UOB) of more than 5% of a prior year's formula funds.

Types of eligible organizations

These types of domestic* organizations may apply:

- State governments

*"Domestic" means the 50 states, the District of Columbia, the Commonwealth of Puerto Rico, the Northern Mariana Islands, American Samoa, Guam, the U.S. Virgin Islands, the Federated States of Micronesia, the Republic of the Marshall Islands, and the Republic of Palau.

Individuals are not eligible applicants under this NOFO.

Completeness and responsiveness criteria

We will review your application to make sure it meets these basic requirements to move forward in the competition.

We will not consider an application that:

- Is from an organization that does not meet all eligibility criteria.
- Requests funding above the award ceiling shown in the funding range.
- Is submitted after the deadline.

Application limits

You may not submit more than one application. If you submit more than one application, we will only accept the last on-time submission.

Cost sharing

Post-award requirements

Before you apply, make sure you understand the requirements that come with an award.

See Step 6: Learn What Happens After Award for information on regulations that apply, reporting, and more.

This program has no cost-sharing requirement. If you choose to share in the costs of the project, we will not consider it during merit review. Recipients agree that once committed, cost sharing amounts are enforceable and subject to reporting and auditing requirements under 2 CFR 200.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 10 of 51

Program description

Purpose

This program provides funding under the Ryan White HIV/AIDS Program (RWHAP) Part B States/Territories Supplemental Grant Program. The purpose of this program is to supplement formula-based funding provided through the HIV Care Grant Program — RWHAP Part B States/Territories Formula, AIDS Drug Assistance Program (ADAP) Formula, and the ADAP Supplemental Awards Notice of Funding Opportunity (HRSA-22-033).

States/territories use this supplemental funding in conjunction with RWHAP Part B HIV Care Grant Program funding to develop or increase access to a comprehensive continuum of high-quality care and treatment services for low-income people with HIV.

Background

The Ryan White HIV/AIDS Program

The Ryan White HIV/AIDS Program (RWHAP) has five statutorily defined parts that provide grants to states, cities, counties, local clinics, and community-based organizations. The grants fund medical care, medication, and essential support services, to meet the needs of people with HIV and family members affected by HIV. Together these grants provide a comprehensive system of care to ensure low-income people with HIV have access to services for early diagnosis of HIV, linkage to care, medically appropriate treatment, retention in care, and sustained viral suppression (a very low or undetectable amount of HIV in the blood).

For nearly four decades, the RWHAP has funded services to provide HIV primary health care, medication, and essential support services, including mental health care, transportation, case management, nutrition, and housing. These services support clients to enter and remain in care, access medications, and reach viral suppression, reducing transmission and lowering health care costs.

Ending the HIV Epidemic

Launched in 2020, the Ending the HIV Epidemic in the U.S. (EHE) initiative further expands federal efforts to reduce HIV transmission. For the RWHAP, the EHE initiative expands the program's ability to meet the needs of clients, specifically focusing on linking people with HIV who are either newly diagnosed, diagnosed but currently not in care, or are diagnosed and in care but not yet virally suppressed, to the essential HIV care, treatment, and support services needed to help them reach viral suppression.

Making America Healthy Again

The Ryan White HIV/AIDS Program helps advance the Making America Healthy Again (MAHA) priorities by:

- **Expanding access to primary care** for people with HIV, particularly those with low incomes, and by Strengthening the health workforce.
- **Fighting the chronic disease epidemic** by providing HIV medical care, treatment, and support services to people with HIV.
- **Supporting improved nutrition** by providing patient-centered focused medical nutrition therapy and food services.
- **Supporting disease prevention** through HIV care and treatment services that help people reach viral suppression, so they live longer, healthier lives and do not transmit HIV.

Key accomplishments

- **Nearly 602,000 people with HIV** in the U.S. received life-saving care, medication, and essential support services through the RWHAP, representing over half of all people diagnosed with HIV in the U.S. This is an increase of nearly 26,000 clients.
- **More than 91%** of Ryan White HIV/AIDS Program patients receiving HIV medical care were virally suppressed in 2024. This is up from 69.5% of patients virally suppressed in 2010 and significantly higher than the 67.2% virally suppressed nationally among all people with diagnosed HIV.
- **More than 47%** of Ryan White HIV/AIDS Program clients are aged 50 years and older, demonstrating the program's success in supporting older clients and its commitment to addressing the unique needs of people aging with HIV.

Program requirements and expectations

Your state/territory should conduct activities to provide core medical and/or support services, as defined in HAB Policy Clarification Notice (PCN) 16-02: RWHAP Services: Eligible Individuals and Allowable Uses of Funds. Your project should address unmet needs among HIV-positive people and improve client-level health outcomes across the HIV care continuum, including viral suppression.

Eligible RWHAP Part B states/territories that are focus areas, or have counties that are focus areas, for the Ending the HIV Epidemic in the U.S. (EHE) initiative should consider if they still need supplemental funding.

As required in section 2620(b) of the Public Health Service (PHS) Act, states/territories must demonstrate the severity of the need for RWHAP Part B supplemental funding, using quantifiable data in one or more of these areas:

- The unmet need for such services, as determined under section 2617(b) of the PHS Act.
- An increasing need for HIV/AIDS-related services, including relative rates of increase in the number of HIV/AIDS cases.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 13 of 51

- The relative rates of increase in the number of HIV/AIDS cases within subpopulations.
- The current prevalence of HIV/AIDS.
- Relevant factors related to the cost and complexity of delivering health care to individuals with HIV/AIDS in the eligible area.
- The impact of comorbid factors, including co-occurring conditions, determined relevant by the Secretary.
- The prevalence of homelessness.
- The prevalence of individuals who were released from federal, state, or local prisons during the past three years and had HIV/AIDS when they were released.
- Factors that limit access to health care, including geographic variation, adequacy of health insurance coverage, and language barriers.
- The impact of a decline in the amount of RWHAP Part B funding received on services available to all individuals with HIV/AIDS identified and eligible under this title.

Statutory authority

42 U.S.C. § 300ff-29a (Title XXVI, § 2620 of the Public Health Service Act)

Award information

Funding policies and limitations

Changes in HHS regulations

As of October 1, 2025, HHS has adopted 2 CFR Part 200, with some modifications included in 2 CFR Part 300. These regulations replace those in 45 CFR Part 75.

Policies

- To make an award, funding must be available and allocated for this program and purpose, at which point we will move forward with the review and award process.
- Have clear policies and good financial practices to avoid spending HRSA funds on unallowable activities. Like other award rules, we may audit your policies, procedures, and controls.
- If we receive more funding for this program, we may:
  - Fund more applicants from the rank order list.
  - Extend the period of performance.
  - Award supplemental funding.

General limitations

- For guidance on some types of costs we do not allow or restrict, see:
  - Project Budget Information in the Application Guide [PDF].
  - 2 CFR Part 200 Subpart E — General Provisions for Selected Items of Cost.
  - Allowable and Unallowable Costs and Activities, in the HHS Grants Policy Statement.
- All costs must be reasonable, necessary, allocable to the award, and adequately documented (2 CFR 200.403).
- You cannot earn profit from the federal award. See 2 CFR § 200.400(g).
- Current appropriations law includes a salary limit of $228,000 as of January 2026 that applies to this program. You may pay salaries at a higher rate if the rate beyond the salary rate limit (Executive Level II) is paid with non-HHS funds. For help calculating salaries under this limit, read more at “salary rate limitation” in the application guide.

Program-specific statutory or regulatory limitations

- Pursuant to section 2620(c) of the PHS Act, the Secretary prioritizes funds to states/territories to address the reduction or disruption of services due to a decline in the amount of formula funding. To determine whether funding has declined, we compare the amount of formula funding received in the current fiscal year (FY) to the amount received in FY 2006.
- If your state/territory has current or potential shortfalls in ADAP resources, you should prioritize using RWHAP Part B supplemental funds to augment ADAP resources if your state/territory has any of these conditions:
  - Existing or anticipated ADAP waiting list.
  - Capped enrollment.
  - Reductions in ADAP formulary.
  - Reduction in the percentage of federal poverty level (FPL) eligibility requirement.
  - Other ADAP restrictions within your state/territory.
- Payor of Last Resort: Charges that are billable to third party payers are unallowable. Third party payers include Medicaid, Children's Health Insurance Programs (CHIP), Medicare (including Medicare Part D), basic health plans, or private insurance, including those purchased through the Health Insurance Marketplace. The RWHAP is the payor of last resort, and recipients must vigorously pursue alternate sources of payments.
  - HRSA expects you to determine eligibility for all clients and to confirm eligibility on a timely basis (please see HAB PCN 21-02).
  - You must coordinate with third-party payers that are ultimately responsible for covering the cost of services provided to eligible or covered people.
- As outlined under applicable statutes, regulation, or policy, you cannot use funds under this notice for the following purposes:
  - Payment for any item or service to the extent that payment has been made, or reasonably can be expected to be made, with respect to that item or service, under any state compensation program, insurance policy, federal or state benefits program, or any entity that provides health services on a prepaid basis (except for a program administered by or providing the services of the Indian Health Service).
  - Cash payment to intended recipients of RWHAP services.
  - International travel.

- Construction (minor alterations and renovations to an existing facility to make it more suitable for the purposes of the award program are allowable with prior HRSA approval).
-
- Development of materials designed to directly promote or encourage intravenous drug use or sexual activity, whether homosexual or heterosexual.
- Pre-Exposure Prophylaxis (PrEP) medications and related medical services or Post-Exposure Prophylaxis (PEP). This is because a person using PrEP or PEP is not diagnosed with HIV and therefore is not eligible for RWHAP-funded medication.

See Manage Your Grant for other information on costs and financial management.

Indirect costs

Indirect costs are costs you charge across more than one project that cannot be easily separated by project. For example, this could include utilities for a building that supports multiple projects.

To charge indirect costs, you can select one of two methods:

Method 1 – Approved rate. You currently have an indirect cost rate approved by your cognizant federal agency at the time of award.

Method 2 – *De minimis* rate. Per 2 CFR § 200.414(f), if you don't have a current negotiated indirect cost rate, you may elect to charge a *de minimis* rate. If you choose this method, costs included in the indirect cost pool must not be charged as direct costs.

This rate is up to 15% of modified total direct costs (MTDC). See 2 CFR § 200.1 for the definition of MTDC. You can use this rate indefinitely for all your federal awards or until you choose to receive a negotiated rate.

Consider your indirect costs when developing your budget.

Program income

Program income is money earned as a result of your award-supported project activities. You must use any program income you generate from awarded funds for approved project-related activities. Find more about program income at 2 CFR 200.307.

Step 2:
Get Ready to Apply

In this step

Get registered	15
Find the application package	15
Application writing help	16

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 18 of 51

Get registered

SAM.gov

You must have an active account with SAM.gov to apply. SAM.gov registration can take several weeks. Begin that process today.

To register:

- Go to SAM.gov Entity Registration and select Get Started. From the same page, you can also select the Entity Registration Checklist for the information you will need to register.
- You must agree to the financial assistance general certifications and representations [PDF] specifically. Those for contracts are different.

When you register, you will also receive your required Unique Entity Identifier (UEI).

Once you register:

- You will have to maintain your registration throughout the life of any award.
- If your organization has multiple UEIs, use the one associated with your physical location.

If you need additional information about user roles in SAM.gov, see “Get registered: SAM.gov user roles” in the application guide.

Grants.gov

You must also have an active account with Grants.gov. You can see step-by-step instructions at the Grants.gov Quick Start Guide for Applicants and How to Apply for Grants.

Find the application package

The application package has all the forms you need to apply. You can find it online. Go to Grants Search at Grants.gov and search for opportunity number HRSA-26-074.

After you select the opportunity, we recommend that you select the Subscribe button to get updates.

Step 3:
Build Your Application

In this step

Application checklist 18
Application contents and format 20

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 21 of 51

Application checklist

There are two types of forms in Grants.gov:

- Some forms allow you to upload components of your application to the form. These include components like your project narrative, budget and budget narrative, and attachments.
- Other forms are more typical, fill-in-the-blank forms.

Make sure that you have everything you need to apply.

Narratives

Component	Grants.gov form	Included in page limit*?
☐ Project narrative	Project Narrative Attachment form.	Yes
☐ Budget narrative	Budget Narrative Attachment form.	Yes

Attachments

Insert each in the Attachments Form in this order.

Component	Included in page limit*?
☐ 1. Staffing plan and job descriptions	Yes
☐ 2. Biographical sketches	No
☐ 3. Project organizational chart	Yes
☐ 4. Tables and charts	No
☐ 5. Core medical services waiver	No
☐ 6. Epidemiological data snapshot	Yes
☐ 7. Unmet need framework and narrative	No
☐ 8-15. Other relevant documents	Yes

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 22 of 51

Other required forms

Upload using each required form in Grants.gov.

Component	Included in page limit*?
☐ Application for Federal Assistance (SF-424)	No
☐ Budget Information for Non-Construction Programs (SF-424A)	No
☐ Project Abstract Summary form	No
☐ Disclosure of Lobbying Activities (SF-LLL), optional	No
☐ Project/Performance Site Location(s)	No
☐ Grants.gov Lobbying form	No
☐ Key Contacts	No

*Only what you attach in these forms counts toward the page limit. The forms themselves do not count.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 23 of 51

Application contents and format

This section includes guidance on each component found in the application checklist.

Application page limit: 60

Submit your information in English and express whole number budget figures using U.S. dollars.

Required format

Required format for project summary, project narrative, budget narrative, and attachments:

Font: A readable font like Arial, Courier, CG Times, or Times New Roman.

File format: We only accept the following document formats:

- .PDF — Adobe Portable Document Format
- .DOC/.DOCX — Microsoft Word
- .RTF — Rich Text Format
- .TXT — Text
- .WPD — Word Perfect Document
- .XLS/.XLSX — Microsoft Excel
- .VSD — Microsoft Visio

Size: 12-point font
Footnotes, charts, graphics, and budget tables may be 10-point or higher.

Ink color: Black

Spacing: Single-spaced, including all text and tables.

Alignment: Left

Headings: Bold all headings and align left.

Size: 8.5 x 11 (Make sure the print area is set and allows printing to 8.5 x 11.)

Margins: 1-inch on all sides.

Footer: On each page as the footer, include your organization's name and page numbers. If a competing continuation or competing supplement, also include your 10-digit award number.

Page numbering:

- Do not number the standard OMB-approved forms.
- Number each attachment page sequentially (that is, 1, 2, 3).
- Reset the numbering for each attachment.
- Treat each attachment as a separate section.

File names: You can find guidance for naming our files in the application guide.

Project narrative

Introduction

See merit review criterion 1: Need.

Briefly describe how you will use RWHAP Part B supplemental funding to support a comprehensive system of high-quality care and treatment for people with HIV.

- Describe how the comprehensive system of care and treatment will improve outcomes across the HIV care continuum.
- Provide a snapshot of epidemiological data as Attachment 6. Describe the current prevalence of HIV/AIDS in your state/territory using data tables or figures. The page limit is 4 pages.

Need

See merit review criterion 1: Need.

Need for HIV-related services, including augmenting ADAP

Explain why you need funds to address issues such as:

- Unmet need.
- An increased need due to an increase in relative rates or prevalence of HIV/AIDS cases.
- A decline in available funding for HIV services, including ADAP.

Note: If you are requesting funds specifically for unmet need, then you must submit an Unmet Need Framework and narrative as **Attachment 7**.

