

**IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF MASSACHUSETTS**

AMERICAN ACADEMY OF HIV
MEDICINE, et al.,

Plaintiffs,

v.

HEALTH RESOURCES AND SERVICES
ADMINISTRATION, et al.,

Defendants.

Case No. 1:26-cv-12638-WGY

**DECLARATION OF STEPHEN P. FERGUSON
IN SUPPORT OF PLAINTIFFS' MOTION REQUESTING JUDICIAL NOTICE
OF GOVERNMENTAL STATEMENTS, POLICIES, AND REPORTS**

I, Stephen P. Ferguson, hereby state and declare as follows:

1. I am an Attorney at Herbert Smith Freehills Kramer (US) LLP and counsel for Plaintiffs in the above-referenced litigation. I am admitted to practice in the State of New York and am admitted *pro hac vice* in this matter.

2. I have personal knowledge of the matters stated herein and am competent to testify thereto.

3. I submit this Declaration in support of Plaintiffs' Request for Judicial Notice of Governmental Statements, Policies, and Reports. The exhibits attached to this Declaration have not previously been filed on the docket in this action.

4. Attached hereto as **Exhibit A** is a true and correct copy of the Application for Grant Funding by the New York City Health Department in response to a HIV Emergency Relief Program Ryan White HIV/AIDS Program (RWHAP) Part A Funding Opportunity Announcement,

submitted in 2020, and which is publicly available at <https://tinyurl.com/5dauxze2> [<https://perma.cc/TH4Q-EVMH>].

5. Attached hereto as **Exhibit B** is a true and correct copy of *New York State's Integrated HIV Prevention and Care Plan 2022-2026*, published by the New York Department of Health in 2022, and which is publicly available at <https://tinyurl.com/456xpnxd>.

6. Attached hereto as **Exhibit C** is a true and correct copy of the publication *Achieving Gender Affirming Care in the Ryan White Part A Portfolio: Recommendations from the Needs Assessment Committee of the NY HIV Health & Human Services Planning Council*, which was published in July 2018, and which is publicly available at <https://tinyurl.com/838cuteb> [<https://perma.cc/YZ49-QJQG>].

7. Attached hereto as **Exhibit D** is a true and correct copy of *San Francisco's Integrated Ending the Epidemics Plan: 2024-2026 Strategies and Activities*, published by the San Francisco Department of Public Health in 2024, and which is publicly available at <https://tinyurl.com/4hvmze5x> [<https://perma.cc/B82X-HE7B>].

8. Attached hereto as **Exhibit E** is a true and correct copy of the *Los Angeles County Integrated HIV Prevention and Care Plan, 2022-2026*, published by the Los Angeles County Commission on HIV and the Los Angeles County Department of Public Health in December 2022, and which is publicly available at <https://tinyurl.com/552z3uah> [<https://perma.cc/2PUL-NDFG>].

9. Attached hereto as **Exhibit F** is a true and correct copy of the *Agenda and Meeting Materials for the Regular Meeting of the Los Angeles County Commission on HIV Planning, Priorities, and Allocations Committee* that occurred on October 21, 2025, and which is publicly available at <https://tinyurl.com/mwk6utxk>.

10. Attached hereto as **Exhibit G** is a true and correct copy of *Practice Guidelines for the Care of Persons Living with HIV/AIDS*, published by the San Diego HIV Health Services Planning Group on September 22, 2021, and which is publicly available at <https://tinyurl.com/3btnrs69> [<https://perma.cc/L7T6-AMDR>].

11. Attached hereto as **Exhibit H** is a true and correct copy of the *State of Florida Integrated HIV Prevention and Care Plan*, published by the Florida Department of Health on January 20, 2023, and which is publicly available at <https://tinyurl.com/4y5mfwh8> [<https://perma.cc/ELN6-VGFR>].

12. Attached hereto as **Exhibit I** is a true and correct copy of the *FY 2025 Standards of Care & Service Delivery Guidelines: Dallas Planning Area*, prepared by the Ryan White Planning Council of the Dallas Area in collaboration with the Ryan White Grants Management Division of Dallas County Health & Human Services and issued in 2025, and which is publicly available at <https://tinyurl.com/y924sasv> [<https://perma.cc/7YCK-EZHF>].

13. Attached hereto as **Exhibit J** is a true and correct copy of the *Guide for HIV/AIDS Clinical Care* published by the Health Resources and Services Administration in 2014, and which is publicly available at <https://tinyurl.com/3jwvtvc4>.

14. Attached hereto as **Exhibit K** is a true and correct copy of the presentation titled “Providing Gender-Affirming Care to People with HIV” by an employee of the Health Resources and Services Administration’s HIV/AIDS Bureau on August 25, 2022, at the 2022 National Ryan White Conference on HIV Care and Treatment.

15. Attached hereto as **Exhibit L** is a true and correct copy of the Record of the Proceedings of the Virtual Meeting of the CDC/HRSA Advisory Committee on HIV, Viral Hepatitis, and STD Prevention and Treatment that took place on April 26-28, 2022, and which is

publicly available at <https://www.cdc.gov/faca/committees/pdfs/chachspt/chachspt-minutes-20220426-28-508.pdf>.

16. Attached hereto as **Exhibit M** is a true and correct copy of the *Integrated HIV Prevention and Care Plan Guidance, including the Statewide Coordinated Statement of Need, CY 2027-2031*, published by Centers for Disease Control and Prevention and the Health Resources and Services Administration in December 2024, and which is publicly available at <https://ryanwhite.hrsa.gov/sites/default/files/ryanwhite/grants/integrated-hiv-prevention-care-plan-guidance-2027-2031.pdf>.

17. Attached hereto as **Exhibit N** is a true and correct copy of the *National HIV/AIDS Strategy for the United States 2022-2025*, published by The White House in 2021, and which is publicly available at <https://files.hiv.gov/s3fs-public/NHAS-2022-2025.pdf>.

18. Attached hereto as **Exhibit O** is a true and correct copy of a social media post by the Health Resources and Services Administration on January 28, 2022 (3:41 PM) through its official @HRSAGov account on X.com concerning the importance of providing gender-affirming HIV care and treatment services for transgender people with HIV, and which is publicly available at <https://tinyurl.com/42pc3uu3>.

19. Attached hereto as **Exhibit P** is a true and correct copy of a social media post by the Health Resources and Services Administration on March 25, 2022 (11:13 AM) through its official @HRSAGov account on X.com concerning gender-affirming HIV care and viral suppression among transgender and gender-diverse clients, and which is publicly available at <https://tinyurl.com/39ka9xhy>.

20. Attached hereto as **Exhibit Q** is a true and correct copy of Executive Order No. 14183, *Prioritizing Military Excellence and Readiness*, 90 Fed. Reg. 8757 (Jan. 27, 2025).

21. Attached hereto as **Exhibit R** is a true and correct copy of Executive Order No. 14187, *Protecting Children From Chemical and Surgical Mutilation*, 90 Fed. Reg. 8771 (Jan. 28, 2025).

22. Attached hereto as **Exhibit S** is a true and correct copy of Executive Order No. 14190, *Ending Radical Indoctrination in K-12 Schooling*, 90 Fed. Reg. 8853 (Jan. 29, 2025).

23. Attached hereto as **Exhibit T** is a true and correct copy of Executive Order No. 14201, *Keeping Men Out of Women's Sports*, 90 Fed. Reg. 9279 (Feb. 11, 2025).

24. Attached hereto as **Exhibit U** is a true and correct copy of the release titled “Supreme Court Bolsters President Trump’s Push to Eliminate Transgender Insanity,” issued by The White House on June 30, 2026, and which is publicly available at <https://perma.cc/484A-4MDN>.

25. Attached hereto as **Exhibit V** is a true and correct copy of the release titled “President Trump Ended Democrats’ ‘Transgender for Everybody’ Insanity,” issued by The White House on March 31, 2026, and which is publicly available at <https://tinyurl.com/2u3jupbf>.

26. Attached hereto as **Exhibit W** is a true and correct copy of the proclamation titled “National Child Abuse Prevention Month, 2025,” issued by The White House on April 3, 2025, and which is publicly available at <https://tinyurl.com/2aywxnsj>.

27. Attached hereto as **Exhibit X** is a true and correct copy of U.S. Office of Personnel Management, Initial Guidance Regarding President Trump’s Executive Order Defending Women (Jan. 29, 2025), which is publicly available at <https://tinyurl.com/243c49d6>.

28. Attached hereto as **Exhibit Y** is a true and correct copy of Matthew J. Vaeth, Office of Management and Budget, Memorandum M-25-13, Temporary Pause of Agency Grant, Loan,

and Other Financial Assistance Programs (Jan. 27, 2025), which is publicly available at <https://tinyurl.com/3zpchy7r>.

29. Attached hereto as **Exhibit Z** is a true and correct copy of the *Directive on NIH Priorities: Restoring Scientific Integrity and Protecting the Public Investment in NIH Awards*, issued by the then-Acting Director of the NIH Matthew J. Memoli on February 21, 2025.

30. Attached hereto as **Exhibit AA** is a true and correct copy of A Guide to Primary Care of People with HIV/AIDS, published by the Health Resources and Services Administration in 2004, and which is publicly available at <https://tinyurl.com/4y7h5xvr>.

31. Attached hereto as **Exhibit BB** is a true and correct copy of a social media post by the U.S. Department of Health and Human Services on August 21, 2025 (5:48 PM) through its official @HHSGov account on X.com concerning removal of references to “gender ideology” from federally funded sex-education materials, and which is publicly available at <https://tinyurl.com/fth82rp7>.

32. Attached hereto as **Exhibit CC** is a true and correct copy of a social media post by the U.S. Department of Health and Human Services on September 27, 2025 (9:00 AM) through its official @HHSGov account on X.com concerning remarks by HHS Secretary Kennedy at the United Nations General Assembly opposing “destructive gender ideology,” and which is publicly available at <https://tinyurl.com/2kuchns5>.

33. Attached hereto as **Exhibit DD** is a true and correct copy of a social medial post by President Donald J. Trump on February 27, 2025 (9:37 PM) through his @realDonaldTrump account on Truth Social concerning Iowa legislation and “Radical Gender Ideology”.

34. Attached hereto as **Exhibit EE** is a true and correct copy of a social medial repost by President Donald J. Trump on January 21, 2025, through his @realDonaldTrump account on Truth Social of a social media post by the @TeamTrump account on January 20, 2026, concerning “radical gender ideology.”

I declare under the penalty of perjury that the foregoing is true and correct.

Executed on September 1, 2026.

EXHIBIT A

INTRODUCTION

Pursuant to the Grant Year 2021 (GY21) HIV Emergency Relief Program Ryan White HIV/AIDS Program (RWHAP) Part A Funding Opportunity Announcement, dated June 11, 2020, the New York City Health Department (NYC HD), as the Grant Recipient (Recipient) for the New York Eligible Metropolitan Area (NY EMA), respectfully submits this application for grant funding. The application describes the GY21 plan to promote a comprehensive scale-up of high-quality care and treatment through the support of core medical and support services that address gaps in the HIV care continuum for eligible people with HIV (PWH) in the NY EMA. The GY21 plan is responsive to federal, state, and local efforts to end the HIV epidemic.

In February 2019, the United States (U.S.) Department of Health and Human Services (HHS) released an operational plan, Ending the HIV Epidemic: A Plan for America (EHE), which aims to end the HIV epidemic in the U.S. by 2030.ⁱ The plan identifies 48 counties, plus Washington, D.C., and San Juan, Puerto Rico, where more than 50% of HIV diagnoses occurred in 2016 and 2017, and an additional seven states with a substantial number of HIV diagnoses in rural areas. Four NYC counties are designated as part of the EHE plan: Bronx, Kings (Brooklyn), New York (Manhattan), and Queens. The EHE plan is comprised of four pillars: Diagnose, Treat, Prevent, and Respond. The NYC HD Bureau of HIV (BHIV) is engaging all its programs and partners to respond to the EHE plan by leveraging RWHAP Part A, Centers of Disease Control and Prevention (CDC) HIV prevention and surveillance jurisdictional funding (CDC PS-18-1802), City and State ending the epidemic resources alongside additional federal EHE funding from Health Resources and Services Administration (HRSA) and CDC. Initial EHE resources (CDC PS-19-1906) received by NYC in September 2019, support the development of the NYC EHE plan, including an Epidemiological Profile and Situational Analysis for the four EHE counties in NYC. A draft plan was submitted to the CDC in December 2019, followed by an extensive community engagement process currently underway to ensure the NYC EHE plan is responsive to local needs. The version of the NYC EHE plan currently receiving input from the community includes the strategies listed below. A final plan will be submitted by March 2021.

- Strategy 1: Increase the number of people who know their HIV status by diagnosing HIV infection as early as possible, promoting routine testing within health care facilities, and scaling up testing options in non-clinical settings.
- Strategy 2: Prevent new HIV acquisition by increasing access to effective prevention interventions, including pre- and post-exposure prophylaxis (PrEP and PEP), condoms, harm reduction (HR), and supportive services.
- Strategy 3: Improve viral suppression (VS) and health outcomes for PWH by optimizing medication adherence and access to care, improving coordination of clinical and supportive services, and increasing access to immediate antiretroviral treatment (iART).
- Strategy 4: Enhance methods to identify and intervene on HIV transmission networks to better support people and communities at increased risk of exposure.
- Strategy 5: In all NYC EHE strategies, utilize an intersectional, strengths-based, anti-stigma, and community-driven approach to mitigate racism, sexism, homophobia, transphobia, and other systems of oppression that create and exacerbate HIV-related health inequities.

The draft plan also includes two cross-cutting issues—Social and Structural Determinants of HIV-Related Health Inequities—and works to ensure the HIV service delivery system is responsive to these strategies.

To achieve the goals of the federal and NYC EHE plans, CDC EHE funding (CDC PS-20-2010) will support a comprehensive HIV program (Component A) to increase HIV screening and

testing in health care and non-health care settings to reduce new HIV diagnoses and increase awareness of HIV status. The new funding will leverage and enhance existing systems and increase linkage to and engagement and re-engagement in HIV care and treatment and early initiation of treatment to improve engagement in care (EiC) and VS among PWH. Through an array of approaches and providers the funding will seek to increase screening, referral, and linkage to PrEP and other HIV prevention services, including syringe service programs, and improve the ability to respond to HIV transmission clusters and outbreaks. BHIV will work to partner with a diverse set of stakeholders within and outside the NYC HD to help inform the development and implementation of programmatic and advocacy activities.

Additionally, EHE resources from HRSA (HRSA-20-078) support Project Planned Resources for a Specific Population-level Equitable Response (Project PROSPER) which aims to improve access to effective HIV care and treatment and improve VS among PWH (EHE Pillar Two), and quickly respond to potential new HIV outbreaks (EHE Pillar Four) in NYC. Project PROSPER will achieve these goals by increasing organizational capacity through trainings for the HIV workforce; expanding implementation of evidence-informed strategies and interventions as well as emerging practices; and improving data collection and management systems.

All HIV care services in the NY EMA support EHE Pillar Four through efforts to link and retain PWH in care, improve access to antiretroviral treatment (ART), and decrease viral load (VL). Like the federal and NYC EHE plans, the GY21 plan is responsive to Governor Andrew Cuomo's 2015 New York State Blueprint for Ending the Epidemic (NYS ETE Blueprint) and the NYS Integrated HIV Prevention and Care Plan (NYS Integrated Plan), which set forth recommendations to reduce the annual incidence of new HIV infections to 750 from the current 3,000 in NYS. The NYS ETE Blueprint is also a guiding document for the NY EMA.

COVID-19 has significantly affected New Yorkers, including PWH, as well as service provision across the NY EMA in GY20, and it is fully expected to continue to do so in GY21. On February 29, 2020, NYC identified its first case of COVID-19. In the ensuing weeks, the number of COVID-19 cases, hospitalizations, and deaths rose. NYC and NYS became the epicenter for the coronavirus pandemic in the U.S. By March 20, 2020, the number of reported daily cases rose to 4,014, with 665 hospitalizations, and 47 deaths. On that day, Governor Cuomo issued an executive order to place NYS on PAUSE requiring all non-essential businesses statewide to close in-office personnel functions effective on March 22, 2020.ⁱⁱ

With the NYS on PAUSE order, many non-clinical community-based organizations (CBOs) ceased providing in-person services in the community while they determined how to meet the needs of clients. Meanwhile, many hospitals were swamped with COVID-19 patients while they sought to set up outpatient telehealth services. Throughout this time, CBOs and clinics worked to transition to providing services virtually or through telehealth. As NYS regions began reopening in phases during the spring and summer, program services started to ramp up, but many continue to experience challenges in delivering services while complying with physical distancing and other requirements mandated by the state. To date, NYC has reported over 238,000 COVID-19 cases, more than 58,000 hospitalizations, and nearly 24,000 confirmed and probable deaths.ⁱⁱⁱ Community members and service providers across the NY EMA are adjusting to COVID-19 and exploring new ways to conduct outreach and provide services while ensuring the safety of staff and clients as the pandemic evolves.

NEEDS ASSESSMENT

A) Demonstrated Need.

1) Epidemiologic Overview.

a) Summary of the HIV epidemic in the EMA geographic area. The NY EMA, which includes the five counties/boroughs of NYC and the adjacent Tri-County Region of Westchester, Rockland, and Putnam Counties, is home to nearly 10 million people (3% of the U.S. population).^{iv} The NY EMA continues to have the largest HIV epidemic in the U.S., reporting in 2018 approximately 5% of all new HIV diagnoses and 13% of PWH nationwide.^v As of December 31, 2019, there were 132,148 people diagnosed and presumed to be living with HIV in the NY EMA, representing 1.4% of the total NY EMA population (*see Table 1*). Of the 1,881 individuals diagnosed with HIV in the NY EMA in 2019, 17% were concurrently diagnosed with AIDS (within 31 days of their HIV diagnosis), a percentage that has remained relatively stable over the last five years.^{vi}

From 2015 to 2019, there was a 28% decrease in HIV diagnoses in the NY EMA; however, the number of PWH remains high due to improved health outcomes associated with ART. These figures demonstrate both the success of the NY EMA's service system in providing HIV care and ongoing need for early intervention and care services to fulfill the goals of the federal EHE plan.

Table 1. NY EMA Population and HIV Diagnoses and Number of PWH by Region and County/Borough, 2019

	Population	HIV Diagnoses*	PWH
New York City	8,336,817	1,772	128,419
Kings (Brooklyn)	2,559,903	459	30,572
Bronx	1,418,207	466	31,280
New York (Manhattan)	1,628,706	344	32,809
Queens	2,253,858	314	18,818
Richmond (Staten Island)	476,143	32	2,564
Outside NYC/Unknown	N/A	157	12,376
Tri-County Region	1,391,615	109	3,729
Putnam	98,320	5	122
Rockland	325,789	24	621
Westchester	967,506	80	2,986
Total	9,728,432	1,881	132,148

Sources: Population estimates: U.S. Census Bureau, American Fact Finder: Quick Facts –2019; New York, Kings, Queens, Bronx, and Richmond counties (NYC): NYC HD, BHIV, data as of 3/31/20; Putnam, Rockland, and Westchester counties: NYSDOH, BHIV, data as of 6/26/20.

*HIV diagnoses include those who were concurrently diagnosed with HIV and AIDS.

b) Socio-demographic characteristics of newly diagnosed, PWH, and persons at high risk.

i-ii) Demographic and socioeconomic data. In 2019, among people newly diagnosed with HIV in the NY EMA, 78% were men, 45% were non-Hispanic Black¹, 38% were Latino/Hispanic, 68% were younger than 40, and 55% were men who have sex with men (MSM), including MSM with a

¹ From this point forward, non-Hispanic Black individuals will be referred to as Black, and non-Hispanic White will be referred to as White. The term “Black” is used throughout this document rather than “African American” because NYC has substantial numbers of people of Caribbean origin who do not identify as “African Americans.”

history of injection drug use (MSM-IDU). In the same year, 3% of new HIV diagnoses in NYC were among transgender people, 96% of whom were transgender women. Data on transgender, gender non-conforming, or non-binary (TGNC/NB) populations are not available for the Tri-County Region. Approximately 90% of newly diagnosed transgender women were Black or Latina, and 56% of newly diagnosed transgender women were Black or Latina ages 20 to 29 years.

In 2019, among PWH in the NY EMA, 72% were men, 43% were Black, 33% were Latino/Hispanic, and 45% were MSM, including MSM-IDU. While new diagnoses remain concentrated among people younger than 40 (68%), people older than 50 accounted for more than half of PWH in 2019 (59%). This highlights the aging of PWH in the NY EMA and underscores the importance of addressing the complex needs of older PWH (OPWH).^{vii}

The number of PWH is highest in low-income Black and Latino/Hispanic communities, where many individuals experience multiple challenges that severely impact health, including racism, stigma, poverty, trauma, mental health (MH) issues, food insecurity, and housing instability. Based on data from NYS Department of Health (NYSDOH), as of July 2020, 64% of PWH diagnosed and reported in the NY EMA were enrolled in Medicaid, and 22% were dually enrolled in Medicaid and Medicare (*see Table 2 on p. 14 for more details*). In comparison, 27% of all NY EMA residents were enrolled in Medicaid in the same time period.^{viii} In 2019 in the NY EMA, PWH residing in high poverty neighborhoods (at least 30% of residents living below the federal poverty level (FPL)) represented 22% of all PWH, and 26% of all deaths among PWH; in comparison, PWH residing in low poverty neighborhoods (less than 10% of residents living below FPL), represented only 10% of all PWH, and 5% of all deaths among PWH in the NY EMA. See *Attachment 3* for the complete diagnoses, number of PWH, and mortality table.

c) Rates of increase in HIV-diagnosed cases within new and emerging populations.

i) Identifying emerging populations, unique challenges, and estimated costs to RWHAP Part

A. As a jurisdiction with a mature epidemic, the number of PWH in the NY EMA has remained relatively stable demographically over the past decade or more. However, the number of new HIV diagnoses reported in NYC from 2001 to 2019 decreased overall and among men and women, all age groups, all NYC boroughs of residence, and within most race/ethnicity and transmission risk categories. This decrease was significant (P value <0.01) for all subgroups except transgender people and Asian/Pacific Islander people.

Data from ongoing HIV surveillance, service utilization analyses, and other sources show that HIV continues to disproportionately affect low-income Black and Latino/Hispanic communities; cisgender gay, bisexual, and other MSM, with increased inequities among youth/young adult men ages 13 to 29 years who have sex with men (YMSM) and Black and Latino MSM; Black and Latina cisgender women; and Black and Latina transgender women. As the impact of HIV on the above populations has been persistent within the NY EMA, no population could be considered emerging.

In 2019, ZIP codes in the Chelsea-Clinton, High Bridge-Morrisania, and Central Harlem-Morningside Heights neighborhoods had the highest new HIV diagnosis rates among NYC neighborhoods; ZIP codes in Chelsea-Clinton and West Queens had the highest HIV prevalence. Many ZIP codes with high new HIV diagnosis rates were also among those with the highest poverty rates, including those in High Bridge-Morrisania. However, ZIP codes in the higher income Chelsea-Clinton neighborhoods were the exception, with the highest new HIV diagnosis rates but relatively low poverty and mortality rates.^{ix} In 2017, people living in high poverty neighborhoods were least likely to have VS compared with people living in lower poverty neighborhoods.^x Previous analyses showed that the rate of HIV/hepatitis C (HCV) coinfection

was five times higher in high poverty neighborhoods than in low poverty neighborhoods; a similar pattern was seen for HIV/hepatitis B and HIV/tuberculosis (TB) coinfection.^{xi}

Improving access to basic necessities for the most vulnerable is critical to ensuring people address their HIV health needs. Thus, the NY EMA allocated 46% of GY21 funds to supportive services, including \$12.5 million to housing services and \$9.7 million to food and nutrition services (FNS). NY EMA further invested in oral health care (\$690,630), emergency financial assistance (EFA) (\$685,618), and other professional services (legal services) (\$4.9 million). To support continued engagement of people most at risk for falling out of care and to address their unique challenges, NY EMA's largest investment was in medical case management (MCM) (\$22.6 million), of which there are two models in the GY21 plan: Care Coordination Program (CCP) and Tri-County MCM.² Both programs serve to engage, link, and retain PWH in medical care to further address barriers to VS. CCP, which was rebid in 2018, has medical eligibility criteria that ensure these resources are prioritized for those who most need them, including people with a history of falling out of care, people who have not achieved VS, and people newly diagnosed with HIV. PWH with HCV and PWH who are pregnant, and who need additional adherence support, are also eligible for CCP services.

ii) Increased need for HIV-related services. As the number of PWH has increased and inequities have persisted, demands on the NY EMA's service system and need for RWHAP Part A funding along the entire HIV care continuum have grown. *Figure 1* illustrates that the need for care remains high in NYC despite the decrease in new HIV diagnoses, due to PWH living longer, healthier lives. **Figure 1. History of HIV epidemic, NYC 1981-2018**

² Two subcategories are included under the MCM category: NYC Care Coordination and Tri-County MCM. Note that from here forward the term "Care Coordination Programs (CCP)" refers specifically to NYC Care Coordination efforts, while MCM describes the general category for the entire NY EMA.

While the number of new HIV diagnoses in NYS has declined, the HIV diagnosis rate in NYS is the highest among Northeastern states, and similar to that of some of the Southern states. The average rate of HIV diagnoses in 2018 (per 100,000 people) was 15.6 in the South and 9.9 in the Northeast. However, NYS's HIV diagnosis rate (12.6) is within the range of southern states—where rates range from 4.8 in West Virginia to 23.8 in Georgia, including North Carolina (11.5), South Carolina (14.1), Texas (15.3), and Mississippi (16.0).^{xii}

Despite overall decreases in estimated HIV incidence among MSM of all race/ethnicities in NYC from 2014 to 2018, in 2018 the estimated incidence among Black and Latino MSM was more than twice the incidence among White MSM. MSM ages 25 to 29 years and 30 to 39 years had the highest HIV incidence rate compared to other age groups.^{xiii} HIV incidence among all MSM attending the NYC HD's Sexual Health Clinics (SHCs) declined from 2012 through 2017, but racial and ethnic inequities persist. Among people with newly diagnosed HIV in NYC in 2018, Black people, women, people ages 20 to 29 years and 50 years and older, people reporting heterosexual, MSM, or MSM-IDU risk less frequently initiated care within one month of diagnosis. There were also inequities in VS among newly diagnosed people in 2019, with Black people, people ages 40 years and older, people with a history of IDU, transgender people, and people of unknown transmission risk all having lower VS rates than their counterparts.^{xiv} In 2019, PWH with a history of IDU were disproportionately represented among all PWH who died, making up only 11% of PWH but 25% of deaths among PWH in the NY EMA.

In the 2017 National HIV Behavioral Surveillance cycle, 28% of the NYC MSM interviewed reported engaging in non-injection drug use for one week or more in the previous 12 months, and compared to those over the age of 50, a much higher proportion of MSM under the age of 50 reported binge alcohol use in the previous 12 months.^{xv} NYC HD routinely conducts surveys online and in-person among sexually active NYC MSM, ages 18 to 40 years. Among eligible online participants in fall 2019, 4.7% (48/1,021) reported methamphetamine use in the past six months; there were no statistically significant differences by race/ethnicity.^{xvi} According to data from the Electronic System for HIV/AIDS Reporting and Evaluation (eSHARE)³, recent methamphetamine use among MSM in the RWHAP Part A population increased from 4.2% in fiscal year (FY) 2012 to 9.6% in FY19. Recent methamphetamine use was highest among MSM who are homeless (11.1%) compared to MSM with a residence in any other borough (Bronx, 8.8%; Brooklyn, 9.1%; Manhattan, 11%; Queens, 5.8%; and Staten Island, 9.4%). Previous work by the NYC HD found methamphetamine use to be associated with unsuppressed VL.^{xvii}

Despite progress toward identifying PWH in the NY EMA and linking them to medical care, HIV still causes significant morbidity and mortality, particularly among Black and Latino/Hispanic communities. A study assessing the relationship between place-based characteristics and VS among MSM in NYC found that residents living in United Hospital Fund (UHF) neighborhoods where less than 30% of residents were Black had a statistically significant higher likelihood of achieving VS, compared to those living in UHF neighborhoods where more than 30% of residents were Black.^{xviii} In another study assessing pre-death care patterns among PWH in NYC, PWH with HIV-related mortality had lower rates of VS, with lowest rates among Black and Latino/Hispanic PWH. In addition, although 54% of deaths between 2007 and 2013 among NYC PWH were due to non-HIV-related causes, 35% of White people compared to 48% of Black and/or Latino/Hispanic people died due to an underlying HIV-related cause.^{xix} Although deaths attributed to HIV have fallen from 2,012 in 2007 to 1,683 in 2018, HIV was the tenth leading cause of

³ eSHARE is a web-based platform for HIV service provider reporting that permits enhanced information-sharing between programs within agencies and real-time access to demographic, services, and outcomes data at the NYC HD.

premature death overall among NYC residents under 65 years of age, and the fifth and sixth leading cause of premature death for Black and Puerto Rican New Yorkers, respectively.^{xx}

2) HIV Care Continuum.

Figure 2. 2018 NY EMA HIV Care Continuum

Sources: Prescribed ART: NYC HD, Medical Monitoring Project (MMP), 2018; All other: NYSDOH, BHIV Epidemiology, data as of 6/26/20.

Notes: “HIV-diagnosed”: those diagnosed by 12/31/18 and living & residing in NYC or the Tri-County Region as of 12/31/2018; “Linked to care”: those newly diagnosed with HIV in 2018 with one or more VL or CD4 count within 30 days of diagnosis; “Retained in care”: those among HIV-diagnosed with at least two VL or CD4 counts in 2018 at least 91 days apart; “Receipt of Care”: the proportion of NYC MMP participants whose medical record documented ART prescription during 12 months prior to MMP interview date (interview date range 9/19/18 – 4/23/19); “Virally suppressed”: those among HIV-diagnosed whose most recent VL in the year was <200 copies/ml.

Although the NY EMA (*as seen in Figure 2*) is working toward EHE goals related to retention in care (90%) and VS (90%), inequities exist among certain subpopulations. In 2018, Black MSM ages 13 to 29 years (YBMSM), Black women, Black OPWH, and Black transgender women were the most disproportionately impacted populations in the NY EMA; these inequities are displayed in *Figures 3a through 3d*. Among YMSM, only 67% of YBMSM were virally suppressed in 2018 as compared to 75% of White MSM ages 13 to 29 years (YWMSM) and 72% of Latino MSM ages 13 to 29 years (YLMSM). Barriers to care include the lack of youth- and young adult-friendly health clinics, lack of social and family support, and lack of technology use to connect patients to a community of other youth/young adults living with HIV and to help them readily access health care providers and track personal data and information.

In 2018, among women living with HIV in the NY EMA, VS was lower among Black women (73%) when compared to White women (77%) and Latina women (78%). Among OPWH, VS was lowest among Black OPWH (77%) compared to White OPWH (82%) and Latino/Hispanic OPWH (81%). HIV care has been fraught with stigma and racism, and the impact of age-related conditions coupled with structural inequities in care are a major barrier to care for Black OPWH. Similarly, among transgender women, VS was lowest among Black transgender women (64%) compared to White transgender women (71%) and Latina transgender women (72%).

These inequities are addressed in part by geographically targeting services to underserved neighborhoods with high numbers of PWH and prioritizing service types that address structural inequity, access to and engagement in care, support for adherence to ART, and basic survival needs (e.g., Housing, FNS, CCP). In 2018, the BHIV’s Care and Treatment Program (CTP) also introduced a number of work groups focused on youth, OPWH, Black and Latina transgender women, and Black and Latina cisgender women, to more systematically identify strategies for reducing inequities. The Planning Council (PC) and CTP also created a service directive for

transgender PWH in NYC. A survey by Black and Latina Cisgender Women Work Group members found communities' top unmet needs include the role of race/racism and stigma in treatment of Black and Latina women with HIV; increasing trauma-informed approaches and services to address trauma experienced by Black and Latina women with HIV; and increasing access to comprehensive social supports for Black and Latina women with HIV. The Black and Latina Transgender Women Work Group identified the absence of transgender providers and staff in HIV medical care and service provision as a major barrier to care. Other barriers include internalized and enacted stigma and use of regular business hours for service provision.

Additionally, the NYS ETE initiative includes a goal that by the end of 2020, 75% of PWH will achieve sustained VS⁴. According to data reported to the NYC HD as of March 31, 2020, in 2019, 69% of PWH established in HIV medical care in NYC achieved sustained VS. Continued efforts to reduce inequities in VS among YBMSM, Black women, Black OPWH, and Black transgender women will drive progress towards these goals.

Notes: Data includes transwomen diagnosed by 12/31/17 and living and residing in NYC region as of 12/31/18.

Virally suppressed includes transwomen whose most recent VL in the year was <200 copies/ml.

*NYSDOH does not currently collect transgender data for the Tri-County Region.

3) Co-occurring conditions (see Attachment 4).

a) Hepatitis C virus (HCV). Roughly 10.6% of PWH in NYC were diagnosed with HCV by December 31, 2018. HIV/HCV coinfection can lead to higher VLs and accelerate the onset of HCV-related complications, including cirrhosis and end-stage liver failure, particularly when HIV is not well-managed. In an analysis among people with HIV/HCV coinfection in NYC in 2016, those without durable VS were 66% less likely to initiate HCV treatment.^{xxi} Facilitating engagement in HCV treatment is vital; according to preliminary findings from a NYC HD analysis of mortality among RWHAP Part A clients served in at least one long-term RWHAP program from 2013-2015, clients diagnosed with HCV had significantly higher odds of death than those without HCV.

NYS Medicaid covers Direct Acting Agents (DAAs) that cure HCV with very few limitations, but coverage under other forms of insurance varies widely. For PWH who are uninsured, or who need assistance with co-pays and deductibles, NYS AIDS Drug Assistance Program (ADAP) added most DAAs to the formulary in November 2016, with the exception of those made by one drug manufacturer. Despite wider availability of effective, well-tolerated treatments in NYC, only 67% of coinfecting RWHAP Part A clients appear to have initiated HCV treatment by the end of 2018; however, this is an increase from 59% at the end of 2017.^{xxii} In July 2018, Governor Cuomo released the nation's first strategy to eliminate HCV allocating \$5 million primarily to community health centers and local health departments outside of NYC. Further, the plan seeks to expand

access to HCV treatment by implementing new policies that will increase access at HR provider settings such as syringe exchange programs. NYS will also require managed care organizations (MCOs) to (1) extend the prior authorization period to six months; (2) eliminate the requirement that patients undergo VL testing in order to continue receiving HCV medication; and (3) reimburse health care providers for use of telehealth or videoconferencing services as a part of HCV treatment.

b) Sexually transmitted infections (STIs). STIs increase the risk of sexual HIV transmission.^{xxiii} In 2018, NYC's STI case rates were highest in neighborhoods with high HIV prevalence; Central Harlem and Chelsea have high rates of primary and secondary (P&S) syphilis, gonorrhea, and chlamydia. In the NY EMA, rates of STIs are higher among PWH than the general population. In 2019, the preliminary rate (per 100,000) of P&S syphilis was 23.6 for the general population, and nearly nine times higher (209.3) for PWH. This is mirrored in preliminary rates of gonorrhea (344.9 for general population vs. 1,206.1 for PWH) and chlamydia (907.2 for general population vs. 1,738.7 for PWH). Since 2001, the number of P&S syphilis cases has increased six-fold in NYC overall. Preliminary data show that in 2019, 95% (1,865/1,973) of P&S syphilis diagnoses were among men, and among those who reported the sex of their sex partners during interview, 88% were MSM; among MSM with P&S syphilis in 2019, 43% were PWH. These data also show that in 2019, over 76,000 new chlamydia diagnoses and approximately 29,000 new diagnoses of gonorrhea were reported in 2019; the highest case rates were seen among Black and Latino men under 29 years of age. Gonococcal infections with decreased susceptibility to azithromycin continue to be reported; however, there is little current evidence of drug resistance to cephalosporins.

c) Mental illness. In the Community Health Advisory & Information Network (CHAIN)⁵ surveys conducted between June 2015 and February 2020 among PWH, 37% of the NYC cohort and 24% of the Tri-County Region cohort reported having severe mental illness (SMI). Among NYC RWHAP Part A clients enrolled and served in 2019, 25% screened positive for depression and 24% screened positive for anxiety using the PHQ-4 tool. Additionally, analyses have found a VS disparity among GY18 RWHAP Part A clients with a recorded MH screen in eSHARE, 76% of clients with at least one MH diagnoses achieved VS. Clients who indicated psychosis had the lowest proportion of VS (67%), followed by bipolar disorder (69%).^{xxiv} In a study examining the relationship between RWHAP Part A MH services utilization and MH outcomes among PWH, higher utilization of MH services was associated with improvements in MH functioning.^{xxv}

d) Substance use disorder (SUD). Among CHAIN participants surveyed from June 2015 to February 2020, 20% of the NYC cohort and 2.7% of the Tri-County Region cohort reported substance use, including IDU. Additionally, 11% of the NYC cohort and 21% of the Tri-County Region cohort reported lifetime IDU. Among RWHAP Part A clients served in 2019, 19% of those assessed reported recent hard drug use (e.g., cocaine, heroin, methamphetamine, and/or prescription drugs). Of RWHAP Part A clients with some evidence of HIV medical care (i.e., at least one lab report) in 2019, 65% of those who reported recent hard drug use during the year were virally suppressed, compared to 83% of those who did not report recent hard drug use.

e) Homelessness. The NY EMA has a high prevalence of homelessness and housing instability, and a real estate market with an extremely low vacancy rate, creating an affordable housing shortage for those most in need.^{xxvi} Between 2011 and 2016, median rents in low-income neighborhoods

⁵ The CHAIN cohort study, in place since 1994, provides ongoing information on the characteristics, co-morbidities, and care needs and service use patterns of PWH in the NY EMA. More than 4,000 PWH have completed 15,516 interviews conducted by researchers at Columbia University. The cohort is broadly representative of the PWH in the NY EMA, with modest over-representation of Black men and women and Latino men, so that participants more closely represent the NY EMA's RWHAP Part A clients.

increased by 26.2%, while real median household incomes fell by less than 3%.^{xxvii} Rent burden is high; in 2017, 50% of NYC renters paid more than one-third of their incomes for rent and utilities, while 32% paid more than one-half of their incomes for rent and utilities.^{xxviii} The COVID-19 pandemic has exacerbated homelessness and housing instability. During the NYS on PAUSE order, many businesses closed or operated at a reduced capacity, resulting in loss of income for many households, increasing the risk of eviction and homelessness, and decreasing the ability to take shelter in place measures to minimize the risk of exposure to COVID-19.^{xxix}

Nearly 133,000 unique individuals accessed the NYC shelter system in FY19, a 61% increase over the last 10 years.^{xxx} Data from the 2020 annual NYC Homeless Outreach Population Estimate Street Survey suggest that nearly 3,900 homeless individuals may be unsheltered on any given night.^{xxxi} Black and Latino/Hispanic people are disproportionately affected by homelessness and housing insecurity, representing 86% of NYC single adult shelter residents in 2020.^{xxxii} Studies also show that the large majority of NYC street homeless have a MH diagnosis and/or other chronic conditions.^{xxxiii} In response, NYC released its Housing New York 2.0 Plan in 2017, and as of September 30, 2019, has created or preserved 136,912 units of affordable housing.^{xxxiv}

The prevalence of homelessness among PWH is especially high. Among CHAIN participants surveyed from June 2015 to February 2020, 15,146 per 100,000 of the NYC cohort, and 775 per 100,000 of the Tri-County Region cohort were homeless. Housing instability and homelessness were also prevalent among RWHAP Part A clients served in 2019, with 9% of those assessed reporting accessing temporary housing during the year, and 21% reporting being unstably housed. Among those engaged in HIV medical care in 2019, 78% of temporarily housed and 66% of unstably housed clients were virally suppressed, compared to 84% of those with stable housing, underscoring the added health benefits of being stably housed.

The risk of acquiring HIV is 90% lower for homeless people in NYC who receive three or more consecutive years of supportive housing, compared with homeless people in NYC who apply for but are not placed in supportive housing.^{xxxv} The average monthly health care and public service costs for chronically homeless people can fall more than 50% following the provision of housing, substance use treatment, and other needed support services.^{xxxvi} PWH enrolled in CHAIN whose HIV medical care did not meet minimum clinical standards and who receive housing assistance were 1.4 times more likely to enter appropriate HIV primary care than those not receiving housing assistance. PWH adhering to ART and who received housing assistance were 1.5 times more likely to remain adherent to ART treatment than those not receiving housing assistance.^{xxxvii} Research also shows longer-term HOPWA enrollment is associated with better HIV health outcomes compared to shorter enrollment.^{xxxviii}

f) Formerly incarcerated individuals. Over two-thirds of NYS inmates return to NYC and reside in seven ZIP codes located in Central Brooklyn, Central and East Harlem in Manhattan, and the South Bronx, where the number of new HIV diagnoses and prevalence of PWH are among the highest in NYC.^{xxxix} According to the NYC Community Health Survey (CHS), over 50,000 people returned to the NY EMA from NYS prisons and local jails within calendar year 2017. Of those released, an estimated 2,400 (8%) were PWH returning primarily to these three areas. Further, while the overall NYC jail census declined from 5,500 in March 2019 to 4,000 in March 2020, the percent of PWH in NYC jails doubled from 4% to 8%, illustrating the overrepresentation of PWH in NYC jails. Approximately 40% of RWHAP Part A clients assessed in 2019 reported a history of incarceration. Among those in HIV medical care in 2019, 69% of clients with a history of incarceration were virally suppressed, compared to 86% of those who had never been incarcerated.

A 2010 cost analysis found that the mean cost of providing linkages to care and social support services to achieve VS among formerly incarcerated PWH is \$8,432. Compared to standard care, the cost per additional quality-adjusted life year saved is \$72,285 suggesting HIV linkage services for formerly incarcerated people is cost-effective.^{xi} These high costs may be attributable to the challenges that formerly incarcerated people—many of whom are Black or Latino/Hispanic—often face upon release, such as homelessness, MH issues, substance use/addiction, joblessness, and other chronic conditions. The presence of these challenges can undermine continuity of care and linkage to case management, housing, financial assistance, and other services.

g) COVID-19 and HIV. To better understand the intersection of COVID-19 and HIV—including the number of PWH diagnosed with COVID-19, whether PWH are at increased risk for COVID-19, and whether PWH have poorer health outcomes following COVID-19 infection—NYC HD conducted a match of reported COVID-19 case and death data against HIV surveillance data. Using the NYC COVID-19 surveillance dataset of confirmed COVID-19 cases and confirmed and probable deaths attributed to COVID-19 (reported as of June 2, 2020), and data from the HIV Surveillance Registry (reported as of March 31, 2020), NYC HD found that PWH made up 1.2% of people diagnosed with COVID-19; a slight under-representation given PWH are 1.5% of the general NYC population. Of the PWH diagnosed with COVID-19, there was an over-representation of Black (45%) and Latino/Hispanic (41%) people compared with citywide diagnoses of COVID-19 (29% Black, 33% Latino/Hispanic). Furthermore, higher proportions of PWH with COVID-19 experienced more serious COVID-19 complications than citywide cases overall, with 42% hospitalized (vs. 26%), 5% admitted to ICU (vs. 3%), and 13% deceased (vs. 8%). The match also identified that 64.3% of PWH with COVID-19 had an underlying condition, versus 35.4% citywide with COVID-19. To address the needs of PWH and of RWHAP Part A subrecipients, the NY EMA transitioned to a cost-based reimbursement model to ensure clients are served effectively and programs costs are addressed. See *p. 14* for additional details.

h) Tobacco dependence. Despite a record low prevalence of smoking in NYC (less than 14%), heavy tobacco use and dependence persist among several populations, including PWH.^{xii} In addition to the commonly known negative health effects of tobacco use, PWH are at additional risk for HIV-specific adverse health outcomes. An analysis conducted by the NYC HD found that recent tobacco smoking was reported by 39% of PWH enrolled in RWHAP Part A in 2019. Recent tobacco smoking was independently associated with low CD4 cell counts and unsuppressed VL, even after controlling for several clinical and sociodemographic characteristics, including substance use and ART prescription status.^{xiii} Data from a CHAIN study confirmed prior findings of the detrimental effect of smoking on long-term survival. Former smokers had a higher rate of long-term survival than current smokers, suggesting that smoking cessation interventions may be an effective means to lengthen life among PWH.^{xiii} Additional studies have found increased risk for some cancers and death, and a reduction in life expectancy related to tobacco use, regardless of VL and CD4 count.^{xliv} In studies exploring tobacco dependence and behavioral health, tobacco use is associated with worse SUD treatment outcomes and increased depressive symptoms.^{xlv}

Despite mounting evidence of poor health outcomes among PWH who smoke, studies show that tobacco smoking is not routinely addressed by HIV service providers, including support service providers such as those in RWHAP Part A-funded MH or HR services. Among RWHAP Part A clients served in 2019, those receiving HR services in the NY EMA and MH services in the Tri-County Region had the highest rate of recent smoking, at 62% and 67% respectively. The NY EMA works with MH and HR providers to treat tobacco dependence in tandem with medical and behavioral health to support significant short- and long-term health benefits to PWH.

i) Intimate Partner Violence (IPV). The NYC HD's PlaySure Network for HIV prevention is a citywide network of HIV testing sites, CBOs, and clinics working together to promote patient-specific approaches to sexual health and HIV prevention, increase access to PrEP and PEP, and link people who test positive for HIV to care. In 2019, among all PlaySure Network clients with a baseline assessment, approximately two-thirds said that their partner had never: physically hurt them, insulted or talked down to them, threatened them with harm, or screamed or cursed at them. Roughly 3% said that their partner had sometimes, fairly often or frequently physically hurt them, insulted or talked down to them, threatened them with harm, or screamed or cursed at them. However, 27% of clients declined to answer any of the questions. When asked about their interest in a referral to an IPV support program, 1.2% of clients said yes, 6.2% declined to answer, 27% said this was not applicable to them, and 66% said no.

4) Complexities of Providing Care.

a) Impact and response to a reduction of RWHAP Part A funding.

Impact. The NY EMA has seen reductions totaling approximately \$28 million since GY11, including a reduction of 1.4%, or \$1,330,082, in GY20. During this period of reductions, the PC and the Recipient have acted to preserve, to the greatest extent possible, those services that most directly impact the health of PWH. All RWHAP service categories have experienced reductions in funding over the years, and, after a careful review of other payers, four have been eliminated altogether: Home and Community-Based Health Services, Outpatient/Ambulatory Health Services, Transitional Care Coordination, and, most recently, Non-MCM. In the last three years, the ADAP allocation alone has absorbed the bulk of the reductions after frank and thoughtful conversations and planning with the NYS HIV Uninsured Care Programs (NYS HUCP), the state program that administers ADAP and other programs for PWH. NYS HUCP was able to absorb the reductions by refocusing some of its rebate funding and RWHAP Part B supplemental funding to preserve NYS HUCP services. With each year's reduction, the PC and the Recipient have been strategic in their response and proactively plan to ensure funding reductions do not erode the NY EMA's successes in VS and reductions in morbidity and mortality.