If you are using funds to augment ADAP services, include information on either of the following, if applicable, in a narrative format:

- An existing or anticipated ADAP waiting list.
- Other cost containment measures. These could include capped enrollment, reduction of ADAP formulary, or reduction in the percentage of FPL eligibility requirement.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 25 of 51

Assessment of increases in the number of cases of HIV/AIDS within new or emerging subpopulations

If you are requesting funding to address needs for new or emerging subpopulations with limited access to existing HIV/AIDS care and services, address all the following bullet points. Explain how you will use funds to meet the need. Select six or fewer subpopulations.

- Unique challenges for each subpopulation related to the service delivery system.
- Service gaps for each subpopulation.
- Estimated costs of care for delivering service to each subpopulation.
- Current HIV viral suppression for each subpopulation.

Impact of comorbidities and other factors on the cost and complexity of providing care

If you request funding to address the impact of comorbidities and other factors on the cost and complexity of providing care, include a table as **Attachment 4** that provides quantitative evidence addressing these impacts. Include data sources. In this section, you must include a narrative explaining the data you provided in the table as **Attachment 4**.

You only need to include information on comorbidities and other factors for which you are applying for funding. Where applicable, include the following information in the table:

- Rates of sexually transmitted infections (STIs), including syphilis.
- Rates of hepatitis and tuberculosis.
- Rates of substance use and mental health disorders.
- Estimated number of people who are homeless.
- Estimated number of people with HIV who were released from federal, state, or local correctional facilities (i.e., prisons and jails) in the past three (3) years.
- The number and percent of people without insurance coverage, including those without Medicaid.
- The number and percent of people with HIV living at or below 138% and 400% of the 2026 FPL. Also include information about your FPL requirements for RWHAP eligibility.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 26 of 51

Access to health care

You may use funds to improve access to HIV health care in your state/territory. This includes access based on either:

- Geographic variation.
- Lack of health insurance.

Discuss the factors impacting access to care. Describe how you will use the requested funds to address each factor.

Approach

See merit review criterion 2: Response.

Describe how you will do all the following to address your demonstrated needs:

- Use programmatic and fiscal forecasting tools to meet projected service needs.
- Develop, maintain, streamline, and/or diversify service delivery models, service contracts, strategic partnerships, and/or collaborations.
- Involve clients, families, and communities with and affected by HIV, as appropriate, in planning, implementing, and improving your project.

High-level work plan

See merit review criteria 2: Response and 4: Impact.

In a narrative format, describe the following.

- How funded services will be used for all the following:
  - Promoting access to high-quality HIV care.
  - Addressing gaps in services.
  - Maximizing health outcomes along the HIV care continuum.
- How you will conduct all these activities:
  - Working with internal and external stakeholders, including people with HIV, to plan program activities.
  - Using the HIV care continuum to respond to the needs of people with HIV.
  - Ensuring availability of the same services throughout your jurisdiction.

In a table or outline format, provide goals and objectives that are specific, measurable, achievable, realistic, and time-framed (SMART). Also address all of these:

- The relationship of the goals and objectives to the needs you will use the requested funds to address.
- The core medical and support services you will provide.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 27 of 51

- The HIV care continuum stages tied to the goals and objectives.
- The anticipated outcome measures.

Resolving challenges

See merit review criterion 2: Response.

Discuss any challenges you anticipate in planning and implementing the proposed project. Include all the following:

- Specific challenges related to each identified need area that you are requesting funding for. This could include access to health care or impact of comorbidities.
- Specific activities or strategies you will use to identify risks and mitigate or resolve these challenges.

Performance reporting and evaluation

See merit review criteria 3: Performance reporting and evaluation and 5: Resources and capabilities.

Discuss your evaluation process and describe all the following:

- How you will collect and analyze data and use it for continuous quality improvement.
- The specific staff who will implement your evaluation process for this project.
- The systems (such as software) and other resources that are available to support evaluation efforts.
- How you will share evaluation results internally and externally with key stakeholders, including people with HIV, to improve program implementation and outcomes.
- How you will determine whether the SMART objectives you proposed in your work plan have been achieved.

See the reporting section for more information.

Sustainability

See merit review criterion 4: Impact.

We expect you to sustain key project elements that improve practices and outcomes for the population of focus. Propose a plan to sustain your project after the period of federal funding ends.

- Describe the actions you'll take to obtain future sources of funding.
- Discuss challenges that you'll likely encounter in sustaining the program. Include how you will resolve these challenges.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 28 of 51

Organizational Information

See merit review criterion 5: Resources and capabilities.

- Briefly describe your agency's mission and structure, including personnel and facilities.
- Describe the scope of your current RWHAP activities.
- Explain how your mission, structure, and scope of RWHAP activities will help you carry out the program requirements of this project.
- If you use funds for personnel costs, you must submit all the following as attachments:
  - A staffing plan and job description for key personnel as **Attachment 1**.
  - Biographical sketches of key personnel as **Attachment 2**.
  - A project organizational chart as **Attachment 3**.

Budget and budget narrative

See merit review criterion 6: Support requested.

Your **budget** should follow the instructions in budget narrative: detailed instructions section of the Application Guide and the instructions listed in this section. Your budget should show a well-organized plan.

HHS now uses the definitions for equipment and supply in 2 CFR 200.1. The new definitions change the threshold for equipment to the lesser of the recipient's capitalization level or $10,000 and the threshold for supplies to below that amount.

The total project or program costs are all allowable (direct and indirect) costs used for the HRSA award activity or project. This includes costs charged to the award and non-federal funds used to satisfy a matching or cost-sharing requirement (which may include maintenance of effort, if applicable).

The **budget narrative** supports the information you provide in Standard Form 424-A. It includes an itemized breakdown and a clear justification of the costs you request. The merit review committee reviews both.

As you develop your budget, consider:

- If the costs are reasonable, allowable and allocable, and consistent with your project's purpose and activities.
- The restrictions on spending funds. See funding policies and limitations.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 29 of 51

In addition, you must:

- Submit a separate line-item budget using Section B Object Class Categories of the SF-424A. The program budget categories for the line-item budget include:
  - **Administration:** Include all funds allocated to recipient administration, planning and evaluation, and clinical quality management.
  - **ADAP:** Include all funds allocated to ADAP activities.
  - **Consortia:** Include all funds allocated to consortia.
  - **Direct services:** Include all funds allocated to state direct services, home- and community-based care, and health insurance premium and cost-sharing assistance.
- Consider the following caps on expenses:
  - Administrative costs may not exceed 10% of the total grant award.
  - Planning and evaluation costs may not exceed 10% of the total grant award.
  - Together, administration and planning and evaluation may not exceed 15% of the total award. For further guidance on the treatment of costs under the 10% administrative limit, refer to HAB PCN 15-01 Treatment of Costs under the 10% Administrative Cap for Ryan White HIV/AIDS Program Part A, B, C, and D [PDF].
- Fulfill the Core Medical Services Requirement. RWHAP Part B supplemental funding is subject to Section 2612(b)(1) of the PHS Act. This act requires that after you have reserved funding for administration, planning and evaluation, and clinical quality management, you must use at least 75% of the remaining funds to provide core medical services that are needed in the state/territory for people with HIV who are eligible under RWHAP. The core medical and support service category definition for this award can be found in HRSA HAB Policy Clarification Notice (PCN) 16-02: RWHAP Services: Eligible Individuals and Allowable Use of Funds [PDF].
  - If you are seeking a waiver for this requirement, you must submit a waiver request. You can do this either before applying, with this application (as Attachment 5, Core Medical Services Waiver), or up to four months into the award period. Submission must be in accordance with HAB Policy Notice (PN) 21-01 Waiver of the RWHAP Core Medical Services Expenditures Requirement [PDF].

To create your budget narrative, see budget narrative detailed instructions in the Application Guide [PDF].

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 30 of 51

Attachments

Place your attachments in this order in the Attachments Form. See application checklist to determine if they count toward the page limit.

Unless the instructions below require it, do not submit organizational brochures or other promotional materials (for example, slides, films, clips).

Attachment 1: Staffing plan and job descriptions

Provide a staffing plan and job descriptions for all key personnel included in the budget.

Limit each job description to one page. Include the role, responsibilities, and qualifications of the proposed project staff.

If your program will not use RWHAP Part B supplemental funding for staffing, attach a one-page document that says, “Attachment 1: Not Applicable.”

Attachment 2: Biographical sketches

Provide biographical sketches of all key personnel included in the budget.

If your program will **not** use RWHAP Part B supplemental funding for staffing, provide a one-page document that says, “Attachment 2: Not Applicable.”

Note: Each biographical sketch should be no more than two pages. Do not include non-public, personally identifiable information. If you include someone you have not hired yet, provide a letter of commitment from that person along with the biographical sketch.

Attachment 3: Project organizational chart

Provide a one-page project organizational chart highlighting the key personnel included in the budget.

If your program will **not** use RWHAP Part B supplemental funding for staffing, provide a one-page document that says, “Attachment 3: Not Applicable.”

Attachment 4: Tables and charts

Provide the cost and complexity comorbidities table and narrative. See the full description of the comorbidities table in the need section of the project narrative.

If your program will **not** use RWHAP Part B supplemental funding due to the impact of comorbidities in the state/territory, provide a one-page document that says, “Attachment 4: Not Applicable.”

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 31 of 51

Attachment 5: Core medical services waiver (if applicable)

You may provide a Core Medical Services Waiver request and supporting documents as Attachment 5.

If you are **not** applying for a waiver now, provide a one-page document that says, “Attachment 5: Not Applicable.”

Attachment 6: Epidemiological data snapshot

This attachment is required for all applicants.

Page limit: 4 pages

Provide data tables or figures, as described in the introduction section of the project narrative, using the most recent available epidemiological data.

Attachment 7: Unmet need framework

If you are applying for RWHAP Part B supplemental funding due to unmet need, provide the Unmet Need Framework and narrative.

If your program will **not** use RWHAP Part B supplemental funding due to unmet need, provide a one-page document that says, “Attachment 7: Not Applicable.”

Attachment 8-15: Other relevant documents

Provide any other documents that are relevant to the application. If you include letters of support, they must be dated and indicate specific commitment to the project, like in-kind services, dollars, staff, space, or equipment.

If you do **not** have any other relevant documents, provide a one-page document that says, “Attachments 8-15: Not Applicable.”

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 32 of 51

Other required forms

You will need to complete some other forms. Upload the following forms at Grants.gov. You can find them in the NOFO application package or review them and any available instructions at Grants.gov Forms.

Forms	Submission Requirement
Application for Federal Assistance (SF-424)	With application.
Project Abstract Summary form	With application.
Grants.gov Lobbying form	With application.
Project/Performance Site Location(s)	With application.
Budget Information for Non-Construction Programs (SF-424A)	With application.
Key Contacts	With application.

Form instructions

The application guide [PDF] has detailed instructions for:

- The Application for Federal Assistance (SF-424).
- The Budget Information for Non-Construction Programs (SF-424A).

Project abstract summary form instructions

Complete the information in the Project Abstract Summary form. Include a short description of your proposed project. Include the needs you plan to address, the proposed services, and the population groups you plan to serve. For more information, see Section 3.1.2 of the Application Guide [PDF].

In this section, also describe all the following:

- Why you need RWHAP Part B supplemental funding to ensure comprehensive HIV care and treatment for people with HIV in your state/territory.
- How this supplemental funding will improve viral suppression and improve client health outcomes across the HIV care continuum.
- The severity of the HIV epidemic in your state/territory, using quantifiable data on:
  - Epidemiology.
  - Comorbidities.
  - Cost of care.
  - Service needs of emerging subpopulations.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 33 of 51

- Unmet need for core medical services (as defined by HAB PCN 16-02 Ryan White HIV/AIDS Program Services: Eligible Individuals and Allowable Use of Funds [PDF]).
- Unique service delivery challenges.

Important: public information

When filling out your SF-424 form, pay attention to Box 15: Descriptive Title of Applicant's Project.

We share what you put there with USAspending. This is where the public goes to learn how the federal government spends their money.

Instead of just a title, insert a short description of your project and what it will do.

See instructions and examples [PDF].

Step 4: Understand Review, Selection, and Award

In this step

Application review	32
Selection process	35
Award notices	36

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 35 of 51

Application review

Initial review

We will review your application to make sure that it meets eligibility criteria, including the completeness and responsiveness criteria. If your application does not meet these criteria, we will not fund it. If this is the case, we will notify your authorized official.

We will not review any pages that exceed the page limit.

Merit review

A panel reviews all applications that pass the initial review. You can find more about the merit review process in the application guide. The members use these criteria.

Criterion	Total number of points = 100
1. Need	45 points
2. Response	20 points
3. Performance reporting and evaluation	10 points
4. Impact	10 points
5. Resources and capabilities	5 points
6. Support requested	10 points

Criterion 1: Need (45 points)

See the project narrative Introduction and Need sections.

The panel will review your application for how well it does the following.

- **Comprehensive system of care and treatment (10 points) —** Details how your state/territory will use RWHAP Part B supplemental funding to support a comprehensive system of high-quality care and treatment for people with HIV and improve outcomes across the HIV care continuum.
- **Data supporting need (15 points) —** Includes data that supports the described need.
- **Severity of need (20 points) —** Demonstrates need and the relative severity of that need for the areas for which you are requesting funding. This includes all the information requested in the need section of the project narrative and its subsections.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 36 of 51

Criterion 2: Response (20 points)

See the project narrative Approach, High-level work plan, and Resolving challenges sections.

The panel will review your application for how well it:

- Proposes strong, appropriate goals, objectives, outcome measures, and activities that relate well to the program's purpose.
- Shows how you will engage stakeholders, including people with HIV, in planning, implementing, and improving your project.
- Details challenges likely to be encountered, and how you will resolve them and address possible risks.

Criterion 3: Performance reporting and evaluation (10 points)

See the project narrative Performance reporting and evaluation section.

The panel will review your application for the following.

Evaluation

- The appropriateness of your methods to collect, analyze, and use data to develop and carry out the project.
- The effectiveness of available resources (such as staff or software) to carry out the evaluation.
- The suitability of plans to share project evaluation results with stakeholders, including people with HIV.

Performance measurement

- Evidence that the measures you selected will assess whether you have met project goals and objectives, and to what extent the results can be attributed to the project.

Criterion 4: Impact (10 points)

See the project narrative High-level work plan and Sustainability sections.

The panel will review your application for:

- How effective the proposed project is in potentially improving the stages of the HIV care continuum. This includes your goals, objectives, outcome measures, and activities.

- How strong the project is in addressing gaps in service. This includes addressing unmet needs due to lack of funds, improving health outcomes, reducing the number of people out of care, and working toward ending the HIV epidemic.
- The strength of the proposed plan to sustain key elements of the project beyond the performance period.

Criterion 5: Resources and capabilities (5 points)

See the project narrative Organizational information and Performance reporting and evaluation sections.

The panel will review your application to determine the extent to which:

- Your agency can fulfill the needs of the proposed project.
- The project staff funded by this award (if any) have the experience necessary to carry out the project.

Criterion 6: Support requested (10 points)

See the Budget and budget narrative section.

The panel will review your application to determine:

- How reasonable costs support the objectives described in the application.
- How reasonable costs are and how well they align with the project's scope.

We do not consider **voluntary** cost sharing during merit review.

We review your application based on its technical merit.

Risk review

Before making an award, we review your award history to assess risk. We need to ensure all prior awards were managed well and demonstrated sound business practices. We:

- Review any applicable past performance.
- Review audit reports and findings.
- Analyze the budget.
- Assess your management systems.
- Ensure you continue to be eligible.
- Make sure you comply with any public policies.

We may ask you to submit additional information.

As part of this review, we use SAM.gov Entity Information Responsibility/Qualification to check your history for all awards likely to be more than $250,000 over the period of

performance. You can comment on your organization's information in SAM.gov. We'll consider your comments before making a decision about your level of risk.

If we find a significant risk, we may choose not to fund your application or to place specific conditions on the award.

For more details, see 2 CFR 200.206.

Selection process

When making funding decisions, we consider:

- The amount of available funds.
- Assessed risk.
- Alignment with HRSA Mission and Strategic Priorities
- Merit review results. These are key in making decisions but are not the only factor.
- The larger portfolio of HRSA-funded projects, including project type and geographic distribution.
- The funding priorities, funding preferences, and special considerations listed.

You cannot appeal a denial, or the amount of funds awarded" which comes above funding priorities: "Additionally, we may not make an award if you are delinquent on two or more Single Audit Report.

Funding preferences

Priority funding

Qualifications to meet the funding preferences:

Qualification 1: RWHAP Part B base formula award decreased by greater than 10% between FY 2006 and FY 2026.

You can request funding preference if:

Section 2620(c) of the PHS Act directs the Secretary to provide funds to states/territories to address the decline or disruption of services related to the decline in the amount of formula funding. We set aside a portion of the RWHAP Part B supplemental funding to award priority funds in conformance with this statutory requirement.

You will be granted priority funding if your RWHAP Part B base formula award decreased by more than 10% between FY 2006 and FY 2026. If you are determined eligible for priority funding, we will calculate the additional amount to be awarded and include that amount in the final award.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 39 of 51

Award notices

We issue Notices of Award (NOA) on or around the start date listed in the NOFO. See How we make awards in the Application Guide [PDF] for more information.

By drawing down funds, you accept the terms and conditions of the award.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 40 of 51

Step 5:
Submit Your Application

In this step

Application submission and deadlines 38
Other submissions 38

Application submission and deadlines

Your organization's authorized official must certify your application. See the section on finding the application package to make sure you have everything you need.

Application deadline

You must submit your application by Friday, July 10, 2026, at 11:59 p.m. ET.

Grants.gov creates a date and time record when it receives applications.

If you need a deadline extension, see "requesting a waiver" in the application guide.

Submission method

Grants.gov

You must submit your application through Grants.gov. You may do so using Grants.gov Workspace. This is the preferred method. For alternative online methods, see Applicant System-to-System.

For instructions on how to submit in Grants.gov, see the Quick Start Guide for Applicants. Make sure that your application passes the Grants.gov validation checks, or we may not get it. Do not encrypt, zip, or password protect any files.

If Grants.gov rejects your application due to errors, you must correct and resubmit before the deadline.

If you want to know more about correcting errors or tracking your application, you can refer to the application guide.

Have questions? Go to Contacts and Support.

Other submissions

Intergovernmental review

This NOFO is not subject to Executive Order 12372, Intergovernmental Review of Federal Programs. No action is needed.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 42 of 51

Step 6: Learn What Happens After Award

In this step

Post-award requirements and administration 40

Reporting 42

Post-award requirements and administration

Administrative and national policy requirements

There are important rules you need to know if you get an award. You must follow:

- All terms and conditions in the Notice of Award (NOA). We incorporate this NOFO by reference.
- The regulations at 2 CFR Part 200, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, modifications at 2 CFR Part 300, and any superseding regulations.
- The HHS Grants Policy Statement. Your NOA will reference this document. If there are any exceptions to the GPS, they'll be listed in your NOA.
- All federal statutes and regulations relevant to federal financial assistance, including those highlighted in HHS Administrative and National Policy Requirements [PDF].
- The requirements for performance reporting and evaluation in 2 CFR 200.301.
- All anti-discrimination laws: By applying for or accepting federal funds from HHS, you certify compliance with all federal antidiscrimination laws and these requirements. Complying with those laws is a material condition of receiving federal funding streams. You are responsible for ensuring subrecipients, contractors, and partners also comply.

Required Alignment with Health Resources and Services Administration (HRSA) Mission and Strategic Priorities

Recipients must use funds awarded under this NOFO to implement program goals or agency priorities in accordance with the HRSA vision, mission, core values, and strategic priorities, where authorized by law.

In administering programs under this and all funding announcements, HRSA prioritizes:

- **Evidence-based healthcare:** Funding activities supported by rigorous scientific evidence, particularly for programs serving children and adolescents, where HRSA is committed to approaches that reflect the highest standards of clinical care and child safety.
- **Biological and physiological integrity:** Recognizing the relevance of biological sex to health outcomes, HRSA encourages applicants to account for sex-based health factors

in program design, data collection, and service delivery where scientifically appropriate.

HRSA will implement these priorities consistent with applicable laws, regulations, court orders, and all required administrative procedures. Applicants are encouraged to describe how their proposed programs align with these priorities in their project narratives.

Funded activities must advance HRSA's vision of protecting and improving the health and well-being of Americans. The particular focus is on those who are medically vulnerable or live in areas with limited access to care. HRSA's duty is to serve wisely, effectively, and with measurable results that justify every taxpayer dollar invested.

Consistent with HRSA's priorities, in carrying out any project funded under this NOFO, the recipient must adhere to the following principles, where they are consistent with the authority and scope of the award and its activities:

- **Gold standard science:** Design and deliver services using gold standard evidence-based and evidence-informed approaches, establish measurable performance goals, and use data to monitor outcomes and drive continuous improvement.
- **Program integrity and fiscal stewardship:** Recipients must:
    - Administer funds in accordance with all applicable federal statutes, regulations, and award conditions.
    - Maintain strong internal controls.
    - Prevent waste, fraud, and abuse.
- **Partnership and local leadership:** Coordinate with state, tribal, territorial, local, and community partners, as appropriate, and tailor services to meet community-identified needs while respecting local decision-making authority.

Recipients must manage any project awarded under this NOFO in accordance with the following objectives in programs authorized to advance them:

- **Make America Healthy Again (MAHA):** While ensuring access to high-quality, affordable physical and mental health care, HRSA prioritizes the health and well-being of all Americans by supporting common-sense, evidence-based health policies that promote:
    - Personal responsibility.
    - Strong families and communities.
    - Proper nutrition.
    - The prevention and management of chronic disease.
- **Child protections, biological integrity, parental rights, and lawful use of funds:** HRSA prioritizes safeguarding children's health and safety by:
    - Not supporting medical interventions for gender dysphoria in minors that lack a

strong evidence base.

- Applying sex-based definitions grounded in biological reality.
- Supporting parental authority, transparency, and choice in education, including school-based health centers that respect parental rights and religious upbringing.
- Ensuring taxpayer funds do not promote or support elective abortions, consistent with federal law and the Hyde Amendment.

- **Advancing evidence-based, merit-driven, and ethically grounded health care**: HRSA will prioritize unbiased, transparent science; merit-based workforce opportunities; and programs that demonstrate measurable outcomes. HRSA will deprioritize organizations with:
  - Conflicts of interest.
  - "Harm reduction" models.
  - Housing-first approaches.
  - Activities that facilitate illegal drug use or unsafe medical practices.
- **Promoting public safety, lawful use of federal funds, and national health priorities:** To the extent permitted by law, HRSA will align funding with administration priorities by:
  - Supporting ending the HIV epidemic through authorized, evidence-based care.
  - Reserving benefits for eligible individuals.
  - Discouraging illegal immigration and unsafe community practices.
  - Prioritizing recipients that enforce public safety, address serious mental illness and substance use through treatment and recovery, and reduce homelessness responsibly.

To the extent allowable by law, under awards, HRSA will give priority to states and municipalities for programs to:

- Enforce prohibitions on open illicit drug use.
- Enforce prohibitions on urban camping and loitering.
- Enforce prohibitions on urban squatting.
- Enforce, and where necessary, adopt, standards that address individuals who are a danger to themselves or others and suffer from serious mental illness or substance use disorder, or who are living on the streets and cannot care for themselves. The approach must be through assisted outpatient treatment or by moving them into treatment centers or other appropriate facilities through civil commitment or other available means, to the maximum extent permitted by law.

HRSA will implement these priorities consistent with applicable laws, regulations, court orders, and any required procedures.

The recipient must demonstrate ongoing compliance with these priorities, in all programs that are authorized to advance them, through program design, implementation, reporting, and evaluation.

Failure to meaningfully align funded activities with the applicable requirements may result in corrective action, additional reporting requirements, or other actions consistent with federal grant regulations at 2 CFR. part 200 and the terms and conditions of this award. This includes termination under CFR. 200.340(a)(4) if an award no longer effectuates the program goals or agency priorities.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 47 of 51

Cybersecurity

- If awarded, you must develop plans and procedures, modeled after the NIST Cybersecurity framework, to protect HHS systems and data.

Successful applicants under this NOFO agree that:

Where award funding involves:	Recipients and subrecipients are required to:
Implementing, acquiring, or upgrading health IT for activities funded by any entity.	Use health IT that meets standards and implementation specifications adopted in 45 CFR 170, Subpart B, if such standards and implementation specifications can support the activity. Visit 45 CFR 170, Subpart B to learn more.
Implementing, acquiring, or upgrading health IT for activities by eligible clinicians in ambulatory settings, or hospitals, eligible under Sections 4101, 4102, and 4201 of the HITECH Act.	Use health IT certified under the ONC Health IT Certification Program if certified technology can support the activity. Visit Certification of Health IT to learn more.

If standards and implementation specifications adopted in 45 CFR part 170, Subpart B cannot support the activity, recipients and subrecipients are encouraged to use health IT that meets non-proprietary standards and implementation specifications developed by consensus-based standards development organizations. This may include standards identified in the ONC Interoperability Standards Advisory.

Case 1:26-cv-12638-WGY Document 19-9 Filed 06/10/26 Page 48 of 51

Reporting

If you are funded, you will have to follow the reporting requirements in the reporting section of the Application Guide [PDF]. The NOA will provide specific details.

You must also follow these program-specific reporting requirements:

- Progress reports at the end of the period of performance.
- Annual performance reports.
- NOFO-specific reporting requirements:
  - **Federal Financial Report (SF-425).** You must account for your expenditures under the project for the year. We will provide more specific information in the notice of award (NoA). You can also see Reporting Requirements on HRSA's website.
  - **Program Terms Report (PTR).** You must submit a program terms report, which will be described in the NoA.
  - **RWHAP Services Report (RSR).** You must comply with the RSR data requirements and make sure your subrecipients also comply. The RSR captures information to show program performance and accountability.
    - All RWHAP core medical service and support service providers must submit client-level data, as instructed in the RSR manual.
    - We will provide further information in the NoA. You can also refer to the HIV/AIDS Program Client-Level Data website for additional information.
  - **ADAP Data Report (ADR).** If you spend any of the RWHAP Part B supplemental award on ADAP, you must comply with ADR data reporting requirements. You must also make sure your subrecipients comply. We will provide further information in the NoA. You can also refer to the HIV/AIDS Program ADAP Data Report website for additional information.

Before you begin

If you believe you are a good candidate for this funding opportunity, secure your SAM.gov and Grants.gov registrations now. If you are already registered, make sure your registrations are active and up-to-date.

SAM.gov registration (this can take several weeks)

You must have an active account with SAM.gov. This includes having a Unique Entity Identifier (UEI).

See Step 2: Get Ready to Apply

Grants.gov registration (this can take several days)

You must have an active Grants.gov registration. Doing so requires a Login.gov registration as well.

See Step 2: Get Ready to Apply

Apply by the application due date

Applications are due by 11:59 p.m. Eastern Time on 07/08/2026.

To help you find what you need, this NOFO uses internal links. In Adobe Reader, you can go back to where you were by pressing Alt + Left Arrow (Windows) or Command + Left Arrow (Mac) on your keyboard.

All activities proposed in your application and budget narrative must align with applicable law, including but not limited to statutes, executive orders, federal regulations and applicable judicial holdings. Accordingly, discretionary awards shall not be used to fund, promote, encourage, subsidize, or facilitate racial preferences or other forms of racial discrimination by the recipient, including activities where race or intentional proxies for race will be used as a selection criterion for employment or program participation; denial by the recipient of the sex binary in humans, or the belief that sex is a chosen or mutable characteristic; illegal immigration; or any other initiatives that compromise public safety. If an application does not align, the application will not receive funding to the extent permitted by law and applicable court orders.

HIV/AIDS Bureau

Strengthening the capacity of community-based organizations to improve health outcomes and reduce HIV transmission, especially for people not yet in regular HIV care.

Summary

The Ryan White HIV/AIDS Program (RWHAP) provides a comprehensive system of HIV care that improves health outcomes and supports HIV viral suppression.

The purpose of the RWHAP Part C Capacity Development Program is to strengthen the capacity of community-based organizations to improve health outcomes and reduce HIV transmission, especially for people not yet in regular HIV care. The focus of this Part C program is on infrastructure.

This capacity development funding offers a one-year opportunity to carry out one short-term activity in FY 2026.

Funding details

Application types: New

Expected total available funding in FY26: $9,000,000

Expected number and type of awards: 60 G (Grants)

Funding range per award: Up to $150,000

We plan to fund awards in one 12-month budget period for a total one-year period of performance from 09/01/2026 to 08/31/2027.

The program and awards depend on the appropriation of funds and are subject to change based on the availability and amount of appropriations.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 7 of 51

Eligibility

You can apply if your organization is in the United States.

Types of eligible organizations

These types of domestic organizations may apply:

- State governments.
- County governments.
- City or township governments.
- Special district governments.
- Public and State controlled institutions of higher education.
- Native American tribal governments (Federally recognized).
- Native American tribal organizations (other than Federally recognized tribal governments).
- Nonprofits having a 501(c)(3) status with the IRS, other than institutions of higher education.
- Nonprofits without 501(c)(3) status with the IRS, other than institutions of higher education.
- Private institutions of higher education.

Additional information on eligibility

Individuals are not eligible applicants under this NOFO.

Completeness and responsiveness criteria

We will review your application to make sure it meets these basic requirements to move forward in the competition.

We will not consider an application that:

- Is from an organization that does not meet all eligibility criteria.
- Requests funding above the award ceiling shown in the funding range.
- Is submitted after the deadline.
- Does not propose one of the three activities listed as described in the Program Requirements and Expectations section. The three available activities in this announcement are: 1. Electronic Health Record and Data Integration, 2. Telehealth, or 3. Office dental equipment for expanding service capacity.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 8 of 51

Application limits

You may not submit more than one application. If you submit more than one application, we will only accept the last on-time submission.

Cost sharing

This program has no cost-sharing requirement. If you choose to share in the costs of the project, we will not consider it during merit review. Recipients agree that once committed, cost sharing amounts are enforceable and subject to reporting and auditing requirements under 2 CFR 200.

Post-award requirements

Before you apply, make sure you understand the requirements that come with an award.

See Step 6: Learn What Happens After Award for information on regulations that apply, reporting, and more.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 9 of 51

Program description

Purpose

This one-year capacity development funding opportunity is intended to strengthen organizational capacity to develop, enhance, or expand access to high quality HIV care and treatment for low-income people with HIV, especially for people not yet in regular HIV care.

HRSA intends to fund one short-term activity under this program that can be completed by the end of the one-year period of performance.

Goal alignment

Proposed projects must:

- Align with program goals.
- Address unmet needs or gaps in care for people with HIV.
- Establish activities that represent a meaningful addition to your existing program.
- Support improved health outcomes for people with HIV.

For additional information, please refer to Policy Clarification Notice (PCN) 16-02 for a list of RWHAP allowable services and use of funds.

For more details, see Program requirements and expectations.