Response. To address the reduction in funding, the PC's Priority Setting and Resource Allocation (PSRA) Committee reassessed each category through an extensive review of Service Category-Specific Fact Sheets in GY20. The documents compiled up to five years of data on allocations, expenditures, service utilization (by service unit), and client demographics. The Fact Sheets also summarized data on payer of last resort (POLR) issues and systems-level considerations (e.g., changes in federal, state, and local funding and policies). To meet the reduction in the GY20 award, the PSRA Committee was able to utilize savings of \$298,268 in the carrying costs of four service categories: n-MCM/Currently or Recently Incarcerated, n-MCM/General Population (NMG), MH, and HR. These service categories did not require the same funding level due to permanent contract take-downs or terminations, as reported by the Recipient. In order to cover the remainder of the reduction to the award, the PC worked closely with the NYSDOH to agree on a reduction of \$1,031,814 to the NY EMA's allocation to ADAP to cover both the reduction in the grant award and the enhancements to categories with demonstrated need. Following the PC's approved reprogramming plan, the reduction to ADAP will be partially restored through reprogramming dollars from underspending contracts over the course of the year, and there will be no effect on the availability of medications for ADAP enrollees. In GY20, the PC enhanced two critical services—FNS and EFA—through unallocated Part A funds resulting from an Early Intervention Services (EIS) contract discontinuation and the reduction in the ADAP allocation.

The NY EMA was also able to increase support for housing through funding received under the Coronavirus Aid, Relief, and Economic Security (CARES) Act.

b) Table 2. NY EMA Uninsured and Poverty

Diagnosed and reported PWH in NY EMA	# of PWH	% of PWH
<i>a1.</i> PWH in the NY EMA enrolled in Medicaid	54,945	63.8%
<i>a2.</i> PWH in the NY EMA enrolled in Medicare & Medicaid (dual eligible)	11,983	21.8%
<i>a3.</i> PWH in the NY EMA enrolled in marketplace exchanges	21,840	25.4%
<i>b.</i> PWH in the NY EMA without any insurance coverage	9,326	10.8%
Active RWHAP clients in the NY EMA, GY20		
<i>c1.</i> PWH in the NY EMA living at or below 100% of 2020 FPL	10,587	80.0%
<i>c2.</i> PWH in the NY EMA living at or below 138% of 2020 FPL	11,712	88.5%
<i>c3.</i> PWH in the NY EMA living at or below 400% of 2020 FPL	13,191	99.6%
<i>c4.</i> PWH in the NY EMA living at or below 500% of 2020 FPL*	13,224	99.9%

Sources: Data in sections a. and b. provided by NYSDOH to NYC HD. Dual eligible is a subset of Medicaid enrolled. Numbers and corresponding percentages reflect insurance program enrollment available through July 2020. Numbers and corresponding percentages in section c. are from eSHARE.

*Residents with income under 500% FPL are eligible for RWHAP services. No income restrictions EIS or HE/RR.

As a result of the COVID-19 pandemic, the NYC unemployment rate was reported at 16% in August 2020.^{xlvii} Since health insurance is tied to many individuals' employment, many New Yorkers found themselves without coverage during the pandemic. Insurance coverage is even more critical for PWH to access necessary medical and supportive services that support VS. According to preliminary data from NYSDOH, more than 4,900 PWH in the NY EMA enrolled in Medicaid, Medicaid/Medicare (dual eligible), or the marketplace exchanges since February 2020 as a result of the COVID-19 pandemic (i.e., indicated job loss, COVID-19 positive test, etc.). Further, an estimated 1,600 PWH in the NY EMA have been without insurance coverage since February 2020.

c) Barriers to accessing health care.

COVID-19. In the current era of COVID-19, clients have experienced numerous barriers to care—reported VL labs to NYC surveillance dropped by 77% in April 2020 when compared to April 2019. To address the challenges and ensure the NY EMA preserves the HIV care system, the Recipient directed reimbursement for cost (versus performance-based reimbursement) until further notice. Use of telehealth has been strongly encouraged and taken up by the vast majority of service providers as appropriate (with the exception of housing and FNS providers which require mostly in-person contact with clients using CDC guidelines). Within the first month of the pandemic, the Recipient communicated the expectation that each client enrolled in each program be contacted to determine their needs with follow up as appropriate. As mentioned earlier, the Recipient worked with the PC to allocate additional resources to critical FNS, Housing, and EFA services.

Geographic variation. NYC is well known for its extensive subway system, but the NY EMA also includes three counties north of NYC that are mostly suburban or rural, and that lack many of the resources of NYC. Not only do non-NYC counties lack robust mass transit, they also do not have as many resources that support access to and retention in health care.

Thus, while New Yorkers are a highly insured population, limited transportation services and lack of local specialists and service providers serve as barriers to obtaining appropriate health care. To increase access to services, the NY EMA considers geographic distribution of contractors during procurement and contracting and has allocated \$358,057 to medical transportation to provide access to taxi and gas vouchers, as appropriate, and to mass transit options where available. The medical

transportation program in the Tri-County Region of the NY EMA ensures that clients are able to attend appointments for services related to their HIV primary care, including medical care, SUD treatment, MH appointments, and to pick up prescriptions. In addition, the NY EMA will enhance EFA in GY21 to help address barriers to care for RWHAP Part A participants throughout the NY EMA. The EFA program is housed in the Tri-County Region, and while it was originally set up to serve that area, the program was enhanced in GY20 and GY21 to cover emergent needs directly affecting the care and treatment of RWHAP Part A clients throughout the NY EMA. The EFA service category entitles any RWHAP Part A participant up to \$2,000 to cover the cost of an emergent need relating to their HIV care and treatment.

Adequacy of health insurance coverage. NYS Medicaid, which expanded to include adults up to 138% FPL with the passage of the Affordable Care Act (ACA), provides insurance coverage for eligible PWH. In addition, insurance coverage is available at no cost to PWH with an income up to 500% of the FPL through a combination of expanded Medicaid and NY State of Health insurance exchange plans alongside support for premiums and copays from the NYS HUCP (*see p. 33-35 for details*). These changes affected health insurance options in the jurisdiction, as well as RWHAP Part A service needs and delivery. From June 2016 to December 2019, Medicaid enrollment increased by 17% among PWH in the NY EMA. In order to continue this trend, specific outreach and enrollment activities continue throughout the NY EMA to ensure that people eligible for health care coverage are enrolled and that coverage is maintained.^{xlvi} Specifically, all RWHAP Part A contracts require programs to assess insurance status and maintain linkage and referral relationships with health plan navigation services to facilitate enrollment in health plans for eligible individuals at enrollment and at every six month reassessment.

Cultural and language barriers. The NY EMA is home to more than 200 languages—with half of New Yorkers speaking a language other than English, including monolingual and multilingual people. Within the RWHAP Part A population, 26% of non-EIS clients in GY19 reported a language other than English as their primary language. Of clients reporting a primary language other than English, most speak Spanish (80%), followed by French (4%), Haitian Creole (3%), African languages (2.5%), and French Creole (2.2%). RWHAP Part A clients also speak Russian, Portuguese, Mandarin-Chinese, Arabic, Tagalog, and Thai, among other languages.

To address these diverse language needs, the NY EMA prints materials in the most common languages of the jurisdiction: English, Spanish, and French/Haitian-Creole. Providers will often adapt and translate materials to meet the needs of their client populations. For example, an agency with expertise in serving Chinese-speaking clients translated CCP materials into Chinese.

To improve services to the diverse RWHAP Part A client population, the Recipient has taken steps to implement standards for Culturally and Linguistically Appropriate Services in Health and Health Care (CLAS Standards).^{xlvi} To help subrecipients recognize steps to make services more responsive to the diversity of clients receiving RWHAP Part A services, the Recipient formed a work group to develop a CLAS Standards self-assessment programs may use to compare their organizations against CLAS Standards. It includes 20 questions addressing governance, leadership, workforce, communication, language assistance, engagement, continuous improvement, and accountability. Providers are asked to complete the self-assessment internally, identify areas for improvement, and take action through quality improvement (QI) projects. NYC HD distributed the tool to NYC RWHAP Part A providers in May 2019 and to Tri-County Region providers in July 2019. Providers are contractually required to complete the self-assessment, identify areas for improvement, and include action steps in their annual RWHAP Part A Quality Management Plan.

Service gaps and plans to address them. The RWHAP Part A service portfolio is carefully designed to meet needs identified through surveillance, program evaluation, CHAIN data, and changes in the NY EMA's health care landscape. Identified needs are addressed through incorporation of lessons learned and evidence-based interventions in service models to support effective diagnosis, linkage to and retention in care, and adherence to ART. COVID-19 has presented additional service needs that the RWHAP Part A program in the NY EMA has sought to address. As previously stated, the Recipient added funds to Housing, FNS, and EFA services to help ensure participants are housed, fed, and able to focus on their HIV care and treatment during the pandemic.

Individuals diagnosed but not currently engaged in care. Based on the HIV care continuum, 29% of people diagnosed with HIV and presumed to still be living in the NY EMA are not currently engaged in care. In addition to robust supportive services to locate and engage these individuals back into care, the RWHAP Part A program provides \$818,259 in funding to the nationally recognized Assess. Connect. Engage. (ACE) Team (formerly Field Services Unit) within the NYC HD's BHIV, which uses a data-to-care (D2C) model to identify PWH who, according to surveillance data, have been lost to care. The aim is to identify and reach people deemed to have never been in care since HIV diagnosis to: (1) ensure that they were aware of their own diagnosis, and (2) assist them with linkage to HIV primary care and services. To do so, the ACE Team has established collaborative relationships with NYC HIV medical providers, social services agencies, and community-based case management providers. In 2019, the ACE Team located 627 PWH who had been out of care for at least 13 months or had never been in care since their HIV diagnosis. Of these, 409 (65%) were re-engaged or linked to HIV care; and 108 clients had unmet needs (e.g., housing, health benefits, transportation), 82 referrals were made to address their needs, and 35 accessed services. Fifty-seven percent (343/606) of people currently not in care who refused to name partners were offered home test kits (Oraquick Rapid) to deliver to any unnamed partners they might think would benefit from HIV testing. Fifteen percent (50/343) accepted the home test kit and 88% (44/50) were confirmed to have received the test kit. Forty-one percent (18/44) of those who received the kits agreed to complete a follow-up interview about their experience. Among people not in care, 12% (74) were found to have an HCV infection per the NYC HD Viral Hepatitis Registry. Therefore, in addition to HIV linkage to care, 38% (28) of people with HIV/HCV coinfection were linked to HCV care.

Individuals who are not currently virally suppressed. In 2018, 25% of PWH in the NY EMA were virally unsuppressed. In GY21, as in previous years, RWHAP Part A services will be distributed to reach high-need, underserved Black and Latino/Hispanic communities, with consideration given to the geographic distribution of Medicaid and RWHAP Parts B-, C-, D-, and F-funded services and providers' capacity to address health inequities. In addition, CCP clients obtain services co-located or linked with primary care providers. CCP programs linked with primary care are required to have a Memorandum of Understanding (MOU) between the program and the primary care provider to ensure CCP staff are included as members of the care team, have access to the clients' clinical information, and participate in joint case conferences. RWHAP Part A-funded initiatives will continue to be complemented by targeted Minority AIDS Initiative (MAI) programs that promote early diagnosis and linkage, adherence to treatment, and stable housing for PWH of color.

Efforts to retain PWH in care and support ART adherence and VS include the RWHAP Part A MH programs, which engage people with psychiatric diagnoses through navigation; educate on MH issues; coordinate care between MH and medical care providers; treatment adherence support; and provide psychiatric, individual, family, and group MH services for those without another payer. Similar services are also provided in HR programs for those using substances.

Lastly, as described on p. 53 in the Clinical Quality Management (CQM) section, each NY EMA RWHAP Part A provider receives client-level reports of those reported to eSHARE as not virally suppressed, in an effort to ensure that these clients are referred to services addressing barriers to VS.

Early Identification of Individuals with HIV/AIDS (EIIHA).

1) Planned Activities of the NY EMA EIIHA Plan for GY21.

a) Primary activities. The primary activities in the NY EMA's EIIHA plan for GY21 are (1) to promote and increase HIV testing, (2) to improve timely linkage of people newly diagnosed with HIV to medical care, and (3) to increase awareness of and referral to HIV prevention services, including PrEP, PEP, treatment as prevention, and condoms. In 2016, the NYC HD rolled out a "status neutral" approach to HIV prevention and care services that simultaneously addresses the needs of PWH and people not living with HIV (see Figure 4). The NY EMA's EIIHA plan for GY21 will build upon the City's successes with this approach and align with the final NYC EHE plan, including building upon activities funded through CDC PS-18-1802, RWHAP Part A, and other local, state, and federal funding sources, and those being planned and implemented under Project PROSPER and CDC EHE funding (see pgs. 1-2). The ultimate aim of all activities is to strategically advance HIV prevention efforts in the four EHE counties to accelerate NYC's progress in reaching the national goal of a 75% reduction in new HIV infections by 2025.

Figure 4. NYC HD Status Neutral Care Plan

Testing. The NY EMA uses a two-tier approach to pursue the EIIHA goal to increase status awareness and reduce the number of undiagnosed and late diagnosed individuals.

Tier 1. The first tier supports sustainable access to HIV testing services for the general population citywide by promoting routine HIV screening programs in health care facilities. The first-tier approach is consistent with the CDC's 2006 Revised Recommendations for HIV Testing of Adults,

Adolescents, and Pregnant Women in Health-Care Settings. Routine screening enables large numbers of people to be tested by taking advantage of established systems for service provision and provides HIV testing to all, regardless of risk, including those who do not perceive themselves to be at risk or whose providers do not perceive them to be at risk for HIV.

The NY EMA has supported routine screening in the past by issuing guidance to clinicians on HIV testing, conducting public health detailing to clinicians' offices on HIV testing, and delivering grand round presentations to clinical practices and medical training programs. The NY EMA also uses City, CDC, and RWHAP Part A funding to support, but not supplant, HIV testing programs in health care settings and to support the implementation of community-level initiatives that promote HIV testing and normalize the testing experience, which has proven to be effective. In 2019, an estimated 7% of PWH in NYC were undiagnosed.^{xlix} To maximize the impact of funding, routine screening funding is focused on clinical facilities serving neighborhoods that are disproportionately affected by HIV and are underserved, such as the South Bronx, Central Brooklyn, and East and Central Harlem. *Table 3* below provides a breakdown by race/ethnicity of people who receive an HIV test during testing events across NYC among the NY EMA-contracted clinical and non-clinical providers. In GY19, the number of HIV tests was particularly high among enrolled Black and Latino/Hispanic people, with a higher proportion of Black individuals receiving a newly diagnosed confirmed positive test compared to Latino/Hispanic and other MSM individuals. Under CDC EHE funding (PS-20-2010), the NY EMA plans to expand capacity for routine testing by funding two cohorts of clinical providers to make system and policy level changes within their institutions to support routine HIV testing. The estimated start date for these contracts is mid-2021.

Table 3. Newly Diagnosed Positive HIV Test Events March 1, 2019 – February 29, 2020

	Total		*Black		*Latino/Hispanic		MSM		TGNC/NB ⁶	
	Clinical	Non-Clinical	Clinical	Non-Clinical	Clinical	Non-Clinical	Clinical	Non-Clinical	Clinical	Non-Clinical
<i>a</i> # Test events	8,951	10,014	3,127	4,522	3,446	4,485	5,282	1,420	351	287
<i>b</i> # Newly diagnosed positive test events	119	81	66	41	49	36	45	44	7	9
<i>c</i> # Newly diagnosed confirmed positive test events	74	43	40	22	29	20	20	27	6	2
<i>d</i> # Newly diagnosed positive test events with client linked to HIV medical care	81	40	44	20	37	18	23	27	6	2
<i>e</i> # Newly diagnosed confirmed positive test events with client linked to HIV medical care	62	33	32	16	25	16	17	21	5	2
<i>f</i> # Newly diagnosed positive test events with client referred for partner services	19	15	10	8	11	8	3	10	2	-
<i>g</i> # Newly diagnosed confirmed positive test events with client referred for partner services	12	13	4	6	7	8	2	8	1	-
<i>h</i> # Newly diagnosed positive test events with CD4 cell count and VL testing ^{±y}	46	31	24	17	17	14	11	13	2	4
<i>i</i> # Newly diagnosed confirmed positive test events with CD4 cell count and VL testing ^{±y}	38	23	21	11	12	11	9	11	2	2

* Not mutually exclusive groups. Tests of clients identifying as Black and Latino/Hispanic can be found in both sets of columns.

⁶ Transgender, gender non-conforming, or non-binary individuals

[±] Includes clients with lab test(s) occurring on or after confirmatory test date. Restricted to confirmatory test dates from 3/1/19 to 2/29/20 and lab tests that occurred within the same time period.

[¥] CD4 and VL data as of November 2019; data maybe incomplete due to reporting lag.

In the Tri-County Region, Medicaid and private insurers are the primary payers supporting the implementation of the NYS HIV testing law, with supplemental RWHAP Part A support for targeted testing among the uninsured and linkage to care for those who test positive for HIV.

Beyond directly contracting for testing services, the NYC HD has taken an additional approach to engage hospitals and community health centers in routine HIV screening through the citywide HIV testing initiative, *New York Knows*. *New York Knows* represents a NYC HD partnership with CBOs, community health centers, hospitals, colleges and universities, faith-based organizations, and businesses to provide voluntary HIV testing to all New Yorkers, routinize HIV testing in health care, identify PWH who are undiagnosed and link them to care, and connect people at risk of HIV to PrEP and other prevention services. Approximately five million HIV tests have been performed by *New York Knows* partners since 2008, with over 460,000 tests conducted in 2019. In 2019, *New York Knows* announced it will expand its focus to include other STIs and HCV.

Approximately 57,000 HIV tests are conducted each year at NYC HD's eight SHCs. Integrated, opt-out HIV testing is available at NYC HD's TB Chest Centers and SHCs for all patients presenting to a clinic. For over 10 years, SHCs have performed pooled nucleic acid amplification testing (pNAAT) to detect acute HIV infections. pNAAT testing is limited to those individuals who are most likely to present with acute infection, including MSM, people who have shared injection drug equipment, and people who exchange sex for money or other material goods. For the general population, the SHCs test clients with the 4th generation Alere Determine test.

Tier 2. The second tier of the NY EMA's EIIHA approach aims to decrease inequities in health outcomes by targeting HIV testing services in non-clinical settings. The NY EMA uses surveillance data to identify the priority populations and communities for these services. To align with its status neutral approach as well as new statewide HIV testing legislation and regulations, in 2017 the NYC HD issued a Request for Proposals (RFP) for HIV Testing and Status Neutral Navigation Services, which included funding from both CDC and RWHAP Part A EIS. Contracts began January 1, 2018. Under this program, CDC Prevention funds are used to contract with 11 clinical facilities to implement status neutral navigation to iART for those newly diagnosed with HIV or out of care, and navigation to PrEP for those who test negative for HIV; and RWHAP Part A EIS funds are used to contract with CBOs (non-clinical) to conduct targeted testing through community and online outreach with required MOUs with clinical providers for expedited linkage to care. The 14 RWHAP Part A-funded CBOs focus on gay, bisexual, and other MSM and TGNC/NB people and their partners, with particular attention to Black or Latino/Hispanic TGNC/NB individuals under 29 years old; Black and Latina/Hispanic heterosexual women, particularly those over 30 years old or living in areas with a high prevalence of STIs; and other priority populations. Funding was prioritized to applicants whose patient population resides in ZIP codes with high numbers of PWH and documented health inequities and/or that have a history of outreaching to priority populations. Selected agencies also have demonstrated cultural responsiveness in their work and have a history of successfully engaging with the priority populations. From March 2019 to February 2020, these funded testing programs conducted 5,665 HIV testing series, identified 58 people with new HIV diagnoses, and linked 58% of those newly diagnosed to HIV medical care within 30 days of diagnosis. These programs also linked 176 clients to a PrEP provider and 43 clients to a PEP provider. In 2021, this portfolio will be rebid so that all resulting contracts, regardless of funding source, will use similar service definitions, standardized payment points, and updated service

models to support HIV testing, linkage to iART, and linkage to PrEP and PEP. New contracts are expected to begin in July 2021.

In addition, RWHAP Part A and CDC funds support targeted testing at all jails in NYC including Riker's Island. Using City funds, the Riker's Island facility offers opt-out HIV testing at intake, and for those who decline, the RWHAP Part A- and CDC-funded contract supports outreach and follow-up to conduct an HIV test at a later date. Additionally, the Riker's Island contract conducts group health education sessions for clients seen in the medical clinic or supportive services area of the jail. These HIV education sessions address topics such as PrEP, PEP, testing, transmission, and, most recently, COVID-19.

The NYC HD launched the Community Home Test Giveaway Virtual Program in April 2020 to address declines in in-person HIV testing during the COVID-19 pandemic. Participants receive online coupon codes from partner organizations to redeem online for a free OraQuick HIV self-test kit delivered to their home address. The program has partnered with 60 CBOs, community health centers, hospital-based clinics, small businesses, and other settings citywide, with 2,075 online coupon codes distributed and 1,914 codes redeemed to date. By promoting free HIV self-tests on multiple platforms, including social media, dating and hook-up apps, text messaging, and email, the program continues to reach communities most affected by HIV. HIV self-testing allows participants to learn of their HIV status from the safety of their home and helps facilitate initiation of PEP or continued adherence to PrEP, without going to a clinical facility for testing. In June 2020, the NYC HD announced Door 2 Door, a new service through which NYC residents can order condoms and other safe sex products for home delivery. Three of NYC HD's eight SHCs are currently open and offering limited services for New Yorkers' sexual and reproductive health needs during COVID-19. New Yorkers can also call the NYC SHC Hotline for telehealth services. Linkage and retention in medical care. The NY EMA promotes linkage to medical services and immediate initiation of HIV treatment (i.e., iART) for those who have diagnosed HIV infections through various strategies. All funded HIV testing programs are required to link newly diagnosed people to care, as well as those previously diagnosed that have fallen out of care. To meet the revised national goal of earlier linkage to care, in 2018, the Recipient began promoting and funding programs to link people newly diagnosed with HIV to HIV medical care within four days of diagnosis and to offer HIV treatment to these clients on the first HIV medical visit, as well as provide prescription and support services for PrEP and PEP to those with a negative HIV test result. Subrecipients receive higher reimbursement rates for linkage to care within four days of diagnosis, and lower reimbursement for linkage within 14 and 30 days of diagnosis. From the Status Neutral Testing RFP, 25 clinical and non-clinical agencies were funded to provide prompt linkage to care with initiation of HIV treatment at the first medical visit. These facilities also provide prescription and support services for PrEP and PEP. From March 2019 to February 2020, clinical programs initiated 464 clients on ART within four days of HIV diagnosis, initiated 437 clients on PrEP, and prescribed PEP to 167 clients. These funded programs join over 40 other contracted providers in delivering PrEP and PEP education, referral, linkage, and prescription services as part of the PlaySure Network.

Through the JumpstART program, SHCs provide HIV treatment on the day of diagnosis or to PWH who have never engaged in treatment, followed by linkage to care and partner services. The City's SHCs also provide PrEP and PEP prescriptions to eligible patients. In 2019, there were 212 new HIV diagnoses in the SHCs, including 29 acute HIV cases; 40% of newly diagnosed patients received JumpstART on the day of diagnosis. A total of 1,130 patients were initiated on PrEP.

Through the Status Neutral Testing RFP, the NY EMA funded clinical facilities to expand linkage to care services. The programs leverage the NYSDOH's Rapid Access to HIV Medications and Treatment Program (Rapid Tx) by providing wrap-around services (e.g., patient education and linkage to services) to increase access to rapid ART initiation, with higher reimbursement for those linked on the same day. Fifteen CCP programs have opted to include iART in their service provision, whereby RWHAP Part A resources provide wrap-around case management, entitlement services, and client education for newly diagnosed or out of care PWH referred by emergency departments, outpatient and inpatient clinics, and HIV testing programs.

From March 2019 to February 2020, the NYC HD BHIV's Clinical Operations and Technical Assistance (COTA) Program conducted a monthly training to increase iART knowledge and practices among HIV social service providers, navigators, and clinicians. To date, 81 clinical and social service HIV providers have been trained. Of the participants who completed the training evaluation to date, all respondents reported they were very satisfied or satisfied with the overall iART training, and all respondents agreed they were very prepared or prepared to use their learned skills in their job immediately. Since March 2020, the in-person training has been suspended due to COVID-19; however, the training was adapted to a webinar format and was delivered on March 12, 2020 to more than 85 attendees. A recorded version of the webinar has also been made available.

COTA also developed a one-hour iART training adapted from a full day training to strengthen clinical and social service providers' knowledge, attitudes, and practices related to the implementation of iART. During the reporting period, COTA delivered the training three times: once in a public hospital, once in a Federally Qualified Health Center (FQHC), and once in a community-based housing organization, reaching more than 45 clinical and social service providers.

On August 21, 2020, COTA launched an iART public health detailing campaign to promote scaling iART in HIV clinics across NYC. COTA developed an iART public health detailing action kit, which includes a variety of clinic resources (e.g., brief guidance documents, workflow examples, payment options guidance, genotype testing guidance, patient facing materials, etc.) to build the capacity of HIV clinic care teams to adopt and operationalize iART. COTA will deliver virtual outreach education visits (e-detailing visits) to HIV providers to disseminate key messages and resources related to iART. The action kits will be mailed to providers' clinics and shared electronically after the e-detailing visits. Pre- and post-e-detailing visit evaluations will be administered to assess the impact of the visits and kits on iART practices within HIV care settings.

Under Project PROSPER and CDC EHE funding, on August 19, 2020, the NY EMA initiated an RFP for an Enhanced D2C (eD2C) Project, building on BHIV's successful work with Brooklyn-based organizations to improve linkage, re-engagement, and durable retention in HIV care; and sustained VS. The eD2C RFP seeks to contract with clinical agencies providing HIV care and treatment in the Bronx, Queens, Manhattan, and Brooklyn. Funded contractors will work in close partnership with BHIV's ACE Team and COTA to build clinic staff capacity to conduct D2C activities; triangulate clinic, external, and NYC HD data sources; and identify and outreach to PWH who have fallen out of care.

Increase rates of retention in care and VS. The NYC HD has funded a citywide scale-up of The Undetectables VS Program (The Undetectables) as part of the NYS ETE initiative. The Undetectables is an ART adherence intervention designed to promote sustained VS among PWH who face individual and/or structural barriers to adherence such as poverty, housing instability, and behavioral health issues. The intervention combines a toolkit of evidence-based adherence support strategies, including financial incentives, and a superhero-themed social marketing campaign in the context of integrated medical, behavioral, and case management services. The toolkit includes

client-centered adherence planning and support, Motivational Interviewing, adherence support groups, adherence devices (e.g., pill boxes), directly observed therapy (DOT), and financial incentives to promote VS. Participants may receive a \$100 gift card incentive for each quarterly lab result showing VS (<200 copies/ml). The marketing campaign supports organizational culture change by engaging clients and staff on the importance of VS to individual and community health. The intervention was originally developed and pilot tested by Housing Works, an HIV service organization in NYC. In July 2016, the NYC HD awarded over \$1.5 million annually in City-funded contracts to seven agencies across NYC, including one for Housing Works to provide training and TA on program implementation to awardees. As of December 31, 2019, The Undetectables programs have served approximately 2,890 PWH in NYC. Among those engaged in care⁷ (n=2,311), 88.7% were virally suppressed at their most recent lab. Among clients enrolled the entire 2018-19 GY (n=1,185), 76.7% demonstrated evidence of durable VS.⁸

The Undetectables is also being disseminated in NYS through other channels. As part of Medicaid redesign efforts, two Delivery System Reform Incentive Payment (DSRIP) Program Performing Provider Systems (PPSs) implemented The Undetectables in NYC and in Albany; and Amida Care, an HIV-focused MCO, launched Live Your Life Undetectable (LYLU) to provide the same financial incentive also requiring dual engagement in primary care and supportive services. More recently, VNS SelectHealth, another HIV-focused MCO, began providing the same financial incentive. Evaluation of City- and DSRIP-funded programs will assess the potential for financial incentives as components of value-based payment (VBP) models.

In addition to The Undetectables, in FY18, Primary Care Status Measures (PCSM)-based data were presented at meetings with providers and also shared via the program-specific Treatment Status Reports (TSRs). TSRs are line-level reports displaying coded identifiers and the ART status of clients who are overdue for a VL test result update in eSHARE (which is used by all NY EMA RWHAP Part A-funded providers) or who were not virally suppressed as of their last VL test results. The TSRs are generated quarterly and sent to program staff by their quality management specialists (QMS). The Recipient also generates annual Agency-level Viral Suppression Reports (AVSR), which aggregate all agency-specific VS data into one report and compares it to all RWHAP Part A clients in NYC. To improve its utility, the AVSR was redesigned in 2019 with enhanced data visualizations to also look at VS among five specific priority populations (OPWH, Black or Latino cisgender MSM, cisgender YMSM, transgender women, and Black and Latina cisgender women) within each agency. These priority populations were selected to align with the NYC HD's Race to Justice initiatives to advance racial equity and social justice.

Referral to PrEP and PEP services. In 2016, using CDC and City funds, the NY EMA funded the PlaySure Network, a network of over 50 CBOs and health care facilities to provide education on PrEP and PEP, navigation and linkage to clinical providers, and PrEP and PEP initiation with adherence support and clinical follow-up. These contracts will be re-bid in 2021, and in the process, the NY EMA will explore ways to better reach priority populations and use alternative delivery methods. In addition, when long-acting injectables become available, the NY EMA plans to integrate their use into its programs. As noted above, in 2017, the SHCs began providing PrEP services and providing full 28-day courses of PEP. Staff from the SHCs also provide status-neutral navigation services to PrEP/PEP providers and HIV medical care. The NY EMA will continue to support and expand these services in GY21. During the COVID-19 pandemic, providers may prescribe 90 days of medicines to patients taking daily PrEP.

⁷ Engaged in care: Having greater than or equal to two VL labs at least 90 days apart during a period of interest.

⁸ Evidence of durable VS: Having no unsuppressed VL within a 12-month period.

The Westchester County Department of Health (WCDOH) has implemented several programs through NYS funding and NY EMA RWHAP Part A EIS funding to expand HIV testing and linkage to services, including PrEP, in the Tri-County Region. WCDOH has concentrated its focus and expanded its PrEP outreach to priority populations including MSM, transgender women, people who inject drugs (PWID), sex workers, homeless individuals, and currently and formerly incarcerated individuals. In GY19, the Tri-County Region increased resources to reach YMSM and women of color (WoC); and in GY20, a RWHAP Part A-funded EIS contract was awarded to the WCDOH to continue this work, in addition to conducting outreach at the local syringe exchange program and county jail in order to engage PWID and incarcerated individuals. Additionally, WCDOH provides policy and programmatic leadership for NYSDOH AIDS Institute (NYSDOH AI) funded PrEP initiatives throughout the Tri-County Region. WCDOH is a voting member of the NYS HIV Advisory Body and participates in ETE initiatives and NYLinks (*see p. 26 for more detail*) in the Upper and Lower Hudson Valley (which includes the Tri-County Region). In this capacity, the WCDOH oversees HIV education, testing, and PrEP/PEP referral programs, and holds monthly provider meetings focused on training and program strategy.

Other Activities. For all NYC HD-funded testing programs, the NYC HD recommends the use of HIV testing technologies that allow for detection of acute and early HIV infections, such as combination HIV antigen-antibody (4th and 5th generation) HIV tests. To support testing programs, the NYC HD provides trainings and TA for providers and publishes testing and prevention resources online. To promote receipt of confirmatory testing among individuals with a preliminary-positive test result, the NYC HD provides a discrete reimbursement point for confirmatory testing among HIV testing contracts. The specific reimbursement for confirmatory testing and recommended on-site collection of specimens have resulted in a higher proportion of tested clients receiving confirmatory results among those who test preliminary-positive.

To support the primary activities in the EIIHA plan, BHIV has created social marketing campaigns over the past several years to promote improvements in sexual health citywide. These include campaigns to increase awareness of HIV status (*BeSure*); encourage individuals to choose the combination of safer sex practices that work for them (*PlaySure*); emphasize initiation and adherence to HIV medications and biomedical prevention interventions (*StaySure*); encourage consumer and provider communications to improve sexual health and wellness, especially to Lesbian, Gay, Bisexual, Transgender, and Queer (LGBTQ) New Yorkers (*Bare It All*). In 2018, BHIV launched the *Living Sure* and *Listos!* Campaigns, which educate and promote PrEP use among cisgender and transgender women, and the Latino/Hispanic community, respectively; and in 2019, to promote the evidence-based finding of Undetectable=Untransmittable (U=U), BHIV launched its *MadeEqual* campaign. BHIV also utilizes digital media including established social media platforms to promote HIV prevention messaging to priority populations and works with contracted agencies to integrate campaigns and messaging into their digital platforms. With the ongoing COVID-19 pandemic, the NYC HD is prioritizing social marketing resources and activities to support COVID-related topics.

The ACE team, housed within the BHIV HIV Epidemiology Program, and the Tri-County region's Health Departments provide partner notification services to PWH diagnosed by providers. BHIV's ACE Team and Tri-County Region Health Departments' Disease Intervention Specialists elicit the names of potentially HIV-exposed partners, confidentially notify these partners of their possible HIV exposure, and offer HIV testing and linkage to care for people who test positive. In 2019, the ACE team offered partner services to all newly diagnosed citywide. ACE interviewed 83% (1,425/1,712) of newly diagnosed in NYC and elicited 498 HIV-exposed partners. Seventy

percent (231/330) of partners with a negative or unknown HIV status were notified and 54% (124/231) were tested, of whom 17% (21/124) had newly diagnosed HIV infections. If those newly diagnosed do not return to receive their test results, ACE can assist testing providers in locating patients, notifying them of their results, and offering partner services. For partners with a negative or unknown HIV status, ACE offered 77% (179/231) linkage to PrEP services, 23% (42/179) expressed interest in PrEP, and 71% (30/42) accepted the PrEP referral.

b) Major collaborations with other programs and agencies. Many NYC HD programs collaborate to identify individuals unaware of their HIV status. Under the leadership of the BHIV Prevention Program, all contracted HIV testing programs in the NY EMA have standardized service models that ensure one data collection process across funding sources, enforce POLR requirements, eliminate duplication of services across funding streams, and coordinate monitoring and evaluation activities. Further, the Prevention Program's key community partner is the HIV Planning Group (HPG). Similar to the RWHAP Part A PC's role with RWHAP Part A programs, the HPG supports all HIV prevention activities through representation of the perspectives of communities impacted by the local HIV epidemic and by reviewing and providing feedback and input in support of the NYS Integrated Plan. Most recently, BHIV is working collaboratively with the PC and HPG as well as internal programs, the NYSDOH AI, City agencies, and community partners to develop the NYC EHE plan. Listening sessions with each EHE borough and priority populations (youth and transgender people) are currently underway to inform the draft plan presented to the PC and HPG for concurrence in January 2021.

BHIV programs practice a unified approach, collaborating with clinical operations, prevention, policy and external affairs, social media and condom expansion, surveillance, and CTPs. The BHIV also collaborates with other NYC HD programs and City agencies that provide services to populations heavily impacted by HIV, such as the Division of Mental Hygiene, Bureau of Sexually Transmitted Infections (BSTI), Bureau of Tuberculosis Control (BTBC), Bureau of Alcohol and Drug Use Prevention, Care, and Treatment (BADUPTC), CTP, Public Health Lab, Office of School Health, Administration for Children's Services, and NYC Health + Hospitals. The NYC HD also works with NYC Health + Hospitals Correctional Health to coordinate comprehensive medical, dental, and MH services for inmates in NYC correctional facilities, including HIV testing and discharge planning to support linkage of inmates to medical care within 30 days of release. The NY EMA also collaborates with the U.S. HHS Region 2 to promote and support PrEP and PEP implementation in FQHCs, Title X clinics, and provide support to NYC providers to refer clients to MH and SUD services such as NYC Well, a 24/7 hotline staffed by trained MH professionals who provide assessments and treatment referrals.

Through a CDC-funded demonstration project, Project THRIVE, the NYC HD collaborates with state and local agencies, such as the NYS Education Department's ACCES-VR program, Workforce1, and the Mayor's Office of Workforce Development, to support referral and linkage of clients to workforce development and employment services. To further these efforts, the NYC HD hosted a day-long workforce development workshop. Starting from 2017, Project THRIVE's Community Advisory Board (CAB) held multiple discussion sessions on the effects of social determinants of health (i.e., stigma and violence, MH, employment, and criminal justice) on linkage and retention in care. Based on these discussions, the CAB created recommendations for addressing social determinants of health in HIV prevention and treatment. These recommendations have informed the NYC HD's solicitation process for contracted services, guidance on contract scopes, and the process of providing feedback to community members. During the COVID-19 pandemic, the CAB has continued to meet virtually.

The *New York Knows* initiative collaborates with over 200 partner agencies that have pledged to support the goals of the initiative to: test every resident for HIV, link PWH to care, link people not living with HIV to prevention services including PrEP, and make HIV testing a routine part of health care in NYC. The initiative recently added promotion of STI and HCV prevention into its programming. *New York Knows* holds regular steering committee meetings in all five boroughs and an annual all partners meeting. The NY EMA is also working closely with the local AIDS Education and Training Center and other City agencies to keep providers up to date on HIV and COVID-19. Preliminary data from *New York Knows* partners show a reduction in HIV testing in the first half of 2020 due to the COVID-19 pandemic. However, data reporting is incomplete. *New York Knows* has embraced virtual modalities to maintain its full meeting schedule since March 2020 and ensure maintained relationships and connections with and between community partners. Continued engagement has helped agencies adapt to delivering services while maintaining the safety of their clients and staff during COVID-19.

BHIV also collaborates with the NYSDOH AI on NYLinks, a statewide project, and a continuation of a previously funded HRSA/HIV/AIDS Bureau (HAB) Special Projects of National Significance initiative, focused on improving linkage to and retention in care and VS. BHIV is an active participant in the Brooklyn regional collaborative established under NYLinks, with staff serving as co-chair of the work group, and is an implementing partner in a statewide scale-up of strategies that have been shown to have promise, including rapid access to treatment, timely linkage to care, as well as improved peer learning and networking among providers, community leaders, and consumers. BHIV coordinates with NYLinks to facilitate engagement of providers in Queens and Staten Island. In addition, BHIV staff participate in borough-based ETE Regional Group meetings, born out of the process to develop the NYS ETE Blueprint, and provide regular updates on surveillance data and prevention and care activities. NYSDOH AI and BHIV also coordinate NYLinks and ETE Regional Group meetings to align with *New York Knows* meetings; and implement joint annual meetings of *New York Knows*, NYLinks, and NYS ETE Regional Groups in Brooklyn, Queens, and Staten Island.

The NYC HD convenes the NYC DSRIP HIV Coalition, comprised of eight hospital-led PPSs and their community partners. In 2015, NYS established the DSRIP program to redesign the health care delivery system, aiming to reduce avoidable hospital visits among Medicaid beneficiaries by 25%. DSRIP HIV Coalition members share best practices and relevant policy developments, and collaborate on HIV-related projects at the health systems level, such as strategies to improve VS and developing models for peer-delivered services. While DSRIP ended in March 2020, the HIV Coalition continues to meet to discuss the evolving NYS Medicaid environment and its impact on the HIV service delivery system.

Finally, BHIV proactively engages members of priority communities to participate in and plan community events including NYC Pride events and World AIDS Day commemoration, among others. BHIV also actively participates in a number of citywide coalitions, including the End AIDS NY 2020 Coalition, NYC Kiki Coalition, Long Term Survivors Wellness Coalition, and the ACT UP Meth Group. In addition, BHIV also works with the Mayor's Office of Workforce Development, through the Considering Work Efforts Work Group, to inform staff on how to enhance the integration of employment services within HIV prevention, care, and treatment programs (*see p. 45 for more details*). In light of COVID-19, BHIV is engaging priority populations virtually.

c) *Anticipated outcomes of overall EIIHA strategy.* The goals of NY EMA's overall strategy include increasing the number of people aware of their HIV status, increasing the proportion of PWH promptly linked to medical care and achieving VS, and increasing the proportion of

populations at-risk for HIV infection receiving prevention services, including PrEP and PEP (*see p. 29-32 for specific strategies*). These goals directly align with the goals of the EHE plan, NYS's ETE Blueprint and Integrated Plan, and the NYC EHE plan. This status neutral approach addresses the needs of PWH and people not living with HIV with its success contingent on the coordination among providers of testing, prevention, and care services, regardless of an individual's HIV status.

The NY EMA continues to promote and fund testing programs that focus on priority populations, including gay, bisexual, and other MSM; TGNC/NB people and their partners; Black and Latina heterosexual women; and other vulnerable populations. Due to these and additional efforts outlined in the EIIHA plan, the proportion of residents in the NY EMA that have ever been tested for HIV continues to increase. Through the CHS, the NYC HD tracks the percentage of NYC residents, aged 18 and older, who report ever testing for HIV. In 2017, 66% of adult NYC resident CHS respondents had ever been tested for HIV; up from 63% in 2012.¹ At the same time, the number of HIV diagnoses in the NY EMA has decreased (*see p. 17-20 for more details*). This declining trend in the number of new diagnoses is partly due to the NYC HD's rigorous and comprehensive effort to increase HIV testing, link PWH to care, and support increased VS within the first 12 months of care. With the on-going implementation of the EIIHA strategy, the NY EMA expects a continued increase in the percentage of NYC residents reporting ever having received an HIV test and continued decrease in the percentage of new HIV diagnoses.

The NY EMA EIIHA incorporates a planned outcome to increase the percentage of people with new HIV diagnoses initiating care. Currently, the NYC HD tracks this indicator using HIV surveillance data and defines timely linkage as a VL, CD4, or genotype test drawn within one month (30 days) of HIV diagnosis. In recent years there has been a steady increase in timely care initiation among the newly diagnosed in NYC, from 65% in 2013 to 82% in 2018. As noted previously, the NY EMA employs several strategies to retain individuals in care, improve ART adherence, and promote sustained VS. The outcome of these efforts will be measured through changes in the stages of the HIV care continuum.

The NY EMA continues to promote and fund PrEP and PEP referral and care services with the goal of increasing the proportion of priority populations, including MSM, TGNC/NB individuals, and Black and/or Latina women, who are aware of and report using these services. This outcome indicator will be measured through the Sexual Health Survey (SHS). Among sexually active NYC MSM ages 18 to 40 years with an HIV negative/unknown status surveyed through the SHS in fall 2019, 97% were aware of PrEP and 36% had taken PrEP in the past 6 months.ⁱⁱ The low uptake underscores the need for continued services to engage people and link to PrEP as well as intensive social marketing and education efforts, such as *Living Sure* and *Listos!*.

During the COVID-19 pandemic peak (March-April 2020), there were notable changes in services provision within the PlaySure Network. During this time period, there was a 54% decrease in linkages to PEP providers and a 46% decrease in linkages to PrEP providers. However, while PrEP initiations decreased 70% between February and April, PrEP follow-up visits remained stable suggesting that those who were already on PrEP were still maintaining adherence. As a likely result of the decrease in COVID-19 activity and the reopening of NYC, the provision of HIV prevention services increased in May and June 2020, but are still below pre-pandemic levels.

2) GY21 EIIHA Plan priority populations. The three selected distinct priority populations are: (1) Black and Latino MSM; (2) TGNC/NB people and their partners; and (3) Black and Latina cisgender women living in neighborhoods with high numbers of PWH.

a) Populations targeted. Three populations were chosen due to inequities in new diagnoses, EiC, and/or VS after a review of local epidemiologic data.

b) Specific challenges with or opportunities for working with the targeted populations.

a) Black and Latino MSM. Fifty-six percent of new HIV diagnoses in the NY EMA in 2019 were among MSM (including MSM-IDU), more than any other transmission risk group. National data indicate that MSM and YMSM, particularly Black and Latino, are at the highest risk for acquiring HIV. The CDC estimates that one in six MSM will have a diagnosed HIV infection in their lifetime, including one in two among Black MSM and one in four among Latino MSM.^{lii} This holds true in the NY EMA, making them a high priority of the overall EIIHA plan. In 2018, YBMSM and YLMSM accounted for 81% of all YMSM living with HIV in the NY EMA. Research has shown that stigma and discrimination due to race/ethnicity and sexual orientation and lack of access to culturally responsive services for MSM of color are barriers to HIV testing and accessing medical services.^{liii} Further, some YMSM who experience homelessness or housing instability face additional barriers to health care including a lack of transportation, financial resources, and/or health care insurance and lack of awareness of available resources.^{liv}

b) TGNC/NB people and their partners. In 2019, 3% of new HIV diagnoses in NYC were among transgender people, 96% of whom were transgender women. Black or Latina women made up roughly 90% of new diagnoses among transgender women, and 56% of newly diagnosed transgender women were 20 to 29 years. No local estimates of HIV prevalence exist, but a 2019 systematic review and meta-analysis found that an estimated 14% of transgender women in the U.S. have HIV; by race/ethnicity, an estimated 44% of Black transgender women, 26% of Latina transgender women, and 7% of white transgender women have HIV.^{lv} The NYS ETE Blueprint notes that stigma and discrimination, including sexism, transphobia, and racism contribute to HIV risk among transgender people, which is amplified by related contextual factors such as poverty, unemployment, homelessness, violence, undocumented status, sex work and condom confiscation, MH needs, substance use, and poor access to health care and affirming providers.

c) Black and Latina/Hispanic cisgender women in areas with high numbers of PWH. In 2018, Black and Latina/Hispanic cisgender women accounted for 90% of all cisgender women living with HIV in the NY EMA. These proportions indicate a continued need for targeted EIS, including HIV testing and status neutral navigation services. Further, previous analyses by the NYC HD have demonstrated that HIV diagnoses and prevalence are more likely to overlap with areas where increased poverty, health inequities, and poor health outcomes are found; these are areas where Black and Latina/Hispanic women typically reside. Risk factors for increased vulnerability among Black and Latina/Hispanic women include low income, substance use, being born outside the U.S., exposure to IPV, and having formerly incarcerated partners.

Other challenges experienced by Black and Latina women include stigma associated with HIV, cultural and linguistic barriers to care, lack of knowledge of HIV prevention tools such as PrEP and PEP, and low self-perceived risk for HIV. For example, a 2017 telephone survey of Black and Latina/Hispanic women in NYC found that only 34% of respondents had ever heard of PrEP and 60% felt they would not benefit from taking PrEP or PEP.^{lvi} PrEP prescriptions among women are disproportionately lower than among men. Between July and December 2018 in NYC, men received PrEP prescriptions at 12 times the rate of women (18,311 vs. 1,524 prescriptions)^{lvii}; however, men have an HIV diagnosis rate that is more than four times higher than women.