Background

The Ryan White HIV/AIDS Program

The Ryan White HIV/AIDS Program (RWHAP) has five statutorily defined Parts that provide grants to states, cities, counties, local clinics, and community-based organizations. The grants fund medical care, medication, and essential support services, to meet the needs of people with HIV and family members affected by HIV. Together these grants provide a comprehensive system of care to ensure low-income people with HIV have access to services for early diagnosis of HIV, linkage to care, medically appropriate treatment, retention in care, and sustained viral suppression (a very low or undetectable amount of HIV in the blood).

For nearly four decades, the RWHAP has funded services to provide HIV primary health care, medication, and essential support services, including mental health care, transportation, case management, nutrition, and housing. These services support

clients to enter and remain in care, access medications, and reach viral suppression, reducing transmission and lowering health care costs.

Ending the HIV Epidemic

Launched in 2020, the Ending the HIV Epidemic in the U.S. (EHE) initiative further expands federal efforts to reduce HIV transmission. For the RWHAP, the EHE initiative expands the program's ability to meet the needs of clients, specifically focusing on linking people with HIV who are either newly diagnosed, diagnosed but currently not in care, or are diagnosed and in care but not yet virally suppressed, to the essential HIV care, treatment, and support services needed to help them reach viral suppression.

Making America Healthy Again

The Ryan White HIV/AIDS Program helps advance the Making America Healthy Again (MAHA) priorities by:

- **Expanding access to primary care** for people with HIV, particularly those with low incomes, and by strengthening the health workforce.
- **Fighting the chronic disease epidemic** by providing HIV medical care, treatment, and support services to people with HIV.
- **Supporting improved nutrition** by providing patient-centered focused medical nutrition therapy and food services.
- **Supporting disease prevention** through HIV care and treatment services that help people reach viral suppression so they live longer, healthier lives and do not transmit HIV.

Key accomplishments

- **Nearly 602,000 people with HIV** in the U.S. received life-saving care, medication, and essential support services through the RWHAP, representing over half of all diagnosed with HIV in the U.S. This is an increase of nearly 26,000 clients.
- **More than 91%** of Ryan White HIV/AIDS Program patients receiving HIV medical care were virally suppressed in 2024. This is up from 69.5% of patients virally suppressed in 2010 and significantly higher than the 67.2% virally suppressed nationally among all people with diagnosed HIV.
- **More than 47%** of Ryan White HIV/AIDS Program clients are aged 50 years and older, demonstrating the program's success in supporting older clients and its commitment to addressing the unique needs of people aging with HIV.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 11 of 51

Program requirements and expectations

You must show:

- That the proposed activity will strengthen organizational capacity.
- Your organization's intent and ability to maintain services, activities or equipment that were either purchased by, or are a direct result of, this federal award.
- Coordinating with other relevant HHS and HRSA providers to avoid duplicating efforts.

You must select only one activity.

You may submit a proposal for only **one** activity from the list of activities below. Do not submit a proposal that includes more than one activity.

The goal of these activities is to enhance an organization's infrastructure to better serve people with HIV.

- **Activity 1:** Electronic Health Record and Data Coordination
- **Activity 2:** Telehealth
- **Activity 3:** Dental equipment for expanding dental service capacity

Brief summaries of each activity

Activity 1: Electronic Health Record and Data Coordination

Improving how Electronic Health Records (EHR) connect with HIV data systems helps reduce duplicate data entry, increases the accuracy of data collection and reporting, and improves care coordination and tracking of referrals.

If you select this activity, funding may be used to purchase software to interface CAREWare (or other HIV data collection systems) with an existing EHR system.

Activities can include:

- Improving the accuracy and efficiency of data collection.
- Creating workflows to reduce administrative burden.
- Verifying and cleaning data.
- Testing historical and new data.
- Integrating oral health and primary care EHR systems.
- Securing consultant services for system integration and coordination.
- Enhancing interoperability to streamline RWHAP eligibility across Parts using existing data sources (e.g., Medicaid, health information exchanges, or marketplace records).

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 12 of 51

All activities must be used to enhance or expand an existing EHR system to improve the:

- Quality.
- Pharmacological safety.
- Efficiency.

Funds cannot be used to purchase a brand-new EHR system. Any component purchased with federal funds must meet certification requirements set by the Assistant Secretary for Technology Policy and be configured to report clinical data electronically for HRSA reporting. More information is available at HealthIT.gov.

Activity 2: Telehealth

Telehealth improves access to care. It does this by reducing or eliminating the time needed to travel to and from appointments, and by lessening other social barriers such as caregiving responsibilities and lack of transportation that can cause people to miss their appointments.

Telehealth allows care delivery across any distance, expanding access to quality primary health.

If you select this activity, you must develop and acquire, through lease or purchase:

- Computer hardware and software.
- Audio and video equipment.
- Computer network equipment.
- Interactive equipment.
- Data terminal equipment.
- Other equipment that furthers the objectives of the proposed telehealth activity.

You must describe technology requirements and each type of equipment to be employed.

Include a concise description of the equipment's:

- Relevance to the project.
- Cost-effectiveness.
- Timeliness.
- Accuracy of care.
- Ease of use.

Discuss the telehealth reimbursement environment and whether Medicare, Medicaid, or private insurance in your state(s) cover telehealth services.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 13 of 51

For resources addressing this topic, access HRSA's Office for the Advancement of Telehealth and HHS's Telehealth for providers.

Activity 3: Dental Equipment for Expanding Dental Service Capacity

Personnel salaries for the provision of dental care (positions such as hygienist, dental assistant, dentist, etc.), purchase of a mobile unit, or construction are **not** allowable under this activity.

Oral health care is one of the core medical service categories in the RWHAP and can be a part of all clinical care plans for people with HIV. A large proportion of people with HIV have unmet dental care needs due to lack of available dental providers, limited transportation, costs of care, or other barriers.

RWHAP Part C supports a comprehensive approach to oral health care for low-income people with HIV, including the co-location of oral health care services with outpatient ambulatory health care.

If you select this activity, you must purchase dental equipment for the purpose of developing, enhancing, or expanding oral health care services for people with HIV.

Specifically, this activity involves creating or expanding a dental operatory in a clinic or in a mobile unit (e.g., van) through purchasing equipment such as:

- Dental patient chairs.
- Sterilization units.
- X-ray imaging instruments.
- Dental operating lights.
- Operatory cabinets.
- Hand pieces.

Statutory authority

42 U.S.C. §§ 300ff-54(c)(1)(B) and (Title XXVI, §§ 2654(c)(1(B) and 2693 of the Public Health Service Act).

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 14 of 51

Award information

Funding policies and limitations

Changes in HHS regulations

As of October 1, 2025, HHS has adopted 2 CFR Part 200, with some modifications included in 2 CFR Part 300. These regulations replace those in 45 CFR Part 75.

Policies

- To make an award, funding must be available and allocated for this program and purpose, at which point we will move forward with the review and award process.
- Have clear policies and good financial practices to avoid spending HRSA funds on unallowable activities.
- Like other award rules, we may audit your policies, procedures, and controls.
- If we receive more funding for this program, we may:
  - Fund more applicants from the rank order list.
  - Extend the period of performance.
  - Award supplemental funding.

General limitations

- For guidance on some types of costs we do not allow or restrict, see
  - Project Budget Information in Section 3.1. of the Two-Tier Application Guide [PDF].
  - 2 CFR Part 200 Subpart E - General Provisions for Selected Items of Cost.
  - Allowable and Unallowable Costs and Activities, in the HHS Grants Policy Statement.
- All costs must be reasonable, necessary, allocable to the award, and adequately documented (2 CFR 200.403).
- You cannot earn profit from the federal award. See 2 CFR § 200.400(g).
- Current appropriations law includes a salary limit of $228,000 as of January 2026 that applies to this program. You may pay salaries at a higher rate if the rate beyond the salary rate limit (Executive Level II) is paid with non-HHS funds. For help calculating salaries under this limit, read more at “salary rate limitation” in the Two-Tier Application Guide [PDF].

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 15 of 51

Program-specific statutory or regulatory limitations

You cannot use funds under this notice for the following:

- Funding restrictions included in Policy Clarification Notice 16-02 *Ryan White HIV/AIDS Program Services: Eligible Individuals and Allowable Uses of Funds*.
- Charges that are billable to third party payors (e.g., private health insurance, prepaid health plans, Medicaid, Medicare, Department of Housing and Urban Development (HUD) funding for housing services, other RWHAP funding including AIDS Drug Assistance Program).
- To directly provide housing or health care services (e.g., HIV care, counseling and testing) that duplicate existing services.
- Payments for clinical research.
- Payments for nursing home care.
- Cash payments to intended clients of RWHAP services.
- Purchase or improvement to land.
- Purchase, construction, or major alterations or renovations on any building or other facility (see 2 CFR 200 – subpart A Definitions).
- PrEP or non-occupational Post-Exposure Prophylaxis (nPEP) medications or the related medical services. As outlined in the updated November 16, 2021 RWHAP and PrEP program letter.
- Purchase of sterile needles and syringes for the purpose of hypodermic injection of any illegal drug use. Some aspects of syringe services programs are allowable with HRSA's prior approval and in compliance with HHS and HRSA policy. See Syringe Services Programs.
- Development of materials designed to directly promote or encourage intravenous drug use or sexual activity, whether homosexual or heterosexual.
- Research.
- Foreign travel.
- Long-term activities.
    - Instead, the activities should be short-term in nature with a targeted completion by the end of the one-year period of performance.

You must have policies, procedures, and financial controls in place. Anyone who receives federal funding must comply with legal requirements and restrictions, including those that limit specific uses of funding.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 16 of 51

Follow the list of statutory restrictions on the use of funds in Section 4.1 (Funding Restrictions) of the Application Guide. We may audit the effectiveness of these policies, procedures, and controls. 2 CFR § 200.216 prohibits certain telecommunications and video surveillance services or equipment. For details, see the HRSA Grants Policy Bulletin Number: 2021-01E.

See Manage Your Grant for other information on costs and financial management.

Indirect costs

Indirect costs are costs you charge across more than one project that cannot be easily separated by project. For example, this could include utilities for a building that supports multiple projects.

To incur indirect costs, you can select one of two methods:

Method 1 – Approved rate. You currently have an indirect cost rate approved by your cognizant federal agency at the time of award.

Method 2 – *De minimis* rate. Per 2 CFR § 200.414(f), if you do not have a current negotiated indirect cost rate, you may elect to charge a *de minimis* rate. If you choose this method, costs included in the indirect cost pool must not be charged as direct costs.

This rate is up to 15% of modified total direct costs (MTDC). See 2 CFR § 200.1 for the definition of MTDC. You can use this rate indefinitely for all your federal awards or until you choose to receive a negotiated rate.

Consider your indirect costs when developing your budget.

Program income

Program income is money earned as a result of your award-supported project activities. You must use any program income you generate from awarded funds for approved project-related activities. Find more about program income at 2 CFR 200.307.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 17 of 51

Step 2:
Get Ready to Apply

In this step

Get registered	17
Find the application package	17
Application writing help	18

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 18 of 51

Get registered

SAM.gov

You must have an active account with SAM.gov to apply. SAM.gov registration can take several weeks. Begin that process today.

To register:

- Go to SAM.gov Entity Registration and select Get Started. From the same page, you can also select the Entity Registration Checklist for the information you will need to register.
- You must agree to the financial assistance general certifications and representations specifically. Those for contracts are different.

When you register, you will also receive your required Unique Entity Identifier (UEI).

Once you register:

- You will have to maintain your registration throughout the life of any award.
- If your organization has multiple UEIs, use the one associated with your physical location.

If you need additional information about user roles in SAM.gov, see “Get registered: SAM.gov user roles” in the Application Guide [PDF].

Grants.gov

You must also have an active account with Grants.gov. You can see step-by-step instructions at the Grants.gov Quick Start Guide for Applicants and How to Apply for Grants.

Find the application package

The application package has all the forms you need to apply. You can find it online. Go to Grants Search at Grants.gov and search for opportunity number HRSA-26-061.

After you select the opportunity, we recommend that you click the Subscribe button to get updates.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 19 of 51

Application writing help

Visit HHS Tips for Preparing Grant Proposals.

Visit HRSA's How to Prepare Your Application page for more guidance.

See Apply for a Grant for other help and resources.

FAQs will be posted on our TA webpage after the webinar.

Join the webinar

Webinar information will be posted to the Related Documents tab on Grants.gov. We recommend you "Subscribe" to the NOFO on Grants.gov to receive updates when documents are posted.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 20 of 51

Step 3: Build Your Application

In this step

Application checklist 20
Application contents and format 22

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 21 of 51

Application checklist

There are two types of forms in Grants.gov.

- Some forms allow you to upload components of your application to the form. These include components like your project narrative, budget and budget narrative, and attachments, as applicable.
- Other forms are more typical, fill-in-the-blank forms.

Make sure that you have everything you need to apply.

Narratives

Component	Grants.gov form	Included in page limit*?
☐ **Project narrative**	Project Narrative Attachment form.	Yes
☐ **Budget narrative**	Budget Narrative Attachment form.	Yes

Attachments

Insert each in the Attachments Form in this order.

Component	Included in page limit*?
☐ 1. Proof of non-profit status	No
☐ 2. Funding preference	No
☐ 3. Federally negotiated indirect cost rate	No
☐ 4. Biographical sketches	No
☐ 5. Program specific line-item budget	Yes
☐ 6. Work plan	Yes
☐ 7. Staffing plan job descriptions	Yes
☐ 8. Agreements with other entities and memoranda of understanding	Yes
☐ 9-15. Other relevant documents	Yes

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 22 of 51

Other required forms

Upload using each required form in Grants.gov.

Forms	Submission requirement
Application for Federal Assistance (SF-424)	With application.
Project Abstract Summary form	With application.
Grants.gov Lobbying form	With application.

*Only what you attach in these forms counts toward the page limit. The forms themselves do not count.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 23 of 51

Application contents and format

This section includes guidance on each component found in the application checklist.

Application page limit: 25

Submit your information in English and express whole number budget figures using U.S. dollars.

Required format

Required format for project summary, project narrative, budget narrative, and attachments.

Font: A readable font like Arial, Courier, CG Times, or Times New Roman

File format: We only accept the following document formats:

- .PDF - Adobe Portable Document Format
- .DOC/.DOCX - Microsoft Word
- .RTF - Rich Text Format
- .TXT - Text
- .WPD - Word Perfect Document
- .XLS/.XLSX - Microsoft Excel
- .VSD - Microsoft Visio

Size: 12-point font
Footnotes, charts, graphics, and budget tables may be 10-point or higher.

Ink color: Black

Spacing: Single-spaced, including all text and tables.

Alignment: Left

Headings: Bold all headings and align left.

Size: 8.5 x 11 (Make sure the print area is set and allows printing to 8.5 x 11.)

Margins: 1-inch on all sides

Footer: On each page as the footer, include your organization's name and page numbers. If a competing continuation or competing supplement, also include your 10-digit award number.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 24 of 51

Page numbering:

- Do not number the standard OMB-approved forms.
- Number each attachment page sequentially (that is, 1, 2, 3).
- Reset the numbering for each attachment.
- Treat each attachment as a separate section.

File names: You can find guidance for naming your files in the Application Guide [PDF].

Project narrative

Introduction

See merit review criterion 1: Need

- Indicate the **one activity** you will implement:
  - Electronic Health Record and Data Coordination.
  - Telehealth.
  - Dental equipment for expanding office capacity.
- Describe the need for capacity development funding within your community and organization.
- Explain how the proposed activity will improve access to high-quality, HIV primary care for low-income people with HIV.
- Demonstrate how this is a **brand-new activity** and does not duplicate nor repeat any infrastructure development activities previously funded under the RWHAP Part C Capacity Development program.
- It also cannot duplicate activities of the RWHAP Part D Women, Infants, Children and Youth (WICY) Supplemental program (HRSA-24-061; HRSA-24-062) or FY 2025 (HRSA-25-050; HRSA-25-049).

Need

See merit review criterion 1: Need

For your proposed activity:

- Outline the equipment or data system needs you plan to address.
  - Describe the gaps in organizational capacity due to limitations in the current system infrastructure.
  - Include changes you have made to the current service delivery system.
  - Describe how the lessons you have learned will be applied to this activity.

- Provide information specific to the selected activity and describe how these gaps or limitations are affecting the optimal provision of quality HIV primary care services.
    - Include how health care gaps or limitations are affecting your organization's ability to optimize HIV outcomes.
- Discuss the relevant barriers to successfully carry out the project. Include the steps you will take to minimize or overcome them.

Approach

See merit review criterion 2: Response

- Provide a clear description of the approach.
    - Include specific action steps.
    - Describe how actions will address the need and attain project objectives.
    - Include how the activity will be used to expand or improve client care.
    - Include the person(s) responsible for putting your proposed project in place (both staff and partners).
- Describe plans to share any information or products developed with the people and communities disproportionately impacted by HIV.
    - You should also plan to share lesson learned with these people and communities.
    - This should include community providers and project partners so they are made aware of the additional capability created by this proposed project.

Work plan

See merit review criteria 2: Response

Provide a detailed work plan for the 12-month period of performance of September 1, 2026 to August 31, 2027. For all activities, the work plan must:

- Describe the activity's goal and objectives.
- Describe how you'll achieve each of the objectives during the period of performance.
- List the key action steps needed to reach the goal.
    - Include when each step will be completed and who is responsible for each.
- Provide a timeline showing when each step will be completed and name the staff responsible for each step.
- Identify the measures you will use to evaluate success.
- Describe the expected outcomes that will show the impact of the activity.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 26 of 51

    - Outcomes may include changes in quality of service, service delivery type, treatment outcomes, knowledge, skills, practices, or other improvements.

Provide the above information in a table format with the following sections outlined:

- Goal and objectives.
- Action steps.
- Timeline.
- Person responsible.
- Evaluation measures.
- Outcomes.

You will also include a more detailed work plan that you will submit as Attachment 6.

Resolving challenges

See merit review criterion 4: Impact

- Discuss challenges that you are likely to encounter in your work plan and explain approaches that you'll use to resolve them.
- Describe the specific activities or strategies you will use to mitigate or resolve anticipated challenges. Include your plan to overcome any barriers to full implementation

Performance reporting and evaluation

See merit review criteria 3: Performance reporting and evaluation and 5: Resources and capabilities

Performance measurement and reporting

- Describe how you will collect and manage data in a way that helps you improve the way you carry out your activity.
- Track the goals and objectives identified in the work plan.

Program evaluation

- Describe how you will evaluate the effectiveness of your proposed capacity development project.
- Describe how you will share evaluation results internally with program staff and externally with key stakeholders (including people with HIV).

See the reporting section for more information.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 27 of 51

Sustainability

See merit review criterion 4: Impact

- Show that the activities outlined in the work plan can be reasonably completed within 12 months.
- Describe the organizational resources that you will use to sustain, without additional funds from the federal government, the project activities or enhancements supported by this award beyond the one-year period of performance.

Organizational information

See merit review criterion 5: Resources and capabilities

- Briefly describe the organizational skills, capabilities, and resources, including staff that will contribute to your organization's ability to carry out the proposed activity.
- Highlight key staff with relevant expertise and experience with similar work.
  - This information should align with the staffing plan provided in Attachment 7 and the biographical sketches of key personnel provided in Attachment 4.
- Discuss the organization's ability to secure agreements or contracts with community-based organizations, health care providers, and consultant services to achieve this project.
- Describe your plan to purchase equipment and execute contracts for services for this project within a reasonable timeframe.

Budget and budget narrative

See merit review criterion 6: Support requested

Your **budget** should follow the instructions in budget narrative: detailed instructions section of the Application Guide [PDF] and the instructions listed in this section. Your budget should show a well-organized plan.

HHS now uses the definitions for equipment and supply in 2 CFR 200.1. The new definitions change the threshold for equipment to the lesser of the recipient's capitalization level or $10,000 and the threshold for supplies to below that amount.

The total project or program costs are all allowable (direct and indirect) costs used for the HRSA award activity or project. This includes costs charged to the award and non-federal funds used to satisfy a matching or cost-sharing requirement (which may include maintenance of effort, if applicable).

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 28 of 51

The **budget narrative** supports the information you provide in Standard Form 424-A. It includes an itemized breakdown and a clear justification of the costs you request. The merit review committee reviews both.

As you develop your budget, consider:

- If the costs are reasonable, allowable and allocable, and consistent with your project's purpose and activities.
- The restrictions on spending funds. See funding policies and limitations.

Line-Item budget:

- In addition to the SF-424 Application Guide requirements, you must also provide the line-item budget and budget narrative according to each object class category (e.g., Personnel, Fringe Benefits, Travel).
    - The budget allocations on the line-item budget must relate to the activities proposed in the project narrative, including the work plan.
- To evaluate your adherence to RWHAP Part C Capacity Development statutory budget requirements, submit a program-specific line-item budget for the one-year period of performance (September 1, 2026 – August 31, 2027).
    - Highlight any administrative costs by making them **bold**.

The budget narrative supports the information you provide in Standard Form 424-A. See other required forms. It includes an itemized breakdown and a clear justification of the requested costs. The merit review committee reviews both.

As you develop your budget, also consider the **restrictions on spending funds**. See Funding policies & limitations.

To create your budget narrative, see detailed instructions in Section 3.1.5 of the Application Guide [PDF].

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 29 of 51

Attachments

Place your attachments in this order in the Attachments Form. See application checklist to determine if they count toward the page limit.

Unless the instructions below require it, do not submit organizational brochures or other promotional materials (for example, slides, films, clips).

Attachment 1: Proof of non-profit status

If your organization is non-profit, you need to attach proof. We will accept any of the following:

- A copy of a current tax exemption certificate from the IRS.
- A letter from your state's tax department, attorney general, or another state official saying that your group is non-profit and that none of your net earnings go to private shareholders or others.
- A certified copy of your certificate of incorporation. This document must show that your group is non-profit.
- Any of the listed documents for a parent organization. Also include a statement signed by an official of the parent group that your organization is a non-profit affiliate.

Attachment 2: Funding preference documentation

Provide information, including supporting documentation, data, and other details according to the instructions for funding preferences for either rural areas or underserved populations. **HRSA will review the information to determine whether you qualify for a funding preference.** See funding preferences for more information.

Attachment 3: Federally negotiated indirect cost rate (if applicable)

Provide any documents that describe working relationships between your organization and others you mention in your project narrative. If you include documents that confirm actual or pending contracts or agreements, the documents should clearly describe the roles of subrecipients and contractors and any deliverables. It is not necessary to include the entire contents of lengthy agreements, so long as the portions you include describe the working relationship between you and the other organization. Make sure letters of agreement are signed and dated.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 30 of 51

Attachment 4: Biographical sketches

Include biographical sketches for the principal investigator/principal director, project coordinator (if different) and any staff directly responsible for implementing the proposed projects that you describe in Attachment 7.

For key personnel, the biographical sketch should be no more than 1-page. Do not include personally identifiable information.

Attachment 5: Program specific line-item budget

Submit as a PDF document a program-specific line-item budget for the 1-year period of performance. SF-424A Section B is not counted toward the page limit; however, the line-item budget itself does count toward the page limit. Reference section See Section 3.4.1. of the Application Guide [PDF].

Attachment 6: Work plan

Attach the project's work plan for the 12-month period of performance of September 1, 2026 to August 31, 2027. Make sure it includes everything required in the project narrative section.

Attachment 7: Staffing plan and job descriptions

See Section 3.1.7 of the Application Guide [PDF].

Include a staffing plan that provides key information about the staff positions. Include: name, position title, brief background, and the role and responsibilities of the person in your proposed project. For each staff, include the sources of funding for your proposed project and corresponding time and effort. It is recommended to supply this information in the form of a table.

Attachment 8: Agreements with other entities

Provide any documents that describe working relationships between your organization and others you refer to in the proposal. Documents that confirm actual or pending contracts or agreements should clearly describe the roles of the contractors and any deliverable. Make sure you sign and date any letters of agreement.

Attachment 9-15: Other relevant documents

You may use attachments 9 through 15 for any other relevant documentation.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 31 of 51

Other required forms

You will need to complete some other forms. Upload the following forms at Grants.gov. You can find them in the NOFO application package or review them and any available instructions at Grants.gov Forms.

Forms	Submission requirement
Application for Federal Assistance (SF-424)	With application.
Project Abstract Summary form	With application.
Grants.gov Lobbying form	With application.

Form instructions

The application guide has detailed instructions for:

- The Application for Federal Assistance (SF-424).
- The Budget Information for Non-Construction Programs (SF-424A).

Project abstract summary form instructions

Complete the information in the Project Abstract Summary form. Include a short description of your proposed project. Include the needs you plan to address, the proposed services, and the population groups you plan to serve. Indicate the funding amount requested and the name the specific activity.

For more information, see Section 3.1.2 of the Application Guide [PDF].

Important: Public information

When filling out your SF-424 form, pay attention to Box 15: Descriptive Title of Applicant's Project.

We share what you put there with USAspending. This is where the public goes to learn how the federal government spends their money.

Instead of just a title, insert a short description of your project and what it will do.

See instructions and examples.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 32 of 51

Step 4: Understand Review, Selection, and Award

In this step

Application review 32
Selection process 36
Award notices 38

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 33 of 51

Application review

Initial review

We will review your application to make sure that it meets eligibility criteria, and the requirements in this NOFO. If your application does not meet eligibility criteria, it will not be funded. If your application does not meet other criteria, we will not fund it.

Merit review

A panel reviews all applications that pass the initial review. You can find more about the merit review process in the Application Guide [PDF]. The members use these criteria.

Criterion	Total number of points = 100
1. Need	10 points
2. Response	35 points
3. Performance reporting and evaluation	15 points
4. Impact	10 points
5. Resources and capabilities	20 points
6. Support requested	10 points

Criterion 1: Need (10 points)

See the project narrative Introduction and Need sections.

The panel will review your application for how well it:

Introduction (3 points)

- States the proposed activity.
- Describes the overall purpose of the proposed project and the need for capacity development funding.
- Explain how the proposed activity will improve access to high-quality primary care for low-income people with HIV.
- Demonstrates that the proposed activity is a brand-new activity that introduces innovative approaches, services, or strategies to the program.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 34 of 51

Need (7 points)

- Justifies the need for capacity development funding to address the gaps in organizational capacity or the limitations of current infrastructure.
- Describes the relevant barriers to successfully carry out the project, and the steps to be taken to minimize or overcome the stated barriers.
- Outlines equipment or data system needs.
- Includes proposed changes to the current service delivery system.
- Describes how the lessons learned will be applied.

Criterion 2: Response (35 points)

See the project narrative Approach, and Work plan sections.

The panel will review your application for:

Approach (15 points)

- Clarity of the approach, including specific action steps and the roles of responsible staff or partners, to ensure effective implementation of the proposed activity.
- The extent to which the activities described in the application can address the need and attain the project objectives.
- The description of intent to share or disseminate relevant information and products developed through the funded activity and lessons learned with other providers in the community and collaborators to this project.

Work plan (20 points)

- Clarity of the goal, objectives, and action steps for the 12-month work plan (Attachment 6).
- The structure and completeness, including when each step will be completed and who is responsible for implementation.
- The extent to which the activities described in the application can address the problem and attain the project objectives.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 35 of 51

Criterion 3: Performance reporting and evaluation (15 points)

See the project narrative Performance reporting and evaluation section.

The panel will review your application for:

- Clearness of the evaluation plan to monitor progress towards project goals and objectives, and efficiency of plan to address barriers to implementation.

Criterion 4: Impact (10 points)

See the project narrative Resolving challenges and Sustainability sections.

The panel will review your application for:

Resolving challenges (5 points)

- The clarity of the outline of challenges likely to be encountered in designing and carrying out the activities in the work plan.
- Describes the specific activities or strategies used to mitigate or resolve anticipated challenges in implementing the proposed activity.

Sustainability (5 points)

- The extent to which activities outlined in the work plan can reasonably be completed in the 12-month period of performance.
- The strength of the applicants proposed plan for sustaining activities, without additional federal funds, beyond the federal funding period

Criterion 5: Resources and capabilities (20 points)

See the project narrative Organizational information and Performance reporting and evaluation sections.

The panel will review your application to determine the extent to which:

Organizational information (10 points)

- The organization demonstrates the ability to secure agreements with community-based organizations, health care providers, and consultant services needed to successfully achieve the proposed project.
- The organization demonstrates the ability to purchase equipment and execute contracts for services for this project within a reasonable timeframe to complete project activities.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 36 of 51

Staffing plan (10 points)

- The staffing plan (Attachment 7) is consistent with the proposed activity.
- Staffing plan is adequate or sufficient for meeting the proposed project goals and objectives.

Criterion 6: Support requested (10 points)

See the Budget and budget narrative section.

The panel will review your application to determine:

- How reasonable the proposed budget is for the period of performance.
- How reasonable costs are and how well they align with the project's scope.
- How sufficient the time is for key staff to spend on the project to achieve project objectives.

We do not consider **voluntary** cost sharing during merit review.

Risk review

Before making an award, we review your award history to assess risk. We need to ensure all prior awards were managed well and demonstrated sound business practices. We:

- Review any applicable past performance.
- Review audit reports and findings.
- Analyze the budget.
- Assess your management systems.
- Ensure you continue to be eligible.
- Make sure you comply with any public policies.

We may ask you to submit additional information.

As part of this review, we use SAM.gov Entity Information Responsibility/Qualification to check your history for all awards likely to be more than $250,000 over the period of performance. You can comment on your organization's information in SAM.gov. We'll consider your comments before making a decision about your level of risk.

If we find a significant risk, we may choose not to fund your application or to place specific conditions on the award.

For more details, see 2 CFR 200.206.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 37 of 51

Funding priorities

A funding priority adds points to merit review scores if we determine that the application meets the listed criteria. Qualifying for a funding priority does not guarantee that your application will be successful.

Priority 1: Not currently funded by this opportunity (2 Points)

We will give you a funding priority if:

Your organization does not hold an active award under this opportunity at the time you apply.

Priority 2: Never funded by this opportunity (2 Points)

We will give you a funding priority if:

Your organization has never received an award under this opportunity.

Priority 3: Alignment with Ending the HIV Epidemic in the U.S. (EHE) initiative (2 points)

We will give you funding priority if the following is met:

Your proposal is in an EHE priority state.

Selection process

When making funding decisions, we consider:

- The amount of available funds.
- Assessed risk.
- Merit review results. These are key in making decisions but are not the only factor.
- The larger portfolio of HRSA-funded projects, including project type and geographic distribution.
- The funding priorities, funding preferences, and special considerations listed.
- Alignment with HRSA Mission and Strategic Priorities

We may:

- Fund out of rank order.
- Fund applications in whole or in part.
- Fund applications at a lower amount than requested.
- Decide not to allow a recipient to subaward if they may not be able to monitor and manage subrecipients properly.
- Choose to fund no applications under this NOFO.

Additionally, we may not make an award if you are delinquent on two or more Single Audit Reports.

You cannot appeal a denial, or the amount of funds awarded.

Funding preferences

This program includes funding preferences, based on section 2654(c)(3) of the PHS Act. If we determine that your application meets these criteria, we will move it up in our ranking of fundable applications. Qualifying for a funding preference does not guarantee that you will receive funding.