Many Black and Latina/Hispanic women in the NY EMA live in neighborhoods with high numbers of PWH that place them at increased risk due to their social and sexual network, even though their own behaviors would not be perceived as “high-risk.” As such they have low self-perceived risk for HIV which may delay or prevent them from presenting for testing or considering PrEP as a prevention option. People born outside the U.S., especially undocumented, may also

delay HIV testing and care services due to stigma associated with HIV, isolation, fear of exposure, and potential deportation, in addition to differences in culture and language.

c) *Specific strategies that will be utilized with the target populations.* The NY EMA's GY21 EIIHA plan was designed to ensure that services provided to priority populations result in a reduction of the number of undiagnosed and late-diagnosed individuals, and that those newly diagnosed promptly access HIV care and treatment. The NY EMA will continue to support its enhanced HIV testing approach through its contracts awarded in 2018 (*p. 17*), along with several innovative programs that are aligned with the national goals outlined in the EHE plan, NYS's goals detailed in the ETE Blueprint and Integrated Plan, and NYC's EHE plan (*p. 1*) to achieve these objectives. Through Medicaid-funded and other third party-funded HIV screening in clinical settings and NY EMA programs supported by RWHAP Part A, CDC, and other funds including *New York Knows*, the NY EMA promotes and supports routine HIV screening in all health care settings. As stated earlier, to maximize the use of funds and to comply with POLR requirements, with the rebid of testing services in 2018 (Status Neutral Testing RFP), the NYC HD prioritized RWHAP Part A EIS funds to address the needs of prioritized populations to receive HIV medical care by funding 14 CBOs to provide HIV testing and support services. CDC funds 11 status neutral linkage and navigation programs in clinical facilities to provide PrEP and PEP services to eligible patients, and offer iART. As noted previously, between March 2019 to February 2020, these funded testing programs conducted 5,665 HIV testing series, identified 58 individuals with new HIV diagnoses, and linked 58% of those newly diagnosed to HIV medical care within 30 days of diagnosis. These programs also linked 176 clients to a PrEP provider and 43 clients to a PEP provider. Awarded contracts run through December 31, 2020. Additionally, with Project PROSPER and CDC EHE funding, the NY EMA initiated an RFP on August 19, 2020 titled Building Equity: Intervening Together for Health. Launched by NYC HD BHIV's COTA team, this RFP aims to provide HIV clinics with resources to replicate identified evidence-informed interventions that are focused on priority populations, and support clinics to build their human and structural capacity to improve engagement, retention, and VS among priority populations. The awarded contracts will run through February 29, 2024.

Funded CBOs use innovative approaches, such as behavioral risk screenings for PEP and PrEP, brief interventions, status neutral navigation activities to iART, PrEP, or PEP, social marketing and new media engagement to those unaware of their status on dating apps and hook-up sites, and other targeted testing efforts to reach priority populations. A qualitative study^{lviii} of barriers and facilitators to HIV primary care among vulnerable populations (YMSM, African immigrants, formerly incarcerated, and transgender women) in NYC highlights the essential role of CBOs in engaging these populations in care, specifically referencing their tailored and culturally responsive services.

To further increase accessibility of testing services, the NYC HD has conducted giveaways of in-home HIV self-tests since 2015. In 2018, the NYC HD conducted a targeted awareness campaign among MSM and TGNC/NB NYC residents who have sex with men through online ads. By completing a brief eligibility survey, these individuals were able to access free HIV self-tests, and over 2,500 individuals accessed HIV tests through this initiative. During the COVID-19 pandemic response, the NYC HD expanded distribution of self-tests to ensure testing access complied with stay-at-home orders. BHIV is currently exploring the integration of STI testing with the giveaway.

The NY EMA promotes U=U, the message that PWH who maintained an undetectable VL for at least six months do not transmit HIV through sex, which was endorsed by the CDC in September 2017.^{lix} The U=U initiative, in combination with the Status Neutral Testing RFP, provides an opportunity for providers to conduct targeted outreach and testing to the priority populations and

link them to care and iART. The BHIV established a work group to incorporate best practices associated with U=U to help the community understand the concept and incorporate it into sexual health decision-making to reduce stigma. Efforts have included: a standardized slide set to substantiate U=U research including the PARTNERS, PARTNERS II, and HPTN 052 results and training modules for condom providers, ACE team, patient navigators, and health educators to support productive and knowledgeable discussions of U=U with community program clients. BHIV's *Made Equal* campaign launched in June 2019 to align with Global Pride events in NYC and promotes the U=U concept; and was designed to reduce HIV-related stigma, celebrate healthy sexuality and sexual pleasure, and redefine what it means to live with HIV. *Made Equal* appeared through outdoor ads across the City as well as digital media.

In addition to focusing on priority populations in the above-mentioned U=U initiatives and Status Neutral Testing RFP activities, the NYC HD also implements several initiatives specific to the EIIHA-identified priority populations. These initiatives include:

Black and Latino MSM. The CDC demonstration project, Project THRIVE, seeks to improve testing, referral, linkage, and navigation to prevention and care services for MSM of color in Brooklyn. Under Project THRIVE, the NYC HD has conducted three listening sessions with MSM of color in Brooklyn to discuss the social determinants that impact their health. The CAB for Project THRIVE meets monthly with the NYC HD staff to discuss and make recommendations on addressing these social determinants. From fall 2019 to spring 2020, BHIV implemented a storytelling initiative throughout NYC to promote LGBTQ wellness and to address HIV-related stigma. CDC-funded contracts also support Black MSM-led organizations to build organizational capacity and infrastructure, supported with experienced TA providers, to increase culturally appropriate services to these communities in NYC.

In September 2018, in response to being awarded funds for CDC PS-17-1711, the NYC HD formed the Project Sol CAB composed of HIV prevention and care service providers who largely identify as Latino MSM to inform aspects of the project as they are developed, ensuring that work is sensitive and engaging to Latino MSM, particularly in developing quality molecular HIV surveillance protocols, provider trainings, CBO detailing, and social media campaigns. The Project Sol CAB expands relationships with organizations serving Latino MSM to support programming for Latino MSM living with and at risk for HIV in HIV prevention, care, and treatment services.

In 2018, BHIV conducted a series of focus groups among MSM engaged in exchange sex, one of which was specifically with Latino-identified MSM. The purpose of the groups was to understand the overall experience of sex work among MSM in NYC and the impact of exchange sex on MSM sex workers' health and safety to improve understanding of how medical and social service providers can better support MSM sex workers. Findings from the groups revealed that most participants found themselves in a violent situation on at least one occasion and almost all felt it was their personal responsibility to protect themselves and their clients from HIV and STIs. Across both groups, participants recommended provider training to reduce discrimination and improve knowledge of both sex work and available services citywide to provide better referrals. The NYC HD will use this data to inform development of services moving forward.

TGNC/NB people and their partners. TGNC/NB-led organizations are recipients of the City-funded ETE contracts to build organizational capacity and infrastructure to increase the availability of culturally appropriate services. Additional efforts to increase competency include trainings for SHC and BHIV staff to increase their knowledge and competency in working with TGNC/NB people. BHIV also convenes a Black and Latina Transgender Women Work Group to addresses the HIV care needs of Black and Latina transgender women by developing recommendations to

ensure gender affirming best practices are implemented across programs in the RWHAP Part A portfolio. In 2020, BHIV concluded a study with TGNC/NB people who engage in sex work to inform activities to support their health and well-being. The study conducted individual interviews with TGNC/NB people who exchange sex for money to elicit information on: the overall experience of sex work among TGNC/NB people in NYC; the impact of health care, law enforcement and employment policies and practices on their lives and work; the impact of sex work on their health and safety and how they navigate sexual health risks; and their experience accessing health care and supportive services. A comprehensive report is currently under review; it will be utilized to inform future activities and services for TGNC/NB people.

Black and Latina/Hispanic cisgender women in areas with high numbers of PWH. Agencies funded through the Status Neutral Testing RFP conduct outreach to people who live in high poverty areas (placing them at higher risk for HIV) and link them to appropriate services, including HIV testing, iART if they test positive, or to prevention services, such as PrEP and PEP if they test negative. Contracts are structured to incentivize agencies to link PWH promptly to care and initiate iART. In 2019, BHIV implemented the fifth wave of its public health detailing campaign to promote PrEP and PEP focused on women's health care providers. Additionally, the PrEP and PEP Action Kit includes patient and provider resources to raise awareness of PrEP and PEP and support initiation and retention in care and treatment. In 2016, BHIV founded the Women's Advisory Board (WAB), a diverse group of dedicated and passionate women leaders with expertise serving and empowering women within their communities. WAB was founded as a collaboration between *New York Knobs*, HPG, and NYC HD's Center for Health Equity and CTP. Since the first meeting, the WAB has grown to over 50 members, representing 11 organizations across all boroughs, and includes cisgender and transgender women and a majority membership of WoC. The WAB is committed to improving HIV prevention and care for women in NYC through dialogue and concerted action. On March 9, 2019, the WAB led the third annual Women's Health and Activism Summit to garner input where participants identified trauma-informed care, domestic violence/IPV, and immigration as high priority topics to be addressed at future Summits. As noted previously, in March 2018, the NYC HD launched a social marketing campaign, *Living Sure*, promoting PrEP and PEP usage among cisgender and transgender women.^{ix} This is the latest addition to the NYC HD's series of sex-positive campaigns, *BeSure*, *PlaySure*, *StaySure*, and *Bare It All*, which seek to improve sexual health and wellness among their respective priority populations.

3) Planned efforts to remove legal barriers to routine HIV testing. In the last decade, the NYC HD worked with NYSDOH and state elected officials to streamline and routinize HIV testing consistent with the CDC's 2006 recommendations. Prior to 2010, any person to be tested for HIV was required to provide written consent. In 2010, NYS Governor David Paterson signed a testing law requiring HIV testing be offered to all patients ages 13 to 64 years receiving hospital or primary care services, with limited exceptions; allowing consent to HIV testing to be part of a patient's general consent to medical care including specific opt-out language; and, in non-correctional settings, allowing oral consent for rapid HIV testing. In 2014, Governor Cuomo signed legislation that eliminated the requirement for written consent for HIV testing except in correctional settings; the following year, further amendments allowed for oral consent in correctional settings.

To coincide with World AIDS Day 2016, Governor Cuomo signed legislation further streamlining HIV testing by removing the requirement to obtain "informed consent" so that a provider, at a minimum, need only orally advise the patient that an HIV test is being performed and then document the advisement or objection in the patient's record. The legislation also removed the upper age limit, requiring HIV testing to be offered at least once as a routine part of health care to

all patients age 13 or older receiving primary care services at an outpatient clinic or from a physician, physician assistant, nurse practitioner, or midwife. Hospitals must also offer HIV testing to all patients and individuals seeking services in emergency departments, with limited exceptions. NYC HD continues to work with NYSDOH and other state agencies to build public and provider awareness of these changes through FAQs, fact sheets, and webinar and in-person trainings.

Other state legislative and regulatory activity has expanded access to HIV services in recent years. The World AIDS Day 2016 legislation expanded access to STI testing by allowing physicians and nurse practitioners to issue non-patient specific orders to nurses to screen individuals at increased risk for syphilis, gonorrhea, and chlamydia infection; it also expanded access to PEP by allowing physicians and nurse practitioners to issue non-patient specific orders to pharmacists to dispense up to seven days of PEP. In April 2017, NYSDOH finalized regulatory amendments classifying HIV as a STI. With this change, local health department clinics must provide HIV prevention and treatment, including PrEP, to patients either directly or by referral. Providers in any setting may provide these services to minors without parental/guardian consent or notification. Medical and billing records containing information regarding such services may not be sent to the parent/guardian without the minor's consent. The following month, NYSDOH finalized regulatory amendments expanding data sharing to allow care coordinators access to HIV-related information for the purpose of linkage to and retention in care. This change has allowed the RWHAP Part A program to provide surveillance data on clients not virally suppressed to CCPs to encourage continued enrollment and increased adherence services.

C) Local Pharmaceutical Assistance Program (LPAP). The NY EMA does not fund a LPAP.

METHODOLOGY

A) Impact of the Changing Health Care Landscape

1) Description of Health Care Options for PWH. Eligible New Yorkers may enroll in Qualified Health Plans (QHPs) (*see Table 4 below*), including Medicaid and Essential Plans, through the NY State of Health website (nystateofhealth.ny.gov). Consumers with incomes between 138% and 250% of the FPL may be eligible for some premium and cost-sharing assistance. In January 2016, NYS introduced Essential Plans, which are plans available to low-income people who don't qualify for Medicaid or Child Health Plus (*see Table 5 below*). The Essential Plans are for New Yorkers with incomes up to 200% of the FPL, and have very low monthly premiums (maximum of \$20 per person per month), free preventive care, and no deductibles. Enrollment in QHPs and Essential Plans continues to grow, with a 150,000 enrollee increase between 2019 and 2020.^{lxi}

Individual plans vary by in-network provider and pharmacy benefit availability. Clients are encouraged to review resources within their desired health plan to determine if their preferred providers are in-network and if current medications are covered, and at which level. *Tables 4 and 5* provide an overview of the QHPs and Essential Plans available by county in the NY EMA.

Table 4. 2020 NY State of Health Plan Availability by County – Individual Market^{lxii}

County	Emblem Health	Empire BlueCross BlueShield	Fidelis Care	Healthfirst	MetroPlus Health Plan	MVP Health Plan	Oscar	United Healthcare
Bronx	x	x	x	x	x		x	x
Kings	x	x	x	x	x		x	x

Rockland	x		x	x			x	x	x
Westchester	x	x	x	x	x		x	x	

QHPs are required to contract with “Essential Community Providers,” including many RWHAP Part A provider sites who care for medically underserved populations, and ensure a level of appropriate geographic distribution. There are currently eight QHPs and nine Essential Plans available in the NY EMA. Medicaid Special Needs Plans (SNPs) offer additional coordination of care and include providers who are experienced with the needs of PWH. Current networks for NYS SNPs do not include the Tri-County Region. SNP eligibility includes TGNC/NB and homeless individuals, regardless of HIV status, in order to better address the needs of these underserved populations. Enabled by the NYS Value Based Payment Innovator program, which allows designated entities to maintain 100% of cost savings for the first five years for reinvestment into innovative services, HIV providers in NYC formed an Accountable Care Organization (ACO) for PWH. The ACO’s goals align with EHE goals, and will coordinate care in order to promote HIV prevention, improve PWH health outcomes, and decrease costs associated with poor health outcomes related to HIV and co-morbidities.^{lxiv} The Amida Care Innovator Network (ACIN), was incorporated in 2018, and the ACO Certificate of Authority (COA) was approved in February 2019. Following receipt of the COA, ACIN submitted its Innovator application to the State in June 2019. The Innovator program has been put on hold due to NYS budgetary reasons, but ACIN continues to communicate with NYS partners regarding the importance of the program.

In the lead-up to the effective dates for the ACA and Medicaid Redesign efforts, the NYC HD assessed provisions that might affect consumers and providers in the NY EMA and how to help them adapt to the changes. The CTP continues to allocate resources to support a Policy Advisor to monitor the health care landscape to ensure PWH have continued access to quality care, and to assess impacts of changes in Medicaid, Medicare, and the NY State of Health. This is to ensure that RWHAP Part A-funded services can fill gaps in the service system and adhere to POLR requirements. The Policy Advisor develops consistent communications related to health systems changes, including notices to providers, presentations, and updates to Recipient staff. In light of requirements that RWHAP Part A is the POLR and that Part A providers ensure clients are appropriately enrolled in coverage, contractual language, and data reporting requirements clarify

RWHAP Part A client assessment and reassessment expectations. This ensures that clients have support to access health insurance, should they be eligible.

During the past several years, NYS has undertaken a variety of initiatives to reduce costs and improve health outcomes for Medicaid enrollees. These initiatives have resulted in the creation of several specialized insurance products and service lines that include payment for supplementary services for vulnerable New Yorkers. In addition to the services paid for by Medicaid fee for service (FFS) and mainstream MCO plans, the additional products and services considered applicable to RWHAP Part A clients are Health Homes (HH) for people with a variety of qualifying conditions who can benefit from coordination of care, HIV SNPs for people living with and at increased risk of HIV, Health and Recovery Plans (HARPs) for people with complex behavioral health needs, and Home and Community-Based Services (HCBS) for a subset of HARP enrollees who need additional support to achieve behavioral health goals. In order to ensure the RWHAP Part A continues to function as the POLR in a rapidly shifting and complex environment of Medicaid programs in NYS, BHIV conducted an in-depth review and cross-walk of all RWHAP Part A services that were potentially reimbursable by Medicaid through FFS and mainstream MCO plans, HHs, SNPs, HARPs, and HCBS in the spring of 2019. This analysis resulted in the creation of POLR guidance for service providers and a review tool for contract oversight staff to use during site visits at agencies with contracts in the applicable service categories.

The NYSDOH has notified stakeholders that they intend to submit an 1115 Medicaid Redesign Team Waiver amendment that would allow for pharmacy benefits to be carved out of Medicaid Managed Care starting in April 2021.^{lxv} The carve out is intended to generate Medicaid savings by centralizing pharmacy benefit management under FFS to increase transparency, maximize rebate revenues, and increase negotiating power. 340B entities in NYS such as FQHCs, hospitals, Ryan White providers, Medicaid Managed Care Plans (including HIV SNPs) have expressed concern that the carve out, if implemented, would result in reduced revenues. The revenues from 340B discounts are used to support outreach, engagement, and adherence services for PWH in NYS.

a) Effect on access to health care services and health outcomes. Both consumers and providers find it difficult to navigate pharmacy benefits. NYSDOH AI provides resources such as webinars and trainings to better navigate drug formularies, but providers and consumers continue to voice concerns regarding increases to out-of-pocket costs for patients.

Essential Plans, which cover 2.9 times more New Yorkers than QHPs, help increase access to New Yorkers with the lowest incomes, since these plans include inpatient and outpatient care, physician services, diagnostic services, and prescription drugs with no annual deductible and low out-of-pocket costs. Essential Plan enrollees with incomes up to 150% of the FPL will have no monthly premium and have an annual out-of-pocket payment limit of \$200. Those with incomes between 150% and 200% of the FPL will have a monthly premium of \$20 and an annual out-of-pocket payment limit of \$2,000. To help cover out-of-pocket costs, the NYS HUCP copay assistance is available for those with an income up to 500% of the FPL. The NY EMA has seen steady increases in ART usage (from 78% of all diagnosed in 2014 to 90% in 2018),^{lxvi} and as a result, increased VS (from 67% in 2014 to 75% in 2018). While it is difficult to attribute improved health care outcomes to a single policy or funding change, enrollment in QHP coverage has been significantly associated with achieving VS in at least two studies.^{lxvii} This is consistent with research findings regarding prescription drug coverage and health outcomes: low-income adults are less likely to take medicines as prescribed due to cost;^{lxix} conversely, adults with chronic medical conditions are more adherent when they have prescription drug coverage.^{lxx, lxxi}

2) Effects of the changing health care landscape on service provision and RWHAP Part A allocations.

a) Service provision and complexity of providing care to PWH. The PC has been working to address changes in the health care system since 2011, with the development of its first Core Medical Services (CMS) Waiver application. As such, additional shifts were made in funding allocations to Housing, FNS, EFA, and the newly created Psychosocial Support Services (PSS) for Transgender, Intersex, Gender Non-Conforming or Non-Binary (TIGNCNB) people to increase services that support engagement in medical and MH services that may be funded through other payers. Increasing resources for these services also helped address inequities in access to medical care due to the burdens of poverty, homelessness, food insecurity, race/ethnicity, and sexual/gender identity. Provisions of the ACA led to increased insurance access for RWHAP Part A clients through: (1) Medicaid expansion and (2) the availability of health insurance plans for purchase on the NY State of Health Marketplace. Although there was greater access to insurance coverage due to Medicaid expansion, increases were relatively modest because NYS Medicaid previously covered single adults with income up to 100% of the FPL. The number of people enrolled in the NYS HUCP has remained stable in recent years as NYS achieved rapid Medicaid enrollment in the early years of the ACA through web-based expanded Medicaid access and, thus, had shorter gaps in Medicaid coverage. As stated on *p. 13-14*, the Recipient, PC, and the NYS HUCP have worked together to ensure continued access to medications for PWH through ADAP while ensuring continued resources are available for the core medical and support services at clinics, hospitals, and CBOs. From GY19-20, RWHAP Part A funding for ADAP was reduced by 34%, which allowed the NY EMA to absorb a portion of reduction to the NY EMA RWHAP Part A GY20 award while simultaneously enhancing the capacity of Housing services, FNS, and EFA in the NY EMA, in light of emergent needs of PWH resulting from COVID-19. Additionally, \$50,000 in ADAP funding has been allocated to the newly created service category, PSS for TIGNCNB individuals, specifically for the development of a comprehensive TIGNCNB public resource directory and provider training curriculum.

b) Changes in RWHAP Part A allocations. The NYS HUCP continues to be a resource for those who are unable to access public or private insurance and those who need financial assistance with health insurance premiums and copays. The NY EMA contributes to the ADAP prescription access program, paying directly for medications. The PC and Recipient also coordinate with the NYS HUCP to assess whether RWHAP Part A funding is needed for other services, including health insurance premium and cost-sharing assistance. Through the CMS Waiver, the NY EMA has continued to allocate funding to further support social services, such as food and housing, to meet clients' basic needs. Redirecting funding from the provision of CMS to supportive services enhances the Recipient's efforts to engage and retain clients in care who receive medical services and medications covered by other payers. Barriers to accessing basic necessities can have adverse health effects and offset progress from maintained adherence to ART. Investing in non-core services aligns with the NY EMA's goal to support clients in achieving VS, improving their quality and length of life, and drastically reducing transmission.

B. Planning Responsibilities.

1) Planning and Resource Allocation.

a) Description of the community input process. Consistent with legislative requirements, the NY EMA in GY20 used a systematic, evidence-driven, representative, and inclusive planning process to prioritize services and allocate resources for GY21. The PC and its committees, with aid

from the Recipient, continued a multi-year process to reassess and rebid the RWHAP Part A portfolio, with the aim of ensuring that the NY EMA's service system is responsive to current needs and identified challenges. All PC subcommittees include a diverse range of consumers, providers, and other stakeholders, and provide extensive opportunities for public comment, as described throughout this section.

The PC works closely with the Recipient and other NYC HD staff throughout the planning process and has a dedicated staff liaison from the BHIV Surveillance Unit who is specifically assigned to the PC to provide up-to-date epidemiological data for planning purposes. This year, the PC accomplished the following:

- Received and provided input into EHE efforts including plans for development of the NYC EHE plan for Bronx, Kings, Manhattan, and Queens counties with the expectation of voting on concurrence in January 2021;
- Received an update on the HRSA 20-078 Project PROSPER to ensure coordination of this new NYC EHE effort with the RWHAP Part A system of care;
- Utilized a data-driven planning tool to develop service priorities and determine funding allocations based on up-to-date information on PWH needs, service utilization, and gaps, including the NY EMA's Needs Assessment, the NYS Integrated Plan, a POLR Analysis, Service Category Fact Sheets with multiple years' historical utilization data, and data analyses from the NY EMA's CHAIN study;
- Allocated 54.3% of RWHAP Part A and MAI funding to CMS for GY21;
- Continued funding for MCM/CCP Programs to optimize medical outcomes;
- Allocated 4.9% of the GY21 portfolio for testing services to reduce the number of individuals who are unaware of their HIV status, and planned these resources in conjunction with the NYC HIV Prevention Program to coordinate with other testing resources;
- Allocated substantial resources to promote access to and maintenance in care for newly diagnosed individuals and to re-engage people who had fallen out of care;
- Allocated funds to create oral health services in the NYC portion of the EMA; and
- Approved increases in targeted service categories in order to address ongoing needs of PWH, fill service gaps for special populations, and address new needs arising from the COVID-19 pandemic.

A breakdown of the PC's committees and corresponding activities are provided below: Needs Assessment Committee (NAC). The NAC built on its previously developed comprehensive formal needs assessment for HIV services in the NY EMA. That assessment, produced with the assistance of the Recipient, reviewed a range of reports and presentations by NYC HD surveillance analysts, CHAIN researchers, and the CTP Research and Evaluation Unit (REU) staff. Findings included: the latest estimate of PWH unaware of their status, estimated numbers of PWH not in care, accessibility and quality of services, service barriers, geographic patterns in HIV burden and distribution of resources, impact of co-morbid conditions on HIV care, service utilization trends, unmet need, and provider capacity and capability, with special attention given to the HIV care continuum to identify populations that fall out of the continuum at each stage.

In GY20, the NAC identified PWH with SMI as a special population with inequitable health outcomes and greater likelihood of falling out of care. SMI is defined as a mental, behavioral, or emotional disorder resulting in serious functional impairment in one or more major life activities. A person with SMI may have major depression, schizophrenia or bipolar disorder, among others. NAC has been conducting an exhaustive review of data from multiple sources on the prevalence of SMI among PWH and RWHAP Part A clients, and the proportion of RWHAP Part A clients with an SMI diagnosis who were engaged or retained in care and virally suppressed. NAC reviewed a

data match between the NYC HD MH and HIV registries which found 1,326 individuals with SMI and diagnosed with HIV in NYC. Additionally, REU staff conducted a match between RWHAP clients screened for MH and the NYC Surveillance Registry found that those with reported MH diagnoses had lower rates of VS than those without a MH diagnosis. Those with more serious diagnoses (i.e., bi-polar disorder and/or reported psychosis) had the lowest VS of all. NAC reviewed the current RWHAP MH Services directive and standards of care to retool the category so that clients with SMI can be better linked to and retained in care and have their SMI and HIV diagnoses optimally treated. NAC is expected to complete a set of recommendations in fall 2020 that the PC can use as a road map for improving health outcomes for this population.

Integration of Care Committee (IOC). The IOC guides the PC in defining individual service categories, reaffirming continuing models of care, and creating new evidence-based service directives. Building on work done by the NAC in GY19, the IOC developed a new service directive for Oral Health Services to be provided in the NYC portion of the EMA (the Tri-County Region already has a small Oral Health program). The RWHAP Part A Oral Health program will fill a large identified unmet need through complementary Medicaid, Medicare, ADAP, and Part F services to ensure a robust system of care.

The service directive has many innovative features, including a screening tool to identify oral health discomfort and screening for human papillomavirus and oral cancers. The core of the service model includes: 1) provision of comprehensive preventative dental care, ensuring coverage of four dental cleanings per year including an annual deep scaling; 2) development of recommendations for common co-morbidities with oral health implications (e.g., diabetes, HCV); and 3) required trainings to build provider capacity to deliver services in a manner that is anti-racist and dismantles stigma. A portion of the allocated funding may be used to cover complex, high-cost services on a case by case basis, such as gum and bone grafts and implants. The directive also ensures that dental materials utilized are long lasting and of high quality; and supports replacement of dentures and other apparatus as needed.

The other principle component of the directive is a centralized Dental Case Management service to support: 1) full integration of oral health care into the service system; 2) increased capacity across the service system to improve access and utilization; 3) facilitation of consumer engagement and education; 4) provision of resources to support the more complex dental needs frequently associated with HIV; 5) development of a resource map to support completion of oral health treatment plans; 6) support of coordination of care with client's care team; and 7) ensures emergency care is funded and available. This service will be incorporated into MCM.

PSRA Committee. Using data assembled by the NAC, and service model definitions and eligibility criteria established by the IOC, the PSRA Committee uses an objective, evidence-based tool to determine service priority rankings and financial allocations, forwarding its recommendations to the full PC for consideration. The tool requires the committee to use data to score service categories on a prioritization grid, with four individually weighted criteria described below:

1) *POLR/ Alternate Providers of Services* (weight=15%). The PSRA Committee assessed each service to determine if RWHAP Part A is the primary funding source and whether other sources provide identical or equivalent services to PWH in the NY EMA. The highest value was assigned to services funded only by RWHAP Part A, and where existing provider capacity was found to be inadequate to serve PWH. In planning for GY21, the PSRA Committee examined a POLR and Coordination of Services Analysis compiled the previous year by consultants on behalf of the PSRA Committee. The analysis helped PSRA Committee members understand how RWHAP Part A serves as POLR by providing core medical and supportive services for PWH who have no other

source of coverage or face coverage limits, and provides services not covered by Medicaid and other payers. Due to NYS Medicaid's robust service coverage, the NY EMA prioritizes funding for supportive services, many of which are not covered by NYS insurance plans but are vital to the health and wellbeing of PWH. Services not covered by Medicaid and private insurance include many of the supportive and coordination services that have been expanded since the NY EMA obtained the CMS Waiver. The PSRA Committee also utilized Service Category Fact Sheets produced by the Recipient that examined each service category in depth. The Fact Sheets included POLR data and system-level considerations that examined other payers of RWHAP Part A services in the NY EMA. The addition of continued funding in NYS for HIV CMS through Medicaid expansion, health insurance exchanges, other RWHAP parts, and the NYS HH program was a critical factor in the PC's approval of the GY21 request for a waiver to the CMS requirement.

2) *Access to Care/Maintenance in Care* (weight=35%). The PSRA Committee assesses each service to determine the degree to which it contributes to access to or continuity of HIV primary care, including identifying people who do not know their HIV status. The highest value is assigned to services that have, as their primary goal, either direct provision of primary medical care or promotion of access to and maintenance in care through direct referral and linkage to medical services. Housing and FNS were deemed high priority services due to the importance of their role in addressing gaps in retention in care and VS.

3) *Specific Gaps/Emerging Needs (Demographic/Special Population)* (weight=25%). The PSRA Committee assesses each service to determine the degree to which it reduces documented service gaps or meets the needs of special populations. The PSRA Committee reviewed data from the CHAIN study documenting unmet need for key services in the study's representative cohort. The highest value was assigned to services promoting health care access and re-engagement of underserved populations, including those who are not engaged in later stages of the HIV care continuum.

4) *Consumer Priority* (weight=25%). The PSRA Committee scored services based on consumer input, as provided by the PC Consumer Committee, consumer members of the Council and PSRA Committee, and the CHAIN cohort study. The highest value was assigned to services identified by PWH as significantly contributing to access to or maintenance in primary medical care and representing a key consumer priority.

The Service Category Fact Sheets also provided eSHARE data over a three-year period on enrollment, performance, service utilization by service type, spending rates, and client demographics (including by priority population), which are used in the PSRA Committee's scoring of each criterion for every service category in the RWHAP Part A portfolio, as well as in allocation decisions, resulting in ranked priorities based on the criteria described above.

Tri-County Region Steering Committee. A local Steering Committee functioning as a subcommittee of the PC conducts service planning and makes resource allocation recommendations to the PC for Rockland, Putnam, and Westchester counties. The Tri-County Region's 30-member Steering Committee includes 11 PWH. All committee members received an orientation on the RWHAP legislation and the community planning process. The committee uses the same PSRA tool described above to rank regional service priorities. The Steering Committee reports to the PSRA, Executive Committee (EC), and full PC to obtain final approval of its spending plan. Most of the service portfolio in the Tri-County Region was recently re-bid for GY20, and the Steering Committee recommended proportional increases to the regional RWHAP Part A portfolio to increase capacity.

i. Involvement of PWH. The active, informed engagement of PWH is essential to the planning process and helps ensure that PC decisions address needs of consumers. The PC's Consumers Committee provides a forum for PWH (PC and committee members, as well as other stakeholder

community members) to be actively engaged in the planning process. PC members and staff living with HIV assist community members in understanding the priority setting and resource allocation process; HIV epidemiology; HIV care continuum; principles of community planning, group dynamics, and decision-making; QI/Quality Management (QI/QM); and the changing health care landscape and its effects on RWHAP services. The committee plays a key role in recruiting new members, including distribution of consumer outreach brochures, available in English and Spanish, at all PC meetings and outreach events. The Committee advocates for consumer engagement in the planning process and supports training and mentoring of new PC members (trainings to maximize informed participation and decision-making are available during the planning cycle).

In response to the challenges that COVID-19 presented to consumer involvement, the PC purchased tablets to loan to consumers who do not have appropriate computer equipment to participate in virtual meetings and read documents electronically. PWH participation continued during the planning year at the same high pre-pandemic levels, despite the challenges created by conducting all meetings virtually. In fact, the Consumers Committee held monthly listening sessions during the NYS on PAUSE order which allowed consumers to ask questions, raise issues in regard to gaps and services, and receive updates from the Recipient and NYC HD about COVID-19 guidelines and policy/service changes.

In GY20, PWH constituted 41% of the PC's 49 members. At the beginning of the planning cycle, after a concerted outreach and recruitment effort by PC staff, one-third of members were PWH who are not aligned with a RWHAP Part A agency. The overwhelming majority (71%) of the PC's non-aligned PWH are people of color. PWH actively serve on all PC committees and make up 37% of the Tri-County Region Steering Committee. The acting governmental co-chair is HIV-positive, and the community co-chair and finance officer are both non-aligned PWH. PWH from outside of the PC and its committees were closely involved in feedback on service quality, needs, and priorities through RWHAP Part A Client Experience Surveys and the ongoing CHAIN study.

To develop the GY21 plan, the PC sought the Consumers Committee's input regarding special populations and geographic areas of the NY EMA that remain disproportionately affected by HIV. Members of the Consumers Committee serve on all committees of the PC, and were particularly active in providing input and feedback at the IOC, NAC, PSRA, Tri-County Region Steering, and Rules & Membership Committees, as well as the Consumer Advisory Committee of the NYSDOH HIV Quality of Care Committee, NYS ETE borough and regional-based task forces, and NY EMA QM Committee, ensuring that consumer input and guidance is incorporated across the service system. In addition, committee members conducted a workshop at the NY EMA's 2019 Power of Quality Improvement Conference, where RWHAP Part A providers heard client perspectives on the need for oral health services, and link between oral health, quality of life, and retention in HIV care.

ii. Addressing funding increases or decreases. The PC's data-driven planning tool allows for an objective planning process for funding increases or decreases. The tool includes built-in weighted formulas based on the prioritized ranking of the services that automatically calculate funding increases or decreases for each service category contingent upon the actual award. The PSRA Committee and PC also review data from the Recipient on service category spending in order to consider targeted reductions in the case of a funding decrease. For GY20, there was a decrease of \$1.3 million in the NY EMA's total grant award (not including additional one-time funds received under the CARES Act). The NY EMA was able to absorb the cut through a reduction in the ADAP allocation. As described on *p. 13-14*, the PC worked closely with NYSDOH to agree on a reduction to the NY EMA's RWHAP Part A allocation to ADAP, based on an assessment of NYS and RWHAP Part B resources and projections of ADAP enrollment (which has decreased due to

expanded Medicaid and state insurance exchange enrollment under the ACA). The ADAP reduction allowed the PC to maintain services at their current levels. If the RWHAP Part A award is further reduced in GY21, the PC will adjust allocations based on expected need. However, the PC requests additional funding to cover the increased cost of service provision and to address unmet needs, particularly those arising from the impact of the COVID-19 pandemic such as housing, financial, and food support. Additional resources are also needed to fund the new Oral Health services, as well as to fully fund expanded PSS for TIGNCNB PWH. Given the ongoing reductions in the NY EMA's award since GY11, critical service levels will most certainly be negatively impacted if further reductions in the RWHAP Part A award occur in GY21.

iii. MAI funding. Planning for MAI funding, including prioritization and allocation of services, is integrated into service planning for RWHAP Part A funds and are aligned with the NYS Integrated Plan goal to reduce health inequities. MAI funds are concentrated in three CMS categories (ADAP, MCM, and EIS) and one support service category (Housing), all of which target the most heavily affected, highest need communities, specifically communities comprised of Black and Latino/Hispanic PWH. Data showed continued gaps in these services for these populations, justifying the need for continued targeted programs. In particular, the PC sought to ensure MAI funds were distributed to impact these populations at multiple stages of the HIV care continuum.

iv. Use of data in the priority setting and allocation process. The PC and committees considered all available and relevant data to assess need, develop service models, prioritize services, and allocate resources for GY21, consistent with the goals in the NYS Integrated Plan. The PC utilized multiple data sources, including surveillance reports, the NY EMA RWHAP Part A Service Category Fact Sheets, POLR Analysis, CHAIN data, NYS HUCP data, HOPWA, and RWHAP Part A program data from eSHARE.

In an effort to increase access to CMS and reduce inequities in access to HIV care, the PC examined evidence of service gaps from the CHAIN study and HIV/AIDS surveillance, which supported the PC's allocation of \$22.6 million for MCM in GY21. Thirty-nine percent of CHAIN cohort members met the criteria of needing MCM services, defined so if they reported interrupted HIV medical care, missed HIV medical care appointments, or had no CD4 or VL tests in the last six months. Of those who needed MCM, only a minority reported adequate utilization of the service, defined as receiving referrals to medical services through a case manager during the past six months.

The overwhelming majority of the MCM commitment is the CCP service model, which receives the largest service category allocation in the NY EMA's portfolio. CCP is a core component of promoting retention in medical care and medication adherence through clinical eligibility criteria and intensive services such as client centered care planning, self-management assessment, navigation, accompaniment, health promotion, and modified DOT. In revising the CCP service directive in GY18 for a re-bid of this service category for contracts starting in GY19, the PC examined NYC HD-reported MCM outcomes data from the Costs, HIV Outcomes, and Real-world Determinants of Success (CHORDS) Study. Significant increases in EiC and VS occurred in all subgroups examined, including those with key barriers to HIV care and treatment adherence. Findings showed a link between reducing psychosocial barriers and greater improvement on 12-month EiC/VS outcomes.^{lxxii} In comparisons of CCP clients' 12-month VS to the VS achieved among similar PWH, CCP-enrollees demonstrated higher rates of VS overall, with significant benefits over usual care for individuals who were newly diagnosed or who had no evidence of VS in the year prior to enrollment.^{lxxiii} Evidence of CCP effectiveness over usual care suggests health benefits for enrolled PWH and the public health value of intervention scale-up, focused on PWH with the greatest need.

Continued funding in GY21 at \$22.6 million was allocated to MCM on the basis of CHORDS data indicating statistically significant VS benefits, above those of usual care, for high-need PWH.^{lxiv}

For GY21, the PC also allocated \$4.1 million to continue n-MCM services for currently or recently incarcerated PWH in order to ensure linkage to care upon release for this marginalized population. Through this program, recently incarcerated PWH are connected to medical and support services that address barriers to optimal HIV primary care and assist in enrollment of PWH eligible for the NY State of Health insurance exchange and expanded Medicaid.

After careful review of data from the Service Category Fact Sheets and POLR analysis, the PC chose to end funding in GY21 of NMG. All service types in this category (i.e., outreach, accompaniment, service coordination, client assistance) are provided across numerous RWHAP Part A categories (Health Education/Risk Reduction (HE/RR), MH, MCM, PSS, EIS). NYC HIV/AIDS Services Administration (HASA), Medicaid HHs, SNPs, RWHAP Parts B, C, and D, and RWHAP Part A CCP and Supportive Counseling all provide similar case management services. Almost half of active NMG clients were actively enrolled in at least one other RWHAP Part A-funded service. NMG has historically under-performed (nearly 20% in 2018), and given this category's duplication of RWHAP Part A and other case management services, the PC determined that there is existing capacity to serve these clients through other programs. Furthermore, this funding can be reallocated to higher priority service categories and to fund new needs (e.g., Oral Health, COVID-19 response through increased allocation to FNS, EFA, and Housing).

Through Service Category Fact Sheets, the PC reviewed data highlighting the needs of historically underserved populations, including racial and ethnic minorities. Needs of PWH of color were assessed through an analysis of epidemiologic trends, utilization patterns by race/ethnicity, disproportionate service needs documented in the CHAIN cohort study, and comparison of geographic distribution of HIV/AIDS cases through mapping RWHAP Part A services. Through the Fact Sheets, the PC reviews service utilization data specifically by gender and age as well as by several special populations, including WoC, YMSM of color, OPWH, those who use substances, and TIGNCNB people. The data have shown that women make up a larger percentage of RWHAP Part A clients in the NY EMA (30.6%) than their proportion of the local epidemic (28.5%).

The PC uses these data to prioritize specific service categories that promote access to care for women, such as PSS services, where a disproportionate share of the clients are women, and which provides family-focused services that aim to remove barriers to care. The PC also promotes the meaningful participation of women living with HIV on the PC and its committees, where they bring an invaluable perspective on the barriers to care for women. The NY EMA ensures adequate and continued support of CMS for women, infants, children, and youth (WICY) through ongoing collaboration with the NYS Medicaid program. In FY19, Medicaid expended more than \$686,435,595 to fund CMS for WICY populations far exceeding the NY EMA's required set-aside \$28,730,976. In addition, the NY EMA is home to nine RWHAP Part D grantees, many of them multi-site consortiums, which specialize in serving WICY populations and sub-populations such as LGBTQ teens, pregnant and perinatal women, WoC, perinatally infected youth, and YMSM.

The PC reviewed evidence on inequities in timely EiC for newly diagnosed people. The PC allocated \$4.1 million to EIS in GY21 (including \$1.6 million in MAI funding) for targeted outreach and testing, and for return to care services targeting individuals found to be out of care for at least six months. The PC also allocated \$878,094 under HE/RR to support HIV self-management education programs for newly and previously diagnosed PWH with barriers to maintaining care. The PC also reviews NYS HUCP demographic reports. These reports provided evidence that many

MSM of color depend on the NYS HUCP for health care access, which influenced the PC's decision to continue to prioritize support for ADAP.

Data on unmet need and utilization of MH services among PWH in NYC, along with barriers that PWH with MH issues face with respect to accessing care, led the PC to continue supporting a MH service model that seeks to increase engagement in MH services; provide treatment and care to PWH with MH issues, including those with co-occurring SUDs, to improve quality of life and MH functioning; facilitate ongoing involvement in bio-psychosocial care and treatment, including adherence to ART and/or psychotropic medications; and reduce use of emergency care. The PC directed a total of \$4.2 million to MH services for GY21.

In GY20, the EMA allocated \$449,825 in RWHAP Part A funds to respond to the economic dislocation caused by COVID-19 by providing emergency funds to pay for necessities such as rent and utilities, as well as personal protective equipment for people who lost income due to the pandemic. In GY21, the PC continues the enhancement to the EFA category to respond to the ongoing COVID-19 crisis with a total allocation of \$685,618.

COVID-19 has brought pressing challenges to PWH in the EMA. Food insecurity is at an all-time high and food banks throughout the EMA have reported shortages and an inability to meet the demand for assistance. For GY21, the PC has allocated an additional \$1 million for FNS for a total of \$9.7 million. The PC is also requesting an increase of \$1.5 million in housing assistance for a total of \$14.2 million in order to respond to the increased need for rental assistance due to COVID-19. As has been amply demonstrated, food and housing insecurity are major barriers to access to and retention in medical care and achieving VS.

The PC reviews unit costs for each RWHAP Part A service category, considering the original funding allocations and modifications for each service category over a three-year period along with client utilization, expenditures, and service units. For example, when considering the GY21 allocation for expanded Oral Health services in NYC, the PC examined unit costs of the current Tri-County Region program and determined that an additional \$500,000 would allow for two pilot programs serving 280 clients, accounting for the increased expense of the higher quality services, procedures, and materials.

The PC also developed an annual plan for anticipated unspent funds, reallocating funds based on need and service costs, and prioritizing reallocated funding to over-performing service categories and ADAP as these funds become available to the NY EMA RWHAP Part A portfolio.

v. Changes in the prioritization and allocation process. In developing the GY21 plan, PC and its committees used the same well-established priority setting tools and process as in the previous year. Updated data was incorporated to reflect a greater understanding of the current local epidemic, the needs of PWH, gaps in services, and inequities in access to HIV care, and the ongoing effects of the changing health care landscape. The NYS Integrated Plan was a cornerstone for developing the goals and objectives of RWHAP Part A services. For example, the goals and objectives of the new Oral Health service directive were mapped to the goals and objectives of the NYS Integrated Plan, including: promoting access and maintenance in HIV-specific medical care; increasing proportion of clients with an undetectable VL and improved immunological health; reducing HIV-related morbidity and mortality; and reducing socio-demographic inequities in those areas.

2) Administrative Assessment. Consistent with legislative mandates, the PC assesses the efficiency of the administrative mechanism in timely allocation of RWHAP Part A funds to areas of greatest need in the NY EMA.

a) *Assessment of Recipient's activities.* The PC's EC is charged with assessing the efficiency of the administrative mechanism in the timely allocation and contracting of RWHAP Part A funds according to the PC's priorities and allocations. Recipient staff presented quarterly commitment and expenditure reports for all Base- and MAI-funded service categories in NYC and the Tri-County Region to the EC, and answered inquiries about increases or lags in spending by service category as well as in the Administration and QM lines. The EC also assessed all legislatively required aspects of the administrative mechanisms, including contract executions and renewals, procurement, and timeliness of sub-contractor payments and spending. The EC reported its findings on GY19 to the EC and full PC in July 2020.

b) *Deficiencies.* The EC determined that there were no deficiencies in the administrative mechanism, and no corrective action was needed for GY19.

3) *Letter of Assurance from Planning Council Chair(s) (see Attachment 6).*

4) *Resource Inventory.*

a) *Coordination of services and funding streams.* The flexibility of RWHAP Part A funding has enabled the NY EMA to develop a range of innovative programs and service delivery strategies that respond to the specific access barriers faced by the NY EMA's PWH most in need of services.

i) *HIV resources inventory (see Attachment 5).*

ii) *Needed resources, and steps taken to secure them.* As mentioned in the introduction, new resources from both HRSA and CDC are welcome additions to support NYC's EHE efforts. The BHIV has received awards for developing the NYC EHE plan (CDC PS-19-1906) based on a community engagement process—this effort has transitioned to virtual listening sessions to inform a plan that will be reviewed and voted upon by both the PC and the HPG in January 2021. The BHIV also received additional resources from the CDC to address the four pillars of the EHE plan (CDC PS-20-2010) and funding from HRSA to support EHE efforts in the Treatment and Response pillars (HRSA 20-078; Project PROSPER) while also serving as a Capacity Building Assistance Provider (HRSA-19-1904) to Northeastern EHE jurisdictions. The activities being planned and implemented under Project PROSPER and CDC EHE program will build upon the City's successes and align with the final NYC EHE plan (*see pgs. 1-2*); and aim to strategically advance HIV prevention efforts in the four EHE counties to accelerate NYC's progress in reaching the national goal of a 75% reduction in new HIV infections by 2025. The CTP is supporting Project PROSPER through review of RFPs for replicating evidence-informed models of care and strengthening data collection and utilization in clinical care settings to improve HIV care outcomes. Additional NYC resources fund programs to fulfill the goals of the NYS ETE Blueprint, allowing for contracts to increase the availability of PrEP/PEP, support VS, provide clinical services, pharmacotherapy, HR support for MSM and transgender women using methamphetamines, and increase the capacity of TGNC/NB-led and Black MSM-led CBOs. In GY20, the NYS HUCP adapted their enrollment process to allow for same-day provision of services and ART for the majority of clients to support iART upon diagnosis. This change has allowed RWHAP Part A EIS and MCM-funded providers and CDC-funded Status Neutral navigation clinical contractors to implement iART by leveraging the NYS HUCP resources. The NYS HUCP provides immediate access to ART and related medical and laboratory services through its ADAP and ADAP Plus programs while RWHAP Part A EIS and CCP resources provide support services to newly diagnosed clients in need of iART through coordination of benefits and insurance, assessment of

urgent needs, and the provision of support and accompaniment services through patient navigation to enhance and ensure adequate linkage to and retention in care.