HRSA will grant only **one** funding preference to any qualified applicant that justifies its qualification.

Qualifications to meet the funding preferences:

- **Attachment 2 is required for all applicants.**
  - HRSA will review the information and determine whether your application qualifies for a funding preference.
  - Receipt of a funding preference is not a guarantee of funding.

Qualification 1: Rural areas

The criterion for this funding preference is based on the provision of HIV primary care services in a rural area including:

- RWHAP recipients are defined as rural if their service area (in part or in whole) or main organizational address is in a HRSA Federal Office of Rural Health Policy (FORHP)-designated rural area.
- FORHP classifies all non-metropolitan counties, as defined by the Office of Management and Budget, as rural.
- FORHP uses Rural-Urban Commuting Area (RUCA) codes to identify other rural areas.
- For more information about **what defines a rural area**, visit FORHP's website.
- To determine if your organization **serves a rural area**, refer to FORHP's Rural Health Analyzer.
    - If your service area (either in part or in whole) or main organizational address **is defined as rural**, print out a screenshot of the result and include the printout as supporting documentation in .pdf format in Attachment 2.
    - If your organization **does not provide HIV primary care services in a rural area**, you can indicate "Not applicable" in Attachment 2.

Qualification 2: Underserved populations

The criterion for this funding preference is the provision of HIV primary care services to underserved populations including:

- Underserved populations include communities and subpopulations that do not have access to adequate HIV primary care services, as defined by HAB PCN 16-02.
- These gaps in the provision of HIV primary care services must be defined and documented in Attachment 2.
- State in Attachment 2 whether your organization provides HIV primary care services for underserved populations.
- You must provide all information to be considered for this funding preference:
    - Data and information on overall HIV primary care gaps, including any inadequate or unavailable HIV primary care services, as defined by HAB PCN 16-02.
    - Data and information on specific HIV subpopulations served by your organization that are disproportionately affected by inadequate or unavailable HIV primary care services, as defined by HAB PCN 16-02.
- If your organization does not provide HIV primary care services to underserved populations, you can indicate "Not applicable" on Attachment 2.

Award notices

We issue Notices of Award (NOA) on or around the start date listed in the NOFO. See "how we make awards" in the Application Guide [PDF] for more information.

By drawing down funds, you accept the terms and conditions of the award.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 41 of 51

Step 5: Submit Your Application

In this step

Application submission and deadlines 40

Other submissions 40

Application submission and deadlines

Your organization's authorized official must certify your application. See the section on finding the application package to make sure you have everything you need.

Application deadline

You must submit your application by 06/01/2026, at 11:59 p.m. ET.

Grants.gov creates a date and time record when it receives applications.

If you need a deadline extension, see "requesting a waiver" in the Application Guide [PDF].

Submission method

Grants.gov

You must submit your application through Grants.gov. You may do so using Grants.gov Workspace. This is the preferred method. For alternative online methods, see Applicant System-to-System.

For instructions on how to submit in Grants.gov, see the Quick Start Guide for Applicants. Make sure that your application passes the Grants.gov validation checks, or we may not get it. Do not encrypt, zip, or password protect any files.

If Grants.gov rejects your application due to errors, you must correct and resubmit before the deadline.

If you want to know more about correcting errors or tracking your application, you can refer to the Application Guide [PDF].

Have questions? Go to Contacts and Support.

Other submissions

Intergovernmental review

This NOFO is not subject to Executive Order 12372, Intergovernmental Review of Federal Programs. No action is needed.

Reporting 46

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 44 of 51

Post-award requirements and administration

Administrative and national policy requirements

There are important rules you need to know if you get an award. You must follow:

- All terms and conditions in the Notice of Award (NOA). We incorporate this NOFO by reference.
- The regulations at 2 CFR Part 200, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, modifications at 2 CFR Part 300, and any superseding regulations.
- The HHS Grants Policy Statement. Your NOA will reference this document. If there are any exceptions to the GPS, they'll be listed in your NOA.
- All federal statutes and regulations relevant to federal financial assistance, including those highlighted in HHS Grants Policy Statement, Appendix D: HHS Administrative and National Policy Requirements.
- The requirements for performance management in 2 CFR 200.301.
- All anti-discrimination laws: By applying for or accepting federal funds from HHS, you certify compliance with all federal antidiscrimination laws and these requirements. Complying with those laws is a material condition of receiving federal funding streams. You are responsible for ensuring subrecipients, contractors, and partners also comply.
- Any applicable statutory provisions.
- The Assurances (standard certification and representations) included in the annual SAM registration.

Required alignment with HRSA mission and strategic priorities

Recipients must use funds awarded under this NOFO to implement program goals or agency priorities in accordance with the HRSA vision, mission, core values, and strategic priorities, where authorized by law.

Funded activities must advance HRSA's vision of protecting and improving the health and well-being of Americans. The particular focus is on those who are medically vulnerable or live in areas with limited access to care. HRSA's duty is to serve

wisely, effectively, and with measurable results that justify every taxpayer dollar invested.

Consistent with HRSA's priorities, in carrying out any project funded under this NOFO, the recipient must adhere to the following principles, where they are consistent with the authority and scope of the award and its activities:

- **Gold standard science:** Design and deliver services using gold standard evidence-based and evidence-informed approaches, establish measurable performance goals, and use data to monitor outcomes and drive continuous improvement.
- **Program integrity and fiscal stewardship:** Recipients must:
  - Administer funds in accordance with all applicable federal statutes, regulations, and award conditions.
  - Maintain strong internal controls.
  - Prevent waste, fraud, and abuse.
- **Partnership and local leadership:** Coordinate with state, tribal, territorial, local, and community partners, as appropriate, and tailor services to meet community-identified needs while respecting local decision-making authority.

Recipients must manage any project awarded under this NOFO in accordance with the following objectives in programs authorized to advance them:

Make America Healthy Again (MAHA): HRSA prioritizes the health and well-being of all Americans by supporting common-sense, evidence-based health policies that promote:

- Personal responsibility.
- Strong families and communities.
- Proper nutrition.
- The prevention and management of chronic disease, while ensuring access to high-quality, affordable physical and mental health care.

Child protections, biological integrity, parental rights, and lawful use of funds: HRSA prioritizes safeguarding children's health and safety by:

- Not supporting medical interventions for gender dysphoria in minors that lack a strong evidence base.
- Applying sex-based definitions grounded in biological reality.
- Supporting parental authority, transparency, and choice in education, including school-based health centers that respect parental rights and religious upbringing.
- Ensuring taxpayer funds are not used to promote or support elective abortions, consistent with federal law and the Hyde Amendment.

Advancing evidence-based, merit-driven, and ethically grounded health care: HRSA will prioritize unbiased, transparent science; merit-based workforce opportunities; and programs that demonstrate measurable outcomes, while deprioritizing organizations with:

- Conflicts of interest.
- "Harm reduction models."
- Housing-first approaches.
- Activities that facilitate illegal drug use or unsafe medical practices.

Promoting public safety, lawful use of federal funds, and national health priorities: To the extent permitted by law, HRSA will align funding with administration priorities by:

- Supporting ending the HIV epidemic through authorized, evidence-based care.
- Reserving benefits for eligible individuals.
- Discouraging illegal immigration and unsafe community practices.
- Prioritizing recipients that enforce public safety, address serious mental illness and substance use through treatment and recovery, and reduce homelessness responsibly.

To the extent allowable by law, under awards, HRSA will give priority to states and municipalities for programs to:

- Enforce prohibitions on open illicit drug use.
- Enforce prohibitions on urban camping and loitering.
- Enforce prohibitions on urban squatting.
- Enforce, and where necessary, adopt, standards that address individuals who are a danger to themselves or others and suffer from serious mental illness or substance use disorder, or who are living on the streets and cannot care for themselves. The approach must be through assisted outpatient treatment or by moving them into treatment centers or other appropriate facilities through civil commitment or other available means, to the maximum extent permitted by law.

HRSA will implement these priorities consistent with applicable laws, regulations, court orders, and any required procedures.

The recipient must demonstrate ongoing compliance with these priorities, in all programs that are authorized to advance them, through program design, implementation, reporting, and evaluation.

Failure to meaningfully align funded activities with the applicable requirements may result in corrective action, additional reporting requirements, or other actions consistent with federal grant regulations at 2 CFR. part 200 and the terms and

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 47 of 51

conditions of this award. This includes termination under CFR. 200.340(a)(4) if an award no longer effectuates the program goals or agency priorities.

Cybersecurity

If awarded, you must develop plans and procedures, modeled after the NIST Cybersecurity framework, to protect HHS systems and data. See details here.

HIT

Successful applicants under this NOFO agree that:

Where award funding involves:	Recipients and subrecipients are required to:
Implementing, acquiring, or upgrading health IT for activities funded by any entity	Use health IT that meets standards and implementation specifications adopted in 45 CFR 170, Subpart B, if such standards and implementation specifications can support the activity. Visit to 45 CFR 170, Subpart B learn more.
Implementing, acquiring, or upgrading health IT for activities by eligible clinicians in ambulatory settings, or hospitals, eligible under Sections 4101, 4102, and 4201 of the HITECH Act	Use health IT certified under the ONC Health IT Certification Program if certified technology can support the activity.

If standards and implementation specifications adopted in 45 CFR part 170, Subpart B cannot support the activity, recipients and subrecipients are encouraged to use health IT that meets non-proprietary standards and implementation specifications developed by consensus-based standards development organizations. This may include standards identified in the ONC Interoperability Standards Advisory.

Case 1:26-cv-12638-WGY Document 19-10 Filed 06/10/26 Page 48 of 51

Reporting

If you are funded, you will have to follow the reporting requirements in “reporting” section of the Application Guide [PDF]. The NOA will provide specific details.

You must also follow these program-specific reporting requirements:

- Information relevant to program-specific goals and progress on the work plan (for example, number of clients served, partnerships)
- Impact of the overall project
- The degree to which the recipient achieved the mission, goal, and objectives outlined in the program
- Recipient accomplishments
- Barriers encountered
- Responses to summary questions regarding the recipient’s overall experiences during the 1-year period of performance.
- Recipients will be expected to provide end-of-the-period of performance outcome data and demonstrate the impact of the project’s activity.

Further information will be available in the NOA.

Before you begin

If you believe you are a good candidate for this funding opportunity, secure your SAM.gov and Grants.gov registrations now. If you are already registered, make sure your registrations are active and up-to-date.

SAM.gov registration (this can take several weeks)

You must have an active account with SAM.gov. This includes having a Unique Entity Identifier (UEI).

See Step 2: Get Ready to Apply

Grants.gov registration (this can take several days)

You must have an active Grants.gov registration. Doing so requires a Login.gov registration as well.

See Step 2: Get Ready to Apply

Apply by the application due date

Applications are due by 11:59 p.m. Eastern Time on 07/10/2026.

To help you find what you need, this NOFO uses internal links. In Adobe Reader, you can go back to where you were by pressing Alt + Left Arrow (Windows) or Command + Left Arrow (Mac) on your keyboard.

All activities proposed in your application and budget narrative must align with applicable law, including but not limited to statutes, executive orders, federal regulations and applicable judicial holdings. Accordingly, discretionary awards shall not be used to fund, promote, encourage, subsidize, or facilitate: racial preferences or other forms of racial discrimination by the recipient, including activities where race or intentional proxies for race will be used as a selection criterion for employment or program participation; denial by the recipient of the sex binary in humans, or the belief that sex is a chosen or mutable characteristic; illegal immigration; or any other initiatives that compromise public safety. If an application does not align, the application will not receive funding to the extent permitted by law and applicable court orders.

Dental reimbursement program.

Summary

The Dental Reimbursement Program reimburses certain costs incurred by eligible entities that have provided uncompensated or partially uncompensated oral health care to people with HIV during a specified one-year period. Funds will be distributed among eligible applicants by comparing each eligible applicant's number of patients with HIV served and unreimbursed oral health care costs to the total number of patients served and costs incurred by all eligible applicants.

Funding details

Application Types: New

Expected total available funding in FY 2026: $9,000,000

Expected number and type of awards: 50 grants

Funding range per award: Amount varies.

We plan to fund awards in a single six-month budget period. The period of performance is 9/1/2026 to 2/28/2027.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 7 of 41

Eligibility

You can apply if you are an accredited domestic dental school and other accredited domestic dental education program, such as dental hygiene program, or those sponsored by a school of dentistry, a hospital with a dental education program that is accredited by the Commission on Dental Accreditation, or a public or private institution that offers postdoctoral training in the specialties of dentistry, advanced education in general dentistry, or a dental-general practice residency. Dental education programs must be accredited by the Commission on Dental Accreditation.

Types of eligible organizations

These types of domestic organizations may apply:

- Public and State controlled institutions of higher education.
- Private institutions of higher education.
- Others. (See text field entitled “Additional Information on Eligibility” for clarification.)

Additional information on eligibility

“Domestic” means the 50 states, the District of Columbia, the Commonwealth of Puerto Rico, the Northern Mariana Islands, American Samoa, Guam, the U.S. Virgin Islands, the Federated States of Micronesia, the Republic of the Marshall Islands, and the Republic of Palau.

Individuals are not eligible applicants under this NOFO.

Completeness and responsiveness criteria

We will review your application to make sure it meets these basic requirements to move forward in the competition.

We will not consider an application that:

- Is from an organization that does not meet all eligibility criteria.
- Is submitted after the deadline.
- **Applications that do not meet the following requirements may be deemed ineligible**:
    - Failure to include the total unreimbursed costs of oral health care provided to low-income people with HIV from July 1, 2024, through June 30, 2025, in fields 18a and 18g of the SF-424 application.

- Failure to submit the required Dental Services Report information on or before the application deadline on the Dental Services Report website.
- Discrepancies between the unreimbursed costs reported on the Dental Services Report and the SF-24 application. HRSA will verify these amounts, and if they do not match, the application may be deemed ineligible.

Application limits

You may not submit more than one application. If you submit more than one application, we will only accept the last on-time submission.

Cost sharing

This program has no cost-sharing requirement. If you choose to share in the costs of the project, we will not consider it during merit review. Recipients agree that once committed, cost sharing amounts are enforceable and subject to reporting and auditing requirements under 2 CFR 200.

Maintenance of effort

Federal funds must add to any existing non-federal funds for your proposed activities. If you receive an award, you will have to spend at least as much as you spent in the last fiscal year before the award. Section 2692(b)(4) of the PHS Act requires this. We will enforce these statutory requirements through all available mechanisms. You must provide supporting documentation of your maintenance of effort in your attachments.

RWHAP Part F DRP funds are not intended to be the sole source of support for oral health care services for people with HIV. The RWHAP statute requires DRP recipients to maintain expenditures of state funds (if any) for DRP-related activities at a level equal to or greater than the fiscal year preceding the DRP reimbursement period. The maintenance of effort (MOE) requirement is important in ensuring that RWHAP funds are used to supplement, not supplant, state funds allotted for oral health care services for people with HIV.

Post-award requirements

Before you apply, make sure you understand the requirements that come with an award.

See Step 6: Learn What Happens After Award for information on regulations that apply, reporting, and more.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 9 of 41

Program description

Purpose

Our purposes are to:

1. Improve access to oral health care services for low-income people with HIV.
2. Support related education and training for the delivery of dental care to people with HIV.

This program will reimburse certain costs incurred by eligible entities that have provided uncompensated or partially uncompensated oral health care to people with HIV from July 1, 2024, through June 30, 2025.