Addressing income as a social determinant of health is an important endeavor to meet the needs of PWH in the EMA given that 88.5% of RWHAP Part A clients earn less than 138% of the FPL. While RWHAP Part A resources are not able to support efforts to engage PWH in employment services, the NYC HD has utilized other resources to address this need. To support PWH needs to engage in employment, the NYC HD leveraged three-years of grant funding from the CDC (15-1506, Project THRIVE) which began in 2017 to launch a demonstration project focused on improving HIV prevention and care outcomes among MSM of color in Brooklyn. In addition, BHIV, in collaboration with the Mayor's Office of Workforce Development, created an internal working group consisting of staff across units, known internally as "Considering Work Efforts Work Group," which is now funded with City resources. A key goal of this group is to inform staff on how to enhance the integration of employment services within HIV prevention, care, and treatment programs to ultimately advance overall health outcomes of PWH throughout the NY EMA. A key deliverable of this initiative was the successful execution of "Career Power Source," an annual community event that took place in October in 2018 and 2019, with current plans to hold a virtual event in 2020. This all-day event brings together consumers, providers, and subject matter experts in an effort to increase access to jobs, employment services, training, and educational resources for the priority populations mentioned above.

The NY EMA used ETE funds to support methamphetamine-specific HR programs to address the harmful effects of methamphetamine use, alongside RWHAP Part A-funded HR services to address the needs of both PWH who use methamphetamines and people not living with HIV who use methamphetamines. In 2020 a crisis line and "come down" room were added to services offered to people who use methamphetamine. Another ETE funded program utilizes elements of CCP to provide status neutral navigation and assessment to PEP, PrEP, MH, housing, and SUD services to those at risk for HIV.

WORKPLAN

A) HIV Care Continuum Table and Narrative.

B) HIV Care Continuum Table (see Attachment 7).

C) HIV Care Continuum Narrative.

a) Utilizing the HIV care continuum in resource planning. The NY EMA takes a strategic systems-level approach to planning for services for those with unmet need. The PC and the CTP Operations and Planning Team regularly use the HIV care continuum to understand gaps and identify new service models that might be able to meet those gaps. The HIV care continuum is also used to measure progress towards ETE goals. The NY EMA was able to produce a combined continuum for NYC and the Tri-County Region, for all PWH, using 2018 data (see Figure 2). Information on all PWH was obtained using the NYS Surveillance Registry. Using NYS's methodology, individuals who have been diagnosed with AIDS with no evidence of care for five years and individuals who have been diagnosed with HIV (non-AIDS) with no evidence of care for eight years are excluded from the total number of diagnosed PWH. This approach yields an accurate estimate of the number of PWH who are still living and residing in the NY EMA and allows for better estimation of progress along the HIV care continuum. The NYC HD's MMP in NYC provides an estimate of ART prescription status for all PWH.

b) Changes in the HIV care continuum. From 2014-2019, the proportion of clients engaged along the different stages of the NY EMA HIV care continuum has remained relatively stable, with

a slight decrease in linkage to care and a slight increase in retention in care, ART prescription, and VS. The NY EMA is invested in evaluating the strategies and interventions necessary to address unmet need and move PWH along the HIV care continuum to VS. As such, the NY EMA was an engaged participant in the HRSA-funded Care Continuum Learning Collaborative, where the NY EMA Recipient staff shared their HIV care continuum-related project plans with peers (Baltimore, Detroit, Tampa/St. Petersburg, Houston/Harris County, and Phoenix/Maricopa County) in their assigned work groups. The NY EMA focused on developing a surveillance-based client-level VS progress report, which was disseminated to CCP providers in July and August 2018 (and semi-annually thereafter), as part of a new D2C initiative. These reports continue to be shared with providers. Also, the NY EMA created a protocol to implement a VBP model across CCP, with the aim of incentivizing QI among subrecipients. The model will be implemented post COVID-19 to ensure the model is based on accurate data.

The NY EMA has been at the forefront of evaluating interventions across the portfolio of services. This includes utilizing resources from the National Institutes of Health (NIH), HRSA, and CDC, among others, to work with academic and other partner institutions to conduct in-depth assessment of outcomes within and across subpopulations of interest. One example has been the work of the CHORDS study to evaluate the CCP model of MCM. This multi-year, multi-phase project evaluated care engagement and VS outcomes among CCP clients overall and according to baseline VL, housing, MH, and SUD status. Initial work of the CHORDS study resulted in CCP being listed as an evidence-informed intervention in the CDC Compendium^{lxxv} of Evidence-Based Interventions and Best Practices for HIV Prevention under the Linkage to, Retention in, and Re-engagement in HIV Care chapter. In addition, this study has highlighted the impact of resolution of psychosocial needs on HIV outcomes. CCP clients reporting cessation of hard drug use post-enrollment showed significantly greater improvement in EiC from the period prior to enrollment than those continuing hard drug use, and clients obtaining stable housing post-baseline showed significantly greater improvement in VS than those remaining in unstable housing.^{lxxvi} In addition, the REU of CTP received new NIH R01 funding for an implementation science study, Program Refinements to Optimize Model Impact & Scalability based on Evidence. This endeavor will evaluate changes in the CCPs resulting from the PC's GY18 service directive.

Other work has demonstrated the need in the NY EMA for supportive services that reduce barriers to VS. As noted above, previous work by the NYC HD among MSM living with HIV enrolled in RWHAP Part A programs in the NY EMA found crystal meth use to be associated with unsuppressed VL.^{lxxvii} In a separate analysis, controlling for sociodemographic and clinical characteristics, recent tobacco smoking was also found to be associated with unsuppressed VL.^{lxxviii} Additionally, in an analysis of the NYC RWHAP Part A FNS program, among clients analyzed between 2011 and 2013, controlling for sociodemographic characteristics, consistent food insufficiency was found to be associated with unsuppressed VL.^{lxxix} The CHAIN study has also demonstrated a relationship between unmet needs and poorer health outcomes, including analyses of the relationship between housing need and retention in HIV medical care,^{lxxx} and has shown that providing services to address these unmet needs reduce the likelihood for poor outcomes. For example, in a longitudinal analysis comparing individuals who were food insecure at one interview and receiving FNS and were then not food insecure by the next interview with individuals who continued to be food insecure, those with resolved food insecurity were less likely to have missed appointments, to have a detectable VL, and to have had an emergency room visit or an inpatient stay compared to those who remained food insecure.^{lxxxi} To address the needs of food insecure PWH the new FNS directive, which is more client-centered and emphasizes the role of healthy

eating and food access on HIV health, was approved by the PC resulting in a procurement process and new contracts in GY20, along with an increased service allocation to support PWH who are food insecure to move through the HIV care continuum. The new contracts are aimed at addressing issues relating to food insecurity, increasing access to care and treatment, and addressing racial and health inequities for PWH in the NY EMA.

B) Funding for Core and Support Services.

1) Service Category Plan.

a) Service Category Plan Table (see Attachment 8).

b) MAI Service Category Plan Narrative.

MAI Initiatives. As previously described, low-income communities of color are disproportionately affected by HIV in the NY EMA. The NY EMA strategically uses MAI funding to reduce health inequities, increase service access, and improve health outcomes for underserved PWH, including Black, Latino/Hispanic, and Asian/Pacific Islander people. In GY20, 94% of PWH served by the MAI program were people of color: 54% were Black, 37% Latino/Hispanic, and 2% Asian/Pacific Islander. The NY EMA strives to use its resources to address HIV health inequities associated with race/ethnicity, particularly among Black and Latino/Hispanic populations who account for 87% of all PWH served by RWHAP Part A, while they constitute only 76% of all PWH in the NY EMA.

Among RWHAP Part A clients served in NYC in 2019, the racial/ethnic inequity in VS rates persisted; 78% of Black RWHAP Part A clients were virally suppressed in 2019, compared to 82% of Latino/Hispanic clients, 87% of White clients, and 91% of Asian/Pacific Islander clients. Across gender categories, VS rates were lowest among transgender clients (74%), 89% of whom were Black or Latino/Hispanic and 80% of whom were transgender women.

Approaches for MAI populations. Due to the large proportion of racial/ethnic populations served by the entire RWHAP Part A program, the PC and the Recipient work to develop strategies and interventions throughout the portfolio that will support positive health outcomes for people of color living with HIV. Thus, there are not separate planning processes for racial/ethnic minority populations or for MAI funding.

MAI activity descriptions. The GY21 MAI funds have been allocated to program services in four service categories: ADAP, EIS, MCM, and Housing Services. These four service categories were selected by the PC to receive MAI dollars because of their combined ability to make an impact along each stage of the HIV care continuum among priority populations by focusing on social determinants of health such as lack of access to regular medical care (including HIV testing and linkage services) and unstable housing. The MAI program service models do not vary from the same service categories in the RWHAP Part A program portfolio; rather, the MAI program prioritizes services to communities where disproportionately burdened minority populations live. All contracted RWHAP Part A services in the NY EMA, including MAI, are required to adhere to CLAS Standards. The NY EMA applies the eligibility criteria below to ensure that MAI funds are directed to high-need communities. Other than ADAP, each MAI-funded agency/program must:

- Direct its services to residents of ZIP code areas with 150 or more reported living HIV/AIDS cases among the MAI populations;
- Have the majority of its program and administrative sites located in ZIP codes with 150 or more reported living HIV/AIDS cases among the MAI populations; and
- Demonstrate that at least 75% of its current active clients who receive HIV/AIDS services are from the MAI populations.

ADAP exclusively serves Black, Latino/Hispanic, and Asian/Pacific Islander clients from the NY EMA who are eligible for ADAP with MAI funds.

c) Core Medical Services waiver (see Attachment 9). A CMS waiver was submitted prior to this grant application.

RESOLUTION OF CHALLENGES

The NY EMA continues to strive to deliver the best possible services aimed at increasing the health of PWH in its concerted effort to end the epidemic while adhering to the RWHAP legislation and accompanying policies. In GY20, the Recipient has worked to resolve a number of challenges through collaboration with the PC, consumers, funded providers, Public Health Solutions (PHS)/Contracting and Management Services (CAMS), and NYSDOH AI colleagues. *Table 6* below highlights the most salient resolved challenges.

Table 6. Resolution of Challenges

Challenges/Barriers	Proposed Resolutions	Intended Outcomes	Current Status for RWHAP Part A/ Care Continuum
Providing Culturally Responsive Care Research has shown that stigma and discrimination related to race, sexual orientation, and gender identity/expression, in addition to lack of access to culturally responsive services, especially for Black and Latino TIGNCNB people, are barriers to HIV medical services. ^{lxxxii} This challenge must be addressed to increase the provision of culturally responsive care to effectively meet the needs of TIGNCNB clients participating in RWHAP Part A services across the NY EMA.	In GY19, the Recipient disseminated a CLAS Standards self-assessment to service providers throughout the NY EMA RWHAP Part A portfolio, results of the assessment are to be incorporated into subrecipient QM plans. The Recipient also collaborates with others in BHIV to engage community partners in addressing stigma, including CHAIN researchers who issued a special report about experiences of stigma among survey participants in GY20. Most importantly, under the newly created PSS for TIGNCNB people, all providers will participate in a comprehensive cultural responsiveness/ awareness training program, with a multi-day curriculum and all-encompassing TIGNCNB resource directory. Both materials will be developed and created by community members identifying as TIGNCNB in GY20 and GY21.	Improve cultural responsiveness across the RWHAP Part A service portfolio, focused on addressing the complex needs of TIGNCNB populations within the NY EMA.	VS among Black Transgender women is 11% lower than the larger population of PWH (64% vs 75%, respectively). This data underscores the need to better meet the needs of Black TIGNCNB PWH by increasing cultural responsiveness at the provider level, engagement at the participant level, and service quality in core medical and support service environments that lead to VS.
Addressing Needs of OPWH (Age 50+) As more of the NY EMA's PWH benefit from the improved health outcomes related to VS, additional co-morbidities associated with HIV and aging must be incorporated in the system of care. As of December 31, 2019, more than half of PWH in the NY EMA were OPWH. Among RWHAP Part A PWH clients in NYC who had	The recipient conducted seven focus groups in collaboration with the community-based Long-Term Survivors Wellness Coalition to assess the unmet needs of OPWH for use in developing future service models aimed at tackling the diverse needs of this priority population. In GY20, the recipient shared results which indicate the needs of OPWH are far more complex than maintaining their HIV care and treatment, and extended to MH and systems navigation for	Address HIV related health inequities and reduce the effect of co-morbidities on OPWH in order to improve health outcomes and reduce preventable mortality.	Work to improve the quality of care to improve retention and VS, and reduce preventable mortality for OPWH.

Challenges/Barriers	Proposed Resolutions	Intended Outcomes	Current Status for RWHAP Part A/ Care Continuum
at least one service during March 2017-February 2018, 58% were OPWH. ^{lxxxiii} Moreover, inequities persist among older people of color with VS rates being the lowest among Black and Latino/Hispanic OPWH when compared to their White counterparts. Moreover, death rates among Black and Latino/Hispanic OPWH were significantly higher than death rates among White OPWH. ^{lxxxiv}	conditions outside of their HIV diagnosis. In GY21, the Recipient will work with the PC to ensure programming is responsive to the needs of those aging with HIV in the NY EMA. In addition, the Recipient will coordinate with Project PROSPER to learn from successes and challenges of the implementation of a clinical model of care for Black and Latino/Hispanic OPWH.		
Addressing Health and Racial Equity Across the RWHAP Part A Portfolio Recent surveillance and eSHARE data analyses indicate that racial and ethnic minority populations are disproportionately affected by HIV. Although the NY EMA is working towards national goals on retention and VS, inequities exist among certain subpopulations, specifically YMSM and Black cisgender women. The overwhelming majority (85%) of YMSM diagnosed with HIV by the end of 2017 and still living in NYC at the end of 2018 were Black or Latino; and over half (59%) of cisgender women diagnosed with HIV by the end of 2017 and still living in NYC at the end of 2018 were Black. YWMSM fared better on VS (at 68% and 71% in 2017 and 2018, respectively) than YBMSM and YLMSM ⁹ . White cisgender women had the same level of VS as Black cisgender women (at 72% in 2018); they also represented a small share (6%) of the population of cisgender women living with HIV ^{lxxxv} .	The Recipient developed, implemented, and maintained work groups designed to advance racial health equity and influence future RWHAP Part A programming focused on: Black and Latina Women; Youth; Mortality; Housing; OPWH; and Transgender women. In GY21, the recipient will collect information to inform the development of locally-defined strategies to improve the accessibility and responsiveness of services for young adult PWH. The Black and Latina Women work group, with support from the Recipient is planning to hold an open forum in GY21 to support Black and Latina/Hispanic women who provide HIV services in the era of COVID-19 and to incorporate lessons learned in future RWHAP Part A programming. The Recipient has developed and offered a racial equity training for RWHAP Part A contracted providers since 2018. These trainings will continue in GY21, and will be done virtually in response to the COVID-19 pandemic. The Recipient will also evaluate eSHARE data to aid in assessing where each priority group is being served in the RWHAP Part A portfolio and to identify gaps in the HIV care continuum.	Increase the quality and responsiveness of services offered to priority populations disproportionately affected by HIV in the NY EMA RWHAP Part A portfolio; decrease inequities identified in priority populations across the HIV care continuum; and improve general health outcomes across priority populations in the NY EMA.	The vast majority of RWHAP Part A clients are Black and Hispanic/Latino in the NY EMA. Given the VS inequity between these populations and White PWH the Recipient will work to improve the quality of care and services offered, with the goal of reducing new diagnoses, unsuppressed VL, and preventable mortality among Black and Latino/Hispanic PWH in the NY EMA.

⁹ However, the YWMSM VS proportions are more labile given that their numbers are also small (<100 in the denominator in each year, as compared with >400 YBMSM and >300 YLMSM in each year).

Challenges/Barriers	Proposed Resolutions	Intended Outcomes	Current Status for RWHAP Part A/ Care Continuum
Addressing the Needs of PWH with Disabilities Under federal, state, and local law, health providers are required to provide reasonable accommodations to individuals with a disability. A 2016 survey of RWHAP Part A providers in the NY EMA identified major challenges to the provision of care for people with disabilities, including: time constraints, lack of resources, lack of funding, and lack of training/education. In 2017, 45% of RWHAP Part A program participants reported having at least one disability at their most recent visit.	Based on a RWHAP provider survey, a review of data in regard to the needs of PWH with disabilities and recommendations from the PC's NAC, the Recipient developed a provider resource guide to aid in better addressing the needs of individuals with various types of disabilities in the NY EMA. Additional efforts include increasing the availability of trainings and TA addressing reasonable accommodations among contracted providers and improved data collection in eSHARE through an update to the disability questionnaire to include more sensitive and inclusive language around disabilities. The resource guide is in final development stages and will be updated as per guidance from the NYC Mayor's Office of Disabilities.	Ensure the provision of reasonable accommodations to PWH with disabilities in order to increase access to and retention in care. Ensure services are delivered in a culturally responsive manner, and are tailored to address provider needs for working with this population.	Work to improve the quality of care and types of services offered to ensure access for all RWHAP Part A participants with disabilities in the NY EMA.
Addressing the COVID-19 pandemic in the RWHAP Part A Portfolio A recent CHAIN survey set out to uncover how participants have been impacted by the COVID-19 pandemic. The results indicated that up to 48% of participants are at a higher risk for serious illness from COVID-19, and 97% had significant increased risk for COVID-19 due to structural inequity indicators, including recent homelessness/housing instability, poverty, and history of incarceration.^{lxxxvi} Furthermore, the findings indicate that up to 49% of participants are experiencing financial hardships and/or are struggling to make ends meet. In addition, a larger proportion of participants (30%) indicated they had been laid off, or had work hours greatly reduced without pay, posing additional barriers for optimal care and treatment.	Enhancements have been made in GY20-21 to provide additional funding to EFA, FNS, and Housing services to address emergent financial needs (which have increased in light of COVID-19), food insecurity, and homelessness/housing instability for PWH in the NY EMA. Additionally, in GY20, the recipient provided flexible service provision standards for RWHAP Part A providers to ensure both provider and client safety while guaranteeing continuity of services during the COVID-19 pandemic. In addition, the recipient authorized a number of changes to contracts, including the provision of remote services, to ensure service continuity for RWHAP Part A clients in the NY EMA, and to prioritize the health and safety of program staff, clients, and communities served.	Ensure RWHAP Part A providers are able to adapt to the current health care landscape, which has shifted both greatly and swiftly in light of COVID-19, and to enable continuity of care and provision of essential support services to PWH in the NY EMA. Additionally, the enhancement made to EFA, FNS, and Housing services will ensure RWHAP Part A participants are not displaced, and are able to continue to adhere to their treatment regimens without the added stressors associated with homelessness, housing instability, or food insecurity.	Continue to provide essential support services to those most impacted by both HIV and COVID-19 to ensure continued progress along the HIV care continuum for RWHAP Part A participants in the NY EMA.

EVALUATION AND TECHNICAL SUPPORT CAPACITY

A. Clinical Quality Management (CQM). The CQM program is a collaborative effort overseen by the RWHAP Part A Project Director and involves BHIV CTP QM/TA and REU, COTA, and Prevention; Housing programs; NYSDOH AI; PHS; PC; consumers; and RWHAP providers.

Through TA, the CQM program seeks to: (1) strengthen RWHAP Part A providers' quality efforts; (2) build providers' capacity for QM while also providing guidance in program model implementation; and (3) improve care across the continuum. The objectives of the CQM program are to: build capacity for QM among RWHAP Part A providers; increase collaboration between RWHAP and Medicaid-funded providers; provide opportunities for peer learning among RWHAP Part A providers; and ensure the continuation of high-quality services for PWH. These objectives are consistent with national goals for increasing the capacity of HIV systems of care that include diverse service providers.

Several processes are in place to provide TA and capacity-building assistance. The CTP QM/TA team members, under the supervision of the CTP Director of QM/TA, identify gaps in the RWHAP Part A system and develop strategies to address gaps and assess quality. QMSs on the CTP QM/TA team, along with REU evaluation specialists, provide TA to RWHAP Part A providers with an emphasis on using data and QI tools to improve care. More specifically, through the CQM program, the grantee develops and implements trainings for RWHAP Part A providers to improve service quality and support QM activities. In August 2019, QM/TA started releasing quarterly memos to advise service providers of updates or clarifications about service definitions and standards, service reporting, documentation, deliverables, and training expectations. The quarterly memos are part of the grantee's plan to improve the quality of TA services by organizing and coordinating the distribution of information.

As part of the CQM program, the NY EMA QM Committee updates and implements the QM plan. The most recent update was completed in July 2019. The committee includes key stakeholders from CTP, the PC (both consumers and staff), NYSDOH AI, Tri-County Region, Housing, HIV Prevention, COTA, and other areas as needed. The plan outlines the CQM program's activities in five domains: consumer engagement, collaboration and coordination, capacity building, service engagement, and service quality. In 2020, the Committee added a new health equity domain, with the objective of improving systems to reduce inequities in health outcomes driven by structural racism. Adding a domain in this area is also consistent with NYC HD's emphasis on addressing racism as a driver of health inequity and poorer health outcomes.

Some CQM efforts are shared with the COTA program to increase coordination between the RWHAP Part A program and non-RWHAP Part A-funded outpatient ambulatory care services. CTP meets regularly with BHIV colleagues in COTA, who are evaluating HIV primary care facilities in NYC to assess client characteristics, clinical and support service capacity, and HIV care outcomes. COTA is also conducting in-person TA visits to support facilities in meeting the NYS ETE initiative's goals. The CQM program uses data from COTA's evaluation and TA to determine how RWHAP Part A services may better support clinical services, including health care settings that receive RWHAP Part A funding through subawards. COTA also coordinates closely with the NYSDOH AI on RWHAP Part B and Medicaid clinical organizational assessments. CTP, Prevention, and COTA and the NYSDOH AI collaborate on shared jurisdictional initiatives including: *New York Knows*, which works to increase HIV testing and linkage; the NYLinks program to increase retention and VS through cross-RWHAP-Part collaboration; and the ETE borough-based and Lower Hudson Valley steering committees which support implementation of the NYS ETE Blueprint and are providing input into the NYC EHE plan.

NYC HD REU staff are responsible for analyzing eSHARE data, as well as consumer survey and supplemental evaluation data, to produce and present portfolio-wide and service category- and agency-level quality performance indicators. Additional analyses (e.g., HIV care continuum measures and mortality rates disaggregated by service category or by client demographic, clinical and/or psychosocial characteristics) help identify inequities in HIV-related health outcomes that may be addressed through program planning and QM/TA efforts.

CTP draws on the expertise of the NYSDOH AI to provide peer learning support through the annual Power of QI Conference. In November 2019, the sixth annual Power of QI conference was held with the theme, *Using Unexpected Results to Improve Performance*, which emphasized that trial and error are essential to the process of improving systems. The Consumers Committee of the PC welcomed conference attendees during the opening plenary and conducted a workshop focusing upon meeting needs for oral health services. HRSA's RWHAP Center for Quality Improvement and Innovation also conducted a workshop about quality improvement through the Project Extension for Community Health Outcomes collaborative. The conference provided a forum for participants to share QM projects through workshops and presentations. Over 250 service providers, consumers, and other stakeholders across the NY EMA attended the Power of QI conference. Bridging Access to Care received the award for best overall project for "*A Look at One HPA Program's Retention Rates and Why Housing Was Lost*" examining and addressing root causes driving housing loss in their program.

1) Use of performance measure data to evaluate inequities in care. Consistent with national goals, BHIV is expanding its efforts to support VS by addressing care quality at the clinic level. The CQM program has collaborated in these efforts by ensuring that RWHAP Part A services support engagement and retention in high-quality clinical care and treatment to achieve and maintain VS. For example, as part of an effort to promote early ART initiation, consistent ART access, and sustained VS, CTP began providing each RWHAP Part A provider agency with client-level reports, known as TSRs, in 2014. The TSRs are prepared every three months using data reported by RWHAP Part A providers in eSHARE. Reports list clients who do not appear to be virally suppressed, distinguishing whether or not the clients are currently prescribed ART. These client-level, custom reports are used to focus programmatic TA and facilitate communication and coordination between RWHAP support service providers, clients, and their medical providers to promote ART use and adherence. In 2017, CTP launched the RWHAP Part A AVSR, and for each organization receiving funding from the RWHAP Part A program, REU prepared a report showing the proportion of each organization's RWHAP Part A clients who were classified as virally suppressed at their last VL test of the calendar year, for multiple years (thus tracking trends over time). Organizations were also able to see how their annual VS proportion compared to that for all RWHAP Part A clients in NYC. The AVSR uses VL data reported to the NYC HIV Surveillance Registry. CTP released new versions of the AVSR in July 2019, breaking down results for five priority subpopulations (OPWH, Black or Latino cisgender MSM, cisgender YMSM, transgender women, and Black and Latina cisgender women) selected in accordance with the NYC HD's Race to Justice initiatives for advancing racial equity and social justice. The updated, expanded AVSR also provides breakdowns of VS proportions among clients "newly enrolled" and clients "established in services," along with guidance for report interpretation (i.e., lower VS among newly enrolled clients may reflect successful outreach to more vulnerable PWH).

In July 2018, CTP began providing Client Progress Reports (CPRs), client-level reports on VS and care status based on information in the NYC HIV Surveillance Registry. Each report lists all clients in a program's current caseload and categorizes them as needing follow-up for connection to

care and/or for VS, requiring case closure due to death, being virally suppressed at last update, or being stably suppressed throughout the report year. CTP rolled out CPRs first to NYC CCP providers who had been re-awarded CCP contracts under the most recent re-solicitation. For these programs, the CPR was designed to facilitate care team decision-making regarding enrollment of some existing clients in the new contracts and closure (with or without a hand-off to other services) of other existing clients, to make room for new enrollment among people with current high need.

Data collected routinely from RWHAP Part A providers include client-level sociodemographic, psychosocial, and health outcomes information, as well as service utilization information. In support of national goals, these data – particularly when merged with comprehensive laboratory data from HIV surveillance – enable the NY EMA to evaluate a range of inequities in service utilization and care continuum indicators, including those related to race/ethnicity, gender, age, transmission risk category, and geographic location, among other factors (e.g., housing stability, disability status). Over 90% of those served in the RWHAP Part A program identify as Black or Latino/Hispanic, and the vast majority (80%) are also living below 100% of the 2020 FPL. As a result, local RWHAP Part A outcomes do not necessarily reflect conventional/general-population racial, ethnic, or income inequities. However, since the sociodemographic subgroups over-represented in the local RWHAP Part A program tend to experience poorer health outcomes, the NY EMA takes a system-wide approach to improving care and outcomes for those served by the RWHAP Part A program. This approach has included strengthening inter-agency coordination and referral systems and the use of data systems to flag clients in need of timely intervention. Together, these data collection, data sharing, and systems coordination efforts help ensure clients served have the appropriate resources and individualized support to achieve and maintain VS. To further address inequities, the NYC HD ensures subrecipients provide services consistent with CLAS Standards according to a protocol designed by QM/TA staff. The protocol calls for RWHAP Part A-funded organizations to assess their compliance with CLAS Standards and incorporate efforts to improve into their QM plans.

The COVID-19 crisis may temporarily interfere with CTP's ability to use performance data to manage service quality. During NYS's PAUSE order, funded organizations worked to re-organize their service delivery systems. In some cases, this made it challenging for them to consistently report their program activities, including data that CTP uses to evaluate service delivery and prepare reports. According to NYC surveillance data, regular VL monitoring has been disrupted, as health care providers responded to the crisis and shifted to remote modes of service delivery, and as patients followed stay-at-home orders, resulting in declines in blood draws for laboratory testing and in reports to the Surveillance Registry as of April 2020.

2) Use of CQM data to inform service delivery. Trends identified through the CQM program enable key stakeholders to assess RWHAP Part A service quality and fidelity to service model guidance over time. Quality indicators, developed in collaboration with RWHAP Part A-funded providers, are often used to inform provider annual QM plans, which are designed to improve service delivery. The indicator data are reviewed for trends to inform long-range service delivery planning and to review the impact of related QI projects.

Most recently, CQM findings informed changes in how CCP services are reimbursed under the 2017-18 re-solicitation, transitioning from the administratively burdensome per-member-per-day reimbursement to FFS. In an effort to ensure service quality, QM/TA staff in CTP worked with CCP providers on an ambitious project to design a system for VBP, an innovative approach for the NY EMA using the Exploration, Preparation, Implementation, and Sustainment framework, a conceptual model of evidence-based practice implementation. In 2019, QM/TA staff invited representatives from CCP programs and other key stakeholders to participate in the design of a

system for VBP for program services. Over the course of four meetings, stakeholders collaborated to consider measures for VBP and payment benchmarks. Using exercises inspired by nominal group technique, stakeholders expressed preferences for types of measures and benchmarks. The grantee will test the new VBP system for CCP comparing the new program data and the program data from the previous GY before implementing in 2021.

ORGANIZATIONAL INFORMATION

A. Grant Administration. Through the rigorous monitoring and accountability measures described below, the NY EMA ensures that RWHAP Part A funds are used effectively to address the country's largest and most complex HIV epidemic. Of the NY EMA's GY20 RWHAP Part A contracts, 48% are reimbursed FFS and 38% are reimbursed through a hybrid FFS and/or for achievement of specific deliverables. Managing the portfolio in this way contributes to efficient resource management with timely reallocation of dollars to highly utilized services and minimal carryover. Through multi-pronged efforts, the NY EMA ensures RWHAP Part A serves as the POLR.

1) Program Organization. GY21 will be the NY EMA's 31st year as a RWHAP Part A Recipient and the NY EMA is committed to efficient program administration, aiming to maximize the effectiveness of HIV services. In GY19, the NY EMA spent nearly 100% of its RWHAP Part A formula award (with \$18,525 requested carryover) and more than 99% of its MAI award (with \$79,479 in requested carryover).

a) RWHAP Part A Administration (see Attachment 10). The Mayor of the City of New York serves as the CEO of the NY EMA. The Mayor has designated the NYC HD as the administrative and fiscal agent for RWHAP Part A. As *Attachment 10* illustrates, the NY EMA's RWHAP Part A program is administered by CTP in the NYC HD BHIV. The BHIV is headed by an Assistant Commissioner, who oversees a staff of over 280 people across eight programs, which includes 49.07 full-time equivalents (FTE) under the RWHAP Part A grant.

The Director of CTP (.85 FTE) oversees all staff responsible for service planning, TA, QM, REU, and RWHAP Part A planning and grant administration, as well as RWHAP Part A fiscal oversight, in collaboration with the Director of Administration (.5 FTE). The Director of Program Planning and Operations (1.0 FTE), collaborates with the Senior Grant Manager (1.0 FTE) and program and administrative fiscal staff (2.45 FTE) to ensure adherence to all applicable HRSA grant reporting and monitoring requirements. The Director of Program Planning and Operations (1.0 FTE) oversees and coordinates the activities of three Program Planners (2.7 FTE) and serves as an alternate to the Director of CTP for PC business and communications with HRSA. The Director of QM/TA (0.94 FTE) oversees a total of 8.0 FTE staff including: one Deputy Director, one QM Project Manager, three QMSs, one Behavioral Health Specialist, one Senior QMS, and one QM Liaison. The Director of HIV Health Equity (1.0 FTE) oversees the implementation of health equity practices within planning, quality management, and TA in CTP. The Director of HIV Prevention (in-kind) oversees the TA provided to the EIS providers, in coordination with the HIV Prevention program. The Director of Housing (0.3 FTE) oversees three Housing Coordinators (2.3 FTE) who manage RWHAP Part A housing subrecipient activities to ensure that housing services and resources are monitored and implemented in a coordinated manner with HOPWA across the NY EMA and in compliance with RWHAP Part A requirements. The Director of REU for the Housing Services Unit (0.5 FTE) coordinates with the Director of Housing for housing services monitoring and evaluation. The Director of COTA (0.2 FTE) oversees 0.26 FTE in TA and training for health care providers. The Director of Administration (0.5 FTE) oversees human resource staff as well as the Deputy Director of Business Systems (0.8 FTE), who manages contract

administration and procurement, including eSHARE data system implementation across Prevention and Care funded with 5.24 FTE for RWHAP Part A (additional FTE is covered with other funds).

RWHAP Part A funds 9.75 FTE in the CTP REU, overseen by the Director of REU (0.7 FTE). Using multiple methods, including merged analyses of provider-reported, HIV surveillance, and survey data, REU staff evaluate RWHAP Part A client and program needs, service utilization, and health outcomes. REU staff track progress on NYS *Integrated HIV Prevention and Care Plan* goals, analyze and prepare eSHARE data for site visits and provider meetings, report on QM performance indicators at the portfolio-wide, service category and agency levels, elicit consumer input through surveys and focus groups, and improve Ryan White Services Report completeness.

The PC Director (1.0 FTE) reports to the NYC HD Deputy Commissioner for Disease Control and oversees a total of 4.9 FTE staff who support the planning and administrative functions of the PC. The PC and Recipient meet weekly to coordinate planning activities and ensure work is conducted in alignment with the MOU approved by HRSA in 2019. The Senior Policy Analyst (0.36 FTE) informs the PC and Recipient of health policy developments and their effect on the NY EMA system of care. The Epidemiologic Liaison (0.4 FTE) works with the PC and HIV Surveillance to provide epidemiological data necessary for PC decision-making.

Temporary Assignment of State and Local Personnel during a Public Health Emergency. In the midst of the COVID-19 response a number of RWHAP Part A supported staff have been activated to assist with response activities including: contact tracing, public information, COVID-19 health equity, and communications. Activated staff report their time dedicated to the response in the City Time system which allows all time dedicated to the response to be charged to the Office of Emergency Management. Given this ability to track staff time during the emergency response, there has been no cost to RWHAP Part A associated with the COVID-19 activation. Given the City's ability to track and assign costs associated with the response, the Recipient has not needed to request permission from the Secretary of HHS for temporary assignment of RWHAP Part A funded staff.

There are currently several vacant Recipient positions: the Assistant Commissioner of BHIV, the Director of COTA, a Health Equity Coordinator, a QMS, an HIV/HCV Evaluation Specialist, an Evaluation Specialist, the Director of Housing, the Senior Grant Analyst, and the Contract Manager. The Assistant Commissioner of BHIV and the Director of COTA positions were only recently vacated, and the rest of the positions are posted and in progress. Candidates are generally named within 90 days of when a job is posted and usually start 6-12 weeks after being named; however, as the City experiences reductions in tax revenue, there is a hiring freeze affecting all vacant positions. The Director of CTP will advocate for hiring of essential grant positions and update the NY EMA's HRSA Project Officer on a regular basis. The NYC HD has an emphasis on recruiting and hiring candidates that are racially and ethnically diverse and more reflective of the NYC population across all roles and levels of leadership. This priority has increased the number of channels in which the NYC HD advertises and recruits for positions. Positions may remain open in order to give hiring managers the opportunity to meet with a diverse candidate pool.

b) Staffing, SOW, and evaluation of contractor or fiscal agent. PHS, the NYC HD's Master Contractor, assists in the administration of the RWHAP Part A program in the NY EMA. The Master Contract was recently re-solicited and PHS was awarded a new nine-year term which is currently being negotiated. Under the direction of the Chief Strategy Office (CSO) and Vice President for CAMS, and four Directors – Senior Director for Programs and Contract Management, Director of Finance and Operations, Director of Business System, and Director of Informatics – PHS administered 144 RWHAP Part A-funded contracts in GY20. PHS employs 19.51 FTE monitoring staff, 2.95 FTE contract administration staff, and 11.61 FTE planning and administrative

staff for a total of 34.07 FTE. The CSO ensures PHS adheres to terms of the Master Contract with the NYC HD and has ultimate responsibility for all operations. Senior Director for Programs and Contract Management oversees programmatic and fiscal monitoring of subrecipients and develops procedures, policies, and standards for contract negotiation and monitoring of subcontractor program performance. Director of Informatics is responsible for: development and management of PHS's information systems, developing policies and procedures for data collection, and ensuring data integrity for contract payment and monitoring. Director of Finance and Operations is responsible for: developing, implementing, and monitoring fiscal policies, administrative procedures, and the portfolio's fiscal compliance. Director of Business Systems is responsible for guiding the procurement process, leading the coordination of cross-unit project management, and continuous QI efforts to ensure compliance with all relevant regulations and terms of the Master Contract.

PHS, under direction from NYC HD, manages the procurement process for RWHAP Part A funds, contract administration including development of subrecipients' contract scopes and budgets, compliance monitoring, TA, subrecipient payment including performance-based reimbursement, fiscal and data management, and external reporting. NYC HD facilitates a monthly coordination meeting and Data Work Group with PHS, to ensure compliance with contractual and HRSA policy requirements, address challenges in the administrative mechanism, including procurement and contracting, and to facilitate communication between NYC HD and PHS leadership.

Monitoring of Master Contract. The Master Contractor reports directly to BHIV on all aspects of its administrative and fiscal processes as outlined in the contractual agreement. BHIV monitors the Master Contractor for compliance with the contractual agreement by conducting site visits, tracking receipt of required reports, and reviewing performance via the Program Progress Report.

BHIV's program and fiscal monitoring staff conduct a minimum of two site visits per contract period for the Master Contract. The site visits consist of a program and fiscal review for a sample of subrecipients. The Master Contract site visits include an entrance interview to discuss changes since the last site visit and the procedure for the current site visit, as well as an exit interview to discuss findings from the current site visit. BHIV reserves the right to conduct additional site visits or adjust site visit dates if necessary, currently all site visits are conducted virtually.

NYC HD Master Contract Subrecipient Sampling Methodology. BHIV staff review at least 10% of RWHAP subrecipients, and BHIV staff review all subrecipients that were on a contract status ("concern," "corrective," or "conditional"), during the site visit review period. If the number of subrecipients on contract status is less than 10% of all subcontracts, then the remaining subcontracts are randomly selected to complete a 10% sample of all subcontracts.

The program and fiscal monitoring staff evaluate documents and files to ensure contractual requirements are being met by the Master Contractor. The program and fiscal monitoring staff complete a site visit report that identifies the material reviewed, compliance with contractual requirements, and if applicable, findings and recommendations to the Master Contractor to remedy findings identified during the site visit.

2) Grant recipient accountability. The NY EMA's multi-faceted contract monitoring process includes monthly electronic data submissions, comprehensive semi-annual reviews, site visits, documentation reviews, frequent telephone and email contact, and other meetings as necessary. Beginning in GY20 PHS and the Recipient initiated a plan to streamline visits as a result of HRSA HAB's GY18 site visit recommendations so that subrecipients receive no more than one site visit per contract per year. However, these face-to-face visits are currently suspended due to COVID-19; alternative fiscal and compliance monitoring is occurring through virtual site visits. All RWHAP Part A providers are required to maintain standardized client-level data records with de-

identified client-level extracts reviewed monthly by PHS for reimbursement and by the NYC HD for service utilization analysis. Using eSHARE, subrecipients finalize client-level data entry by the 15th of each month, the point at which PHS and the NYC HD consider subrecipient-reported data to be ready for assessment for reimbursement and performance. In addition, PHS requires the submission of a monthly Program Narrative Report, which details successes and challenges of the previous month and identifies staff vacancies and changes in program operations. These reports are reviewed by PHS in advance of reimbursement. PHS Contract Managers (CMs) review spending levels for cost-based contracts and total drawdown of reported services data for performance-based contracts and withhold reimbursement if subrecipients fail to submit required monthly programmatic reports, external audit reports, and/or if reports are incomplete or contain unapproved services as well as unbudgeted or unallowable costs.

PHS CMs are responsible for both fiscal and programmatic contractual monitoring, ensuring that costs and service activities are allowable and conform to the contract's budget and scope of services. In addition, providers are assigned a NYC HD QMS with expertise in the relevant programmatic content. QMSs provide one-on-one TA and guidance in QM and convene provider meetings to facilitate peer-led discussions of lessons learned. CMs and QMSs meet at least twice a year per service category to share data on contract performance, review qualitative information on services, and develop action plans to address challenges. While QMSs focus on QM and program development and implementation, CMs monitor contract deliverables and service documentation, conduct fiscal monitoring, and ensure compliance with relevant eligibility and administrative requirements, including client-level reporting.

QMSs and CMs collaborate to ensure that consistent guidance is provided to RWHAP Part A subrecipients through joint site visits. Site visit findings that are successfully addressed post site visit may not lead to formal corrective action. Each RWHAP Part A contract specifies the nature of services to be delivered, eligibility requirements for clients, licensing or other staff qualifications, and contractual expectations. Contracts specify the number of clients to be served and service delivery targets. Each subrecipient providing RWHAP Part A services must have operational grievance procedures in place (including whistleblower policies) and a mechanism for consumer input. Each subrecipient must collect and maintain client-level data in accordance with the NY EMA's reporting requirements for enrolled clients.

i) Common program and fiscal subrecipients' monitoring findings and corrective action process. The three most common fiscal and program monitoring findings are documentation issues, data inaccuracies, and insufficient service levels. Documentation issues, including the need for information consistent with standards of a service type or model as well as missing or incomplete documentation of services, may result in recoupment for services and low service levels. TA is provided within a targeted timeframe, usually three to six months, to facilitate improvement. For providers with persistent performance concerns, PHS implements a progressive process for corrective action in coordination with NYC HD. The process starts with targeted TA in an expected timeframe; should improvement not result, corrective measures are implemented which require a written plan with timeframes for specific metrics of required performance.

Due to the impact of COVID-19, many subrecipients were required to transition to virtual services while maintaining contract compliance. For example, one subrecipient came up with a novel approach to outreach efforts in the absence of site/community-based visits. The COVID-19 pandemic forced the agency to rethink traditional outreach approaches such as neighborhood outreach, home visits, and accompaniments. Many of the agency's clients often have no phone, access medical care sporadically, and unpredictably present to the clinics for urgent visits. To meet

this need during the pandemic, agency Navigators and Care Coordinators developed a relationship with on-site clinic staff to catch clients as they walked into the clinic for unscheduled visits. On-site nurses and medical assistants now immediately reach out to the agency team via cell when a lost-to-care client presents for care. This allows the agency team an opportunity to do a phone visit with the patient while they wait in an exam room.

ii) *Process for ensuring compliance with the single audit requirement.* Consistent with the HHS Uniform Administrative Requirements (45 CFR 75), RWHAP Part A subrecipients are contractually required to submit a single audit report, when applicable, within 30 days after its completion, but no later than nine months after the end of the audit period. A subrecipient is deemed out of compliance if it fails to submit its audit reports by the required due date. Written notification of the delinquency is sent to the subrecipient and payments may be placed on hold pending full compliance. If a single audit is not applicable, the subrecipient must submit a letter of explanation from its auditor or Chief Executive Officer. The letter of explanation must be accompanied by a list showing all of the subrecipient's federal grant revenue and expenses in order to support its claim that it is exempt from preparing the single audit report. PHS communicates any material changes in federal and state audit requirements as they occur, to ensure compliance with up-to-date audit rules. In GY19, PHS contracted with 85 subrecipients; however, only 76 audit packages were required to be submitted since several RWHAP subrecipients are part of larger consortiums and their financials are consolidated into one audit package. All but one of the 76 audit packages were submitted in GY19. The audit package for one subrecipient was submitted during GY20. Of all audit packages received, 44 (58%) were submitted late. The reasons for late submission of the audits vary but included among them are turnover of key staff in the subrecipients' finance area and delayed start of the audits. PHS retains the right to hold payment for failure to submit audit packages and did so during GY19 for several subrecipients. During GY19, the subrecipient payment holds were released upon submission of their audit packages. PHS's Fiscal Manager (FM) and Fiscal Analyst (FA) ensure audit reporting compliance of all subrecipients, conduct a detailed review of audits, follow up on findings identified in the audit, and submit a management letter, if issued. Satisfactory responses from subrecipients are a condition of ongoing compliance, and in some instances, their ability to draw down funds.

iii) *Addressing subrecipient audit findings.* In GY19, 24% of the NY EMA's RWHAP Part A subrecipients' audit reports contained issues noted. Issues ranged from general observations to auditor recommendations, some of which were unrelated to the RWHAP Part A programs or the agencies' infrastructure. Of the issues noted, only 9% were identified as material weaknesses. Issues cited included: lack of written methodology for expenses allocated to government grants; lack of full compliance with federal and Office of Management and Budget guidelines; lack of an updated financial policy and procedures manual; lack of time and effort record keeping; insufficient back-up documentation supporting purchases; lack of accounts analysis and bank reconciliation performance; inadequate segregation of duties; deficiencies in internal controls; and net assets deficits. For subrecipients with audit findings, PHS requests semi-annual updates on corrective measures. In cases where management provides an inadequate or lack of response, the agency may be placed on corrective or conditional status. PHS will then request a corrective action or compliance plan to resolve the audit deficiency; during this time, the agency's reimbursements are placed on hold. None of the agencies with material weakness noted in audit reports were placed on corrective or conditional status. PHS was satisfied with the agencies' responses and action taken to resolve the material weaknesses, which typically follow the audit recommendations.

b) *Third party reimbursement.* During GY19, the NY EMA continued its robust process to ensure all RWHAP Part A funds serve as the POLR. As previously mentioned, the PC undertakes a comprehensive analysis of all available resources and service delivery systems in the process of establishing priorities and allocations for funding. The PC uses an objective priority-setting tool, with one of four criteria being “POLR/Alternate Providers of Service.” This tool helped the PC to design the GY20 RWHAP Part A Spending Plan to address gaps, especially those in Medicaid.

Beginning in GY11 and continuing through GY20, the Recipient and PC staff have implemented the National Monitoring Standards and ongoing monitoring of the changing health care landscape. This includes review and analysis of resources released by HRSA/HAB (e.g., policy notices) and the NYS Medicaid Redesign Team, as well as attending the RWHAP all-recipients conference, which support implementation of POLR. This information was shared with stakeholders through presentations to committees of the PC and Recipient staff, including the monthly Recipient report issued to the PC. Information gleaned through these efforts was incorporated into the *POLR Tool*. The NY EMA requires agency certification to bill Medicaid in all applicable service categories (MCM, MH, Oral Health, and Medical Transportation).

i) *Monitoring third party reimbursement.* Contractual provisions define RWHAP Part A reimbursement as “last dollar funds pursuant to federal law,” mandating that payments cannot duplicate reimbursement that has already been made or can reasonably be expected to be made by other payers. Contracts require subrecipients to carefully monitor third-party reimbursement. As mandated in the RFP and in the eventual contract, all RWHAP Part A providers must participate in applicable NYS Medicaid programs for those services reimbursed by Medicaid. In addition, the NY EMA generally prioritizes non-Medicaid covered services and individuals in service design and planning. Hence, the history of applying for the CMS waiver.

As described on *p. 36*, the Recipient conducted an analysis in GY19 resulting in the creation of updated POLR guidance for service providers and a review tool for contract oversight staff to use during site visits at agencies with contracts in applicable service categories (able to bill Medicaid). During contract negotiations, PHS and subrecipients identify all potentially reimbursable services and explore sources of third-party payment. Contracts that include services potentially reimbursable by Medicaid and other payers are subject to a review of all billing records associated with a patient visit. This review forces coordination between grants management and Medicaid billing staff.

ii) *Documentation of client screening and ensuring POLR.* All subrecipients are required to document the screening of every client for Medicaid, Medicare, the NYS health insurance exchange, or other third-party insurance eligibility and to help eligible clients apply at intake and reassessment, every six months. eSHARE requires input of insurance status for both new and continuing clients, prohibiting submission of reporting forms until such questions are answered. The reporting software captures insurance provider type at time of assessment and reassessment.

Many PWH with incomes between 138 and 500% of the FPL are eligible for discounted premiums for plans on the NY State of Health insurance exchange, resulting in more PWH with health insurance. All service providers who provide benefits counseling and enrollment services are required to become Certified Application Counselors, as training capacity allows, or establish a referral relationship with designated navigator agencies. This helps to ensure that PWH who are eligible for other sources of assistance access those resources before the RWHAP Part A care system, and that PWH are receiving enrollment assistance from application counselors who understand the HIV care system.

iii) *Tracking and use of program income.* The NYC HD and PHS require subrecipients to establish a sliding fee schedule and caps-on-charges policy. Subrecipients are required to track and

report program income for all service categories. In addition to reporting program income earned, programs also report how they have or will use the income to improve RWHAP Part A programs. The most common use of program income is to pay for administrative costs that were not covered under the 10% administrative cap. Due to the safeguards intended to ensure that RWHAP services are designed in light of other local resources, RWHAP Part A funds remain the POLR, with very few instances when a program might earn program income from RWHAP activities. To improve tracking of program income, contract language regarding 340B program income was added to all contract documents in FY19 to ensure that subrecipients are aware that if they are using their RWHAP Part A subrecipient status for 340B eligibility, 340B program income must be reported to the recipient on a yearly basis. A letter highlighting contract language and addressing frequently asked questions was also sent to all subrecipients.

c) Fiscal oversight.

i) Fiscal staff accountability. The NY EMA ensures the efficient use of funds for their intended purpose through fiscal monitoring and accountability protocols. Fiscal staff is supervised by senior managers at PHS and the NYC HD. Spending is recorded and tracked in the PHS data and payment management systems, which are reconciled with the PHS financial accounting system on a quarterly basis. PHS staff prepare and submit detailed quarterly spending reports to the NYC HD, which in turn, the department uses to report by service category to the PC. On a quarterly basis, NYC HD staff prepare service category spending reports to the PC to review and discuss the NY EMA's spending rate. Unobligated balances are tracked continuously, and funds are reprogrammed as necessary in order to maximize services and spending by redirecting funds to services in accordance with the PC-approved reprogramming plan. At the end of the contract term, subrecipients must report the aggregate amount of program income generated and costs covered by it. The Director of Finance and Operations and Assistant Comptroller at PHS manages fiscal tracking and reporting and reports directly to the CSO and Chief Financial Officer, who are part of PHS's senior management team. At the NYC HD, the Grant Fiscal Administrator and the Director of Program Planning and Operations of CTP, all overseen by the Director of CTP and the Director of Administration in the BHIV, are responsible for fiscal oversight and reporting on the RWHAP Part A grant, including implementation of the HRSA/HAB National Monitoring Standards.

Roles and responsibilities of fiscal staff. With the NY EMA's use of performance-based reimbursement, PHS's organizational fiscal monitoring of programs is a combination of efforts that includes agency on-site fiscal review by the CM who is responsible for fiscal monitoring of cost-based contracts and who verifies expenditures are adherent to subrecipients' approved budgets and the Contract Coordinator (CC) who verifies the appropriateness of documentation for services for which the subrecipient received performance-based payment. The CM and CC's work is supervised by a PM. The FM and FA conduct an additional review of the subrecipient's audited financial statements and single audit reports.

NYC HD fiscal staff and the Director of Program Planning and Operations of CTP, in collaboration with the Master Contractor, prepares and submits the following information to HRSA: administrative budgets, allocation and expenditure tables, the SF424A and the Federal Financial Reports, unobligated balance and carryover requests, and other fiscal documents required under the conditions of award. In addition, PHS fiscal staff and the Director of Program Planning and Operations of CTP interpret and summarize the fiscal monitoring standards into policies and procedures for the NY EMA, seeking clarification from HRSA as necessary.

Coordination of program and fiscal staff. The assignment of a CM for RWHAP Part A contracts ensures that a single staff member develops an understanding of each contract's program and fiscal

operations. In addition to site visits, CMs review expenditure reports for cost-based contracts and services data for performance-based contracts as well as authorize and process payments into PHS' accounting system. In addition, semi-annual reviews of the portfolio for compliance with contract terms is conducted which include the audit review, so that CMs and their supervisors are aware of organizational findings that may affect RWHAP Part A contracts.

ii) *Tracking funds.* The NYC HD separately tracks Formula, Supplemental, MAI, and Carryover funds through PHS data and accounting systems, PAMS and Intacct, and AMS Advantage. In standard quarterly reports, PHS reports expenditures to the NYC HD in each funded service category, outlines funding commitments per service category, and summarizes spending rates. The reports are combined with separately tracked NYC HD program fiscal spending data and presented to the PC to monitor expenditures, allocate funding for next year's spending plan, and develop a carryover plan for unspent funds at closeout.

iii) *Subrecipient reimbursement.* PHS reimburses subrecipients monthly and the contract management system logs and time-stamps receipt of monthly reports and automatically uploads expenditure data. The NYC HD extracts data from the client-level database (eSHARE) on the 16th of each month, transmitting it to PHS for payment processing and compliance monitoring.

CMs review reports to determine payment. For cost-based contracts, reported expenditures must be consistent with approved budgets and allowable per the RWHAP program. For performance-based contracts, client-level data correspond to approved service types for payment. Services exceeding approved amounts for each class are disallowed unless a contract is modified to shift projected services between service types or a request for enhancement funding is approved. In addition, many services have utilization restrictions for payment (i.e., frequency limits, minimum group size, or prerequisites). When possible, these rules are enforced electronically, through the payment system database, others are found only through site visits. PHS and the NYC HD developed and provided subrecipients with the *Guide to Requirements for Services: Payability and Data Reporting*, which PHS updates routinely. This Guide provides guidance on submitting data for performance-based contracts. The current version is available on the PHS website.

In the second half of each month, PHS emails subrecipients an electronic report called the Master Itemization Report, which summarizes and itemizes all services recognized by the systems to date. Particular services may be flagged for a number of reasons, including incomplete data entry, duplicate client entries, and failure to meet programmatic requirements. Such problems are identified through a combination of automated data checks and site visits by CMs and CCs. Some problems may be correctible while others may result in recoupment during closeout.

Reimbursements may be withheld despite complete monthly reports. Reasons for withholding include expired insurance policies, delinquent reports, or previously identified disallowances in excess of outstanding contract balances. All withheld reimbursements are discussed with supervisory staff and documented in subrecipient files and the PHS contract management database.

The PHS contract management database computes the payment and notes any disallowances. CMs generate payment authorization reports, validate them, enter the payment into the accounting system, and attaches the payment documents to the entry in the accounting system. The payment is then reviewed by the PMs, who supervise the CMs, for final review and approval ensuring back-up documents support payment. Upon approval, the PHS Accounts Payable Department issues payments once a week, via check or electronic transfer (as selected by the subrecipient). Staff log payment dates in the payment system and reconcile all payments with the accounting system. PHS pays subrecipients within 30-45 days of receipt of all required reports, with the exception of payment withheld pending receipt of any delinquent report.

In addition, over-performing performance-based contracts may be eligible for enhancements to reimburse them for services if unobligated funding is available and modified service category allocations adhere to the PC's reprogramming plan. The GY19 reprogramming plan has allowed for reallocation between service categories up to 20%. Such enhancements reimburse subrecipients for any incremental costs associated with the provision of additional services.

The NYC HD working closely with PHS develops standardized reimbursement rates for performance-based contracts. To ensure reimbursement rates can cover subrecipients program operating costs, the NYC HD and PHS develop rates that are inclusive of the following: 1) current market salaries for service staff, 2) salary costs of support staff, 3) average Fringe Benefit Rate, 4) costs of other than personnel services (OTPS), 5) Indirect Costs/Overhead (capped at the legislative amount), and 6) a markup for missed client appointments. The NYC HD and PHS create a mockup program and associates costs to test the feasibility of the reimbursement rates.

Section I: Executive Summary of Integrated Plan and SCSN

1. Executive Summary of Integrated Plan and SCSN

A. Approach

New York State's Integrated HIV Prevention and Care Plan 2022-2026 (Integrated Plan) stands on a foundation of many years of hard work by the New York State Department of Health AIDS Institute (NYSDOH AI), New York City Department of Health and Mental Hygiene (NYCDOHMH), and Nassau County Department of Health (NCDOH) and partners and stakeholders across the state, including the Nassau-Suffolk HIV Health Services Planning Council, New York City HIV Planning Group (NYC HPG), HIV Health and Human Services Planning Council of New York, and New York State HIV Advisory Body (NYS HAB). Because of this integrated, coordinated work, New York State (NYS) is poised to end the HIV epidemic by 2024.

NYS was on track to meet core goals for ending its HIV epidemic by the end of 2020, with outcomes measuring Ending the Epidemic (ETE) progress available by December 2021. However, NYSDOH AI, NYCDOHMH, NCDOH, and partners on the frontline spent the majority of 2020 and 2021 responding to the unprecedented COVID-19 pandemic. Providers adapted to the new landscape and found innovative ways to deliver services and support consumers. Still, the public health emergency delayed the achievement of ETE goals. Since the start of the COVID-19 pandemic, there have been increases in HIV diagnoses in certain parts of the state, significant reductions in HIV testing and laboratory reporting, and decreases in the number of New Yorkers accessing PrEP. As a result, NYS is revising its ETE timeline and pledges to reach ETE goals by the end of 2024, with outcomes measuring ETE progress available by December 2025.

The Integrated Plan reflects feedback from HIV planning groups, providers, people with HIV, stakeholders, and affected communities collected through a wide range of community engagement and planning activities. The goals and specific populations presented in the Integrated Plan align with other national initiatives, including the National HIV/AIDS Strategy: 2022-2015 (NHAS) and the Ending the HIV Epidemic in the U.S. (EHE) initiative. The Integrated Plan also aligns with existing statewide efforts, including the ETE initiative and the [2015 *Blueprint: Plan to End AIDS in New York State* \(The Blueprint\)](#), as well as the work of the two Ryan White HIV/AIDS Program (RWHAP) Part A-funded eligible metropolitan areas (EMA) located in NYS: the New York EMA, which includes New York City and Putnam, Rockland, and Westchester Counties, and the Nassau-Suffolk EMA, which includes Nassau and Suffolk Counties.

In many ways, the current HIV landscape in NYS is very different than the one that gave rise to the first Integrated Plan in 2017. The COVID-19 pandemic impacted NYS efforts to end the HIV epidemic by the end of 2020 and key data points still have not returned to pre-pandemic levels. For example, electronic reporting of HIV-related laboratory tests (e.g., HIV antigen-antibody, CD4, viral load) decreased 66% from March to April 2020. In 2020, the number of reports submitted monthly remained at levels averaging approximately 24% lower than in 2019 and, to date, have not returned to 2019 levels. HIV testing conducted through NYSDOH AI-funded sites

averaged well over 2,500 tests per month in 2019 but dipped below 500 tests per month in April 2020 and did not reach 2,000 tests in any given month until July 2021.

Despite these challenges, NYS has met its goal of “bending the curve” of its HIV epidemic. HIV prevalence in NYS decreased in 2019 and in 2020. The most recent data demonstrate a continued decrease in HIV incidence (an estimate of the number of new infections) from 2,813 in 2013 to 1,467 in 2020, a 48% decrease. NYS also saw a continued decrease in new HIV diagnoses, from 3,391 in 2013 to 1,933 in 2020, a 43% decrease.

COVID-19 also gave focus to health disparities. COVID-19 had a significantly disproportionate impact on communities of color, especially Black and Hispanic/Latino New Yorkers. NYS has reinforced its commitment to health equity, reducing racial and ethnic health-related disparities, and addressing the social determinants of health (SDOH) experienced within communities of color as we work to end the HIV epidemic. This commitment is integrated into the broader work of NYSDOH AI, NYCDOHMH, and NCDOH. In July 2022, NYS Health Commissioner Dr. Mary T. Bassett announced the creation of a new Office of Health Equity and Human Rights to address health disparities and work to improve diversity, equity, and inclusion within NYSDOH. Led by Deputy Commissioner Johanne Morne, the new office will house NYSDOH AI and the Office of Minority Health and Health Disparities Prevention and Language Access and the Office of Gun Violence Prevention. With this change, Joseph Kerwin became the Acting Director of NYSDOH AI.

HIV Epidemic in NYS

HIV-related data and other data inform community engagement and planning activities and are also used to measure progress in achieving NYS’s ETE goals.

The Epidemiologic Snapshot, described in greater detail in Section III, provides a summary of the HIV epidemic in NYS, highlighting epidemiologic trends and progress since the start of the ETE initiative, using 2013 as the baseline year, and providing a snapshot of HIV epidemiology in 2020. Among the topline results:

- **Overall.** Since the peak of NYS’s HIV epidemic in the 1990s, the number of people newly diagnosed with HIV and the number of deaths among people with diagnosed HIV have declined, while linkage to care and rates of viral suppression have steadily increased. Despite these successes, disparities related to race and ethnicity, age, and geographic regions persist in HIV diagnoses and care outcomes.
- **Aware of HIV Status.** It is estimated that over 90% of NYS residents are aware of their HIV status, increasing from 91% in 2013 to 94% in 2020.
- **PrEP.** The number of people who filled a prescription for pre-exposure prophylaxis (PrEP) increased drastically from 3,388 in 2014 to nearly 40,000 in 2020.
- **STIs.** HIV often occurs simultaneously with other sexually transmitted infections (STIs). Gonorrhea rates have increased steadily for six years in NYS, and congenital syphilis rates have increased for four years. In 2020, the number of chlamydia and early syphilis cases in NYS declined for the first time in five years, as a result of access to services during COVID-19.
- **Hepatitis C.** In 2020 in New York State (excluding New York City), 4,131 newly diagnosed cases of hepatitis C were reported to the NYSDOH, of which 3,945 were

chronic, 181 were acute, and five were perinatal. An additional 3,001 newly diagnosed cases of hepatitis C were reported to the NYCDOHMH (2,810 chronic, 185 acute, and six perinatal). The number of newly reported hepatitis C cases declined in both jurisdictions since 2019.

- **Syringe Services.** To aid in the prevention of infectious disease transmission, NYS expanded its syringe services program (SSP) substantially in the past ten years, with the number of participants served increasing from 21,456 in 2012 to 35,409 in 2021.
- **Overdose Prevention Centers in NYC.** On November 30, 2021, NYC authorized the opening of the first overdose prevention centers (OPC) in the U.S. The OPCs are privately funded, not funded by governmental or public resources, and they are situated within harm reduction programs in East Harlem and Washington Heights in Manhattan, two neighborhoods with high burdens of fatal overdose. As of April 3, 2022, OPC services have been used over 14,000 times by more than 1,000 individuals, and staff have averted over 230 overdoses.
- **Newly Diagnosed with HIV.** From the initiation of ETE in 2014 to 2019, the number of people newly diagnosed with HIV in NYS decreased by 31%. HIV diagnoses decreased by 19% from 2019 to 2020. This large yearly decrease likely reflects a continued decline in transmission but also effects of the COVID-19 pandemic, including reduced availability and uptake of HIV testing and prevention services, delays in diagnosis of HIV, and reduced frequency of laboratory monitoring for HIV.
- **Demographics of Newly Diagnosed.** Among all NYS residents newly diagnosed with HIV in 2020, 80% were male (sex at birth), 46% were non-Hispanic Black, 30% were Hispanic/Latino, 33% were aged 20-29, and the most frequently reported transmission risk was a history of male-to-male sexual contact (48%).
- **Linked to Care and Viral Suppression.** Alongside the steady decrease in new diagnoses since the onset of the ETE initiative, linkage to care and viral suppression outcomes have continued to improve. The percentage of people linked to care within 30 days of diagnosis increased from 69% in 2013 to 83% in 2020. Additionally, the percent of individuals achieving viral suppression (<200 c/mL) within three months of diagnosis more than doubled, from 23% in 2013 to 54% in 2020.
- **Persons Living with Diagnosed HIV.** In 2020, there were 105,610 persons living with diagnosed HIV (PLWDH) in NYS, maintaining an annual 2% decrease observed since 2017. Reflecting demographic trends seen amongst people newly diagnosed with HIV, 72% of PLWDH were male (sex at birth), 45% were non-Hispanic Black, 29% were Hispanic/Latino, and the most frequently reported transmission risk was a history of male-to-male sexual contact (45%). The majority of PLWDH were aged 50-59 years old (30%), while most people newly diagnosed with HIV were aged 20-29 years. In 2020, 86% of PLWDH were in care, an increase from 81% in 2013. Seventy-five percent of PLWDH were virally suppressed, compared to 66% in 2013.
- **Deaths among Persons with Diagnosed HIV.** The number of deaths among persons with diagnosed HIV has decreased since the mid-1990s, though in 2020 there was an increase in deaths consequent to the COVID-19 pandemic. The percent of deaths related to HIV decreased from 36% in 2013 to 24% in 2019.
- **Eliminating Disparities.** NYS has realized many gains in the prevention and treatment of HIV and continues to prioritize efforts to eliminate disparities. From 2013 to 2020,

non-Hispanic Black and Hispanic/Latino people accounted for the largest percent of new HIV diagnoses in NYS. These individuals represented 73% of new diagnoses, but only 33% of the NYS population in 2020. In contrast to non-Hispanic Black and Hispanic/Latino people, non-Hispanic White and Asian-American/Native American/Multi-Race individuals newly diagnosed with HIV represented a lower proportion compared with their representation of the NYS population.

- **Demographic Measures of Linkage to Care and Viral Suppression.** Linkage to care within 30 days of diagnosis varied by race and ethnicity, with 73% of non-Hispanic White individuals, 66% of non-Hispanic Black individuals, and 69% of Hispanic/Latino individuals in care in 2013. This increased to 85% of non-Hispanic White, 80% of non-Hispanic Black, and 85% of Hispanic/Latino individuals in 2020, with disparities still remaining. Similar patterns were seen in viral suppression among those in care. Of those in care, 91% of non-Hispanic White, 77% of non-Hispanic Black, and 81% of Hispanic/Latino PLWDH were virally suppressed in 2013. This increased to 93% of non-Hispanic White, 84% of non-Hispanic Black, and 88% of Hispanic/Latino PLWDH by 2020.

Approach to Ending the HIV Epidemic

Partnerships and collaboration with other government agencies are essential to plan and achieve ETE goals. NYSDOH AI, NYCDOHMH, and NCDOH, as the recipients of Ryan White HIV/AIDS Program (RWHAP) Part A and Part B funding, shared a collaborative process to develop this Integrated Plan. NYSDOH AI works closely with governmental partners in NYC and Long Island, as well as in all NYS regions, to prioritize, plan, and implement HIV prevention and care efforts statewide. This ongoing collaboration aims to increase efficiency in programming and funding allocation, maximize information sharing, coordinate planning, ensure community program alignment, and facilitate innovative strategies to address the HIV epidemic in NYS.

Ongoing, data-informed community engagement and planning activities are designed to ensure that strategies employed at the state and local level are responsive to service gaps, barriers to access, service-delivery challenges, and the needs of specific populations. In addition, the Integrated Plan is framed around key overarching elements.

Health Equity. As defined by Centers for Disease Control and Prevention (CDC), health equity is achieved when every person has the opportunity to “attain his or her full health potential” and no one is “disadvantaged from achieving this potential because of social position or other socially determined circumstances.” Additionally, “health inequities are reflected in differences in length of life; quality of life; rates of disease, disability, and death; severity of disease; and access to treatment.” Efforts to enhance health equity address SDOH, the many issues that can impact health and limit access to care. Health equity also recognizes intersectionality, how factors like race and ethnicity, class, gender, sexual orientation, and physical ability overlap and are interdependent, making it necessary to recognize all the reasons a person may be marginalized.

Stigma Reduction. Reducing stigma has long been a priority of NYSDOH AI. While primarily focused on HIV, stigma-reduction efforts in NYS also focus on racism, homophobia, transphobia, and other stigmas that people affected by HIV may experience.

Status Neutral Approach. The status neutral approach emphasizes sustained engagement in high-quality care, regardless of HIV status. The status neutral approach aims to improve both HIV care and prevention outcomes by embedding HIV prevention and care into routine care. The “whole-person” approach aims to advance health equity, reduce HIV-related stigma, and drive down disparities.

Undetectable=Untransmittable (U=U). In 2017, NYSDOH AI was the first state health department in the U.S. to sign on to the Prevention Access Campaign U=U Consensus Statement. This statement affirms that people with HIV who have achieved and continue to maintain an undetectable viral load do not sexually transmit HIV. U=U aligns with NYSDOH AI’s efforts to destigmatize HIV and to support innovative biomedical and social efforts to improve the health and well-being of people with HIV.

NYSDOH AI provides robust support to providers across the state to offer the best services possible, especially services that support these overarching elements. Guidelines address optimum care. Evidence-based interventions are encouraged, and technical assistance is available to support implementation. NYSDOH AI regularly conducts statewide quality improvement activities, with each RWHAP Part A jurisdiction having complementary quality management plans and activities.

Ongoing/Emerging Needs

For the most part, needs are identified at the local level and planning groups identify and prioritize strategies to meet these needs. Ongoing community engagement activities (e.g., regional and theme-based listening sessions, population- and issue-specific advisory groups, surveys) allow consumers, providers, stakeholders, and at-risk communities a voice in the process.

As mentioned above, Black and Hispanic/Latino people face significant health inequities and are disproportionately impacted by HIV. Black and Hispanic/Latino men who have sex with men (MSM) and Black and Hispanic/Latina cisgender women are two of the Integrated Plan’s specific populations. Another specific population identified within the Integrated Plan is people aging with HIV. Fifty-six (56) percent of people with HIV in NYS are over 50. People aging with HIV may experience aging-related conditions/co-morbidities at an earlier age. Also, aging is a time of transition. HIV treatment advances have led to improved health outcomes for so many people with HIV and have opened up new pathways to sustaining health over a long life. However, for people who are aging, their income may diminish, social networks may shrink, and there may be physical decline such as loss of mobility or the ability to carry out daily tasks. As people with HIV age, services need to be added or modified to address the needs related to aging. The HIV care system is in need of additional resources to innovate models of care to address comorbidities of people aging with HIV, such as issues related to memory, mobility, nutrition, physical exercise, vision, hearing, and mental health.

Another significant challenge NYS faces is current and expected workforce shortages, especially in critical areas such as public health and mental health, exacerbated by the COVID-19 pandemic. Unpublished preliminary data from the RWHAP-funded Northeast/Caribbean AIDS Education and Training Center (NECA AETC) in spring 2022 indicate that retirement may significantly reduce the HIV workforce in NYS. The purpose of this study was to evaluate the

number of current practicing healthcare providers prescribing HIV antiretroviral medication (for emergency post-exposure prophylaxis (PEP), PrEP, and/or antiretroviral treatment (ART)) and the number of care providers projected to continue to provide HIV-related care over the next five years. The study focused on prescribing HIV clinicians and pharmacists. The decline in the number of infectious disease physicians with a specialty in HIV medicine is notably impacting service delivery. (Results are described in Section IV: Situational Analysis.)

As the Integrated Plan is being written (summer/fall 2022), NYSDOH AI is responding to the domestic monkeypox virus (MPV) outbreak. NYS will continue to be transparent in its approach to respond to emerging issues such as MPV and how these issues are impacting efforts to achieve the goals of the Integrated Plan. Furthermore, NYSDOH AI remains committed to ensuring community engagement and input remains central to the response. For example, NYSDOH AI held two virtual community focus groups on sexual health messaging regarding MPV in August 2022, with over 75 individuals in attendance. Other activities have included the release of MPV clinical guidance and sex positive and stigma-mitigating messaging, and the launch of equity-focused MPV vaccine pilot initiatives.

Integrated Plan Goals

The goals in the Integrated Plan are aligned with the four EHE pillars—diagnose, treat, prevent, respond. In addition, the Integrated Plan includes goals that focus on two fundamental aspects of health equity:

Inclusive. Invite and incorporate input from the specific populations, people with lived experience, partners, and other stakeholders.

Equitable. Address the unique needs and circumstances of affected populations, increase quality services where needed, and seek to address disparities (e.g., access to PrEP).

Incorporating inclusion and equity components into the other goals strengthens the overall Integrated Plan and NYS's commitment to racial equity and inclusion by identifying tangible and actionable steps that will be integrated throughout NYS's effort to achieve the goals.

2022 – 2026 Integrated Plan Goals	
 Diagnose • Increase the percentage of persons living with HIV who know their serostatus to at least 98%. • Increase the percentage of New Yorkers who tested for HIV in the past 12 months. • Reduce the number of new HIV diagnoses by 55%.	 Treat • Increase the percentage of persons living with diagnosed HIV who receive HIV medical care with suppressed viral load to 95%. • Increase the percentage of persons living with diagnosed HIV who receive HIV medical care to 90%. • Increase the percentage of Black persons living with diagnosed HIV who

	receive HIV medical care with suppressed viral load to 95%. • Increase the percentage of Hispanic/Latino persons living with diagnosed HIV who receive HIV medical care with suppressed viral load to 95%. • Reduce current disparities in median CD4 among persons living with diagnosed HIV.
 Prevent • Increase the number of individuals filling prescriptions for PrEP to 65,000. • Reduce current disparities in PrEP utilization rates (defined as the number of individuals on PrEP/100,000) across all racial and ethnic groups, age groups, and across all genders (identified by assigned sex at birth) across all regions in NYS. • Reduce current disparities in statewide SSP service utilization across all racial and ethnic groups, age groups, and across all genders (identified by assigned sex at birth) across all regions in NYS.	 Respond • Analyze surveillance data monthly to identify HIV transmission clusters and outbreaks to facilitate prompt public health response. • Re-engage 75% of persons identified as out of care within six months. • Reduce current disparities in the reengagement rate of persons living with diagnosed HIV identified as out of care within six months across all racial and ethnic groups, age groups, and across all genders (identified by assigned sex at birth) across all regions in NYS.

Monitoring Progress

As stated above, community engagement and planning activities allow NYS to continually monitor for service gaps, barriers to access, service delivery challenges, and the needs of specific populations. Planning groups can select the most appropriate strategies based on local conditions and these can be modified to address emerging issues and trends in the HIV epidemic.

To monitor progress toward achieving our ETE goals, NYS uses epidemiologic and other data to measure improvement. These data are made available on the [ETE Dashboard](#), which integrates various data sources to provide key metrics for tracking ETE progress.

NYSDOH AI uses several methods to communicate with partners, people with HIV, stakeholders, and communities, including by email using a regularly updated listserv. Information on progress toward achieving ETE goals and local needs flows both ways between NYSDOH AI and planning bodies. Regional, topic-specific, and population-focused listening sessions are held across NYS. These provide an opportunity to disseminate updates on progress toward ETE and Integrated Plan goals and obtain input from participants. The annual *Call to Action* letter ([updated in 2022](#)) for partners and stakeholders presents progress updates, priorities, and emerging issues.

How the Plan was Developed

Integrated Plan development and review are a result of the input and work of over 1,000 stakeholders. A guiding principle for NYS's continuum of services is that effective program development must be informed by input from the community. NYSDOH AI coordinates with colleagues at NYCDOHMH and NCDOH and with the Interagency Task Force on AIDS. The NYDOH AI convenes the NYS HIV Planning Body Coordinating Group comprised of RWHAP Part A and the NYS HAB members to synergize planning efforts across jurisdictions. At the statewide level, NYSDOH AI receives input on an ongoing basis from a variety of groups, including the NYS AIDS Advisory Council (AAC), the AAC ETE Subcommittee, expert clinical committees and consumer committees, the Uninsured Care Program Advisory Council, consumer groups, advocacy organizations/groups, other ad hoc work groups, and the 40-member NYS HAB, which was formed through integration of the Prevention Planning Group and the Statewide AIDS Services Delivery Consortium. Within the EMAs, input is also received from the RWHAP Part A planning councils (the HIV Health and Human Services Planning Council of New York and the Nassau-Suffolk HIV Health Services Planning Council) as well as the New York City HIV Planning Group. In addition, focus groups and other forums are held on specific policy or program issues. Hundreds of people are involved in these committees and groups, including recipients of RWHAP funds, a variety of HIV-related programs, community leaders, government representatives, advocates, researchers, and other stakeholders. Consumers are represented in all groups; for example, 29% of the NYS HAB members are people with HIV.

The Integrated Plan is also informed by the development of *The Blueprint* and *Ending the Epidemic (ETE) Beyond 2020 Addendum Report*. NYSDOH AI provides ongoing data updates to planning groups to inform their decision making and collects qualitative data through listening sessions and from advisory groups. In 2020, NYSDOH AI held 13 regional sessions, eight theme-based sessions, and two sessions for medical providers; in June 2022, NYSDOH AI held two additional statewide virtual listening sessions. Fifteen population-focused and topic-specific advisory groups have produced reports with recommendations (2018-2020). The Integrated Plan was posted for public comment in October 2022. Letters of concurrence were received from New York State HIV Advisory Body (NYS HAB), HIV Health and Human Services Planning Council of New York, New York City HIV Planning Group (NYC HPG), and the Nassau-Suffolk HIV Health Services Planning Council. This highly collaborative process has been instrumental in creating an HIV prevention and care system across the state that supports efforts to achieve ETE and Integrated Plan goals.

B. Documents Submitted to Meet Requirements

The Integrated Plan closely aligns with and builds on NYS ETE efforts contained in *The Blueprint* and the *ETE Beyond 2020 Addendum Report*, as well as the National HIV/AIDS Strategy: 2022-2026. The Integrated Plan is closely informed by the EHE initiative that includes the New York City 2020 Ending the HIV Epidemic Plan (NYC 2020 EHE Plan) submitted as a deliverable for CDC PS19-1906. The Integrated Plan is also informed by the discussions and results from NYCDOHMH- and NCDOH-led community listening sessions in 2020.

All required documents are included in the Integrated Plan and are summarized in the checklist provided at the conclusion of the plan.

Section II: Community Engagement and Description of Jurisdictional Planning Processes

Overview

A foundation of the NYSDOH AI overall planning strategy – and one of its primary strengths – is a commitment to work with and obtain input from partners, consumers, and other stakeholders throughout the planning, implementation, and monitoring process. These partnerships – with people with HIV, other consumers, service providers, community leaders, advocacy groups, research entities, and federal, state, and local government agencies – have made ETE planning and programming successful in NYS. Partnerships inform the design and implementation of ETE policies and programs, and the partners are fully invested in and committed to working together to achieve the shared goals of the ETE initiative.

Table II.1 lists the community engagement activities conducted by NYSDOH AI that contributed to the Integrated Plan. These activities reflect the breadth and inclusiveness of NYSDOH AI efforts to engage all partners and stakeholders in the planning and prioritization process. Table II.2 lists the community engagement activities conducted by NYCDOH and NCDOH, which have informed their planning processes for HIV prevention, care, and treatment funding and programs.

In this Section:

- NYS approach to planning process
- Engagement of key jurisdictions, community members, and stakeholders
- Meeting programmatic requirements (i.e., SCSN, Part A and B requirements, CDC requirements)

Table II.1: Statewide Community Engagement Activities for Integrated Plan

Activity	Date	Participants	Process
NYS HIV Planning Body Coordinating Group	May 16, 2022	Representatives of Nassau-Suffolk HIV Health Services Planning Council, NYCDOHMH, New York City HIV Planning Group, HIV Health and Human Services Planning Council of New York, NYSDOH AI, and NYS HIV Advisory Body	Representatives reviewed Integrated Plan goals and discussed process for prioritizing strategies.
Listening Sessions (conducted virtually)	June 1 and June 7, 2022	The June 1 session was attended by 53 participants. The June 7 session was attended by 18 participants.	Participants took part in a facilitated discussion addressing barriers to prevention and care, key resources, unmet needs, important allies/partners in carrying out HIV-related activities, inequity and health disparities,

			systemic/structural issues, and the impact of COVID-19. The listening sessions were promoted through use of existing listservs consisting of all previously engaged community partners, funded providers, and longstanding advisory groups. Additionally, ETE Regional Committees were asked to encourage additional individuals who were not previously engaged in ETE conversations to attend. Communication was drafted with background information on the purpose of the sessions and need for community input and shared with funded providers and advisory group members as well as other identified stakeholders. The NYS HIV Planning Body Coordinating Group also informed their members. Findings from the listening session are captured in Section III.4 of the Integrated Plan and informed prioritization of strategies.
Prioritization of Strategies to Support Goals	June 2022	The survey participants/respondents were gathered from the advisory bodies (NYS HAB, HIV Health and Human Services Planning Council of New York, NYC HIV Planning Group, and the Nassau-Suffolk HIV Health Services Planning Council). Members provided the initial responses to proposed strategies and were then asked to prioritize what was	The goal of the survey was to rank strategies based on agreed-upon criteria for implementation. An additional goal was to ensure that all responses/strategies are included in an intentional way to prioritize review and implementation. Respondents were given three weeks to complete the prioritization survey. Respondents were invited to participate by email. Two reminders of the deadline were

		submitted within each area of focus. Respondents are representative of communities served and stakeholders engaged in service delivery. Respondents are residents of all NYS regions and are diverse in representation of populations affected by HIV.	sent, and the deadline date was extended to increase the number of responses.
NYS HIV Planning Body Coordinating Group	July 25, 2022	Representatives of Nassau-Suffolk HIV Health Services Planning Council, New York City Department of Health and Mental Hygiene, New York City HIV Planning Group, HIV Health and Human Services Planning Council of New York, New York State AIDS Institute, and New York State HIV Advisory Body	Representatives discussed: prioritization of goals; outcome of community engagement listening session findings; resource inventory update.
Stakeholder and Community Review of Draft Plan (public comment period)	October 2022	The invitation to review the draft Integrated Plan went out to all members of the NYS HIV Planning Body Coordinating Group as well as to all NYSDOH AI stakeholders that received the Call for Documents. This includes all funded providers, all advisory body members, and other identified stakeholders. The draft plan was posted on the NYSDOH AI website for stakeholders to review.	Stakeholders and community members received an email that notified them that the public comment period was open, provided a link to where the document was posted, and contained instructions on how to submit comments by the due date. Results were summarized and included in the Integrated Plan document.

Letters of Concurrence	October/November 2022	Letters (attached in Section VII) were received from: Nassau-Suffolk HIV Health Services Planning Council New York City HIV Planning Group HIV Health and Human Services Planning Council of New York New York State HIV Advisory Body (NYS HAB)	Letters of concurrence were received from all required planning bodies.
------------------------	-----------------------	--	---

Table II.2: EMA Community Engagement Activities

EMA	Community Engagement Activities
New York City and the New York EMA (which includes New York City and Putnam, Rockland, and Westchester Counties)	Listening Sessions. Between June and December 2020, NYCDOHMH facilitated nine virtual listening sessions, drawing a total of 308 participants. In planning the sessions, NYCDOHMH partnered with agencies (across the Bronx, Brooklyn, Manhattan, and Queens) and stakeholders serving members of the specific populations identified in the NYC 2020 EHE Plan and worked to enlist new voices into the planning process. Additionally, the NYC EHE team held monthly meetings with NYSDOH AI Planning leadership to coordinate the EHE and NYS ETE planning efforts in anticipation of the Integrated Plan. Community Survey. The community survey, in English and Spanish and English, took place in September and October 2020, with 619 respondents. The survey was disseminated through community-based organizations (CBOs) serving the specific populations, including both HIV- and non-HIV-specific CBOs; local stakeholders, including community leaders, advocates, and staff at organizations; local government agencies; the New York City HIV Planning Group, HIV Health and Human Services Planning Council of New York, and other HIV planning bodies and community advisory boards; and other traditional and non-traditional partners across the city. In March 2022, NYSDOH AI staff attended New York City HIV Planning Group and HIV Health and Human Services Planning Council of New York meetings to provide an overview of the process for developing the Integrated Plan and gather feedback on the process and on components of the NYC 2020 EHE Plan to incorporate into the Integrated Plan. The Planning Council's Consumers Committee hosted three additional virtual sessions to gather additional feedback on the Integrated Plan.

Nassau-Suffolk EMA	Consumer Needs Assessment Surveys. The Nassau-Suffolk EMA engages consumers through needs assessment surveys. Over 450 consumers participated in the 2019 survey, which was administered online, in person at RWHAP Part A provider locations, and by telephone. The survey was offered in both English and Spanish. Training was provided to peers who were enlisted to assist with the survey administration. Topic-specific consumer needs assessments are also conducted (e.g., newly diagnosed, out-of-care, women of color). Committees. The Strategic Assessment and Planning Committee of the Planning Council is instrumental in engaging stakeholders and the community. They host annual community forums and hold population-specific focus groups to elicit feedback on services and to assess needs and identify gaps. This committee also conducts a consumer and provider survey every two years. Consumer Involvement Committee members also serve as facilitators for the community forums since peer-to-peer interactions often result in better community feedback and engagement. The Clinical Quality Management (CQM) Committee of the Planning Council engages key stakeholders, including providers and people with HIV, to obtain feedback on quality-related issues and disparities. The CQM Committee relies heavily on consumer feedback and shared experiences related to accessing care to determine quality improvement activities.
---------------------------	--

1. Jurisdictional Planning Process

Partnerships and collaboration with other government agencies are essential to ongoing planning activities and achieving ETE goals. The NYSDOH AI, the NYCDOHMH, and the NCDOH, as recipients of RWHAP Part A and Part B funding, worked together to develop the *Integrated HIV Prevention and Care Plan, 2022-2026* for NYS. Other partners and stakeholders also contributed to the Integrated Plan.

The NYSDOH AI works closely with governmental partners in NYC and Nassau-Suffolk Counties and all other regions in NYS, to prioritize, plan, and implement HIV prevention and care efforts statewide. This ongoing collaboration increases efficiency in programming and funding allocation, maximizes information sharing, promotes coordination, ensures community programs are aligned, and facilitates adoption of innovative strategies to address the HIV epidemic statewide.

a. Entities Involved in the Planning Process

A wide range of stakeholders are critical to the success of the Integrated Plan. Beyond our state regional partners, the NYSDOH AI involves a wide array of partners in the planning and implementation of New York's HIV-related activities. The Integrated Plan development and review is a result of input from over a thousand stakeholders. **Table II.3** lists the various participants that took part in the development of the Integrated Plan. This includes people with HIV, other consumers, HIV service providers, advocates, community representatives,

government agencies, and other involved parties. The Integrated Plan aligns with New York State's ETE efforts, as well as the NHAS and the EHE initiative.

Overview of the Planning Process. Below is a brief description of the key steps of NYS's planning process.

Table II.3. HIV Prevention and Care Planning Participants

- NYSDOH AI, NYCDOHMH, NCDOH (RWHAP Part A and B recipients)
 - New York State HIV Planning Body Coordinating Group
 - New York State HIV Advisory Body (NYS HAB)
- Part A planning councils (the HIV Health and Human Services Planning Council of New York and the Nassau-Suffolk HIV Health Services Planning Council as well as the New York City HIV Planning Group)
 - New York State AIDS Advisory Council (AAC)
 - AAC ETE Subcommittee
 - RWHAP Part C and Part D recipients
 - ETE Regional Committees
 - Interagency Task Force on AIDS
- Expert clinical committees and consumer committees convened by the AIDS Institute Office of the Medical Director, including HIV Quality of Care Clinical Advisory Committee and Consumer Advisory Committee
 - Uninsured Care Program Advisory Council
 - Consumer groups
 - Advocacy organizations/groups
 - Ad hoc work groups

- **Coordination of Planning.** NYSDOH AI, NYCDOHMH, and the NCDOH program teams are responsible for coordinating the plan development, including developing and providing tools for facilitating the work of planning bodies, updating the Epidemiologic Snapshot for NYS, completing the Resource Inventory, gathering data/plan segments from all entities, and writing the Integrated Plan. The HIV Planning Coordinating Group is responsible for reporting back to their home planning body on progress and interim milestones and bringing information and concerns to bi-monthly meetings. The HIV Planning Coordinating Group identifies goals and strategies for inclusion in the Integrated Plan. Members include representatives from Nassau-Suffolk HIV Health Services Planning Council, NYCDOHMH, NYC HPG, HIV Health and Human Services Planning Council of New York, NYSDOH AI, and NYS HAB. The members of the HIV Planning Coordinating Group convened six times during the planning year (virtually) to develop the Integrated Plan and will meet at least twice a year after submission to review progress and ensure that the jurisdictional planning processes are well-coordinated and responsive to statewide needs and priorities.
- **Planning Bodies/Councils Input.** Statewide HIV planning bodies and planning councils contribute information to develop the Integrated Plan narrative, identify goals, strategies, and activities, and support stakeholder involvement.

- **Stakeholder Input.** Stakeholders participate in surveys, focus groups, listening sessions, and other forums throughout the process to identify service and resource gaps and barriers, monitoring and evaluation efforts, and jurisdictional follow-up actions.
- **Additional Methods of Providing Input.** Hundreds of people are involved in these committees and groups, including recipients of RWHAP funds, staff from HIV-related programs, community leaders, government representatives, advocates, researchers, and other stakeholders. Consumers are represented in all groups. For example, 29% of the NYS HAB members are people with HIV.

Development of NYS's ETE Plan. The 64-member ETE Task Force developed the *Plan to End AIDS in New York State*, also known as *The Blueprint*, based on almost 300 recommendations received from the community via statewide stakeholder sessions, online forums, conference calls, and widely disseminated surveys. *The Blueprint* was presented to planning bodies, advisory groups, other state and local agencies, and community representatives.

The ETE Task Force's advisory work continues through the AAC ETE Subcommittee. Ongoing regional and population specific ETE discussions include more than 500 participants. Since its release, NYS has worked collaboratively with all partners to implement the recommendations included in *The Blueprint* and monitor their implementation. Further input continues, such as the convening of several advisory groups to develop specific implementation strategies in support of *The Blueprint* recommendations.

Role of Planning Committees and Stakeholders. Planning committees and stakeholders were vitally important in developing the recommendations for the Integrated Plan (and in other NYSDOH AI planning activities). This input can take the form of suggesting recommendations or reviewing and synthesizing them once they are developed. More information on the needs assessment process and how findings are used to make these recommendations can be found in Section III.

Use of Data in Planning Process. The NYSDOH AI's planning activities are informed by a range of data and other sources, including epidemiological data, research, and evaluation studies.

- Studies utilizing epidemiologic data to examine trends as well as specific objectives, such as linkage to and retention in care and viral suppression.
- Medicaid and contract/program data, including Early Identification of Individuals with HIV/AIDS (EIIHA) data.
- Input from providers, consumers, and other community representatives obtained through a variety of forums, such as regional listening forums, frequent stakeholder meetings, and other planning meetings.
- Input from advisory bodies, such as the New York State AIDS Advisory Council, the NYS HAB, the Interagency Task Force on HIV/AIDS, the AAC Ending the Epidemic Subcommittee, and consumer and provider advisory committees.
- Program, epidemiologic, Medicaid, and quality data are used to capture and address gaps (e.g., gaps in the continuum of care, including people with HIV who are unaware of their status, people with HIV not in care, and people with HIV who are not virally suppressed).

- HIV care continuum data are used to assess ETE progress and assess gaps.

In addition, evaluation of the overall ETE initiative is aligned with milestones and key metrics tracked to monitor *The Blueprint* and published on the [ETE Dashboard](#).

The goals in the Integrated Plan align with these metrics.

Role of Issue-Specific Advisory Groups to Address Structural and Social Factors.

There are many structural and social factors that place communities at risk for HIV, hepatitis C, opioid overdose, and STIs. To ensure that key issues related to ETE and the voices of those whose lives are impacted by these issues are not lost, the NYSDOH AI convenes 15 population and issue-based advisory groups to develop tailored strategies for communities disproportionately affected by HIV. The advisory group members are diverse in terms of age, gender, lived experience, geography, and racial and ethnic diversity. The goals of the advisory groups are to:

- Develop specific implementation strategies in support of *The Blueprint*;
- Optimize impact on identified communities in NYS; and
- Ensure that healthcare and treatment needs are prioritized and met.

The [advisory groups](#) that developed implementation strategies focused their recommendations on the following key groups or topics: Native American; Asian and Pacific Islander; transgender and gender non-conforming individuals; older adults; women; expanding employment opportunities; Black MSM; Hispanic/Latino gay and bisexual men; young adults; STIs; data; pharmacy planning and partnerships; drug user health; non-English speaking, migrant, seasonal farm workers and new immigrants; and sentinel events such as injection drug use.

Considering Social/Structural Issues

Structural Factors: community, cultural, economic, legal, organizational, physical, and policy aspects of the environment that impede or facilitate efforts to prevent and effectively treat HIV.

Social factors: economic and social determinants that influence the health of both people and communities. These include racism, sexism, homophobia, transphobia, stigma, trauma (multigenerational and episodic), conditions for early childhood development, education, employment, income and job security, food security, health services, access to services, housing, social exclusion, and stigma.

b. Role of the RWHAP Part A Planning Councils

Part A EMAs are required to convene planning councils that conform to specific RWHAP requirements. For example, at least 33% of members must be unaligned (i.e., not affiliated with a service provider) and be living with HIV. Responsibilities of Part A planning councils include:

- Setting funding priorities for the allocation of federal HIV/AIDS service dollars under Part A of the RWHAP;
- Conducting consumer needs assessments and identifying the needs of people with HIV in the region;
- Developing a comprehensive service plan for delivering HIV services; and
- Evaluating how efficiently the providers of HIV services are selected and reimbursed through the administrative mechanism.

Given these responsibilities, the work of these planning councils directly aligns with integrated planning at the state level.