Funding opportunity goals

- Reduce the new HIV infections in the U.S. by focusing on HIV care and treatment strategies so that people with HIV reach viral suppression and therefore do not sexually transmit HIV.
- Help low-income people with HIV by providing: medical care, medications , and support service to help them stay in care .
- Reach people with HIV who are out of care by leveraging partnerships, focusing interventions, and engaging communities.

Background

The Ryan White HIV/AIDS Program

The Ryan White HIV/AIDS Program (RWHAP) has five statutorily defined Parts that provide grants to states, cities, counties, local clinics, and community-based organizations. The grants fund medical care, medication, and essential support services, to meet the needs of people with HIV and family members affected by HIV. Together these grants provide a comprehensive system of care to ensure low-income people with HIV have access to services for early diagnosis of HIV, linkage to care, medically appropriate treatment, retention in care, and sustained viral suppression (a very low or undetectable amount of HIV in the blood).

For nearly four decades, the RWHAP has funded services to provide HIV primary health care, medication, and essential support services, including mental health care, transportation, case management, nutrition, and housing. These services support clients to enter and remain in care, access medications, and reach viral suppression, reducing transmission and lowering health care costs.

Ending the HIV Epidemic

Launched in 2020, the Ending the HIV Epidemic in the U.S. (EHE) initiative further expands federal efforts to reduce HIV transmission. For the RWHAP, the EHE initiative expands the program's ability to meet the needs of clients, specifically focusing on linking people with HIV who are either newly diagnosed, diagnosed but currently not in care, or are diagnosed and in care but not yet virally suppressed, to the essential HIV care, treatment, and support services needed to help them reach viral suppression.

Making America Healthy Again

The Ryan White HIV/AIDS Program helps advance the Making America Healthy Again (MAHA) priorities by:

- **Expanding access to primary care** for people with HIV, particularly those with low incomes, and by strengthening the health workforce.
- **Fighting the chronic disease epidemic** by providing HIV medical care, treatment, and support services to people with HIV.
- **Supporting improved nutrition** by providing patient-centered focused medical nutrition therapy and food services.
- **Supporting disease prevention** through HIV care and treatment services that help people reach viral suppression so they live longer, healthier lives and do not transmit HIV.

Key accomplishments

- **Nearly 602,000 people with HIV** in the U.S. received life-saving care, medication, and essential support services through the RWHAP, representing over half of all diagnosed with HIV in the U.S. This is an increase of nearly 26,000 clients.
- **More than 91%** of Ryan White HIV/AIDS Program patients receiving HIV medical care were virally suppressed in 2024. This is up from 69.5% of patients virally suppressed in 2010 and significantly higher than the 67.2% virally suppressed nationally among all people with diagnosed HIV.
- **More than 47%** of Ryan White HIV/AIDS Program clients are aged 50 years and older, demonstrating the program's success in supporting older clients and its commitment to addressing the unique needs of people aging with HIV.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 11 of 41

Program requirements and expectations

- **Dental Services Report** — You must submit a Dental Services Report electronically. For detailed instructions, see Appendix.
- **Patient payment for services** — Recipients must have consistent policies and procedures related to verification of patients' financial status.
- **Payor of last resort and eligibility determination** — With the exception of programs administered by or providing the services of the Indian Health Service, the RWHAP is the payor of last resort. Recipients may not use RWHAP Part F DRP funds for a service if payment has been made, or reasonably can be expected to be made, by a state compensation program, under an insurance policy, under a Federal or State health benefits program, or by an entity that provides health services on a pre-paid basis.
    - Eligibility and confirmation should be determined in accordance with guidelines in HAB PCN 21-02 Determining Client Eligibility & Payor of Last Resort [PDF] in the RWHAP. HRSA HAB expects all RWHAP recipients and subrecipients to establish, implement, and monitor policies and procedures to determine client eligibility.
    - To extend finite RWHAP grant resources to low-income people with HIV, recipients and subrecipients must vigorously pursue and rigorously document enrollment into, and subsequent reimbursement from, health care coverage for which their clients may be eligible. Examples include Medicaid, Medicare, Children's Health Insurance Program (CHIP), state-funded HIV programs, employer-sponsored health insurance coverage, and health plans offered through other private health insurers.
- **Recipients cannot use RWHAP Part F DRP funds to supplement the maximum cost allowance for services reimbursed by third party payments such as Medicaid, Medicare, or other insurance programs.** Please note that recipients cannot use direct or indirect federal funds such as RWHAP Parts A, B, C, D and Part F Community Based Dental Partnership Program (CBDPP) to duplicate reimbursement for services funded under Part F DRP. Additionally, recipients cannot bill RWHAP Parts A, B, C, D or Part F CBDPP for services reimbursed by RWHAP Part F DRP.
- **Other financial management issues** — Funds received from DRP must be allocated to the accredited dental schools and other accredited dental education programs (see Eligibility section that provide oral health services to low-income people with HIV. HRSA expects that these reimbursement funds will provide expanded access to oral health care for people with HIV.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 12 of 41

- **Education and training** — RWHAP Part F DRP awarded applicants must ensure HIV-related oral health education and training for dental students, dental hygiene students, dental residents, or other dental providers. Education and training curricula should focus on the provision of comprehensive oral health care for people with HIV.

Statutory authority

42 U.S.C. § 300ff-111(b) (Title XXVI, § 2692(b) of the Public Health Service (PHS) Act).

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 13 of 41

Award information

Funding policies and limitations

Changes in HHS regulations

As of October 1, 2025, HHS has adopted 2 CFR Part 200, with some modifications included in 2 CFR Part 300. These regulations replace those in 45 CFR Part 75.

Policies

- To make an award, funding must be available and allocated for this program and purpose, at which point we will move forward with the review and award process.
- Have clear policies and good financial practices to avoid spending HRSA funds on unallowable activities. Like other award rules, we may audit your policies, procedures, and controls.

General limitations

- For guidance on some types of costs we do not allow or restrict, see
  - Project Budget Information in Section 3.1. of the Two-Tier Application Guide [PDF].
  - 2 CFR Part 200 Subpart E - General Provisions for Selected Items of Cost.
  - Allowable and Unallowable Costs and Activities, in the HHS Grants Policy Statement.
- All costs must be reasonable, necessary, allocable to the award, and adequately documented (2 CFR 200.403).
- You cannot earn profit from the federal award. See 2 CFR § 200.400(g).
- Current appropriations law includes a salary limit of $228,000 as of January 2026 that applies to this program. You may pay salaries at a higher rate if the rate beyond the salary rate limit (Executive Level II) is paid with non-HHS funds. For help calculating salaries under this limit, read more at “salary rate limitation” in the Two-Tier Application Guide [PDF].

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 14 of 41

Program-specific statutory or regulatory limitations

You cannot use funds under this notice for the following:

- Funding restrictions included in PCN 16-02.
- Services that must be paid for by other sources, consistent with the RWHAP payor of last resort requirement in PCN 21-02.
- Payments for inpatient hospitals, nursing homes, and other long-term care facilities.
- Cash payments to intended clients of RWHAP services.
- Purchase of, or improvement to land.
- Purchase, construction, or major alterations or renovations on any building or other facility (see 2 CFR 200 – subpart A Definitions).
- PrEP or non-occupational Post-Exposure Prophylaxis (nPEP) medications or the related medical services. As outlined in the updated November 16, 2021 RWHAP and PrEP program letter.
- Purchase of sterile needles and syringes for the purpose of hypodermic injection of any illegal drug use. Some aspects of syringe services programs are allowable with HRSA's prior approval and in compliance with HHS and HRSA policy. See Syringe Services Programs.
- Development of materials designed to directly promote or encourage intravenous drug use or sexual activity, whether homosexual or heterosexual.
- Research.
- Foreign travel.

You must have policies, procedures, and financial controls in place. Anyone who receives federal funding must comply with legal requirements and restrictions, including those that limit specific uses of funding.

- Follow the list of statutory restrictions on the use of funds in Section 4.1 (Funding Restrictions) of the Application Guide.
    - We may audit the effectiveness of these policies, procedures, and controls. 2 CFR § 200.216 prohibits certain telecommunications and video surveillance services or equipment.
    - For details, see the HRSA Grants Policy Bulletin Number: 2021-01E.

See Manage Your Grant for other information on costs and financial management.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 15 of 41

Indirect costs

Indirect costs are costs you charge across more than one project that cannot be easily separated by project. For example, this could include utilities for a building that supports multiple projects.

To incur indirect costs, you can select one of two methods:

Method 1 – Approved rate. You currently have an indirect cost rate approved by your cognizant federal agency at the time of award.

Method 2 – *De minimis* rate. Per 2 CFR § 200.414(f), if you do not have a current negotiated indirect cost rate, you may elect to charge a ***de minimis*** rate. If you choose this method, costs included in the indirect cost pool must not be charged as direct costs.

This rate is up to 15% of modified total direct costs (MTDC). See 2 CFR § 200.1 for the definition of MTDC. You can use this rate indefinitely for all your federal awards or until you choose to receive a negotiated rate.

Consider your indirect costs when developing your budget.

Program income

Program income is money earned as a result of your award-supported project activities. You must use any program income you generate from awarded funds for approved project-related activities. Find more about program income at 2 CFR 200.307.

Step 2:
Get Ready to Apply

In this step

Get registered	16
Find the application package	16
Application writing help	17

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 17 of 41

Get registered

SAM.gov

You must have an active account with SAM.gov to apply. SAM.gov registration can take several weeks. Begin that process today.

To register:

- Go to SAM.gov Entity Registration and select Get Started. From the same page, you can also select the Entity Registration Checklist for the information you will need to register.
- You must agree to the financial assistance general certifications and representations specifically. Those for contracts are different.

When you register, you will also receive your required Unique Entity Identifier (UEI).

Once you register:

- You will have to maintain your registration throughout the life of any award.
- If your organization has multiple UEIs, use the one associated with your physical location.

If you need additional information about user roles in SAM.gov, see “Get registered: SAM.gov user roles” in the Application Guide [PDF].

Grants.gov

You must also have an active account with Grants.gov. You can see step-by-step instructions at the Grants.gov Quick Start Guide for Applicants and How to Apply for Grants.

Find the application package

The application package has all the forms you need to apply. You can find it online. Go to Grants Search at Grants.gov and search for opportunity number HRSA-26-085.

After you select the opportunity, we recommend that you click the Subscribe button to get updates.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 19 of 41

Step 3: Build Your Application

In this step

Application checklist 19
Application contents and format 21

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 20 of 41

Application checklist

There are two types of forms in Grants.gov.

- Some forms allow you to upload components of your application to the form. These include components like your project narrative, budget and budget narrative, and attachments, as applicable.
- Other forms are more typical, fill-in-the-blank forms.

Make sure that you have everything you need to apply.

Narratives

Component	Grants.gov form	Included in page limit*?
☐ Attachments	Insert each in the Other Attachments form	Yes, unless marked otherwise
☐ Other required forms	Upload using each required form	No
☐ Dental Services Report	Submit this on the Dental Services Report website	No

Attachments

Insert each in the Attachments form in this order.

Component	Included in page limit*?
☐ 1. Maintenance of effort	Yes
☐ 2. Other relevant documents (if applicable)	Yes

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 21 of 41

Other required forms

Upload using each required form in Grants.gov.

Forms	Submission requirement
☐ Application for federal assistance (SF-424)	With application.
☐ Project/Performance site location(s)	With application.
☐ Project abstract summary form	With application.
☐ Grants.gov lobbying form	With application.
☐ Key contacts	With application.

*Only what you attach in these forms counts toward the page limit. The forms themselves do not count.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 22 of 41

Application contents and format

This section includes guidance on each component found in the application checklist.

Application page limit: 10

Submit your information in English and express whole number budget figures using U.S. dollars.

Required format

Required format for project summary, project narrative, budget narrative, and attachments.

Font: A readable font like Arial, Courier, CG Times, or Times New Roman.

File format: We only accept the following document formats:

- .PDF - Adobe Portable Document Format
- .DOC/.DOCX - Microsoft Word
- .RTF - Rich Text Format
- .TXT - Text
- .WPD - Word Perfect Document
- .XLS/.XLSX - Microsoft Excel
- .VSD - Microsoft Visio

Size: 12-point font
Footnotes, charts, graphics, and budget tables may be 10-point or higher.

Ink color: Black

Spacing: Single-spaced, including all text and tables.

Alignment: Left

Headings: Bold all headings and align left.

Size: 8.5 x 11 (Make sure the print area is set and allows printing to 8.5 x 11.)

Margins: 1-inch on all sides

Footer: On each page as the footer, include your organization's name and page numbers. If a competing continuation or competing supplement, also include your 10-digit award number.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 23 of 41

Page numbering:

- Do not number the standard OMB-approved forms.
- Number each attachment page sequentially (that is, 1, 2, 3).
- Reset the numbering for each attachment.
- Treat each attachment as a separate section.

File names: You can find guidance for naming your files in the Application Guide.

See the reporting section for more information.

Attachments

Place your attachments in this order in the Attachments Form. See application checklist to determine if they count toward the page limit.

Unless the instructions below require it, do not submit organizational brochures or other promotional materials (for example, slides, films, clips).

Attachment 1: Maintenance of effort documentation

Counts toward page limit.

You must maintain state funds (if any) that support proposed activities. These include cash, in-kind, and other contributions. If there were no state funds expended, enter zero. Do not include any federal funds. See maintenance of effort requirement.

You must provide a baseline aggregate expenditure of state funds for the most recently completed fiscal year prior to the application deadline and estimates for the following fiscal year using a chart like the one shown in this section.

As an example, if your fiscal year begins July 1, you report actual expenditures of state funds for oral health care services for people with HIV from July 1, 2024, through June 30, 2025, in column one. In column two, you report estimated expenditures for the next fiscal year (July 1, 2025, through June 30, 2026).

Additionally, provide a brief description of the methodology your institution or program used to calculate MOE for oral health care services for low-income people with HIV. Provide a description of consistent data set(s) of state expenditures for oral health care services for low-income people with HIV and a brief narrative of any changes from the previous FY and the projected FY spending.

Use this sample format to provide the maintenance of effort documentation.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 24 of 41

FY before application: Actual nonfederal expenditures	First FY of award: Estimated nonfederal expenditures
$	$

Attachment 2: Other relevant documents (if applicable)

Include here any other documents that are relevant to your application.

Other required forms

You will need to complete some other forms. Upload the following forms at Grants.gov. You can find them in the NOFO application package or review them and any available instructions at Grants.gov Forms.

Forms	Submission requirement
Application for federal assistance (SF-424)	With application.
Project/performance site location(s)	With application.
Project abstract summary form	With application.
Grants.gov lobbying form	With application.
Key contacts	With application.

Form instructions

The application guide has detailed instructions for:

- The Application for Federal Assistance (SF-424).

Project abstract summary form instructions

Complete the information in the Project Abstract Summary form. For more information, see Section 3.1.2 of the Application Guide [PDF] .

Please name your project title “FY 2026 RWHAP Part F Dental Reimbursement Program” and include the following information:

- The total unreimbursed costs of oral health care provided to people with HIV from July 1, 2024, through June 30, 2025, that are entered in fields 18a and 18g of the SF-424 Application for Federal Assistance. This amount should also match the unreimbursed cost reported on Tab Two of the DSR.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 25 of 41

Important: Public information

When filling out your SF-424 form, pay attention to Box 15: Descriptive Title of Applicant's Project.

We share what you put there with USAspending. This is where the public goes to learn how the federal government spends their money.

Instead of just a title, insert a short description of your project and what it will do.

See instructions and examples.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 26 of 41

Step 4: Understand Review, Selection, and Award

In this step

Application review	26
Selection process	27
Award notices	27

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 27 of 41

Application review

Initial review

We will review your application to make sure that it meets eligibility criteria, and the requirements in this NOFO. If your application does not meet eligibility criteria, it will not be funded. If your application does not meet other criteria, we will not fund it.