As noted above, development of the Integrated Plan is facilitated by the NYS HIV Planning Body Coordinating Group. It is composed of the leadership of all the state's HIV planning bodies (HIV Health and Human Services Planning Council of New York, Nassau-Suffolk HIV Health Services Planning Council, NYS AIDS Advisory Council, NYC HIV Planning Group, NYCDOHMH and NYSDOH AI).

NYC 2020 EHE Planning Process. Local and state ETE planning efforts originated with community leadership and have encompassed broad engagement and collaboration among community leaders, advocates, health and supportive service providers, researchers, and government representatives, including NYCDOHMH staff. NYCDOHMH worked with community members who reflect the diverse and complex NYC HIV epidemic to review the status of *The Blueprint* recommendations and 2015 NYC ETE Plan strategies, last updated in 2020; gather broad input on successes, gaps, and unmet needs; and further develop the existing plans to address persistent HIV-related health inequities.

The NYC 2020 EHE Plan development and data collection involved an iterative dialogue of community engagement and feedback, conducted through nine NYCDOHMH listening sessions, seven NYSDOH AI listening sessions, and a community-wide survey that generated 619 responses.

- **Listening Sessions.** Between June and December 2020, NYCDOHMH facilitated nine virtual listening sessions, drawing a total of 308 participants. Each session was well-attended, with anywhere from 11 to 93 participants, with an average of 35 participants across all sessions. In planning the sessions, NYCDOHMH sought to partner with agencies and stakeholders serving members of the specific populations identified in the NYC 2020 EHE Plan and worked to enlist as many new voices as possible in the planning process. Partner organizations were evenly distributed across the Bronx, Brooklyn, Manhattan, and Queens, and helped recruit participants for their respective listening sessions.

- **Community Survey.** NYCDOHMH launched the community survey in English and Spanish on September 1, 2020 and accepted submissions through October 16, 2020. During development of the survey, NYCDOHMH collected feedback from community members and planning bodies, including on the wording of the survey's demographic questions, the literacy level of survey questions, and overall length of the survey. Based on this feedback, NYCDOHMH revised the survey to expand the age ranges and include immigration status. The survey was designed to be completed within 15 to 20 minutes and was disseminated through CBOs serving NYC 2020 EHE Plan priority populations, including both HIV- and non-HIV-specific CBOs; local stakeholders, including community leaders, advocates, and staff at organizations; local government agencies; the NYC HPG, HIV Health and Human Services Planning Council of New York (Planning Council), and other HIV planning bodies and community advisory boards; and other traditional and non-traditional partners across the city. In total, 619 participants responded to the feedback portion of the survey.
- **Key NYC 2020 EHE Plan Partners.** NYCDOHMH has a long history of collaborating with local HIV prevention and care planning bodies to identify needs, prioritize services, allocate resources, and develop comprehensive service directives. The NYC HPG and Planning Council operate as NYCDOHMH's primary HIV community planning bodies. Both are comprised of community members, service providers, government representatives, and advocates, as well as community members affected by HIV but unaffiliated with the HIV service delivery system. In addition, NYCDOHMH collaborates with NYS HAB, which provides input on and support for HIV prevention and care activities statewide.
 - NYC HPG works to inform NYCDOHMH's HIV prevention efforts. Appointed by the NYCDOHMH Commissioner, members fully reflect communities affected by HIV in New York City. Among NYC HPG's 25 members in 2021, 56% are Black, Indigenous, People of Color (BIPOC), 64% are ages 20 to 39 years, 16% identify as people with HIV, and 45% identify as gay and/or MSM or women who have sex with women. Further, 8% are transgender and 4% identify as gender nonconforming.
 - The Planning Council uses a systematic, evidence-driven, representative, and inclusive planning process to prioritize services and allocate RWHAP Part A funding across service categories for the New York EMA, which includes New York City and the Tri-County Region (Putnam, Rockland, and Westchester Counties). Among the Planning Council's 50 members in the 2020-2021 planning cycle, people with HIV constituted 38% of members, and at the beginning of the planning cycle, one-third of members were people with HIV not affiliated with a RWHAP Part A-funded agency. A majority (81%) of the Planning Council's non-affiliated people with HIV are BIPOC.
 - NYCDOHMH has long-standing relationships with state and local government agencies, community bodies, healthcare facilities, and CBOs, which facilitate communication, collaboration, and coordination of HIV prevention and care efforts. Collaborative partners include hospitals, community health centers, federally qualified health centers (FQHCs), and CBOs, some of which receive funding through NYCDOHMH; Designated AIDS Centers; SSPs; LGBTQ+ health centers; NYSDOH

Quality of Care networks; institutions of higher education; faith-based organizations; NYC Department of Education and its School-Based Health Centers; New York City Administration for Children's Services and affiliated foster care agencies and juvenile justice facilities; New York City Health + Hospitals (H + H), the City's public hospital system; and New York City Mayor's Office to End Domestic and Gender-Based Violence.

- NYS HAB is an advisory body to the NYSDOH AI, drawing on the expertise and experiences of consumers, providers, and community members to provide guidance on service needs, affected populations, and emerging issues related to HIV prevention, healthcare, and supportive services throughout NYS. NYS HAB membership has equal representation of men and women, and 60% identify as LGBTQ+, 80% are BIPOC, and 11% are people with HIV.

Nassau-Suffolk HIV Health Services Planning Council. The Nassau-Suffolk HIV Health Services Planning Council was formed in 1992 and is an all-volunteer member body appointed by the county in which each member resides. Members include service providers, those with lived experience, consumers, and other stakeholders.

Community input is integral to the EMA's planning process and is incorporated into the Priority Setting Resource Allocation (PSRA) process at various stages. People with HIV are involved in the PSRA planning process through membership in the Strategic Assessment and Planning Committee, Finance Subcommittee, and the Planning Council. All meetings are open and community participation is encouraged. To ensure people with HIV can fully participate in the PSRA process, training is provided. People with HIV also gain understanding through attendance of committee meetings and participating at all levels of the needs assessment and planning processes. The Strategic Assessment and Planning Committee hosts annual community forums and population-specific focus groups to gain feedback on services and to assess needs and gaps. This serves as an opportunity for the community to provide input regarding the Part A-supported services they need and utilize and to help shape the service system. The qualitative data gathered reflect direct consumer experiences. Additional input on consumer experience comes from the Consumer Involvement Committee (CIC). It has a standing agenda that addresses barriers, gaps in services, and any service utilization issues as reported by consumers affiliated with the different consumer advisory boards at provider agencies.

Other examples of community engagement and information exchange include:

- Ongoing recruitment efforts of the membership subcommittee and CIC to increase unaligned consumers on the planning council and committee membership;
- United Way of Long Island regularly sends out a weekly mailing of HIV-related information as a resource to both consumers and providers within the community, which includes a link to the planning council website;
- Sharing of information on the planning council website, Twitter page, and United Way's Facebook page; and

- Observance of World AIDS Day by hosting an annual event that is open to the community.

c. **Role of Planning Bodies and Other Entities**

The NYS HAB plays a key role in leading and coordinating planning across the state. The NYS HAB is an integrated care and prevention advisory body to the NYSDOH AI. It identifies and addresses prevention and healthcare needs with an emphasis on linkage, retention, and viral suppression.

The NYS HAB focuses on integration, synergy, and efficiency in responding to jurisdictional needs and federal requirements. Its mission is to provide recommendations and guidance on service needs, affected populations, and emerging issues related to HIV prevention, healthcare, and supportive services throughout NYS. It uses recommendations from *The Blueprint*, the NHAS and the *NYS Integrated HIV Prevention and Care Plan* to guide its work.

NYS HAB membership is comprised of 33-40 people drawn from 11 designated regions of the state. Up to three members are appointed to the NYS HAB from each region of the state. NYS HAB membership reflects the people served in terms of race/ethnicity, sexual orientation, age, risk category, gender identity, and other identified criteria. Twenty-nine (29) percent of the current NYS HAB membership are people living with HIV. Full NYS HAB meetings are open to the public.

There are four co-chairs: two community co-chairs and two governmental co-chairs. The executive committee and by-laws committee are charged with overall governance of the NYS HAB. The NYS HAB has standing committees that address HIV prevention, healthcare, and supportive service needs. Each committee reviews available epidemiological, evaluation, behavioral and social science, cost-effectiveness, and needs assessment data to determine HIV needs and to make recommendations about how these needs can best be met. Three additional standing committees are:

- **Best Practices Committee:** Identifies cutting-edge healthcare issues and prevention/intervention strategies and recommendations related to needs and gaps to maximize effective HIV prevention, supportive services, and service coordination of programs across all NYS regions and populations with an emphasis on identification of new cases, rapid linkage to care, retention, and viral suppression.
- **Emerging Issues Committee:** Identifies, examines, and provides information and recommendations related to developing trends about HIV prevention, healthcare, and supportive services throughout NYS. Monitors national trends and changes that impact NYS.
- **Social Determinants Committee:** Identifies specific populations and communities (statewide and regionally) disproportionately affected by HIV and makes recommendations to address health disparities and SDOH that impact their overall health and well-being.

d. **Collaboration with RWHAP Parts**

The Integrated Plan update includes an updated Statewide Coordinated Statement of Need (SCSN). The SCSN is an integral component of this Integrated Plan. The purpose of the SCSN is

to provide a collaborative mechanism to identify and address the most significant HIV-related needs of people with HIV and to maximize coordination, integration, and effective linkages across all RWHAP Parts.

Participation and input into the SCSN process by all RWHAP recipients, HIV planning bodies, HIV service providers, and other interested organizations throughout NYS was requested in a formal communication to over 1,000 stakeholders in March 2022. It asked for planning documents, local needs assessments, and proposals. These documents and data were used in the state-level planning process.

e. Engagement of People with HIV

As mentioned above, NYSDOH AI has a long history of engaging people with HIV in the planning and design of HIV-related activities/services. NYSDOH AI engaged people with HIV and community stakeholders throughout the entire process to develop the Integrated Plan and will continue to engage them on an ongoing basis as the plan is implemented. People with HIV contributed to development of the plan in many ways.

- Membership of each planning body participating in the development of the Integrated Plan.
- Input in developing *The Blueprint*.
- Participation in numerous regional forums/listening sessions, focus groups, community calls, online portals, and ongoing needs assessments to inform annual planning and priority setting.
- Regular structured consumer surveys.
- Four sessions with the Consumer Committee of the NY EMA Planning Council to gather input on each section of the Integrated Plan led by Committee leadership with NYSDOH AI and NYCDOHMH staff in attendance.

Facilitating Engagement/Participation of People with HIV

- Best practices in cultural competence and cultural appropriateness are emphasized.
- Meeting schedules are posted online and promoted through traditional and social media.
- Efficiency of meetings is emphasized to respect the time commitment required of participants.
- Presentations and planning-related documents present complex information in an understandable way.
- Interpretation services are available for people who do not speak English and the deaf and hard of hearing as necessary.
- There are options to provide input and recommendations online and via conference calls.

The people involved in developing the Integrated Plan reflect the people affected by the HIV epidemic in NYS. Memberships of the various planning bodies and their committees/task forces reflect the local epidemic in terms of race/ethnicity, gender, transmission risk, and geography.

f. Priorities

Key priorities were identified through the planning and community engagement processes. The persistent racial and ethnic disparities in new HIV diagnoses and rates of HIV viral suppression are the highest identified priority areas of need and form the basis for many of the priorities identified. Our thorough discussion of the priorities is included in the needs assessment (Section

III) and the situational analysis (Section IV). These priorities are reflected in the goals and priority strategies of the Integrated Plan.

Key priorities identified in *ETE Beyond 2020 Addendum Report* are listed below. These were identified through the input of advisory committees (population and topic specific), listening sessions (2020), and a statewide survey.

- Ensure access to adherence, treatment, and prevention services.
- Increase efforts to engage specific populations in healthcare services.
- Increase community engagement/outreach and partnerships/collaborations.
- Address mental health and substance use by utilizing a trauma-informed care approach.
- Increase technology resources and telehealth services.
- Develop strategies to address resource deficiencies and barriers to care.

In addition, NYSDOH AI continues to identify emerging issues that have an impact on achieving the goals of the Integrated Plan. Most recently, these were identified in the 2022 NYSDOH AI Call to Action.

As stated in a March 2022 Dear Colleague letter from then-NYSDOH AI Director, Johanne E. Morne, ***“We must have the courage to look clearly at these disparities and have the integrity to ask ourselves a series of difficult questions about how we will prioritize our efforts to prevent new cases of HIV among Black New Yorkers, and work to eliminate racial disparities in rates of viral suppression.”***

Addressing Racial Disparities: Key Priorities

Priority #1: Take decisive action to address persistent disparities in new HIV diagnoses and HIV viral suppression rates for BIPOC New Yorkers. Ensure every Request for Application NYSDOH AI releases beginning in 2022 has a health equity component and evaluative criteria specific to health equity. Make the following resources and trainings available:

- Guidance tool for applying a health equity lens in the work of an agency.
- Standardized SDOH screening integrated into the AI Reporting System (AIRS).
- Provider training on how to conduct SDOH screening in a consumer-centered, affirming manner.
- Healthcare organization considerations in support of health equity.
- Health equity competencies for healthcare providers.
- Regional training/networking sessions on racism as a root cause of inequitable health outcomes.

Response: Beginning in 2022, NYSDOH AI contract managers will dialogue with funded agencies to identify specific actions, consistent with the funding stream, to prioritize innovative, culturally appropriate HIV prevention services, and to refine models of HIV care, treatment, and support services to reduce racial and ethnic disparities in new diagnoses, linkage to care, and viral suppression.

Priority #2: Take action in accordance with NYS's Hepatitis C Elimination Plan. On November 17, 2021, NYS released its Hepatitis C Elimination Plan. The plan is rooted in four guiding principles: health equity; harm reduction; trauma-informed care; and engagement of people with lived experience. The plan is comprised of nine recommendations related to prevention; 12 related to testing and linkage to care; six related to care and treatment access; and 14 related to SDOH.

Priority #3: Stem the increasing tide of congenital syphilis. The number of congenital syphilis cases in NYS has more than doubled over the last five years. Congenital syphilis, which results from untreated maternal syphilis infection in pregnancy, is entirely preventable. Each case represents a failure of the public health and healthcare systems. To reduce missed prevention opportunities, NYS needs sustained, consistent, equitable, and timely access to high-quality prenatal care for all people, including transgender people. The NYSDOH AI is calling on all healthcare providers in NYS to:

- Screen people for syphilis as recommended;
- Determine pregnancy status of all people of reproductive capacity diagnosed with syphilis;
- Make sexual health discussions a routine part of every prenatal visit; and
- Screen all pregnant people at least three times during their pregnancy, including at the time pregnancy is first identified, between 28 and 32 weeks, and upon delivery.

Response: The NYSDOH AI-supported Clinical Education Initiative's Sexual Health Center will prioritize training on these important topics.

Priority #4: Meet the needs of older adults with HIV.

NYS will advance efforts on several fronts including:

- **Enhanced Data Analysis.** NYSDOH AI staff will analyze data to determine the extent to which AI-funded providers and direct services programs are serving older adults at risk for, or living with, HIV to identify disparities and work to modify existing programming and to identify new programming possibilities.
- **Uninsured Care Programs (UCP) Outreach to Older Adults.** UCP will provide outreach to participants in adult day programs, senior service programs and other settings to discuss available services, including PrEP Assistance Program and AIDS Drug Assistance Program (ADAP) Plus Insurance Continuation. The program will develop written materials for its Medicare consumers to educate individuals on the benefits of utilizing the UCP in conjunction with other health insurance like Medicare.
- **Develop a Continuing Education Concentration on HIV and Aging for Certified Peer Workers (CPW).** CPWs will be trained to conduct age-related screenings that will help connect older adults with HIV to needed services related to reduced mobility, memory, and frailty.

Priority #5: Expand access to harm reduction services and mental health services. In 2021, legislation provided new tools to combat the opioid crisis, including expanding access to substance use disorder treatment in NYS prisons and county jails. This historic legislation reminds us that all health and support services providers should take every opportunity to

promote access to harm reduction services, treatment for substance use disorder, access to naloxone, and safety planning to reduce opioid overdose. Our systems should work to destigmatize mental health services and strengthen our capacity to make effective referrals for needed services. Using a harm reduction model to address the intersection of health, mental health, and substance use must be a priority for 2022.

g. Updates to Other Strategic Plans Used to Meet Requirements

The Integrated Plan closely aligns with NYS ETE efforts, as well as the NHAS and the EHE initiative that includes New York City's ETE plan. *ETE Beyond 2020 Addendum Report* included the findings from both regional virtual listening sessions and theme-based listening sessions, held in 2020. It also included the results of a statewide survey conducted from December 2020 to January 2021. In addition to these data from the *ETE Beyond 2020 Addendum Report*, the Integrated Plan incorporates findings from two listening sessions held in June 2022.

NYC ETE Plan. The NYC ETE plan reflects and builds upon *The Blueprint*. The NYC ETE Plan employs an HIV status-neutral approach to reduce the number of new HIV infections to non-

epidemic levels; improve the health and well-being of people with HIV and people vulnerable to HIV; and eliminate HIV-related health inequities.

The NYC ETE Plan aligns with NYS ETE priorities and goals. In 2020, NYSDOH AI released the *ETE Beyond 2020 Addendum Report*, which describes how NYS will build on *The Blueprint* to take the ETE initiative beyond 2020. The report includes key themes and outcomes informed by feedback received from stakeholders throughout 2020, and summarizes NYS's ETE planning process, essential partnerships that support the ETE initiative, statewide ETE metrics, progress to date, and community-identified emerging priorities.

NYC ETE Plan: Strategies for Ending the HIV Epidemic

- Strategy 1: Increase the number of people who know their HIV status by diagnosing HIV infection as early as possible, promoting routine testing within healthcare facilities, and scaling up testing options in non-clinical settings.
- Strategy 2: Prevent new HIV acquisition by increasing access to effective prevention interventions, including pre-exposure prophylaxis (PrEP), emergency post-exposure prophylaxis (emergency PEP), condoms, harm reduction, and supportive services.
- Strategy 3: Improve viral suppression and other health outcomes for people with HIV by optimizing medication adherence and access to care, improving coordination of clinical and supportive services, and increasing access to immediate antiretroviral treatment (iART).
- Strategy 4: Enhance methods to identify and intervene on HIV transmission networks to better support individuals and communities at increased risk of exposure.
- Strategy 5: In all NYC ETE strategies, utilize an intersectional, strengths-based, anti-stigma, and community-driven approach to mitigate racism, sexism, homophobia, transphobia, and other systems of oppression that create and exacerbate HIV-related health inequities.

Section III: Contributing Data Sets and Assessments

1. Data Sharing and Use

NYSDOH AI provides and shares a wide range of data to support community engagement and planning activities. Data sharing from the HIV epidemiology system is achieved through project-specific data use agreements as allowed by existing HIV epidemiology security and confidentiality protocol, [NYS public health laws](#) and applicable [CDC's National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention \(NCHHSTP\) data security and confidentiality guidelines](#). Currently, HIV epidemiology data are shared electronically with staff conducting Partner Services; select staff in NYSDOH AI communicable disease registries for co-morbidity assessment (e.g., tuberculosis (TB), STI, etc.); healthcare providers for the purposes of linkage and retention in medical care using the HIV/AIDS Provider Portal; NYCDOHMH for epidemiology and partner services as outlined in a memorandum of understanding; the AI Office of Medicaid Policy and Programs, for sharing with Medicaid Managed Care Plans to improve viral load suppression. Matching is conducted with the NYSDOH AI Reporting on an ongoing basis for a variety of HIV prevention-related monitoring and evaluation. NYC and NYS have established direct lines of programmatic collaboration to ensure that a comprehensive prevention and care program exists in NYS. This extends to both the prevention and epidemiology work portfolios. For example, the AI funds 100+ providers in NYC to deliver a range of evidence-based prevention programming. NYS and NYC epidemiology units have data sharing agreements in place to ensure HIV epidemiology data for people who migrate across the NYS/NYC border are available to both jurisdictions. NYCDOHMH supports NYSDOH AI activities through letters of agreement to ensure an equitable distribution of federal resources to the whole state, keeping in mind the maintenance of shared infrastructure and other responsibilities that fall solely to NYS, the symbiosis of the epidemiologic data systems, and the programming based on these systems.

In this Section

- Data Sharing and Use
- Epidemiologic Snapshot
- HIV Prevention, Care, Treatment Resource Inventory
- Needs Assessment

Epidemiologic Data. HIV epidemiologic data are used on an ongoing basis for planning and targeting interventions. They are available in the [NYS HIV/AIDS Surveillance Annual Report](#) and through the [ETE Dashboard](#).

Slide Sets to Support Community Engagement and Planning. Every year, NYSDOH AI makes tailored presentations at and/or provides data sets for regional, topic-specific, and population-focused listening sessions. Among the information provided are updates on progress to ETE and Integrated Plan goals, in general and related to the topics/populations.

Data Collected through Community Engagement/Needs Assessment Activities.

NYSDOH AI uses various methods to share data collected through community engagement and needs assessment activities. For example, the *ETE Beyond 2020 Addendum Report* included the

findings from both regional virtual listening sessions and theme-based listening sessions, held in 2020. It also included the results of a statewide survey conducted from December 2020 to January 2021. In addition to these data from the *ETE Beyond 2020 Addendum Report*, the Integrated Plan incorporates findings from two listening sessions held in June 2022.

Data Sharing Agreements. As stated above, NYS and NYC epidemiology units have data sharing agreements in place to ensure HIV epidemiologic data for people who migrate across the NYS/NYC border are available to both jurisdictions.

2. Epidemiologic Snapshot

Introduction

As the state public health authority, the NYSDOH is responsible for maintaining the NYS Registry of confirmed and suspected HIV/AIDS cases.

On June 29, 2014, NYS announced the Ending the Epidemic (ETE) Initiative, a plan to move the state closer to the end of the HIV epidemic. The three-point plan aims to: 1) identify persons with HIV who remain undiagnosed and link them to healthcare; 2) link and retain persons diagnosed with HIV in healthcare to maximize virus suppression so they remain healthy and prevent further transmission; and 3) facilitate access to PrEP to prevent the acquisition of HIV. ETE will maximize the availability of lifesaving, transmission-interrupting treatment for HIV, saving lives and improving the health of NYS residents. The plan will help NYS overcome its historical burden of the worst HIV epidemic in the country and work towards a future where new infections are rare and those living with HIV are able to live normal lifespans with minimized complications.

This Epidemiologic Snapshot provides a summary of the HIV epidemic in NYS, highlighting epidemiologic trends and progress since the start of the ETE Initiative, and additionally provides a snapshot of HIV epidemiology in NYS during 2020. Completeness of 2020 data may be affected by the COVID-19 pandemic and subsequent public health response, known as NY PAUSE. Reported HIV-related laboratory testing result volume and clinician reports of persons with diagnosed HIV were lower compared to prior years. Additionally, HIV surveillance activities in NYS were delayed, potentially resulting in an inaccurate count of persons with diagnosed HIV.

Background

Since the peak of NYS's HIV epidemic in the 1990s, the number of persons newly diagnosed with HIV and the number of deaths among persons with diagnosed HIV have declined, while linkage to care and rates of viral suppression have steadily increased. Despite these successes, disparities remain among race/ethnicity, age, and geographic regions in HIV diagnosis and care.

HIV Prevention

It is estimated that over 90% of NYS residents are aware of their HIV status, increasing from 91% in 2013 to 94% in 2020.

Awareness of HIV status is one pillar of ETE aimed at preventing HIV transmission. Another prevention goal is increasing PrEP access throughout the state. The number of individuals who

filled a prescription for PrEP increased dramatically from 3,388 in 2014 to nearly 40,000 in 2020.

HIV often occurs simultaneously with other sexually transmitted infections. Gonorrhea rates have increased steadily for six years in NYS, and congenital syphilis rates have risen for the past four years. In 2020, the number of chlamydia and early syphilis cases declined for the first time in five years, as a result of access to services during COVID-19.

In 2019, 6,175 newly diagnosed cases of hepatitis C were reported to the NYSDOH AI, of which 5,911 were chronic, 253 were acute, and 11 were perinatal. The number of newly reported hepatitis C cases declined in NYS overall but increased in New York City (NYC). The majority of newly reported cases were chronic, indicating that infection happened in the past. The number of acute cases was low in 2019 but was higher than in the previous year. In 2019, the rate of newly reported hepatitis C was highest amongst those aged 25-34 years. Sixty (60) percent of females with newly reported hepatitis C were of reproductive age (ages 15-44).

Aside from sexual transmission, HIV can be transmitted through the sharing of needles and “works” associated with injection drug use. To prevent transmission of HIV via this mode, NYS has established a syringe services program. This program has expanded substantially in the past ten years, with the number of participants served increasing from 21,456 in 2012 to 35,409 in 2021.

New HIV Diagnoses

From the initiation of ETE in 2014 to 2019, the number of persons newly diagnosed with HIV in NYS decreased by 31%. HIV diagnoses decreased by 19% in 2020 compared to 2019, perhaps indicating a continued decline in transmission but also possibly reflecting a lack of testing or delayed reporting as a result of the COVID-19 pandemic.

Among all NYS residents newly diagnosed with HIV in 2020, 80% were male (sex at birth), 46% were non-Hispanic Black, 30% were Hispanic/Latino, 33% were aged 20-29, and the most frequently reported transmission risk behavior was a history of male-to-male sexual contact (48%).

Alongside the steady decrease in new diagnoses since the onset of the ETE initiative, linkage to care and viral suppression outcomes have continued to improve. HIV care is defined as a CD4, viral load, or genotype test result reported to NYSDOH AI. The percentage of persons linked to care within 30 days of diagnosis increased from 69% in 2013 to 83% in 2020. Additionally, the percent of individuals obtaining viral suppression (<200 c/mL) within three months of diagnosis more than doubled, from 23% in 2013 to 54% in 2020.

Persons Living with Diagnosed HIV (PLWDH)

In 2020, there were 105,610 PLWDH in NYS, maintaining an annual 2% decrease observed since 2017. Reflecting demographic trends seen among persons newly diagnosed with HIV, 72% of PLWDH were male (sex at birth), 45% were non-Hispanic Black, 29% were Hispanic/Latino, and the most frequently reported transmission risk was a history of male-to-male sexual contact (45%). The majority of PLWDH were aged 50-59 years old (30%), while most persons newly diagnosed with HIV were aged 20-29 years. In 2020, 86% of PLWDH were in care, an increase from 81% in 2013. Seventy-five (75) percent of PLWDH were virally suppressed, compared to 66% in 2013.

HIV Care Cascade

The HIV Care Cascade presents a snapshot of engagement in care among all persons with HIV in NYS at one point in time, across the continuum of care from transmission through diagnosis, participation in care, and success of care.

Deaths among Persons with Diagnosed HIV

The number of deaths among persons with diagnosed HIV has decreased since the mid-1990s, though in 2020 there was an increase in deaths consequent to the COVID-19 pandemic. The percent of deaths related to HIV decreased from 36% in 2013 to 24% in 2019.

Mother-to-Child HIV Transmission (MTCT)

At the height of the HIV epidemic in 1990, nearly 2,000 women with diagnosed HIV gave birth in NYS. That year, the HIV MTCT rate was estimated to be 475 – 760 infected infants per 100,000 births, indicating a transmission rate of approximately 25-40%. In 2020, there was a MTCT rate of 0.3% among HIV-exposed infants with known status and 0.48 HIV-infected infants per 100,000 live births. The CDC defines “elimination” of MTCT as a transmission rate of less than one percent of HIV-exposed infants and less than one case of MTCT per 100,000 live births. Based on these criteria, NYS has successfully eliminated MTCT for the sixth consecutive year and seventh year overall (2013 and 2015-2020).

HIV Cluster Detection and Response

Cluster detection and response involves identifying risk networks or geographic areas that show increased transmission of HIV. The overarching goal of cluster detection is to use available data to help focus proven, but resource limited, HIV prevention tools and interventions where they are needed most. A cluster is defined as an increase in the number of persons newly diagnosed with HIV in a particular geographical area over a specific time period.

A health advisory was issued in October 2020 after elevated numbers of new diagnoses were observed in the spring and summer of 2020 in Monroe County. NYS activated the NYSDOH AI Outbreak Response, which included bi-weekly meetings with key partners from epidemiology, prevention, healthcare, and drug user health programs to actively respond to the increases in new diagnoses. A listening session was held on October 30, 2020, where Monroe County community providers helped to identify potential strategies and recommendations to address the emergent situation.

Disparities in HIV-related Outcomes by Demographic

NYS has made many gains in the prevention and treatment of HIV and continues to prioritize efforts to eliminate disparities. From 2013-2020, non-Hispanic Black and Hispanic/Latino individuals accounted for the largest percent of new HIV diagnoses in NYS. These individuals represented 73% of new diagnoses, but only 33% of the NYS population in 2020. Non-Hispanic White and Asian American/Native American/Multi-Race individuals represented a greater proportion of the NYS population than the population newly diagnosed with HIV.

Race/Ethnicity Composition of Persons Newly Diagnosed with HIV (2011-2020) in Comparison with the General Population (2020)

Note that the number of persons newly diagnosed with HIV in NYS was 3,971 in 2011 and 1,933 in 2020.

Linkage to care within 30 days of diagnosis varied by race/ethnicity with 73% of non-Hispanic White individuals, 66% of non-Hispanic Black individuals, and 69% of Hispanic /Latino individuals in care in 2013. This increased to 85% of non-Hispanic White, 80% of non-Hispanic Black, and 85% of Hispanic/Latino individuals by 2020, with disparities still remaining. Similar patterns were seen in viral suppression among those in care. Of those in care, 91% of non-Hispanic White, 77% of non-Hispanic Black, and 81% of Hispanic/Latino PLWDH were virally suppressed in 2013. This increased to 93% of non-Hispanic White, 84% of non-Hispanic Black, and 88% of Hispanic/Latino PLWDH by 2020.

Impact of COVID-19 and Monkeypox (MPV) on PLWDH

NYS was the epicenter of the COVID-19 and Monkeypox (MPV) outbreaks. NYS has prioritized understanding the impact of the COVID-19 pandemic as well as MPV on PLWDH. A recent study found that from March 1-June 7, 2020, 2,988 PLWDH were diagnosed with COVID-19, a rate of 27.7 per 1,000 PLWDH, which was higher than among persons living without diagnosed HIV (19.4 per 1,000) in NYS. Further research identified that about 30% of PLWDH had not received a dose of a COVID-19 vaccine as of October 24, 2021.

As of July 2022, there were 88 persons diagnosed with MPV in NYS outside of NYC. Of these 88 individuals, 33%, or 29 individuals, had been previously diagnosed with HIV.

3. HIV Prevention, Care, Treatment Resource Inventory

To compile this resource inventory, NYSDOH AI worked directly with partners at the NYCDOHMH and NCDOH to collect accurate information across all NYS programs from the most up to date sources available. In some cases, information for CDC, Substance Abuse and Mental Health Services Administration (SAMHSA) and other grant funding was obtained via internet research. The fiscal year information is noted with each source for reference.

i. Funding Source	ii. Funding Amount (\$)	% of Total Funding	iii. Funded Service Provider Agencies/Contracts	iv. Services Delivered	v. HIV Care Continuum Step(s) Impacted
Statewide					
New York State Medicaid Expenditures Statewide (SFY20-21)	\$2,500,692,797	69.44%	N/A	Outpatient/Ambulatory Health Services, Substance Abuse/Mental Health Services, Oral Health, Other Outpatient/Community Based Primary Medical Care Services, Home/Community Based Support Services, Counseling and Testing, Prescription Medications	Diagnosed, Linked to Care, Retained in Care, Prescribed ART, Virally Suppressed
HRSA Ryan White HIV/AIDS Program (RWHAP) Part C (EIS) (FY 2020)	\$2,925,411	0.08%	37	EIS, core medical services, support services, quality management, and administration.	Diagnosed, Linked to Care, Retained in Care, Prescribed ART, Virally Suppressed
HRSA Ryan White HIV/AIDS Program (RWHAP) Part D (WICY) (FY2020)	\$626,986	0.02%	14	Medical services, clinical quality management, support services, and administrative costs.	Diagnosed, Linked to Care, Retained in Care, Prescribed ART, Virally Suppressed
HRSA Community Based Dental Program (FY2021)	\$588,509	0.02%	2	Increasing access to oral health care for people with HIV.	Retained in Care
HRSA Ryan White HIV/AIDS Program (RWHAP) Part F (FY2016)	\$4,636,222	0.13%	17	Assists accredited dental schools, post-doctoral dental programs, and dental hygiene education programs with uncompensated costs incurred in providing oral health treatment to patients with HIV infection.	Retained in Care
HRSA Ryan White Special Projects of Significance (SPNS) (FY2020)	\$2,205,000	0.06%	5	Support innovative demonstration projects that test and respond to the challenge of HIV/AIDS service provision to underserved and vulnerable populations.	Diagnosed, Linked to Care, Retained in Care, Prescribed ART, Virally Suppressed
HRSA Ryan White Special Projects of Significance (SPNS) (FY2022-2024)	\$2,250,000	0.06%	5	Support innovative demonstration projects that test and respond to the challenge of HIV/AIDS service provision to vulnerable populations of Aging with HIV.	Diagnosed, Linked to Care, Retained in Care, Prescribed ART, Virally Suppressed
HRSA AIDS Education and Training Centers (AETC) Program (2021)	\$3,845,677	0.11%	1	Trains health care providers to treat people living with HIV/AIDS through a network of regional centers and associated sites.	Diagnosed, Linked to Care, Retained in Care, Prescribed ART, Virally Suppressed

a. Strengths and Gaps

Strengths. The ongoing community engagement and planning processes allow for regular reassessment of needs and prioritization of resources across the state.

Gaps. While there are always opportunities to improve access to services and how they are delivered, NYSDOH AI has confidence that services are in place to support the care cascade and that these are available across all jurisdictions in the state, while taking into account the needs of specific populations. Gaps are identified through ongoing community engagement and planning processes, as described elsewhere in this report.

b. Approaches to Partnerships

Partnering opportunities. All stakeholders and partners had an opportunity to participate in the planning process, through either community engagement activities (e.g., listening sessions, advisory groups, surveys) or as members of planning bodies. These opportunities are widely promoted by NYSDOH AI, NYCDOHMH and Nassau-Suffolk Counties.

Development of Resource Inventory. As stated above, NYSDOH AI staff, as part of the Integrated Plan workgroup, worked directly with partners in New York City and Nassau-Suffolk Counties to collect accurate information across all NYS programs.

4. Needs Assessment

Achieving the goals of ETE requires addressing inequities and SDOH, such as income and employment instability; access to affordable, quality food, housing, education, and healthcare; economic injustice/poverty; racism; homophobia; transphobia; discrimination; and stigma. Additionally, NYS will plan to integrate the recently adopted National HIV/AIDS Strategy Federal Implementation Plan's five indicators that reflect the multi-dimensional factors of quality of life among people with HIV. The indicators address self-rated health, unmet need for mental health services, hunger/food insecurity, unemployment, and unstable housing or homelessness. These new measures will expand focus beyond clinical measures for people with HIV.

Many ETE efforts, especially outside of EMAs in NYS, are funded by the state through contracted CBOs and providers. The work of many of these organizations seeks to prioritize health equity to promote equal access.

In the Needs Assessment Subsection

- Overarching Needs Assessment Findings
- Services People Need to Access HIV Testing
- Services People with HIV Need to Stay in HIV Care and Achieve Viral Suppression
- Barriers to Accessing HIV Testing, Prevention, and Care and Treatment Services
- EMA and Emerging Communities Need Assessment Activities
- Priorities
- Actions Taken
- Needs Assessment Approach

While equity and health access have been central factors since before development of the ETE plan in 2014, moving forward, NYS must continue to focus on taking the steps necessary to

address mistrust, stigma, and the SDOH that keep people from accessing HIV services and remaining in care. This is reflected in the status neutral approach that is central to this plan. This approach facilitates the integration of prevention and treatment—a unified process from outreach to testing to comprehensive primary care. It addresses the needs of the whole person while mitigating HIV-related stigma and other SDOH.

A large percentage of people with HIV in NYS are aware of their status (94%), in care (80%), and virally suppressed (70%). This is a significant achievement, although the COVID-19 pandemic did impact the state's ETE efforts. An ongoing challenge is that some individuals who remain undiagnosed and outside of care may face significant challenges to testing and engaging in HIV care.

NYSDOH AI has incorporated key approaches related to SDOH into ETE activities. These include status neutral approaches, U=U, and the continuum of HIV care in the state that includes services that address SDOH (e.g., case management, outreach, food and nutrition, housing, transportation, health education, and legal services). These services are designed to meet the needs of specific populations and align with the priorities in *ETE Beyond 2020 Addendum Report* (see below) and the priorities of partners and stakeholders.

- Promote health equity and addressing health disparities and stigma.
- Partner and collaborate with key stakeholders (e.g., policy makers, government, provider, and community partners; consumers; and research entities) to address SDOH.
- Promote services that are responsive to the lived experiences, trauma, and stigma that disproportionately affect communities of color, indigenous populations, LGBTQ+ communities, and transgender and gender non-conforming individuals.
- Assist service providers in implementing trauma-informed practices and policies.
- Promote promising practices that address health disparities. The continuum of HIV care in the state includes services that address SDOH (e.g., case management, outreach, food and nutrition, housing, transportation, health education, and legal services).

There are many overlapping aspects to these outreach and engagement activities; for example, they focus on the same specific populations. As the status neutral approach emphasizes, it is the person, and their life circumstances, that must be considered, not their HIV status. This approach allows NYS to make progress toward ending the HIV epidemic, but more importantly, improve the lives of those specific populations that are engaged in services.

Needs Assessment Activities that Informed Development of Integrated Plan Goals

Ongoing needs assessment activities (described below) informed the development of the Integrated Plan's goals and the strategies prioritized to meet them. The findings of the needs assessment align with and reinforce the state's commitment to health equity and will inform NYS's efforts to continue to reduce disparities and provide more welcoming services. Many of the needs identified are overarching as they relate to systemic issues that impact those vulnerable to HIV, the newly diagnosed, and people with HIV.

Given that this Integrated Plan focuses on the four EHE pillars—diagnose, treat, prevent, respond—the focus areas under which needs fall are indicated. Since ongoing engagement in

care supports achieving viral suppression and those who are virally suppressed cannot transmit the virus, New York considers these activities to also support prevention.

Overarching Needs Assessment Recommendations

- Ensure comprehensive healthcare, with integration of primary care (for HIV, STIs, hepatitis, and other co-occurring conditions) and specialty care for all people, including those who are uninsured or underinsured. *(Pillars: Treat, Prevent)*
- Use a person-centered approach and ensure access to culturally and linguistically appropriate prevention and healthcare services. *(Pillars: Diagnose, Treat, Prevent)*
- Facilitate patient access to their electronic medical records, pharmacy, and laboratory data to empower patients and improve continuity of care and adherence. *(Pillars: Treat, Prevent)*
- Address stigma and discrimination in healthcare services. Expand quality indicators to include stigma and discrimination to provide a baseline for providers and health plans to use to improve a patient's healthcare experience. *(Pillars: Diagnose, Treat, Prevent)*
- Ensure access to care for residents of rural, suburban and other areas of the state. *(Pillars: Diagnose, Treat, Prevent)*
- Address health inequities and social determinants of health. *(Pillars: Diagnose, Treat, Prevent)*
- Improve engagement with specific populations, (e.g., youth, people aging with HIV, incarcerated individuals, people of trans experience). *(Pillars: Diagnose, Treat, Prevent)*
- Assess and address the impact of the COVID-19 pandemic. *(Pillars: Diagnose, Treat, Prevent)*
- Continue telehealth services statewide post COVID-19; address barriers to these services experienced by specific populations (e.g., lack of access to technology; lack of knowledge related to use of technological tools). *(Pillars: Treat, Prevent)*
- Address mental health and substance use by using a trauma-informed care approach and harm reduction. *(Pillars: Diagnose, Treat, Prevent)*
- Address the unique healthcare needs of specific populations, including, but not limited to, LGBTQ+ and Hispanic/Latino communities, incarcerated individuals and those preparing for re-entry, and people with disabilities and multiple health conditions including mental health and substance use. *(Pillars: Diagnose, Treat, Prevent)*
- Educate providers and consumers on healthcare-related topics in relation to specific populations (e.g., LGBTQ+ individuals, people with disabilities, people with multiple medical conditions, youth). *(Pillars: Diagnose, Treat, Prevent)*
- Increase focus on health literacy and health education for younger individuals. *(Pillars: Diagnose, Treat, Prevent)*

Summary of Needs by Region

In addition to there being overarching needs, there are needs specific to geographic regions. The *ETE Beyond 2020 Addendum Report* presented need-related themes by region, which were identified through the needs assessment activities that informed the report.

Table III.1. Key Themes by Region from NYS ETE Beyond 2020 Addendum Report Listening Sessions

Services for People who Need to Access HIV Testing. The 2022 listening sessions identified three needs related to HIV testing.

- Greater availability of rapid HIV testing in nontraditional settings (i.e., many do not have access to or seek primary care where they could receive testing). (*Pillar: Diagnose*)
- Greater availability of home HIV testing. (*Pillar: Diagnose*)
- Incentives for at-risk populations (e.g., immigrants) for HIV testing and linkage to care. (*Pillar: Diagnose*)

Within New York's framework of health equity, NYSDOH AI is working to improve availability and accessibility of HIV testing and address the concerns of specific populations.

An estimated 10,200 people in New York are living with HIV but do not know their status. These individuals must be identified and linked to treatment to improve their health and to reduce the risk of transmission to partners. Specific populations include: MSM; youth, including young MSM; LGBTQ+ people; people who use drugs; Medicaid recipients; people who are uninsured or underinsured; women; communities of color; incarcerated people; and people receiving hospital or primary care, who are required by law to be offered an HIV test. Additionally, individuals who are out of care and those who are not virally suppressed, while not the primary focus of HIV testing programs, are people who should be linked or reengaged in treatment. Populations are addressed based on epidemiologic data related to new diagnoses and risk behaviors. Populations are also addressed based on *The Blueprint* priorities and input and recommendations received through the community engagement and planning process,

specifically recommendations and implementations strategies identified by the ETE Subcommittee and the ETE regional and population- and topic-specific workgroups.

Testing by CBOs and in Other Settings. NYSDOH AI has contracts with community partners so that HIV testing/referral is available in a variety of settings, especially those that serve at-risk individuals. CBOs that provide HIV testing have been advised to ensure their efforts reach specific populations such as Black and Hispanic/Latino MSM, women of color, and transgender men and women. CBOs use evidence-based outreach strategies to address HIV stigma and present knowledge of HIV status as the community norm. Several CBOs are using vans to reach community residents or to make testing available in environments where people engage in risk behaviors. HIV testing is available onsite at NYSDOH AI authorized SSPs.

Testing in Healthcare Settings. Since 2010, NYS Public Health Law (NYSPHL) has required healthcare providers to offer HIV testing to all individuals age 13 to 64 as a routine part of healthcare (see below for more information on laws related to HIV testing). The *Expanded HIV Testing Partnership Model* supports capacity building in healthcare facilities to increase HIV testing in underserved communities. It also created billing standards for reimbursement so that HIV testing is sustainable in these setting. As part of this initiative, two public service announcements (PSA) promote HIV testing and partner services—one targeting providers and the other targeting community members. The PSAs have been distributed on social media, through medical associations, and by CBOs.

Home Testing. To reach individuals who do not access HIV testing in traditional and non-traditional settings, NYSDOH AI and NYCDOHMH offer self-testing through the HIV Home Test Giveaway campaign for individuals at risk for HIV infection who may not be reached in other HIV testing settings. Both state and city campaigns were initiated in 2016 and expanded in April 2020 in response to the COVID-19 public health emergency. The campaigns were further expanded in November 2020 to include cisgender Black women and the LGBTQ+ community.

Services People Placed At-Risk of HIV Need to Stay HIV Negative

While the 2022 listening sessions identified the need for more LGBTQ+ healthcare centers that provide comprehensive healthcare and sexual health services, including access to PrEP and HIV testing for MSM and transgender and gender nonconforming populations. These are not the only needs in this area. As noted above, addressing the systemic issues related to health equity will strengthen New York's services to specific populations.

Also, it is important to note that NYSDOH AI has made a significant effort to increase access to PrEP. This includes the state-funded PrEP Assistance Program (PrEP-AP), which provides PrEP services to people who are uninsured or underinsured and a voluntary PrEP directory that allows people to search for PrEP prescribers based on their location. According to the directory, PrEP prescribers are available in all areas of the state with the highest number of new HIV diagnoses.

As of 2022, there are 25 NYSDOH authorized SSPs and four Second Tier Syringe Exchange Programs with 17 programs across 56 sites in NYC, and 11 programs with 28 locations across the remainder of the state. These programs are designed to reduce the risk of acquiring HIV through injection drug use. The range of services offered varies across the sites. These include

HIV, STI, and hepatitis counseling and testing; peer-based risk reduction counseling; behavioral interventions; mental health counseling; opioid overdose prevention training; aftercare for overdose; and care management.

Services to Link Newly Diagnosed to Care and Treatment

The needs assessment identified two areas for improvement, which are very general.

- Increase linkage to care. (*Pillars: Treat, Prevent*)
- Ensure rapid initiation of ART. (*Pillars: Treat, Prevent*)

As the epidemiologic snapshot indicates, 83% of newly diagnosed individuals are linked to care within 30 days of diagnosis. Across NYS we are working to do better through several initiatives and activities.

Early identification of individuals with HIV/AIDS (EIIHA) is thoroughly integrated throughout the ETE and the Integrated Plan. These activities include:

- Funding linkage and retention initiatives in Medicaid managed care plans to engage the individuals in care and treatment;
- Uninsured Care Programs (UCP) provides universal access to HIV medications and care by bridging the gap between Medicaid and private insurance coverage; and
- Revision of the UCP enrollment process to facilitate same-day enrollment and rapid access to treatment.

NYSDOH AI's policy on rapid initiation of ART states that all new HIV diagnoses are an immediate call to action for every provider who engages with that person, with the goal being rapid initiation of ART. Providers serving people with HIV should strive for same-day initiation of HIV treatment. An updated clinical guideline was published on *When to Initiate ART and Rapid ART Initiation*. The guideline was developed for primary care providers and other clinicians to encourage initiation of ART at the time of HIV diagnosis, ideally on the same day or within 96 hours.

In conjunction with this policy, the Data to Care Rapid Treatment Project was established. It focuses on identifying areas of improvement in the steps of the treatment-to-viral-load-suppression process. Work includes enhanced data collection and detailed data reviews to identify barriers to rapid ART initiation and the development of programmatic interventions to ensure same-day initiation of ART or within four to seven days of diagnosis. Educational materials have been developed to introduce newly diagnosed to the concept of rapid treatment.

Services that People Need to Stay in Care and Achieve Viral Suppression

The needs assessment identified multiple ways to improve retention in care and support consumers in achieving viral suppression.

- Use data to identify HIV-positive people who have not achieved viral suppression and address their support service, behavioral health, and adherence needs. Use client-level data to identify and assist patients lost to care or not virally suppressed. (*Pillars: Treat, Prevent*)

- Monitor performance related to viral suppression by HIV providers, facilities, and managed care plans to improve treatment outcomes across the state. (*Pillars: Treat, Prevent*)
- Use electronic medical record prompts in all settings to identify non-suppressed people in need of re-engagement or other assistance. (*Pillars: Treat, Prevent*)
- Ensure adequate, stable levels of support to people with HIV in housing, transportation, employment, nutrition, substance abuse treatment, mental health services, and/or childcare. (*Pillars: Treat, Prevent*)
- Train and employ people with HIV as peer guides who can help others navigate support systems and offer personal understanding and encouragement to overcome stigma and discrimination that may undermine treatment adherence. (*Pillars: Treat, Prevent*)
- Address gaps in healthcare resources and services for people aging with HIV. (*Pillars: Treat, Prevent*)

The following activities are examples of what is currently being done across the state to support retention and viral suppression.

- Retention and adherence programs that identify people out of care and not virally suppressed and link them to care and treatment.
- Matching epidemiologic and Medicaid data to identify people in Medicaid managed care plans who are out of care and not virally suppressed.
- Expanded partner services, which uses HIV epidemiology data to identify previously diagnosed and reported people with HIV who appear to be out-of-care and uses partner services staff to re-engage these individuals in medical care and notify and test/treat partners.
- Retention and adherence initiatives targeted to specific populations, such as adolescents/young adults, young MSM, young MSM of color, and transgender people.
- Provision of a range of services that address SDOH and facilitate linkage to care and treatment, such as housing services, case management, food and nutrition, transportation, legal services, and benefits counseling.
- Implementation of the Client Progress Report (CPR), which matches AIRS data and HIV Surveillance data to create a consumer level retention and viral suppression status report. This report is distributed to eligible providers to assist in determining the care status of their consumers.
- In NYC, there are also projects underway to facilitate equitable long-acting injectable (LAI) ART awareness, uptake and adherence. The NYCDOHMH Bureau of Hepatitis, HIV, and STI (BHHS) Clinical Operations and Technical Assistance Program is working on the provider detailing side, and the BHHS Care and Treatment Program is working on a National Institutes of Health (NIH) implementation-science grant to identify and pilot test RWHAP medical case management-type support service strategies to facilitate access and adherence to LAI ART. These efforts are directed at the Treat pillar and the goals of viral suppression and health equity.

Barriers to Accessing Existing HIV Testing, Prevention, Care, and Treatment Services

As mentioned above, the needs assessment process identified many overarching needs that, when addressed, will result in a more welcoming, accessible, and empowering healthcare experience. This will hopefully make people more likely to get tested for HIV and engage and stay in care. The needs assessment also identified barriers specific to testing, engagement, retention, and supporting those placed at risk to remain negative.

State Laws and Regulations Related to HIV Testing. NYS has several laws designed to increase access to HIV testing. NYSDOH AI has also enacted policies to support access to testing. Since 1990, the state has supported the integration of HIV testing in healthcare settings via Medicaid and required integrated HIV testing in grant-funded programs. Laws related to HIV testing are listed below.

- Since 2010, NYS Public Health Law (NYSPHL) has required healthcare providers to offer HIV testing to all individuals age 13 to 64 as a routine part of healthcare. In 2014, the state removed the requirement for written consent; in 2015 the requirement was removed in correctional facilities; and in 2016 the upper age limit of 64 was eliminated. Steps are taken to ensure the law is observed such as review of licensed facilities with emergency departments for HIV testing policies and procedures, the review of patient admissions for compliance with the mandatory offer, and a review of FQHCs of NYC to determine if HIV testing was conducted when an individual had an STI and if STI testing was conducted when an HIV test was conducted.
- The NYS Public Health Law was amended to require reporting of acute HIV within 24 hours. This modification supports the identification of people with HIV early in their infection and linking them to treatment. Initiation of treatment during acute HIV infection can improve health outcomes and reduce HIV transmission.
- An amendment to the Public Health Law has been requested to mandate reporting of negative HIV screening results, which will aid in the identification of newly acquired infections through the determination of a seroconversion window. This reporting will be especially critical in facilitating rapid initiation of HIV treatment. It will also assist in targeting testing initiatives.
- Future legislative proposals include modifying state law to allow pharmacists and dentists to conduct HIV testing.

Barriers to Accessing HIV Services (Prevention, Testing, Care, Treatment). New York's statewide approach has been to tailor services to the needs of specific at-risk populations, creating a more welcoming environment. In support of a status neutral approach, New York strives to offer a range of services addressing SDOH regardless of HIV status. These include specialized care centers for adolescents and youth access programs; transgender healthcare programs; prevention and related services for gay men and MSM; SSPs; drug user health hubs; LGBTQ+ health and human services; family-centered care for women; and the Uninsured Care Programs.

Below are just two of many examples of this tailored approach within the NYS.

- Activities specific to MSM include a home HIV testing campaign.

- Activities associated with incarcerated individuals include the Criminal Justice Initiative (CJI). The goal of the CJI is to provide interventions and support services that reduce the spread of HIV/STI/hepatitis C and meet the priority needs of people with HIV and at-risk in the NYS Department of Corrections and Community Supervision system. The goal is to identify new infections and ensure connection to medical care and partner services. The CJI uses peers to deliver HIV/STI/hepatitis C-related information. It is designed to support people with HIV exiting NYS correctional facilities in achieving successful community re-entry, with a focus on addressing barriers to services.

Needs Assessments Statewide, EMAs and Emerging Communities Activities

In addition to statewide activities to assess needs, below are brief summaries of needs identified by EMAs, other NYS communities, and through information gathered from statewide regional listening sessions.

EMA Needs Assessment: New York City. The NY EMA, which includes New York City and Westchester, Putnam and Rockland Counties, continues to have one of the largest HIV burdens in the U.S. During the recent period of concerted efforts to implement *The Blueprint* and NYC ETE Plan (2016-2020, the last year for which data are available), there was a 40% decrease in new HIV diagnoses in the NY EMA from 2016 to 2020.

Based on information provided in the NY EMA Grant Year 2022 RWHAP Part A submission, in 2020, among all people newly diagnosed with HIV in the NY EMA, 78% were men, 47% were non-Hispanic Black, 34% were Hispanic/Latino, 75% were younger than 45, and 59% were MSM, including MSM with a history of injection drug use (MSM-IDU). In the same year, 3% of new HIV diagnoses in the NY EMA were among transgender people, 98% of whom were transgender women. Approximately 91% of newly diagnosed transgender women were Black or Hispanic/Latina, nearly all of whom were between the ages of 20 and 29. In 2020, among people with HIV in the NY EMA, 72% were men, 43% were Black, 33% were Hispanic/Latino, and 59% were MSM, including MSM-IDU. While new diagnoses remain concentrated among people younger than 45 (75%), people 45 and older accounted for more than half of people with HIV in 2020 (69%). These data highlight the already large number of people aging with HIV in the NY EMA and underscore the importance of assessing and addressing their evolving needs.

Equity Framework. The prevalence of HIV is highest among Black and Hispanic/Latino New Yorkers and among people who live in neighborhoods of high or very high poverty. Many people in these communities experience multiple challenges that severely impact health, including racism, stigma, poverty, trauma, mental health issues, food insecurity, and housing instability.

Increased Need for HIV-related Services. As the number of people with HIV has increased and inequities have persisted, demands on the NY EMA's service system and needs along the entire HIV care continuum have grown. Specific actions to address needs include:

- Increase testing to reduce late diagnoses;

- Provide and disseminate information to people at risk for HIV about the importance of early HIV diagnosis;
- Ensure prompt linkage to care following diagnosis;
- Increase outreach among people who have dropped out of care;
- Increase efforts to identify barriers to viral suppression among people with HIV who are in care, particularly among vulnerable populations; and
- Address barriers to care for different populations of people with HIV through specific actions (e.g., ensuring a diverse body of service providers who represent the lived experience of different populations of people with HIV, providing services that are affirming and reflect cultural humility and trauma-informed care, and tailoring information related to HIV testing, care, and treatment to address cultural and linguistic differences).

EMA Needs Assessment: Nassau-Suffolk. The two-county Nassau-Suffolk EMA is located on Long Island—with the population of people with HIV almost evenly split between the two counties. The people with HIV in the EMA are disproportionately Black, Hispanic/Latino, male, and people above the age of 50 when compared to their representation in the general population. New infections among Hispanic/Latino communities continue to grow, making this population the majority of people with HIV in the EMA. People who identify as MSM represented the largest number of newly diagnosed people with HIV. In addition, data indicate that risk factors include substance use; involvement in the legal system; and mental health co-morbidities. The 2022 listening sessions also noted that the political climate of Long Island perpetuates stigma and represents a barrier to HIV prevention and care services.

At-Risk Population. Using various data, the Nassau-Suffolk EMA has identified four at-risk populations: Black, Hispanic/Latino, MSM, and cis and transgender women of color. In addition, HIV testing patterns are reviewed using data provided by NYSDOH AI annually and are reflected in the EIIHA plan with collaborative partners in outreach, early intervention services, and HIV prevention. Specific populations include those more vulnerable to HIV infection for reasons that include engagement in high-risk behaviors, poverty, marginalization by society, and fear of accessing HIV services.

Needs. Nassau-Suffolk EMA needs assessment activities have identified the following needs:

- Services that are culturally and linguistically responsive to a shifting demographic;
- Services that address subsistence needs such as food, housing, and transportation;
- Messages that reach MSM and other targeted groups and services in place to link and keep them in care;
- Affordable housing for people with HIV; and
- Transportation for people with HIV to provide access to primary care, core medical services, and support services (in a context of limited public transportation).

Emerging Communities: Albany, Buffalo, and Rochester. Through RWHAP Part B, NYS receives emerging communities (EC) funding, which is distributed in three regions in NYS: Albany; Buffalo; and Rochester. The Health Resources and Services Administration (HRSA) determines the award amounts and the geographic region of each EC annually. Use of these

funds is responsive to identified needs, as supported by the recommendations and input through the existing planning and community engagement processes.

This funding is used along with all NYSDOH AI resources to ensure geographic parity in access to HIV and status neutral services. It supports one provider in each region. Currently, services are targeted to MSM. They focus on non-medical case management, health education/risk reduction, and psychosocial support emphasizing linkage to and retention in care and treatment. The proposed services are consistent with the local needs assessments, *The Blueprint*, and the Integrated Plan.

a. Priorities

The goals and strategies presented in this plan were drafted and prioritized through New York's ongoing planning and needs assessment processes (See Section II). Further insight into needs was provided by the 2022 listening sessions. In July 2022, planning groups engaged in a process to prioritize specific strategies to support the achievement of this plan's goals. These strategies are presented in Section V.

b. Actions

We have described many of the ongoing activities carried out across the state to achieve the goals of the ETE and this plan. In addition, Section V includes strategies, prioritized by planning groups, that will support achievement of the plan's goals.

c. Approach

Identifying Needs. Needs assessment is ongoing as part of the ETE initiative and public advisory planning process and conducted by the ETE Subcommittee to the NYS AIDS Advisory Council. The Subcommittee identifies needs and recommends implementation strategies to respond to these needs. It is made up of community leaders, advocates, health and social services providers, researchers, government representatives, and consumers. In addition, there are population- and topic-specific advisory bodies that identify needs for specific populations, including but not limited to Asian/Pacific Islanders, Native Americans, Non-English speaking migrant seasonal farm workers, new immigrants, women, Latino gay/bisexual men, Black MSM, young adults, and older adults (50+). There are also regional ETE committees throughout the state that focus on the needs specific to each region. People with HIV participate in all these groups.

2020 Listening Sessions, ETE Beyond 2020 survey. The listening sessions were designed to get feedback and provided opportunities for stakeholder discussions to identify needs and increase the areas of focus for ETE efforts beyond 2020. Each session was attended by an average of 55 participants representing different communities impacted by HIV in NYS.

Each listening session included a trauma-informed care introduction and exercises to acknowledge current realities pertaining to COVID-19, loss, structural racism, and other difficult present-day experiences. The listening sessions were regionally based and representative of counties throughout NYS.

Theme-based listening sessions focused on the following topics: sexual health; trauma-informed care; health equity; aging with HIV; faith communities; and LGBTQ+ Health. Regional sessions, focused on local needs, were conducted for Upper Manhattan, Lower Manhattan, Bronx,

Brooklyn, Queens, Capital District, Buffalo, Rochester, Syracuse, Mid-Lower Hudson Valley, Nassau, Suffolk and Staten Island.

The feedback gathered from the listening sessions was utilized to develop the ETE Beyond 2020 survey that collected quantitative data to complement the qualitative data collected from the listening sessions. Input from advisory bodies, the ETE population- and issue-specific advisory groups, the listening sessions, and the statewide survey were used to develop the ***ETE Beyond 2020 Addendum Report***. Input from advisory bodies, the ETE population and issue-specific advisory groups, the listening sessions, and the statewide survey were used to develop the *ETE Beyond 2020 Addendum Report*. As mentioned above, needs assessment findings presented in the *ETE Beyond 2020 Addendum Report* were used to inform needs assessment activities for the Integrated Plan. The report describes how NYS will build on *The Blueprint* to take the ETE initiative beyond 2020.

Needs Assessment Activities, 2022. In June 2022 NYSDOH AI held two virtual listening sessions to gather stakeholder input on the Integrated Plan. The findings from these sessions are reflected in this plan.

Unmet Need Estimate. As part of the Part B base grant application for FY2022, NYSDOH AI conducted an unmet need analysis using the state HIV epidemiology system. HIV epidemiologic data were combined AIRS data and Uninsured Care Program (ADAP) data. The AIRS and ADAP data represent the number of consumers in the jurisdiction who received any Part B or Part-B related funded service. These data also provide information regarding the care patterns for these individuals. The epidemiologic data includes care status indicators (e.g., viral load and CD4 lab reporting), the ADAP data includes additional information about medical visits, and the AIRS data includes information on medical case management. Combining these data sets provides a more comprehensive picture about the care and services consumers are receiving.

Section IV: Situational Analysis

This section focuses on the strengths, challenges, and identified needs for the jurisdiction. It draws on both quantitative and qualitative data from numerous sources, as well as input from planning groups and community engagement activities (e.g., listening sessions). It describes the specific populations identified by planning groups. It also presents ongoing and emerging challenges, both statewide, in NYC, and in other specific populations/geographic areas; service gaps; workforce issues; and other emerging issues that will impact achievement of the goals of the Integrated Plan.

In this Section

- NYS Response to HIV: Strengths
- Themes Identified by Needs Assessment Activities
- NYS Workforce Issues
- Challenges and Mitigation Strategies
- EMA Situational Analysis
- NYS Specific Population

1. Situational Analysis

Informing the Integrated Plan: Overarching Elements

There are several key elements that form the overarching framework for the Integrated Plan. These key elements are reflected in the goals and strategies of the Integrated Plan.

Health Equity. Health equity emphasizes equal access to healthcare to ensure everyone has the same opportunity to be as healthy as possible. Efforts to enhance health equity address:

- **Social Determinants of Health.** These relate to conditions where a person lives and if healthcare is available and accessible. SDOH focus on many issues that impact people's daily lives: housing; transportation; racism/discrimination; stigma; violence; education and employment opportunities; availability of nutritious food (e.g., food deserts); opportunity for physical activity; and air and water quality. Also considered are language and literacy skills—does the person have the ability to effectively communicate with clinicians. Health literacy focuses on the ability to talk about and understand health issues.
- **Intersectionality.** Race, class, gender, sexual orientation, physical ability, and other factors create an overlapping and interdependent system of discrimination and disadvantage. People have unique experiences related to discrimination, oppression, and stigma. In creating accessible and welcoming services it is important to consider everything that could marginalize a person.

Stigma Reduction. While primarily focused on HIV, stigma-reduction efforts in NYS also focus on racism, homophobia, transphobia, and other factors. These efforts have been underway for several years.

The Stigma and Resilience (STAR) Coalition is a collaboration with NYSDOH AI, NYCDOHMH, NYC HPG, and the HIV Center for Clinical and Behavioral Studies and the NECA AETC, both at

Columbia University. The goal of the coalition is to involve agencies and others who are committed to reducing stigmas that work against optimal HIV prevention, care, and treatment.

The NYSDOH AI supported a statewide, multi-level anti-stigma campaign on billboards, subway cars, healthcare sites, pharmacies, social media platforms/dating sites, and TV PSAs. As part of the ETE initiative, this coalition guided the work of four projects in New York City: *Mapping NYC Stigma-Reduction Initiatives*, *Compendium of Successful Stigma-Reduction Approaches*, *STAR Project Town Hall*, and *Stigma and Drivers*. The provider training, *From Stigma to Affirmation*, identifies steps to address stigma. NYSDOH AI has also encouraged providers to diversify the cultural/ethnic climate within their organizations by hiring staff who reflect the communities they serve.

Status Neutral Approach. This health equity approach to HIV education, testing, and treatment emphasizes treating everyone regardless of their HIV status with similar access to services. This approach integrates prevention and treatment services so that both become part of comprehensive primary care and address the needs of the whole person while mitigating HIV-related stigma. All consumers receiving HIV testing or other services (e.g., STI screenings) are treated the same. Depending on the results of HIV testing, people are referred to either HIV prevention or HIV treatment. Those who are HIV negative are referred to PrEP and condoms. Those who are HIV positive are referred to, or re-engaged in, treatment.

Undetectable=Untransmittable (U=U). In September 2017, the NYSDOH AI became the first state health department in the nation to sign on to the Prevention Access Campaign Undetectable=Untransmittable Consensus Statement. This statement affirms that people with HIV who have achieved and continue to maintain an undetectable viral load do not sexually transmit HIV. U=U aligns with NYSDOH AI's efforts to destigmatize HIV and to support innovative biomedical and social efforts to improve the health and well-being of all people with HIV.

Sexual Health Focus. Borne out of the pioneering work and success of New York City's sexual health clinics, the sexual health focus is embraced statewide to offer comprehensive, affirming sexual healthcare, including STI and HIV testing; stigma free sexual history taking; supportive sex positive environments; PEP; PrEP initiation and navigation; and partner services. NYSDOH AI's Office of Sexual Health and Epidemiology conducts behavioral epidemiology to guide policy and programmatic development. Several sources of primary and secondary data are used to understand risk behaviors in: 1) groups at higher risk of STIs through HIV/STI Partner Services disease intervention activities analytics; 2) localities with higher STI rates through supporting local testing efforts; and 3) the general population through supporting inclusion of a state-added sexual behavior module on the annual statewide Behavioral Risk Factor Surveillance System (BRFSS) survey, coordinated with the NYSDOH Division of Chronic Disease Prevention.

NYS Response to HIV: Strengths

By necessity, NYS has been at the forefront of our nation's response to HIV. These efforts have been guided by the NYSDOH AI, which is committed to eliminating new infections, improving the health and well-being of people with HIV, STIs, and viral hepatitis, and improving LGBTQ+ health and the health of people who use drugs.

Below are the strengths that New York brings to the ETE effort.

- Significant consumer and stakeholder involvement.
- Commitment to health equity, reduction of SDOH, and elimination of stigma.
- Robust local, regional, and state-level planning processes.
- Ongoing needs assessment activities.
- Focus on use of data to track and report progress on ETE goals.
 - This includes creation of the web-based, public-facing ETE Dashboard system that allows users to measure, track, and disseminate actionable information on progress toward ETE goals.
- The NYS Quality of Care (QOC) Program, which is designed to ensure equitable access to HIV care that promotes the health and well-being of all people with HIV in NYS.
 - The program collects data on the performance of HIV providers, uses these data to identify areas for improvement, and supports improvement activities by building capacity for quality management.

Themes Identified by Needs Assessment Activities

Recent needs assessment findings reflect how the COVID-19 pandemic and the social justice movement have had a tremendous impact on communities across the state. In particular, COVID-19 shed greater light on health disparities among Black, Indigenous, and Hispanic/Latino communities in the state. Below we present major themes from needs assessment activities and the EHE pillars that are the focus of the theme. We also present identified challenges and needs that have been identified through needs assessment activities over the past few years. These challenges and needs are addressed by the goals and strategies presented in Section V.

Address Health Inequities and SDOH *(Pillars: Diagnose, Treat, Prevent)*

- Address inequities and disparities among vulnerable populations (e.g., low income, unstable housing, intimate partner violence, people with disabilities).
- Engage communities (e.g., leaders, stakeholders, people with lived experience).
- Better understand intersectionality of demographic factors (e.g., examine data by race/ethnicity).
- Employ strategies to address health inequities that focus on multiple conditions (e.g., HIV, STIs, heart disease, diabetes).
- Assess the educational needs of vulnerable populations.

Needs Assessment Activities

As noted in previous sections, as part of ETE, NYSDOH AI and our partners carried out multiple needs assessment activities in the last few years. The findings have been provided to our planning partners and informed the development of the Integrated Plan. Reports from 15 population- and issue-specific advisory group (most completed 2018 – 2020) were analyzed and included. While the reports have different formats, most include a description of their planning process and specific recommendations.

- 2019 listening sessions held by planning bodies (2019).
- 2020 NYSDOH AI held 13 regional community listening session, eight theme-based sessions, and two sessions for medical providers.
- 2020 and Beyond ETE Survey.
- 2022 Virtual Community Listening Sessions (2).

- Provide non-English educational materials (e.g., Spanish, Chinese, Russian, Italian, French).

Systemic Issues (Pillars: Diagnose, Treat, Prevent)

- Loss of 340B funding
- Criminalization of sex work
- Racism
- Stigma (HIV, homophobia, transphobia)

Access to Adherence, Treatment, and Prevention Services (Pillars: Diagnose, Treat, Prevent)

- Assist consumers in returning to routine care, treatment, and medication adherence.
- Educate providers and consumers on healthcare-related topics pertaining to specific populations (e.g., LGBTQ+, people with disabilities, people with co-morbidities, older adults (50+) with HIV, youth).
- Expand outreach and harm reduction strategies.
- Integrate trauma-informed care (including policies to ensure this strategy is being implemented).
- Implement strategies to prevent re-traumatization. The focus should be “what happened to you?” not, “what is wrong with you?”
- Continue telehealth services, address access issues (e.g., limited internet access) and provide training to consumers.
- Continue home visits to support retention in care.
- Assess effectiveness of service delivery changes resulting from COVID-19 (e.g., delivery of prescriptions, 90-day refills).

Engage Specific Populations in Healthcare Services (Pillars: Diagnose, Treat, Prevent)

- Assess the healthcare needs of underserved populations (e.g., LGBTQ+, Hispanic/Latino, incarcerated/re-entering individuals, people with disabilities, people with mental illness, people with substance use disorder).
- Increase engagement of people with unstable housing to support adherence.
- Increase health literacy/health education, resources, and services for youth/young adults.
- Address gaps in healthcare services for older adults (50+) with HIV.
- Address needs of incarcerated/re-entering individuals.
- Create safe spaces for vulnerable populations (e.g., LGBTQ+, transgender) that will facilitate open communication/interaction with providers.

Community Engagement/Outreach and Collaborations (Pillars: Diagnose, Treat, Prevent)

- Increase coordination across the NYSDOH AI portfolio to improve collaboration with stakeholders.
- Increase collaboration with organizations focused on mental health and substance use disorder.
- Offer HIV testing in non-traditional healthcare settings statewide.
- Identify new ways to work with faith-based communities/organizations.
- Improve data reporting practices and increase access to data for stakeholders.
- Utilize additional social media and virtual platforms to promote HIV services (with input from consumers and stakeholders).

- Increase opportunities for non-traditional community organizations to receive funding/support to engage vulnerable populations.
- Increase partnerships with organizations that address SDOH (e.g., nutrition, housing).
- Work with communities to provide interactive and educational activities in hard-to-reach areas of the state.
- Foster relationships with community leaders and local businesses to address SDOH.

Increase and Enhance Mental Health and Substance Use Disorder Services (Pillars: Diagnose, Treat, Prevent)

- Increase mental health, health education, and harm reduction services to offset barriers to care.
- Assess trends in substance use disorder and mental illness post COVID-19.
- Integrate a trauma-informed approach to treatment.
- Provide more educational materials related to mental health and substance use disorders.
- Address shortage of mental health providers.

Communication and Education (Pillars: Diagnose, Treat, Prevent)

- Campaigns that promote sex positivity tailored to specific communities (e.g., LGBTQ+, people who use drugs, youth, faith-based).

Workforce Issues

The COVID-19 pandemic, starting in March 2020, greatly changed healthcare in profound ways, and New York was again the epicenter. It lay bare the stress and risk that clinicians face, especially in health emergencies. Lives were lost and clinicians left the field due to burnout and other considerations. This exacerbated current and expected workforce shortages.

Workforce-related issues were highlighted in the 2017-2021 Integrated Plan. The previous Integrated Plan included findings from a needs assessment conducted during November 2015-June 2016 by the RWHAP-funded NECA AETC to identify HIV training and technical assistance gaps and priorities in the region covered by the NECA AETC, which includes the states of New York and New Jersey and the territories of Puerto Rico and U.S. Virgin Islands. The assessment echoed other local and national findings—identifying a shortage of trained providers in many parts of the region, which at that time was expected to worsen due to retirement of long-time HIV providers.

Healthcare Providers: Training Needs

- Strategies to address stigma homophobia, transphobia, racism
- Cultural competency
- Trauma-informed care, including resources for trauma management
- Substance use disorder treatment options
- HIV, HCV, and STI treatment options
- Social Justice
- Geriatrics, issues related to aging with HIV (i.e., needs of people with HIV over 50)

Preliminary data (unpublished) from the AETC Program HIV Workforce study conducted in spring 2022 indicate that retirement may significantly reduce the HIV workforce in New York.

The purpose of this study was to evaluate the number of current practicing healthcare providers prescribing HIV antiretroviral medication (for PEP, PrEP, and/or ART) and the number of care providers projected to continue to provide HIV-related care over the next five years. The study focused on prescribing HIV clinicians and pharmacists.

- Twenty-one (21) percent of respondents reported it was VERY likely they would retire from clinical practice entirely within the next five years. An additional 15% said it was somewhat likely they would retire.
- Thirty-four (34) percent said they would be reducing or stopping to see HIV patients within next five years. While the top reason (26%) was too much time spent on documentation, retirement (15%) and burnout (15%) were also cited.
- Thirty-six (36) percent reported the current supply of clinicians providing direct medical care to patients with HIV in their community is unable to meet demand.
- When asked about concern for shortage of various professions over the next five years, the most frequently cited concerns were around mental health providers (92% concerned); dentists (78%); providers treating substance use disorder (74%); and infectious disease specialists (72%).

Three important workforce issues raised in NYSDOH AI's 2022 listening sessions include:

- Workforce reflective of populations served (i.e., more diversity in healthcare workforce);
- Need for more mental health providers; and
- Expanded use of peers in delivery of services (trainings to professionalize peers, advancement opportunities, support as they engage in work).

Training Needs

Training needs, identified through needs assessment activities by NECA AETC and NYSDOH AI, have remained fairly consistent in recent years.

Table IV.1: Training Needs, Topics

NECA AETC November 2015- June 2016 Needs Assessment	NYSDOH AI 2020 Listening Sessions	NECA AETC, 2021- 2022 Needs Assessment
• Strategies for retaining and re-engaging consumers in care • Better integration of mental health and substance use treatment in care • Hepatitis C • HIV and aging	• Strategies to address stigma homophobia, transphobia, and racism • Cultural competency • Trauma-informed care, including resources for trauma management • Substance use disorder treatment options • HIV, hepatitis C, and STI treatment options	• Stigma • Behavioral health • Health equity and racial justice • PrEP • EHE initiatives • HIV and aging • Immediate ART • Oral health

	• Social Justice	<i>(Ranking of topics by likelihood agencies will seek training on the topic)</i>
--	--	---

These topics identified through needs assessment activities also align with NECA AETC's most frequently requested training topics in 2021-2022. These included: stigma/discrimination; cultural competence/humility; PrEP; motivational interviewing; retention/re-engagement in care; treatment as prevention (U=U); mental health disorders; substance use disorder; and behavioral prevention.

In addition to training HIV providers, as the population of people over 50 with HIV increases, HIV providers are collaborating with chronic disease specialists and geriatricians. These specialists also require training on coordination of care, co-management, drug interactions, and other clinical issues related to aging with HIV. They may also require training in cultural competence, bias and stigma reduction, confidentiality/privacy, and how to create a welcoming environment for people with HIV.

Supporting the HIV Workforce

In this Integrated Plan, there are specific strategies to address workforce issues (See Section V).

- Provide trainings for medical and other providers to assess barriers, increase, promote and expand access to routine HIV testing as per NYS guidelines in medical and nonmedical settings (*Pillar: Diagnose*).
- Increase trainings to build the capacity of the HIV workforce to deliver high-quality care, treatment, and secondary prevention service to ensure effective referrals, follow-up, and engagement for consumers (*Pillar: Treat*).
- Partner with local and state government agencies to leverage and promote workforce development opportunities for people with HIV, and members of specific populations (*Pillar: Treat*).
- Employ peer workers (especially members of specific populations) to support sustained engagement in HIV prevention and care services (*Pillar: Treat*).
- Support peer employment and fair compensation while maintaining their benefits in peer transition to work (*Pillar: Treat*).
- Engage/partner with NYS Clinical Education Initiative (CEI) to establish curriculum, training requirements Continuing Medical Education (CME) credits and evaluation to increase training opportunities to non-HIV specialties (*Pillar: Prevent*).
- Develop status neutral toolkit for providers to increase their ability to communicate with consumers (*Pillar: Prevent*).

Regional partners, people with HIV, providers, and stakeholders will continue to identify workforce issues through needs assessment, planning, and prioritization processes. Moving forward, NECA AETC is available to meet the training needs of clinicians and providers in NYS. Importantly, they have proven themselves able to pivot to address emerging issues as they did during the COVID-19 pandemic. From March 2020-November 2021, NECA AETC held 197 training and capacity building events focused specifically on COVID-19, reaching 6,840

participants. Topics included COVID-19 testing, diagnosis, treatment, clinical trial updates, vaccines, coping with loss and grief, best practices in telehealth, safely reopening clinic space, and the disparate impact of COVID-19 on communities of color. NECA AETC will be an important partner in achieving the goals of the Integrated Plan and ETE.

Prescription Drug Coverage, Costs and the 340B Program

A potential challenge may emerge if disruptive legislative changes are made affecting the 340B federal drug discount program. Preserving access to savings from the 340B program is an important policy and legislative priority for NYS safety net health programs, providers, and consumers. Enacted by Congress in 1992, the 340B program provides discounts on prescription drugs for populations served by eligible entities such as FQHCs, RWHAP recipients, and disproportionate share hospitals. The subsequent savings enable safety net providers to provide medical care to uninsured individuals as well as vital wraparound services like nutrition, transportation, and housing. Safety net providers depend on funds generated from the 340B program to provide care and services to 2.3 million underserved New Yorkers. Approximately 70% of those individuals are people of color and nearly 90% are low-income. The NYS AAC, among other key stakeholders in the Integrated Plan development, place a high priority on safety net providers maintaining full access to these vitally important 340B savings.

Statewide Challenges and Mitigation Strategies

Challenge	Mitigation Strategy
Advance Health Equity and Dismantle All Forms of Oppression Including racism and homophobia and other “isms” and “phobias” that contribute to HIV-related health inequities.	Develop internal and external policies, practices, and partnerships with other state agencies, organizations, and entities.
Increase Community Engagement/Outreach While this is important for all populations, emphasis should be placed on people facing housing instability/homelessness, youth and young adults, LGBTQ+ individuals, people who inject drugs, and older adults with HIV.	Strengthen partnerships and collaboration with other state agencies and CBOs.
Address Barriers to Engaging in Prevention and Care Due to SDOH Especially for populations at increased risk of HIV acquisition for improved linkage to prevention and care services.	Build partnerships with organizations that can help to address these needs. Use evidence-based practices to re-engage people in care.
Increase Training for Providers to Address Equity Topics include cultural competency, implicit bias, stigma, trauma-informed care, health equity, and LGBTQ+ sensitivity.	Promote training opportunities available through NYSDOH AI and NECA AETC.

Sustainable Funding for Community-Based Organizations Especially those that reach individuals at risk for and with HIV and organizations addressing SDOH.	Promote technical assistance through NYSDOH AI and NECA AETC.
Maintain 340B Program Discounts Potential legislative changes to savings program on prescription drugs for populations served by eligible entities such as FQHCs, RWHAP recipients, and disproportionate share hospitals.	Promote efforts to maintain 340B program to continue reimbursing and supporting safety net providers to provide medical care to uninsured individuals as well as vital wraparound services like nutrition, transportation, and housing.
Integrate Trauma-Informed Care Approach into All NYSDOH AI Programming/Initiatives	Promote training opportunities available through NYSDOH AI and NECA AETC for the purpose of integrating trauma-informed care into all NYSDOH AI programming/initiatives.

EMA Situational Analyses

New York City

New York City's four most populous counties – Bronx, Kings (Brooklyn), New York (Manhattan), and Queens – are among the 48 counties designated as part of the EHE initiative. NYCDOHMH coordinates New York City's response to the HIV epidemic, including HIV testing initiatives; prevention, care, and treatment programming; epidemiology; training and technical assistance; policy advocacy; community engagement; social marketing; and racial equity and social justice initiatives. Fundamental to this work is a commitment to racial equity and social justice to dismantle the underlying racism, identity-based stigmas, and other systemic oppressions that drive HIV-related health inequities.

The NYC ETE Plan reflects and builds upon *The Blueprint*. NYC's ETE Plan, first implemented in 2015, employs an HIV status neutral approach to: reduce the number of new HIV infections to non-epidemic levels; improve the health and well-being of people with HIV and people vulnerable to HIV; and eliminate HIV-related health inequities. The NYC ETE Plan includes key strategies, which align with the goals in *The Blueprint*.

NYCDOHMH and planning bodies prioritize, plan, and implement HIV epidemiologic and status neutral prevention and care efforts citywide. This ongoing coordination aims to: increase efficiency and reduce duplication; maximize the volume and accessibility of programming and services; ensure that community input informs the design and implementation of jurisdictional plans to end the epidemic; and facilitate implementation of innovative strategies to address the HIV epidemic. These combined, coordinated HIV planning and program efforts will inform the development and implementation of the Integrated Plan.

NYC Response to HIV: Strengths

- NYCDOHMH supports health promotion and education through sexual health marketing campaigns focused on HIV testing, biomedical prevention and treatment, and stigma.
- Health insurance coverage is widely available to people with HIV in NYS. Medicaid, which NYS expanded to include adults up to 138% of the federal poverty level (FPL)

following the passage of the Affordable Care Act is the primary payer of care for New Yorkers with HIV, and Medicaid supports a full range of healthcare services, medications, and care management services. In addition, insurance coverage is available at no cost to New Yorkers with HIV with an income up to 500% FPL (as of April 2019) through a combination of expanded Medicaid and New York State of Health insurance marketplace plans, and the NYS Uninsured Care Programs provides support for premiums and copays for income-eligible New Yorkers.

- HIV prevention and care services and other healthcare services are available through a wide array of healthcare service delivery sites across NYC and NYS, including Designated AIDS Centers, state-certified, hospital-based programs that serve as hubs for a continuum of hospital and community-based care; hospital-based HIV clinics; and FQHCs and other community health centers located in medically underserved neighborhoods. NYCDOHMH's innovative sexual health clinics and telemedicine hotline offer low- to no-cost services for [sexually transmitted infections \(STIs\)](#), including HIV. Anyone 12 years or older can receive walk-in services, regardless of immigration status. No parental consent is necessary.
- NYC and NYS have been leaders in using a public health approach to injection drug use, including injected heroin and other opioids, to protect individual and community health by preventing transmission of HIV and hepatitis C. NYC has taken specific action in recent years to expand access to harm reduction services including authorizing the opening of two privately funded overdose prevention centers, supporting numerous SSPs, and providing extensive naloxone distribution and services, including through NYCDOHMH's peer-led non-fatal overdose response system (Relay).
- NYC and NYS have a deep network of CBOs that employ a range of funding sources to provide HIV testing, prevention, and care services for New Yorkers affected by HIV. CBOs, including specific population-led grassroots organizations with critical access to underserved populations, engage in individual and system-level advocacy to ensure the communities they serve have access to culturally affirming, comprehensive services.

NYC Areas of Need

Many New Yorkers face complex, challenging environments affecting HIV prevention and HIV-related health outcomes. These issues can include unstable housing, food insecurity, poverty, immigrant status, criminal justice involvement, mental health, substance use, and intimate partner violence, among other factors. Through its planning, programming and partnerships, NYCDOHMH works to address these issues related to social and structural determinants of health and various types of stigma that can drive inequitable access to HIV testing, prevention, care, and treatment services for New Yorkers. NYC and the NY EMA are working to resolve a number of challenges, in collaboration with the Planning Council, consumers, and providers.

New York City Challenges and Mitigation Strategies

Challenge	Mitigation Strategy
Addressing Needs of People with HIV age 50 and Over	The Planning Council's Consumer Committee worked with the NYCDOHMH to create a service directive for referral for healthcare,

More than half the people with HIV in the NY EMA are 50+. Inequities persist among this population in terms of viral suppression rates, with Black and Hispanic/Latino people with HIV experiencing lower rates of viral suppression than White people with HIV. Late diagnoses are higher, especially for women. Death rates for Black and Hispanic/Latino people with HIV are also significantly higher.	supportive services, and outpatient medical services, while improving existing services to ensure responsiveness to the clinical and support needs of people aging with HIV. Additional strategy: to conduct training to increase the clinical capacity of core medical and support service providers to address the needs of this population.
Addressing Health and Racial Equity Across the EMA's Portfolio Racial/ethnic minority subgroups are disproportionately affected by HIV (e.g., cisgender Black women, young Black MSM, Black and Hispanic/Latino older people with HIV).	The Planning Council convened work groups designed to advance racial health equity and make recommendations related to EMA activities. Additional strategy: to conduct focus group project to identify gaps and ways to enhance services; focus group findings will also inform provider training and technical assistance.
Addressing Impact of COVID-19 A survey conducted by NYCDOHMH and described in its Grant Year 2022 RWHAP Part A grant submission indicated many people with HIV were experiencing financial hardship or struggling to make ends meet, including many who had been laid off or had reduced hours.	NYCDOHMH will provide additional support for people with HIV to address financial needs, food insecurity, and homelessness/housing instability. Additional strategies: develop flexible service provision standards to ensure provider/consumer safety and facilitate continuity of services; provide cost-based reimbursement, allowing providers to adjust to evolving healthcare landscape.

Nassau-Suffolk

As of December 31, 2020, according to the NCDOH, 5,302 individuals were living with HIV/AIDS in the EMA. The number of new HIV diagnoses over a 3-year timeframe (2018-2020) fluctuated between 178 and 120 cases per year, with an annual average of 158 cases. A major challenge is late diagnoses. In 2020, 28% of the newly diagnosed had already progressed to AIDS, with the majority of these cases among Black and Hispanic/Latino populations. People with HIV in the EMA are disproportionately Black, Hispanic/Latino, male, and above the age of 50. MSM are the leading transmission risk category (43.0%). Males comprise 69.1% of people with HIV. Racial and ethnic minorities (including people of more than one race) account for close to 63% of all people with HIV in the EMA.

The EMA's approach to HIV prevention and care services aligns with the four guiding goals outlined in the *2017-2021 NYS Integrated HIV Prevention and Care Plan*. These goals are to: 1) reduce new HIV infections; 2) increase access to care and improve health outcomes for people

with HIV; 3) reduce HIV-related disparities and health inequities; and 4) achieve a more coordinated response to the HIV epidemic.

Needs

- Services that are culturally and linguistically responsive to a shifting demographic
- Resources to address subsistence needs such as food and housing
- Transportation (very limited public transportation in a suburban area)
- Messages that reach MSM and other targeted groups
- Services that keep people in care.

Nassau-Suffolk Challenges and Mitigation Strategies

Challenge	Mitigation Strategy
Changing Healthcare Landscape The pandemic thrust consumers, physicians, and other healthcare and service providers onto virtual platforms and other digital technologies at an unprecedented speed.	• Assess consumer satisfaction with virtual services and develop or strengthen a hybrid model that allows consumers to choose how they access healthcare and support services. • Connect consumers to existing resources in the community for assistance with obtaining expanded broadband services, tablets, phones, etc. • Provide consumer training to ease usage of virtual platforms and digital technologies.
Stigma Stigma makes it difficult to identify, link, and retain the newly diagnosed in care.	• Utilize social media, trainings, and peers to increase awareness of HIV and U=U, a campaign that addresses stigma. • Expand access to mental health services and support groups to address needs of individuals dealing with stigma. • Implement best practices learned from the National HIV Challenge to reduce HIV-related stigma and disparities.
Barriers for Populations Experiencing Inequities in Health Outcomes Socioeconomic factors such as income and education often lead to hardships for people with HIV in obtaining healthcare. Structural factors such as racism, misogyny, transphobia also contribute to inequities.	• Collaborate with planning council and subrecipients, and other service providers to broaden efforts to address socioeconomic factors that prevent people with HIV accessing healthcare and/or remaining engaged in healthcare.

	• Improve health literacy, with emphasis on people with limited English proficiency, to ensure understanding of treatment options and the availability of services. • Increase funding for essential supportive services (e.g., transportation, legal) that help keep people with HIV in care. • Facilitate health insurance enrollment through the marketplace, apply for ADAP.
--	--

a. Specific Populations: 2022-2026 Integrated Plan

Through planning and prioritizing processes and efforts to identify unmet need, three specific populations have been identified for the Integrated Plan:

- Black and Hispanic/Latino men who have sex with men (MSM);
- Cisgender women of color; and
- People with HIV age 50 and over.

Each of these populations face unique challenges and have specific needs. In addition to the data issues listed below, ETE advisory groups have developed reports for each of these populations.

Black and Hispanic/Latino MSM

- Of the total 1,993 individuals newly diagnosed with HIV in 2020, 681 (35%) were Black and Hispanic/Latino MSM, 526 of whom resided in NYC. Black and Hispanic/Latino MSM made up more than two-thirds of all MSM diagnosed in 2020. While the number of MSM diagnosed with HIV has decreased in recent years, Black and Hispanic/Latino MSM continue to be disproportionately represented among new diagnoses.
- Many Black and Hispanic/Latino MSM with HIV, particularly young MSM, are unaware of their HIV infection. This may be due to recent infection, underestimation of personal risk, or fewer opportunities to get tested.
- Black and Hispanic/Latino men have lower rates of ART adherence and viral suppression.
- Providers are less likely to discuss PrEP with black and Hispanic/Latino MSM than White MSM.

Cisgender Women of Color

- Women made up 19.5% of new HIV diagnoses in 2020; 378 women were diagnosed that year. Of these, 88% were women of color. This represents a significantly disproportionate impact on women of color given that they make up just 45% of women living in NYS.
- Condomless sex continues to be a significant risk factor for cisgender women of color.
- Awareness of PrEP remains low among cisgender women of color. PrEP education has primarily focused on men.

People with HIV age 50 and over

- Fifty-six (56) percent of people with HIV in NYS are over age 50.
- Eighteen (18) percent of New Yorkers who were newly diagnosed with HIV in 2020 were over the age of 50 (342 out of 1,933).
- Of adults aged 50 and older who were newly diagnosed with HIV in 2020, 70% were from NYC and 46% were non-Hispanic Black. Those over 50 were more than twice as likely to be diagnosed late than those under 50 (34% vs. 16%).

- Aging is a time of transition, which can result in reduced income, less mobility, changes in support networks, and mental health issues.
- Loneliness, depression, and anxiety are significant issues for this population and more support services to address these issues are needed, especially as this population will continue to grow.

While these are the specific populations, all people placed at risk and those living with HIV will continue to be a focus of HIV prevention and treatment activities, with attention paid to geographic differences.

NYS will also continue to tailor services to meet the needs of populations disproportionately impacted by HIV. In particular, NYS will continue to work with partners to provide and improve tailored services for transgender individuals given the unique needs of this population.

How the Integrated Plans Goals Address the Needs of Specific Populations.

With two exceptions, the Integrated Plan goals are designed to respond the needs and improve services for all populations, including specific populations, and bring NYS closer to achieving the ETE goals. Likewise, almost all the strategies apply to all populations.

Because of the low viral suppression rates of Black and Hispanic/Latino people with diagnosed HIV, goals focused on improving this metric (and the health of these populations) are included. Establishing these goals will bring ongoing focus on supporting improvement in this area.

Goal: Increase the percentage of Black persons living with diagnosed HIV who receive HIV medical care with suppressed viral load to 95%.

Input from Advisory Groups

The ETE Advisory Groups that developed implementation strategies are listed below. Their suggestions were incorporated into ongoing planning processes.

[Black Men who Have Sex with Men](#)

[Latino Gay and Bisexual Men](#)

[Older Adults](#)

[Women](#)

[Young Adults](#)

Goal: Increase the percentage of Hispanic/Latino persons living with diagnosed HIV who receive HIV medical care with suppressed viral load to 95%.

NYC and Nassau-Suffolk Specific Populations

Specific populations identified by NYC and Nassau-Suffolk as service priorities are aligned with the three primary specific populations of the Integrated Plan, and include:

**New York and Nassau-Suffolk EMAs:
Specific Priority Populations**

- Black MSM, including Black cisgender MSM and Black transgender MSM
- Hispanic/Latino MSM, including Hispanic/Latino cisgender MSM and Hispanic/Latino transgender MSM
- Black women, including Black cisgender women and Black transgender women
- Hispanic/Latina women, including Hispanic/Latina cisgender women and Hispanic/Latina transgender women
- All people of trans experience and people who identify as gender nonconforming, gender non-binary, or genderqueer
- People with HIV ages 50 years and older
- Youth and young adults ages 13 to 29 years
- Those who can benefit from HIV prevention and care services

Section V: 2022-2026 Goals

The goals presented in this Integrated Plan reflect the CDC/HRSA guidance to align our work with the four pillars of the Ending the HIV Epidemic initiative. These four areas of focus are: diagnose, treat, prevent, and respond.

In addition, we present strategies for implementing and achieving the goals. Below we describe how these strategies were identified and prioritized.

The goals reflect the state's three-point ETE plan that aims to improve the health of all New Yorkers living with HIV. The three points highlighted in the ETE plan are:

- 1) Identify people with HIV who remain undiagnosed and get them linked to care;
- 2) Link and retain people diagnosed with HIV in healthcare to maximize viral suppression; and
- 3) Increase access to PrEP for people who are HIV negative.

2022-2026 Integrated Plan: Areas of Focus

Diagnose all people with HIV as early as possible.

Treat people with HIV rapidly and effectively to reach sustained viral suppression.