Risk review

Before making an award, we review your award history to assess risk. We need to ensure all prior awards were managed well and demonstrated sound business practices. We:

- Review any applicable past performance.
- Review audit reports and findings.
- Analyze the budget.
- Assess your management systems.
- Ensure you continue to be eligible.
- Make sure you comply with any public policies.

We may ask you to submit additional information.

As part of this review, we use SAM.gov Entity Information Responsibility/Qualification to check your history for all awards likely to be more than $250,000 over the period of performance. You can comment on your organization's information in SAM.gov. We'll consider your comments before making a decision about your level of risk.

If we find a significant risk, we may choose not to fund your application or to place specific conditions on the award.

For more details, see 2 CFR 200.206.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 28 of 41

Selection process

When making funding decisions, we consider:

- The amount of available funds.
- Assessed risk.
- Alignment with HRSA Mission and Strategic Priorities

We may:

- Fund applications in whole or in part.
- Fund applications at a lower amount than requested.
- Choose to fund no applications under this NOFO.

- Additionally, we may not make an award if you are delinquent on two or more Single Audit Reports.

You cannot appeal a denial, or the amount of funds awarded.

Award notices

We issue Notices of Award (NOA) on or around the start date listed in the NOFO. See "how we make awards" in the Application Guide [PDF] for more information.

By drawing down funds, you accept the terms and conditions of the award.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 29 of 41

Step 5: Submit Your Application

In this step

Application submission and deadlines 29
Other submissions 30

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 30 of 41

Application submission and deadlines

Your organization's authorized official must certify your application. See the section on finding the application package to make sure you have everything you need.

Application deadline

You must submit your application by 07/10/2026, at 11:59 p.m. ET.

Grants.gov creates a date and time record when it receives applications.

If you need a deadline extension, see "requesting a waiver" in the Application Guide [PDF] .

Submission method

Grants.gov

You must submit your application through Grants.gov. You may do so using Grants.gov Workspace. This is the preferred method. For alternative online methods, see Applicant System-to-System.

For instructions on how to submit in Grants.gov, see the Quick Start Guide for Applicants. Make sure that your application passes the Grants.gov validation checks, or we may not get it. Do not encrypt, zip, or password protect any files.

If Grants.gov rejects your application due to errors, you must correct and resubmit before the deadline.

If you want to know more about correcting errors or tracking your application, you can refer to the Application Guide [PDF] .

Have questions? Go to Contacts and Support.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 31 of 41

Other submissions

Intergovernmental review

This NOFO is not subject to Executive Order 12372, Intergovernmental Review of Federal Programs. No action is needed.

Dental Services Report

Dental Services Report : You must submit this report electronically. Complete and submit the Dental Reimbursement Program Dental Services Report in the Dental Services Report website. You'll need to request access to the website the first time you visit it by completing the registration form on the Dental Services Report website.

Step 6: Learn What Happens After Award

In this step

Post-award requirements and administration 32
Reporting 35

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 33 of 41

Post-award requirements and administration

Administrative and national policy requirements

There are important rules you need to know if you get an award. You must follow:

- All terms and conditions in the Notice of Award (NOA). We incorporate this NOFO by reference.
- The regulations at 2 CFR Part 200, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, modifications at 2 CFR Part 300, and any superseding regulations.
- The HHS Grants Policy Statement. Your NOA will reference this document. If there are any exceptions to the GPS, they'll be listed in your NOA.
- All federal statutes and regulations relevant to federal financial assistance, including those highlighted in HHS Grants Policy Statement, Appendix D: HHS Administrative and National Policy Requirements.
- The requirements for performance management in 2 CFR 200.301.
- All anti-discrimination laws: By applying for or accepting federal funds from HHS, you certify compliance with all federal antidiscrimination laws and these requirements. Complying with those laws is a material condition of receiving federal funding streams. You are responsible for ensuring subrecipients, contractors, and partners also comply.
- Any applicable statutory provisions.
- The Assurances (standard certification and representations) included in the annual SAM registration.

Required Alignment with HRSA Mission and Strategic Priorities

Recipients must use funds awarded under this NOFO to implement program goals or agency priorities in accordance with the HRSA vision, mission, core values, and strategic priorities, where authorized by law.

In administering programs under this and all funding announcements, HRSA prioritizes:

- **Evidence-based healthcare:** Funding activities supported by rigorous scientific evidence, particularly for programs serving children and adolescents, where HRSA is committed to approaches that reflect the highest standards of clinical care and child safety.

- **Biological and physiological integrity:** Recognizing the relevance of biological sex to health outcomes, HRSA encourages applicants to account for sex-based health factors in program design, data collection, and service delivery where scientifically appropriate.

HRSA will implement these priorities consistent with applicable laws, regulations, court orders, and all required administrative procedures. Applicants are encouraged to describe how their proposed programs align with these priorities in their project narratives.

Funded activities must advance HRSA's vision of protecting and improving the health and well-being of Americans. The particular focus is on those who are medically vulnerable or live in areas with limited access to care. HRSA's duty is to serve

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 35 of 41

wisely, effectively, and with measurable results that justify every taxpayer dollar invested.

Consistent with HRSA's priorities, in carrying out any project funded under this NOFO, the recipient must adhere to the following principles, where they are consistent with the authority and scope of the award and its activities:

- **Gold standard science:** Design and deliver services using gold standard evidence-based and evidence-informed approaches, establish measurable performance goals, and use data to monitor outcomes and drive continuous improvement.
- **Program integrity and fiscal stewardship:** Recipients must:
  - Administer funds in accordance with all applicable federal statutes, regulations, and award conditions.
  - Maintain strong internal controls.
  - Prevent waste, fraud, and abuse.
- **Partnership and local leadership:** Coordinate with state, tribal, territorial, local, and community partners, as appropriate, and tailor services to meet community-identified needs while respecting local decision-making authority.

Recipients must manage any project awarded under this NOFO in accordance with the following objectives in programs authorized to advance them:

Make America Healthy Again (MAHA): HRSA prioritizes the health and well-being of all Americans by supporting common-sense, evidence-based health policies that promote:

- Personal responsibility.
- Strong families and communities.
- Proper nutrition.
- The prevention and management of chronic disease, while ensuring access to high-quality, affordable physical and mental health care.

Child protections, biological integrity, parental rights, and lawful use of funds: HRSA prioritizes safeguarding children's health and safety by:

- Not supporting medical interventions for gender dysphoria in minors that lack a strong evidence base.
- Applying sex-based definitions grounded in biological reality.
- Supporting parental authority, transparency, and choice in education, including school-based health centers that respect parental rights and religious upbringing.
- Ensuring taxpayer funds are not used to promote or support elective abortions, consistent with federal law and the Hyde Amendment.

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 36 of 41

Advancing evidence-based, merit-driven, and ethically grounded health care: HRSA will prioritize unbiased, transparent science; merit-based workforce opportunities; and programs that demonstrate measurable outcomes, while deprioritizing organizations with:

- Conflicts of interest.
- "Harm reduction" models.
- Housing-first approaches.
- Activities that facilitate illegal drug use or unsafe medical practices.

Promoting public safety, lawful use of federal funds, and national health priorities: To the extent permitted by law, HRSA will align funding with administration priorities by:

- Supporting ending the HIV epidemic through authorized, evidence-based care.
- Reserving benefits for eligible individuals.
- Discouraging illegal immigration and unsafe community practices.
- Prioritizing recipients that enforce public safety, address serious mental illness and substance use through treatment and recovery, and reduce homelessness responsibly.

To the extent allowable by law, under awards, HRSA will give priority to states and municipalities for programs to:

- Enforce prohibitions on open illicit drug use.
- Enforce prohibitions on urban camping and loitering.
- Enforce prohibitions on urban squatting.
- Enforce, and where necessary, adopt, standards that address individuals who are a danger to themselves or others and suffer from serious mental illness or substance use disorder, or who are living on the streets and cannot care for themselves. The approach must be through assisted outpatient treatment or by moving them into treatment centers or other appropriate facilities through civil commitment or other available means, to the maximum extent permitted by law.

HRSA will implement these priorities consistent with applicable laws, regulations, court orders, and any required procedures.

The recipient must demonstrate ongoing compliance with these priorities, in all programs that are authorized to advance them, through program design, implementation, reporting, and evaluation.

Failure to meaningfully align funded activities with the applicable requirements may result in corrective action, additional reporting requirements, or other actions consistent with federal grant regulations at 2 CFR. part 200 and the terms and

Case 1:26-cv-12638-WGY Document 19-11 Filed 06/10/26 Page 37 of 41

conditions of this award. This includes termination under 2 CFR. 200.340(a)(4) if an award no longer effectuates the program goals or agency priorities.

Cybersecurity

If awarded, you must develop plans and procedures, modeled after the NIST Cybersecurity framework, to protect HHS systems and data. See details here.

Health IT

Successful applicants under this NOFO agree that:

Where award funding involves:	Recipients and subrecipients are required to:
Implementing, acquiring, or upgrading health IT for activities funded by any entity.	Use health IT that meets standards and implementation specifications adopted in 45 CFR 170, Subpart B, if such standards and implementation specifications can support the activity. Visit to 45 CFR 170, Subpart B learn more.
Implementing, acquiring, or upgrading health IT for activities by eligible clinicians in ambulatory settings, or hospitals, eligible under Sections 4101, 4102, and 4201 of the HITECH Act.	Use health IT certified under the ONC Health IT Certification Program if certified technology can support the activity. Visit the Certification of Health IT site to learn more.

If standards and implementation specifications adopted in 45 CFR part 170, Subpart B cannot support the activity, recipients and subrecipients are encouraged to use health IT that meets non-proprietary standards and implementation specifications developed by consensus-based standards development organizations. This may include standards identified in the ONC Interoperability Standards Advisory.

Reporting

If you are funded, you will have to follow the reporting requirements in “reporting” section of the Application Guide. The NOA will provide specific details.

You must also follow these program-specific reporting requirements:

- Progress reports, Federal Financial Report, and the final report noted under Section 6 of HRSA’s SF 424 Application Guide are not required for DRP.

Appendix

Dental Services Report

Instructions

For instructions on completing the report, see reporting requirements on our website under “Dental Services Report.”

We will only accept actual counts of people with HIV who received oral health care services from your institution or program as the basis of your application for DRP funding.

- **Funding and payment coverage:** You should only report direct reimbursements from third party payers (public and private) as payment for services provided in Section 2 Tabs 1 & 2. You should not report funding from the RWHAP or other federal grant programs as reimbursements in these items.
- **Unreimbursed costs:** The total unreimbursed costs of oral health care provided to people with HIV from July 1, 2024, through June 30, 2025, that are entered in fields 18a and 18g of the SF-424 Application for Federal Assistance must match the amount reported in Section 4 Tab 2 on the Dental Reimbursement Program Dental Services Report. We may verify the unreimbursed costs listed on the DSR and SF-424 application for Federal Assistance if there are differences. ***If these amounts do not match, we may deem your application ineligible.**
- **Narratives:** Please include narrative responses in Section 4 Tab 3, not to exceed one page in length for each item. Your responses will better inform us about your institution or program; your collaborations in the larger community; your training of students, residents, and providers; and other accomplishments. Your responses will also help us target technical assistance activities, document the value of funds expended, and demonstrate the importance of continued RWHAP funding for oral health care.

THE COURTROOM DEPUTY: All rise. U.S. District Court is now in session, the Honorable Jon S. Tigar presiding.

Please be seated.

Calling Civil Case Number 25-1824-JST, San Francisco AIDS Foundation, et al. v. Trump, et al.

Parties, please state your appearance, beginning with the plaintiff.

MS. TAYLOR: Thank you, Your Honor. Camilla Taylor for the plaintiffs.

MR. ABRIGO: Jose Abrigo for the plaintiffs.

MR. GONZALEZ-PAGAN: Good afternoon, Your Honor. Omar Gonzalez-Pagan for the plaintiffs.

MS. PELECANOS: Good afternoon, Your Honor. Pelecanos for the plaintiffs.

MS. GHEIBI: Good afternoon, Your Honor. Pardis Gheibi for the Government.

MR. JEU: Christopher Jeu on behalf of the Government.

THE COURT: Welcome. And good afternoon to those of you in the audience.

As you all know, the matter is on calendar to consider San Francisco AIDS Foundation and the other plaintiffs' motion for a preliminary injunction.

vague. Again --

THE COURT: I know you wouldn't say "so what" to a judge, but I'm just trying to summarize.

MS. GHEIBI: But what we're saying is we're not putting forth a definition for it. And we're saying, under the case law, that's okay. The same way the Government didn't have to put forth a definition of what it means to be "excellent" or "decent," it doesn't have to put forth a definition for "equity."

THE COURT: Let's take another word from these orders. This is from the gender order. And it's a word that Ms. Taylor focused on a few minutes ago, which is what it means to, quote, "promote," closed quote, gender ideology. And this time, rather than ask you what something means, I'm going to give you some specific examples and ask if you can tell me whether doing the action that I'm describing would promote gender ideology. And these are all things that I could see one of the plaintiff agencies doing --

MS. GHEIBI: Mm-hm.

THE COURT: -- in the day-to-day conduct of their work.

So, for example, would referring to someone -- a client perhaps or an agency employee -- by a pronoun other than Mr., Ms., Mrs., or Miss promote gender ideology?

MS. GHEIBI: I want to -- I want to make something

clear here, that Plaintiffs are assuming that just because their entity promotes gender ideology, that means they're going to lose all the funds. And I want to be very clear that that's not what the executive order says. I think that the relevant provision --

THE COURT: I'm sorry, Ms. Gheibi.

Madame Reporter, would you read my question back, please?

(Reporter read back.)

MS. GHEIBI: Under the executive order, yes. But it does not mean they automatically lose funding if the funding does not go to a program that promotes gender ideology. So the question is, is it -- is the entity just doing it outside of the scope of the program versus within the scope of the program?

And I think Plaintiffs -- from their declarations -- they seem very concerned that just because their entity sort of either respects --

THE COURT: Yeah. I appreciate the clarity.

MS. GHEIBI: Yes.

THE COURT: What if an agency trained its employees to ask clients which pronoun they use? Would that promote gender ideology?

MS. GHEIBI: I think it would fall within the scope -- yes, it would promote gender ideology. But, again, the question is, is the --

THE COURT: Again, I appreciate the --

MS. GHEIBI: -- funding going to it?

THE COURT: Again, I appreciate the clarity. This is in some relatively stark contrast to our earlier conversation. What if a facility designated its restrooms, quote, "all gender," closed quote, even if the agency had more than one restroom and could designate specific genders if it wanted to? Would that be promoting gender ideology?

MS. GHEIBI: I'm sorry, could you repeat that?

THE COURT: Sure. I want you to imagine an agency that has at least two bathrooms. And it designates each of them, quote, "all gender," closed quote, even though it doesn't have to because it has two bathrooms. It could identify or it could designate a men's bathroom and a women's bathroom if it wanted to. But it chooses not to do that. It just puts a sign outside each bathroom that says "all gender." Would that promote gender ideology, in your view?

MS. GHEIBI: I don't know the answer to that question -- I don't know if the answer to that question is yes or no under the executive order. I can't answer that --

THE COURT: A little closer to the line.

MS. GHEIBI: -- hypothetical.

THE COURT: Okay. Does the Government make any argument in its brief regarding legitimate Government interests advanced by the gender order? I ask because I didn't see such

CERTIFICATE OF REPORTER

I certify that the foregoing is a correct transcript from the record of proceedings in the above-entitled matter.