Prevent new HIV transmissions by using proven interventions, including PrEP and syringe services programs.

Respond quickly to potential HIV outbreaks to get needed prevention and treatment services to people who need them.

Goals in Support of Health Equity

In addition to standard goals that will be used to measure NYS's progress in the four focus areas, NYS has identified 14 goals to ensure that our work continues to address health equity and reduce health disparities. At their core, the goals are developed as SMART goals (**specific, measurable, achievable, relevant, and time-bound**). Several of the goals have an expanded definition and are SMARTIE goals, with the "IE" standing for "inclusive" and "equitable."

Inclusive. Invite and incorporate input from the specific populations, people with lived experience, partners, and other stakeholders.

Equitable. Address the unique needs and circumstances of different populations, increase quality services where needed, and seek to address disparities (e.g., access to PrEP).

By incorporating inclusion and equity components to SMART goals, this approach strengthens our commitment to racial equity and inclusion by identifying tangible and actionable steps that will be integrated throughout NYS's ETE work.

Prioritizing Strategies to Achieve Goals

To support achievement of the goals, NYS compiled strategies currently being used in NYS's ETE response and identified potential new strategies through our planning and community

engagement activities. NYS engaged planning groups to prioritize the strategies based on four criteria: 1) magnitude of impact; 2) alignment with ETE plan; 3) sustainability; and 4) ease of implementation.

Prioritization Criteria

Magnitude of Impact	Alignment with ETE Plan	Sustainability	Ease of Implementation
Likely to have a significant impact on HIV prevention and care	Likely to directly address ETE three-point plan	Likely to be maintained over time	Likely to be implemented with ease

Survey Responses

Surveys were provided to planning group members in summer 2022. They were instructed to rank the strategies based on the criteria listed above. Sixty (60) responses were received.

For each focus area, strategies were ranked using a five-point Likert scale (five being most highly rated) for the four criteria. Weighted averages calculated across the responses were used to rank the strategies. An overall score was used to rank the strategies based on the four criteria.

NYS will focus on the top strategies related to goals. Over the next five years, strategies will be modified, and new strategies added as needs change, evidence-based interventions are identified, and advances occur in treatment and prevention. These modifications will be informed by NYS's planning and community engagement activities.

1. Description of 2022-2026 Goals

The following goals for the next five years reflect strategies that will help ensure a unified, coordinated approach for all HIV prevention and care funding and program priorities.

2022-2026 Goals and Strategies: Diagnose

Goal: Increase the percentage of persons living with HIV who know their serostatus to at least 98%.

Goal: Increase the percentage of New Yorkers who tested for HIV in the past 12 months.

Goal: Reduce the number of new HIV diagnoses by 55%.

Diagnosis Strategies Ranked Based on the Four Prioritization Criteria	
1.	Promote HIV, STD/STI low cost or free testing locations. Promote free HIV at home testing kits sponsored through the NYSDOH AI by utilizing social media platforms and existing program materials to help engage high-risk individuals to get tested and know their status.
2.	Improve access to regular repeat HIV testing among members of specific populations and other New Yorkers vulnerable to acquiring HIV through strategies such as co-location of services.
3.	Improve detection of acute HIV infection.
4.	Provide trainings for medical and other providers to assess barriers and increase, promote and expand access to routine HIV testing as per NYS guidelines in medical and nonmedical settings.
5.	Increase public awareness of the current recommendations for routine, ongoing testing using social media, and increase specificity in advertising with other technologies and methods. Engage planning bodies to review/recommend social media messages and updated NYS educational materials for distribution.
6.	Build stronger connections with urgent care networks such as CitiMD and specialty care centers for LGBTQ+ individuals to connect consumers to HIV-specific service providers.
7.	Educate communities on their sexual health rights and how to navigate testing.
8.	Expand opportunities (data collection/programmatic) to include specific populations that are not currently always reflected in existing data (e.g., transmasculine individuals, same gender loving women).

2022-2026 Goals and Strategies: Treat

Goal: Increase the percentage of persons living with diagnosed HIV who receive HIV medical care with suppressed viral load to 95%.

Goal: Increase the percentage of persons living with diagnosed HIV who receive HIV medical care to 90%.

Goal: Increase the percentage of Black persons living with diagnosed HIV who receive HIV medical care with suppressed viral load to 95%.

Goal: Increase the percentage of Hispanic/Latino persons living with diagnosed HIV who receive HIV medical care with suppressed viral load to 95%.

Goal: Reduce current disparities in median CD4 among persons living with diagnosed HIV.

Treatment Strategies Ranked Based on the Four Prioritization Criteria
1. Promote access to bias-free and culturally and linguistically appropriate HIV care, treatment, secondary prevention, healthcare, and supportive services.
2. Provide health literacy resources with emphasis on bilingual patient education specific to non-English speaking consumers to improve disease knowledge, adherence, and retention in care.
3. Improve access to services by expanding program hours, availability of appointments, locations, and staffing composition.
4. Improve linkage and retention in care through targeted support and follow-up of medical care to confirm that continuity of care is provided.
5. Employ peer workers (especially members of specific populations) to support sustained engagement in HIV prevention and care services.
6. Support peer employment and fair compensation while maintaining their benefits in peer transition to work.
7. Increase trainings to build the capacity of the HIV workforce to deliver high-quality care, treatment, and secondary prevention services and to ensure effective referrals, follow-up, and engagement for consumers.
8. Partner with local and state government agencies to leverage and promote workforce development opportunities for people with HIV and members of specific populations.
9. Promote strategies (e.g., patient-reported outcome measures, patient-reported experience measures) to improve patient encounters, experiences, and outcomes, which will support engagement and retention in care.
10. Increase access to healthcare and support services, including social support services, necessary to ensure optimal care to people (50+) as they age with HIV.

2022-2026 Goals and Strategies: Prevent

Goal: Increase the number of individuals filling prescriptions for PrEP to 65,000.

Goal: Reduce current disparities in PrEP utilization rates (defined as the number of individuals on PrEP/100,000) across all racial and ethnic groups, age groups, and across all genders (identified by assigned sex at birth) across all regions in NYS.

Goal: Reduce current disparities in statewide SSP service utilization across all racial and ethnic groups, age groups, and across all genders (identified by assigned sex at birth) across all regions in NYS.

Prevention Strategies Ranked Based on the Four Prioritization Criteria	
1.	Increase public awareness and uptake of PrEP, emergency PEP, and U=U through social media educational campaigns, print media, and engaging social media influencers to educate, and address stigma.
2.	Implement programming to empower specific populations to increase access to behavioral health and evidenced-based HIV prevention interventions, including those promoting PrEP and emergency PEP.
3.	Build provider capacity to take comprehensive sexual histories and offer PrEP and emergency PEP to consumers.
4.	Enhance existing care networks to improve and increase access to the referral system across the region focusing on cultural competency and stigma-free care.
5.	Strengthen relationships with CBOs that provide free or low-cost prevention methods such as condoms and other social & health services.
6.	Promote the availability of online and hotline resources (such as the NYS HIV/STI/HCV Hotline, United Way Long Island 2- 1-1, and the Long Island Crisis Center Hotline).
7.	Engage/partner with NYS Clinical Education Initiative (CEI) to establish curriculum, training requirements, Continuing Medical Education (CME) credits, and evaluation to increase training opportunities for non-HIV specialties.
8.	Develop status neutral toolkit for providers to increase their ability to communicate with consumers.
9.	Create forums to facilitate dialogue between cisgender men and cisgender women on heterosexual prevention measures.

2022-2026 Goals and Strategies: Respond

Goal: Analyze surveillance data monthly to identify HIV transmission clusters and outbreaks to facilitate prompt public health response.

Goal: Re-engage 75% of persons identified as out of care within six months.

Goal: Reduce current disparities in the reengagement rate of persons living with diagnosed HIV identified as out of care within six months across all racial and ethnic groups, age groups, and across all genders (identified by assigned sex at birth) across all regions in NYS.

Response Strategies Ranked Based on the Four Prioritization Criteria	
1.	Improve capacity for community/zip code level surveillance data to better identify clusters and high need areas.
2.	Use zip code level and unmet need data to refine targeted outreach strategies.
3.	Increase flexibility of funding applications and allocations to redirect funds to priorities and programs that meet the needs of the identified cluster groups.

Section VI: 2022-2026 Integrated Planning Implementation, Monitoring and Jurisdictional Follow Up

The NYSDOH AI, with input from jurisdictional partners, planning groups, and stakeholders, will be responsible for ensuring the success of the Integrated Plan goals by overseeing the five key phases identified in the CDC/HRSA guidance: implementation; monitoring; evaluation; improvement; and reporting and dissemination.

NYSDOH AI and its jurisdictional partners, NYCDOHMH and NCDOH, will provide to their respective planning partners and stakeholders, including the NYS HAB, the HIV Health and Human Services Planning Council of New York, New York City HIV Planning Group, and the Nassau-Suffolk HIV Health Services Planning Council, regular updates on the progress of the Integrated Plan implementation, solicit feedback, and use the feedback for plan improvements. Working with federal partners at CDC and HRSA, each jurisdiction will use established reporting mechanisms (i.e., grant applications, annual progress reports, and communications with project officers) to document progress on achieving the goals presented in the Integrated Plan. These reporting updates will include each jurisdiction's plans to monitor and evaluate implementation of the goals and strategies included in the Integrated Plan.

In This Section

- Implementation;
- Monitoring;
- Evaluation;
- Improvement;
- Reporting and Dissemination;
- Updates to Other Strategic Plans Used to Meet Requirements

1. Implementation Approach

The sections below describe the infrastructure, procedures, systems, and tools that will be used to support the five key phases of integrated planning and ensure goals are met.

a. Implementation

This section describes the process for coordinating partners, including new partners, people with HIV, people at risk for exposure to HIV, contractors, and administrators from different funding streams to meet the Integrated Plan goals, with a focus on how NYS will leverage and coordinate funding streams.

NYSDOH AI awards funds in every region of the state to ensure geographic parity to the fullest extent possible. In procuring and reprocurring funds and making allocation decisions on funding for services for people with HIV, coordination takes place with Part A EMAs to avoid duplication and gaps in services in geographic areas. The Uninsured Care Programs (UCP) serve residents of all regions. The following is taken into consideration when making funding/contract decisions.

- Information gained through reporting and quality management mechanisms, such as onsite monitoring, helps to assess the performance of funded organizations, for documenting performance successes, and for anticipating challenges in the provision of contract services and deliverables.
- NYSDOH AI carries out quality management activities that monitor performance through review of contractual standards and deliverables, onsite monitoring, and continued provision of technical assistance.
- NYSDOH AI employs a participatory process for identifying service needs that impact program development and utilizes participation from consumer groups to guide policy and program development/revision. NYSDOH AI community engagement and planning processes are ongoing, involving established planning bodies whose members include people with HIV. Community engagement activities include focus groups and listening sessions with key stakeholders, including contractors, at-risk individuals, and people with HIV. Additionally, focus groups are held on specific policy or program issues. Regular communication with HIV providers, consumers, and community leaders has resulted in services that have supported improved health outcomes for people with HIV in NYS.
- Agencies receiving NYSDOH AI funds are required to involve people with HIV in the planning and design of services or have a consumer advisory body. This includes federal Minority AIDS Initiative (MAI) funds NYS receives that prioritize people of color.
- NYSDOH AI coordinates all program activities when allocating all funds. The various funding sources, such as Medicaid, RWHAP, MAI, and CDC, are taken into consideration when NYSDOH AI makes funding decisions. Coordination across all programs/initiatives follows the same process. For example, in allocating MAI funds, NYSDOH AI examines other existing outreach programs in each region to avoid duplication and ensure that RWHAP funds are the payer of last resort. Another example is that, under MAI, geographic boundaries were negotiated as part of the contract award process to define target service areas to ensure that MAI-funded agencies serve distinct regions. Contract managers work with their MAI-funded agencies to develop an outreach/education action plan that prioritizes the specific populations at disproportionate risk for HIV infection in the service area and focuses on the geographic areas to be served by the agency.
- Technical assistance is provided to contractors by NYSDOH AI on an as-needed basis. This ensures the success of all contractors, especially those that have contacts focused on providing services to specific populations. This TA can link them to evidence-based practices and the support needed to implement them.

b. Monitoring

Two types of monitoring are necessary as the state works to achieve the goals of the Integrated Plan. This first is monitoring our progress in achieving the plan's goals using epidemiologic, Behavioral Risk Factor Surveillance System (BRFSS), and PrEP data. The NYS HAB HIV Planning Coordinating Group will be convened at least twice a year to review goals, strategies, progress, and receive updates from each planning body to seek areas of alignment.

Programmatic monitoring helps to ensure the accessibility and quality of services provided and identifies possible gaps in services. NYSDOH AI used multiple methods to monitor consumers served, services provided, and the performance of contracted organizations. Program

monitoring is conducted through the review of work plans and periodic reports, on-site monitoring, the review of data reports, and the analysis of quality review results.

Client-level Data. All NYSDOH AI funded contractors are required to use the NYSDOH AI Reporting System (AIRS) to track consumers and services provided. This allows the NYSDOH AI to track consumers and services for all RWHAP Part B, CDC, and state-funded contracts. Providers are allowed to utilize the system to track consumers and services from other funding sources as well, such as, RWHAP Part C, D, and directly funded CDC contracts. In order to ensure that consumers and services are tracked appropriately, each contract is assigned a unique “program” within AIRS. Individual consumers are then enrolled into the appropriate program within AIRS to allow for reporting under each contract. Once a consumer is enrolled, all subsequent services entered for that consumer into that program are reported under the specific contract. For contracts funded by the NYSDOH AI, a special file is sent electronically to each provider to load into their AIRS system. This file “locks” the set-up information for each AI-funded program, ensuring that information cannot be changed by the provider. This file also assigns individual services to the program, which ensures that only the services approved in the contract can be entered and reported for the program. All data are then de-identified and securely transmitted to the NYSDOH AI electronically on a monthly basis where it is compiled in a statewide SQL database. This database is used by contract managers and management staff to monitor individual contract performance against their approved set of deliverables.

Site Visits. NYSDOH AI’s *Resource Guide for Site Visit Monitoring* established policies and procedures for program and fiscal monitoring. The Guide is continuously being updated to include new procedures for implementing the National Monitoring Standards as well as updating best practices. The guide addresses both fiscal and program monitoring. On-site monitoring is conducted every 24 months at a minimum. More frequent monitoring, sometimes targeted, is conducted as needed. Contractors are required to submit work plans identifying goals, objectives, and projected activities. Program reports are generally required on a monthly or quarterly basis. The process for corrective action involves the submission of a written plan of action or correction by the contractor and NYSDOH AI monitoring of the implementation of the plan until all concerns are resolved.

c. Evaluation

The measurable goals identified in the Integrated Plan will be tracked on an ongoing basis. Most goals will be tracked using HIV epidemiologic data. BRFSS data will be used to track the testing-related goals (Prevent) and PrEP data (purchased from contractor) will be used to track PrEP-related goals (Prevent). As stated above under monitoring, the HIV Planning Coordinating Group will be convened at least twice a year to review progress in achieving the goals and determine if changes to priorities or strategies are required.

In August 2022, the White House Office of National AIDS Policy (ONAP) released the *NHAS Federal Implementation Plan*. The plan introduces five new NHAS indicators of progress focused on quality of life among people with HIV. These indicators reflect the multi-dimensional nature of quality of life among people with HIV. The indicators address self-rated health, unmet need for mental health services, hunger/food insecurity, unemployment, and unstable housing or homelessness. They expand focus beyond just clinical measures for people with HIV. The

indicators closely align with the state's focus on SDOH and health equity. Over the next five years as the Integrated Plan is implemented, the state will explore ways to integrate quality of life indicators into evaluation activities. In late 2022, NYSDOH AI's Center for Quality Improvement and Innovation (CQII) plans to convene a national consensus meeting of HIV providers and people with lived experience to develop strategies to use QI methodologies and tools to improve quality of life for people with HIV served in HIV ambulatory care settings.

CQII was funded by HRSA in 2022 to conduct a national pilot project to explore measurement systems to utilize patient-reported outcome measures and patient-reported experience measures to improve HIV outcomes and patient experiences using QI methodologies and tools. Participating RWHAP recipients carried out improvement projects addressing various domains (well-being, housing stability, food insecurity, communications with clinicians). Prior to the pilot project, CQII developed a step-by-step guide to assist HIV providers to implement those domains in HIV clinic settings. The guide was forwarded to HRSA for review and approval for public dissemination. NYSDOH AI will be exploring similar ways to address patient-reported outcomes and experiences with providers in NYS.

d. Improvement

NYSDOH AI has a robust program designed to ensure quality HIV care is delivered to every New Yorker with HIV. The NYS Quality of Care (QOC) Program is committed to ensuring equitable access to HIV care that promotes the health and well-being of all people with HIV in NYS. The QOC Program collects data on the performance of medical and non-medical HIV providers, uses these data to identify areas for improvement, and fosters improvement both by supporting improvement activities and by building capacity for quality management. QOC Program Standards outline the expectations for HIV providers in NYS, regardless of their caseload, funding, location, or service delivery model. All HIV ambulatory programs and Part B-funded non-medical providers are expected to establish a Quality Management program to assess the extent to which HIV health services provided to consumers are consistent with these QOC Program Standards. QOC staff and coaches conduct organizational assessments of each HIV ambulatory care program in NYS annually to evaluate, track, and support adherence to the QOC Program Standards.

The following quality improvement initiatives are integrated into the QOC Program and are being implemented or continued statewide in 2020.

- Organizational HIV Treatment Cascade: With the goal of increasing the proportion of people with HIV who achieve durable viral suppression, the QOC program has asked clinical HIV providers across NYS to submit organizational treatment cascade data, which identify the proportion of people with HIV at each clinic at each stage of the care continuum, from diagnosis through viral suppression.
- Topic-specific reviews are conducted annually in accordance with identified priority areas such as: HIV and aging; hepatitis C co-infection; and sexual health.
- QOC focuses upon stigma reduction and resiliency building. The program works with the Stigma and Resiliency (STAR) Coalition, which includes NYCDOHMH, in identifying effective stigma reduction activities through interviewing HIV care providers.

- Quality Improvement (QI) curriculum is being developed by the program.
- The QOC program collaborates with clinical and supportive service providers, particularly Part B recipients, to provide QI coaching and training and to monitor the quality of care.
- The QOC program provides QI training for staff of the NYSDOH AI.
- The QOC program collaborates with NYCDOHMH in providing capacity building opportunities to providers, particularly programs that have been identified as having special challenges such as low viral suppression rates.
- The program works with NYCDOHMH Clinical Operations and Technical Assistance program to develop TA material for HIV providers regarding evaluative frameworks for remote/telehealth HIV care.
- The program maintains quality learning networks and NYLinks regional groups aimed at improving the health and well-being of people with HIV and ending the epidemic.

NYSDOH AI also works with NYCDOHMH to support the Part A Quality Assurance Program. This close partnership ensures alignment of quality improvement activities in NYS and NYC. Beyond the HIV-related indicators, there has been increased interest in identifying and measuring other indicators. Earlier this year, ONAP charged a small working group of representatives from six federal agencies involved in developing and implementing the NHAS to carefully listen to community input and evaluate options for possible data sources, measures, and targets that could be adopted starting this year. As a result of this work and community input, ONAP ultimately adopted five indicators that reflect the multi-dimensional nature of quality of life among people with HIV. The ONAP indicators address self-rated health, unmet need for mental health services, hunger/food insecurity, unemployment, and unstable housing or homelessness.

NYSDOH AI receives support from HRSA's HIV/AIDS Bureau (HRSA HAB) for CQII to provide quality improvement-related TA to all RWHAP recipients, including recipients and subrecipients in NYS. Two of CQII's recent activities supported by HRSA HAB efforts align with the goals of the Integrated Plan and broader goals (e.g., NHAS). In 2022, CQII conducted a pilot project on integrating patient reported outcome and experience measures into evaluation activities. These included indicators related to quality of life, which align with the NHAS indicators focused on quality of life for people with HIV. CQII developed a guide for incorporating patient-reported outcomes and experiences and will build on this work.

In addition, CQII has received funding from HRSA HAB to conduct a national learning collaborative focused on older people (50+) with HIV. This aligns with the Integrated Plan's specific populations. The findings and evidenced-based practices identified through the learning collaborative will inform state efforts to serve older people with HIV.

e. Reporting and Dissemination

NYSDOH AI has multiple methods for communicating with stakeholders on a range of critical issues, including progress in achieving the goals of the Integrated Plan.

Regular NYSDOH AI Communications with Stakeholders. NYSDOH AI maintains an email listserv of contractors/consultants, planning/advisory group members, people with HIV, and

other stakeholders. Topics include funding opportunities; technical assistance resources; emerging issues; policy updates; and events (e.g., awareness days, World AIDS Day)

Bi-Directional Communications with Planning Groups. Information flows in multiple ways between NYSDOH AI, NYCDOHMH, and NCDOH and their jurisdictional planning groups. These entities regularly provide information (e.g., data sets, presentations) to planning groups about the Integrated Plan and other critical issues, which they in turn, disseminate to stakeholders within their jurisdiction. For needs assessment, planning, and other community engagement activities, planning groups obtain input from members and stakeholders and report it to NYSDOH AI, NYCDOHMH, and NCDOH.

Regional, Topic-Specific, and Population-Focused Listening Sessions. NYSDOH AI makes tailored presentations at and/or provides data sets for regional, topic-specific, and population-focused listening sessions, as requested. Among the information provided is updates on progress to ETE and Integrated Plan goals, in general and related to the topics/populations. These sessions also provide an opportunity to hear from stakeholders about gaps, areas for improvement, and emerging issues.

Call to Action Letters. For the past several years, the NYSDOH AI *Call to Action* letters written by the AI Director, have been widely shared. They emphasize key priority areas—identified through needs assessment activities—to move the state toward achieving ETE goals and charge all grant-funded programs, clinical programs, healthcare providers, stakeholders, and community partners to implement strategies that prioritize state *Blueprint* goals and objectives as well as the priority areas. Providers and stakeholders are encouraged to use data, program evaluation, and quality improvement methods to assess and monitor progress. Topics covered over the last few years include stigma; trauma-informed care; and health inequities and SDOH. The 2022 letter focused on: reducing racial disparities in healthcare; increasing access to harm reduction and mental health services; meeting the needs of older (50+) people with HIV; and efforts to eliminate hepatitis C, a co-morbidity of HIV.

Notices about Community Engagement Activities. Opportunities for community engagement (e.g., listening sessions, surveys) are announced via email to partners, stakeholders, and others using mailing lists compiled by NYSDOH AI. The email messages contain pertinent information (e.g., purpose, location, RSVP requirements). Depending on the opportunities, flyers are sometimes attached that can be posted to increase outreach.

ETE Dashboard. Planning groups, partners, and stakeholders have access to data related to achieving the goals of the ETE. The purpose of the Ending the Epidemic (ETE) Dashboard System is to **measure, track, and disseminate actionable information on progress towards achieving ETE goals to all interested stakeholders.** Multiple data sets are used including HIV epidemiology, Medicaid Data Warehouse, the Electronic System for HIV/AIDS Reporting and Evaluation (eSHARE), the AIDs Institute Reporting System (AIRS), the Behavioral Risk Factor Surveillance System (BRFSS), the NYC Community Health Survey (CHS), and NYS Vital Statistics.

Section VII: Letters of Concurrence

Signed letters of concurrence with the Integrated Plan are included from the co-chairs of the following planning councils/groups:

- HIV Health and Human Services Planning Council of New York
- Nassau-Suffolk HIV Health Services Planning Council
- New York City HIV Planning Group (NYC HPG)
- New York State HIV Advisory Body (NYS HAB)

Rockville, MD 20857

Melissa Thomas Proctor, MS., MSW
Public Health Adviser
Centers for Disease Control and Prevention
NCHSTP/DHP/PDB

Dear Kerry Hill and Melissa Thomas Proctor:

On November 27, 2022, the HIV Health and Human Services Planning Council of New York ("Planning Council") voted unanimously to concur with the joint submission by the New York State Department of Health, New York City Department of Health and Mental Hygiene, and the Nassau County Department of Health in response to the guidance set forth for health departments and HIV planning groups funded by the CDC's Division of HIV/AIDS Prevention (DHAP) and HRSA's HIV/AIDS Bureau (HAB) for the development of an Integrated HIV Prevention and Care Plan ("Integrated Plan"), including the Statewide Coordinated Statement of Need (SCSN) for calendar years (CY) 2022-2026.

The Planning Council has reviewed the Integrated HIV Prevention and Care Plan submission to the CDC and HRSA to verify that it describes how programmatic activities and resources are being allocated to the most disproportionately affected populations and geographical areas with high rates of HIV. The planning body **concurs** that the Integrated Plan submission fulfills the requirements put forth by the CDC's Notice of Funding Opportunity for Integrated HIV Surveillance and Prevention Programs for Health Departments and the Ryan White HIV/AIDS Program legislation and program guidance. The Integrated Plan identifies service needs and barriers; presents goals and strategies for program development, implementation, and evaluation; depicts the continuum of care statewide and by region and population; and demonstrates the extensive involvement of stakeholders. The Integrated Plan is also consistent with the National HIV/AIDS Strategy, New York State's Plan to End AIDS, including New York State's Ending the Epidemic Beyond 2020 Addendum Report, and New York City 2020: Ending the HIV Epidemic.

Below is a description of the key steps taken by our coordinated statewide planning process.

- Coordination of Planning.** New York State Department of Health, New York City Department of Health and Mental Hygiene, and Nassau County Department of Health program teams are responsible for coordinating the plan development, including developing and providing tools for facilitating the work of planning bodies, updating the Epidemiologic Snapshot for the state, completing the Resource Inventory, gathering data/plan segments from all entities, and writing the plan. The New York State HIV Planning Coordinating Group is responsible for reporting back to their home planning body on progress and interim milestones and bringing information and concerns to bi-monthly meetings. The coordinating group identified goals, objectives, and strategies for inclusion in the Integrated Plan. Members include representatives from Nassau and Suffolk HIV Health and Human Services Planning Council, New York City Department of Health, New York City HIV Planning Group, New York HIV Health and Human Services Planning Council, New York State AIDS Institute, and New York State HIV Advisory Body. The members of the HIV Planning Coordinating Group will continue to convene at least twice annually to review progress and ensure that the jurisdictional planning processes are well-coordinated and responsive to statewide needs and priorities.
- Planning Bodies/Councils Input.** Statewide HIV Planning Bodies/Councils contributed information to develop the Integrated Plan narrative, identify goals, objectives, strategies, and activities, and support stakeholder involvement.
- Stakeholder Input.** Stakeholders participated in surveys, focus groups, listening sessions, and other forums throughout the process to identify service and resource gaps and barriers, and identify monitoring and evaluation efforts, and jurisdictional follow-up actions.
- Additional Methods of Providing Input.** Hundreds of people are involved in these committees and groups, including recipients of RWHAP funds, various HIV-related programs, community leaders, government representatives, advocates, researchers, and other stakeholders. Clients are represented in all groups.

We look forward to continuing collaboration with our colleagues statewide and with our community partners in implementing the Integrated Plan to provide quality HIV prevention and care services throughout our jurisdiction.

The signatures below confirm the **concurrence** of the Planning Council with the Integrated Plan.

Graham Harriman

Melissa Thomas Proctor, MS., MSW
Public Health Adviser
Centers for Disease Control and Prevention
NCHSTP/DHP/PDB

Dear Kerry Hill and Melissa Thomas Proctor:

The New York City HIV Planning Group concurs with the following joint submission by the New York State Department of Health, New York City Department of Health and Mental Hygiene, and the Nassau County Department of Health in response to the guidance set forth for health departments and HIV planning groups funded by the CDC's Division of HIV/AIDS Prevention (DHAP) and HRSA's HIV/AIDS Bureau (HAB) for the development of an Integrated HIV Prevention and Care Plan, including the Statewide Coordinated Statement of Need (SCSN) for calendar year (CY) 2022-2026.). Of the twenty-one (21) members who voted, nineteen (19) voted to concur with the Plan, one (1) voted to abstain, and one (1) casted a vote of non-concurrence.

As in previous years, the New York City HIV Planning Group has reviewed the Integrated HIV Prevention and Care Plan submission to the CDC and HRSA to verify that it describes how programmatic activities and resources are being allocated to the most disproportionately affected populations and geographical areas with high rates of HIV. The planning body **concurs** that the Integrated HIV Prevention and Care Plan submission fulfills the requirements put forth by the CDC's Notice of Funding Opportunity for Integrated HIV Surveillance and Prevention Programs for Health Departments and the Ryan White HIV/AIDS Program legislation and program guidance. The Integrated Plan identifies service needs and barriers, presents goals and strategies for program development, implementation, and evaluation, depicts the continuum of care statewide and by region and population, and demonstrates extensive involvement of stakeholders. The Integrated Plan is also consistent with the National HIV/AIDS Strategy, New York State's Plan to End AIDS, including New York State's Ending the Epidemic Beyond 2020 Addendum Report, and New York City 2020: Ending the HIV Epidemic.

Below is a description of the key steps taken by our coordinated statewide planning process.

- **Coordination of Planning.** New York State Department of Health, New York City Department of Health and Mental Hygiene, and Nassau County Department of Health program teams are responsible for coordinating the plan development, including developing and providing tools for facilitating the work of planning bodies, updating the Epidemiologic Snapshot for the state, completing the Resource Inventory, gathering data/plan segments from all entities, and writing the plan. The HIV Planning Coordinating Group is responsible for reporting back to their home planning body on progress and interim milestones and bringing information and concerns to bi-monthly meetings. The coordinating group identified goals, objectives, and strategies for inclusion in the Integrated Plan. Members include representatives from Nassau and Suffolk HIV Health and Human Services Planning Council, New York City Department of Health, New York City HIV Planning Group, New York City HIV Health and Human Services Planning Council, New York State AIDS Institute, and New York State HIV Advisory Body. The members of the HIV Planning Coordinating Group will continue to convene at least twice annually to review progress and ensure that the jurisdictional planning processes are well-coordinated and responsive to statewide needs and priorities.
- **Planning Bodies/Councils Input.** The New York City HIV Planning Group engaged in a multi-year process to contribute information to develop the Integrated Plan narrative, identify goals, objectives, strategies, and activities, and review the Plan at various stages.
- **Stakeholder Input.** Stakeholders participated in surveys, focus groups, listening sessions, and other forums throughout the process to identify service and resource gaps and barriers, and identify monitoring and evaluation efforts, and jurisdictional follow-up actions.
- **Additional Methods of Providing Input.** Hundreds of people are involved in these committees and groups, including recipients of RWHAP funds, various HIV-related programs, community members and leaders, government representatives, advocates, researchers, and other stakeholders. Clients are represented in all groups.

The signatures below confirm the New York City HIV Planning Group's **concurrence** with the Integrated HIV Prevention and Care Plan.

We look forward to a continued collaborative and productively supportive relationship with our colleagues and community partners statewide as we implement the Integrated Plan to provide quality HIV prevention and care services throughout our jurisdiction.

Appendix A: Governmental Partner, Stakeholder and Public Comments

Overview of Comments and Process

After developing the complete first draft of the Integrated Plan, NYSDOH AI requested and encouraged review and comment from governmental partners, including the NYCDOHMH and NCDOH, and from planning council/group stakeholders, including the HIV Health and Human Services Planning Council of New York, the Nassau-Suffolk HIV Health Services Planning Council, the New York City HIV Planning Group, and the NYS HAB. In addition, NYSDOH AI posted the Integrated Plan draft for Public Comment in October 2022. All comments were reviewed and considered. Many comments suggested content already included in the Integrated Plan.

Several comments, both from stakeholders and during public comment, suggested changes to the wording or the metrics of the goals presented in the draft Integrated Plan. While these suggestions were considered, ultimately it was decided that since the goals were developed, vetted, and approved by stakeholders during the planning process, and the goals align with existing ETE goal and metrics, apart from some minor changes in wording, the goals presented in the draft Integrated Plan were retained.

Below is a summary of the comments received.

Governmental Partner and Stakeholder Comments

Comments were received from governmental partners and by planning council/group stakeholders and many of these comments were incorporated into the final Integrated Plan document. In addition to receiving written comments from partners and stakeholders, NYSDOH AI staff made presentations to the planning councils/groups and received feedback during the meetings and in breakout sessions. The following were comments that were incorporated into the Integrated Plan:

- Emphasize the importance of addressing stigma in improving HIV prevention and care services.
- Explain the role of people with HIV in developing the Integrated Plan and in other planning processes.
- Include information on the potential for disruptive changes to the 340B prescription drug discount program.
- Include strategies for co-location of HIV testing.
- Include routine testing for high-risk populations in specific settings.
- Address continuity of care for people with HIV.
- Expand HIV surveillance efforts (to address populations not currently captured).
- Address patient experience (and how it relates to engagement and retention).

- Address the needs of people over 50 living with HIV.
- Provide information on low HIV testing rates during COVID-19 pandemic.
- Ensure communities of color are captured in data related to HIV testing, care, and services.

Public Comments

Specific comments on recommended language and additions were received from two individuals that were incorporated into the Integrated Plan:

- Revise 2020 STI data to reflect access to services during COVID-19.
- Increase references to the Tri-County region of the New York EMA (Putnam, Rockland and Westchester Counties).

Comments were received from four individuals who recommended increased emphasis of issues in certain areas. It should be noted that the Integrated Plan is a framework for providing services and evaluating efforts for the next five years. Needs assessment, community engagement, and planning processes will be ongoing during this time and will focus on responding to ongoing and emerging needs. These public comments have been noted and can be revisited moving forward.

- Do not require social service providers to collect demographic information since disclosing this information may serve as a deterrent to people seeking services, such as HIV testing.
- Increase focus on addressing persistent disparities in new HIV diagnoses and HIV viral suppression rates for Black New Yorkers.
- Increase training opportunities for healthcare workers, including primary care providers.
- Balance focus on New York City vs. the rest of NYS.
- Focus on health equity related to specific populations (e.g., people with substance use disorder, people experiencing housing instability, people with serious and persistent mental illness).
- Include more information on the development of the Integrated Plan and the involvement of key stakeholders (e.g., people with HIV, managed care organizations, faith-based organizations, educational organizations).
- Include recommendation to allow condoms in prison.
- Include recommendation to expand scope of practice for pharmacists.

NAC Findings Process Guiding Principles

- The input and participation of TGNB community members is central to the development and implementation of these recommendations.
- These recommendations are intersectional by necessity, and require collaboration across agencies and institutions to maximize their effectiveness in improving the health outcomes for TGNB individuals.
- The development and implementation of these recommendations assume support, guidance and collaboration with regard to program evaluation, research, and policy efforts.

5

Assessing the Need*

Across NYC TG Women of Color have significantly lower levels of viral suppression

Assessing the Need (Cont'd)*

Younger TG Women of Color are even less likely to achieve viral suppression

7

Assessing the Need (Cont'd.)

The gap in viral suppression for TG women of color compared to all PLWHA of color has narrowed, but persists. There is also a gap between PLWHA of color and white PLWHA.

8

Assessing the Need (Cont'd.)

Younger, US born and all Black trans woman have some of the lowest rates of viral suppression, indicating that racism, among other barriers to care, is likely.

9

All Ryan White Part A PLWH vs. Black and Latina Transgender Women Clients Engaged in Selected Stages of the HIV Care Continuum, 2016*

Compared to all Ryan White Part A PLWH, a lower proportion of black and Latina transgender women clients were virally suppressed in 2016, despite a higher proportion of those transgender women clients being prescribed ART.

Needs Assessment Committee Findings

- TGNB do not feel welcome or comfortable accessing healthcare and support services. Gender affirming care is the exception and not the rule at most agencies, with a lack of representation seen in everything from the images on the walls to the staff make-up
- TGNB experience pervasive and widespread discrimination and violence, even in the offices of service providers, where a lack of expertise, sensitivity and awareness frequently characterizes service delivery
- Service barriers to engagement in and adherence to treatment among TGNB persons have not been adequately identified and bears out in inconsistent TGNB enrollment and service utilization throughout the Ryan White Part A portfolio
- The quality of gender affirming care available throughout the portfolio is not transparent and lacks accountability.

11

Purview of the Recommendations

1. **NY HIV PLANNING COUNCIL:** Increase the capacity of the NY HIV Planning Council to address the needs of TGNB individuals seeking services provided by Ryan White Part A programs.
2. **GRANTEE:** Increase and ensure the capacity of Ryan White Part A (RWPA) funded organizations to provide appropriate and relevant services to TGNB
3. **GRANTEE'S RESEARCH AND EVALUATION UNIT:** Evaluate current capacity of RWPA portfolio to improve health outcomes among TGNB clients
4. **NY HIV PLANNING COUNCIL & GRANTEE:** Develop strategies, best practices and interventions that address stigma and discrimination against TGNB clients in RWPA services
5. **NY HIV PLANNING COUNCIL:** Assess and address barriers to care unique to the TGNB experience

12

Recommendations

1. **Increase the capacity of the NY HIV Planning Council to address the needs of TGNB individuals seeking services provided by Ryan White Part A programs.**
 - Conduct a mandatory TGNB-specific trainings in a series format for NY HIV Planning Council and committee members
 - Develop a TGNB Advisory Board for the NY HIV Planning Council to guide best practices
 - Review service categories and models to ensure TGNB needs are addressed
 - Ensure TGNB representation reflective of the epidemic in the NY HIV Planning Council and the committees

13

Recommendations (Cont'd.)

2. **Increase and ensure the capacity of Ryan White Part A (RWPA) funded organizations to provide appropriate and relevant services to TGNB**
 - Mandate regular Gender Affirming Care Trainings for all RWPA staff and organizational leadership in a series format developed and led by TGNB
 - Facilitate development of a peer certification specialization for working with TGNB clients and peer leadership development through inter-institutional collaborations
 - Develop and enhance NY HIV Planning Council's standards of care, and policy guidance with best practices specific to TGNB clients, including issues of stigmatization and discrimination
 - Ensure the provision of technical assistance to organizations to integrate TGNB peers for service delivery and the implementation of Gender Affirming Care
 - Publish a public facing report card that assesses the quality of gender affirming care provided by funded RWPA organizations

14

Recommendations (Cont'd.)

3. Evaluate current capacity of RWPA portfolio to improve health outcomes among TGNB clients

- Conduct qualitative and quantitative analyses of service gaps within the RWPA portfolio
- Conduct an analysis on the quality of care and effectiveness of services, including experiences of stigma and discrimination, provided to TGNB within the RWPA portfolio
- Ensure participation of TGNB clients in the evaluation of services and programs

15

Recommendations (Cont'd.)

4. Develop strategies, best practices and interventions that address stigma and discrimination against TGNB clients in RWPA services

- Assemble research on best practices and standards of care to eliminate stigmatization and discrimination against TGNB clients during the delivery of RWPA services
- Conduct regular updates of policy requirements, trainings, guides to practices, standards of care and service models to reflect emerging research, practices and policies

16

Recommendations (Cont'd.)

5. Assess and address barriers to care unique to the TGNB experience

- Allocate funding for non-medical case management and/or psychosocial support services to support a service model that specifically targets barriers to care and treatment that TGNB individuals face to achieve viral suppression

EXHIBIT D

San Francisco's Integrated Ending the Epidemics Plan

**2024 – 2026 STRATEGIES AND
ACTIVITIES**

Serving as the HRSA/CDC-
required integrated plan
for the HIV Community
Planning Council; SF's
local strategy to align with
California's Integrated
Statewide Strategic Plan
for Addressing HIV, HCV,
and STIs from 2022-2026;
and SF's local Ending the
Epidemics plan.

1. Introduction

BACKGROUND

In 2020, San Francisco (SF) received funding from the federal Ending the HIV Epidemic initiative, and in October of that year released its plan entitled ***Ending the Epidemics: Collective Strategies for Addressing HIV, Hepatitis C, and Sexually Transmitted Infections in San Francisco***. SF’s plan laid out an ambitious agenda for ending the syndemic of these three conditions, and this plan paved the way for a number of innovative strategies and activities that rolled out from 2020 through 2024, at which time the federal CDC EHE funding will be folded into cooperative agreements with states and directly funded cities. Concurrently, the California Department of Public Health (CDPH) published its ***Integrated Statewide Strategic Plan for Addressing HIV, HCV, and STIs from 2022 – 2026***, and invited CA counties to join their efforts by developing locally tailored versions of the State’s plan. While developing its strategic plan, CDPH collaborated with HRSA and CDC to allow their plan to fulfill the CDC and HRSA requirement that funded jurisdictions develop an integrated HIV care and prevention plan, and SF signed on to this agreement. In short, this plan serves multiple purposes, helping to streamline the many plans and planning processes that exist, in order to take a holistic, coordinated approach to the syndemic.

This plan:

- Meets CDC and HRSA (both EHE and Ryan White Part A) requirements for an HIV Integrated Plan
- Fulfills CDPH’s recommendation that each California county have a local plan that reflects CDPH’s strategic plan;
- Outlines SF’s strategies and activities to end the epidemics for 2024 – 2026; and
- Informs the priorities for HIV, HCV, and STI-related funding applications for 2024 – 2026.

Ultimately, the purpose of this plan is to provide a roadmap to overcoming inequities in health outcomes in HIV, HCV, and STIs in SF. This plan will be updated at least every 5 years, and more frequently if needed. Each year, SFDPH will provide an update to the HIV Community Planning Council (HCPC) on progress made on the blueprint activities.

HOW THIS PLAN IS ORGANIZED

This plan begins with an overview of the foundational services, programs, and other efforts that are the hallmark of SF’s approach to serving communities affected by HIV, HCV, and STIs – in other words, the service infrastructure and signature strategies that have been established over many decades, and what many have come to think of as the “San Francisco model.” A high-level overview is offered, because to describe the extensive network of services would take hundreds of pages.

The next section describes the efforts that SF is undertaking and will undertake in the next few years that go above and beyond the core work – bold strategies and activities that aim to make a significant contribution to ending the epidemics. In alignment with CDPH’s strategic plan, this section is organized by the social determinants of health (SDoH), because these are the factors that continue to drive new infections and poor health outcomes among

people living with and at risk for HIV, HCV, and STIs. SF cannot end the epidemics without lifting up these root causes and doing what is possible to lessen their impacts on health and wellness.

INPUT AND ENGAGEMENT

Drafts of this plan were shared with the following key stakeholders for input/feedback throughout plan development:

- ETE Steering Committee (October 17, 2023)
- SDFPH ETE Leadership Committee (October 24, 2023)
- SDFPH HIV Working Group (November 13, 2023)
- HCPC Council Affairs Committee (November 14, 2023; April 9, 2024)
- HIV Community Planning Council (HCPC) (November 27, 2023; April 22, 2024)
- Getting to Zero SF Steering Committee (February 12, 2024)
- HIV/AIDS Providers Network (March 1, 2024)
- HIV Housing Workgroup (March 26, 2024)
- End Hep C SF leadership (April 15, 2024)
- Frontline Organizing Group (April 16, 2024)

Input and feedback from these groups helped fill in gaps in the plan, including highlighting the Mayor's Office of Housing and Community Development's (MOHCD) efforts, ensuring that workforce development is inclusive of PLWH who are re-entering the workforce, recommending expansion of partnerships with local SAMHSA-funded programs, and much more.

2. Epidemiology and Priority Populations

EPIDEMIOLOGY OF HIV, HCV, AND STIS IN SAN FRANCISCO

The state of HIV, HCV, and STIs in SF

In the last decade, the landscape of HIV, HCV, and STIs has changed considerably in San Francisco (SF). Advances in treatment and prevention for HIV, HCV, and STIs have impacted the epidemiologic profiles, with some populations experiencing more benefit than others. This phenomenon—where the implementation of new interventions tends to disproportionately benefit people with privilege (e.g., white people, cis men, people with health insurance)—can be largely explained by the social determinants of health affecting those with less privilege. Factors such as lack of housing and income inequality are more pervasive and intense than ever before, resulting in disparities in health outcomes by race/ethnicity, housing status, transmission risk group, gender, and mental health and substance use, neighborhood, and other demographic and behavioral factors.

Declines in new HIV diagnoses and increases in HIV viral suppression rates, HCV cures for thousands of SF residents, and innovations in STI prevention are successes to be celebrated. In many ways, the most challenging work remains, because it requires going beyond the simple provision of services to addressing the deeply complex issues of poverty, racism, homophobia and transphobia, access to care, mental health and substance use, incarceration, and much more. An added challenge is that declines in the local and state economies and a large budget deficit are leading to reductions in funding for social services. These factors demand an increased focus on person-centered, integrated services, increased innovation, and a social determinants of health-informed approach.

The need for a syndemic approach

Syndemics are epidemics of diseases or health conditions that interact with each other, exacerbating their adverse effects on communities that face inequities,¹ and are often driven by the same upstream social determinants of health. Given the overlap in the populations experiencing disparities in HIV, HCV and STI outcomes, as well as the overlap in transmission routes of HIV, HCV, and STIs, strategies to address these epidemics must be coordinated and integrated. The interconnectedness of HIV, HCV, and STIs, and the shared social determinants of health affecting their health outcomes, including substance use, mental health,² homelessness, poverty, racism, and homophobia, among others, demand a syndemic framework and a fully integrated system of care.

The next several pages summarize the current status of HIV, HCV, and STIs, with an emphasis on persistent disparities that could be addressed through a syndemic approach.

¹ <https://www.cdc.gov/hiv/pdf/division-of-hiv-prevention/cdc-hiv-dhap-external-strategic-plan-2022.pdf> (p. 11)

² Substance use and mental health are medical disorders, which makes them different than the other SDoH. Like the other SDoH though, they are upstream factors (with social and environmental components as well as medical) that impact HIV/HCV/STI transmission and health outcomes.

HIV

Background

As a result of hard-fought accomplishments in prevention, care, and treatment services informed by a robust HIV surveillance system, SF is on track to achieve its goal to ‘Get to Zero’: zero new HIV infections; zero HIV deaths; and zero HIV stigma. Over the last decade, SF has implemented a data-driven, high impact prevention (HIP) strategy, with resulting significant, steady reductions in new HIV diagnoses and increasing linkages to care and viral suppression among people living with HIV (PLWH) (Exhibit 1).

As shown in Exhibit 2, in 2019, new HIV diagnoses dropped below 200 to 179, a 67% decrease since 2006.³ However, in 2021, for the first time in more than a decade, new HIV diagnoses increased (147 to 166), likely due to delayed diagnoses during the COVID-19 pandemic. In 2022, new diagnoses remained essentially level at 157.¹

HIV Disparities and Health Inequities

Despite promising trends, HIV-related disparities persist in SF with respect to diagnosis and viral suppression rates. Populations experiencing HIV-related disparities include people who are Black/African American, people who are Latina/o/e/x, gay men and other men who have sex with men (MSM), trans women, people who inject drugs (PWID), and people experiencing homelessness (PEH). Select examples are shown in Exhibit 3, next page.

Exhibit 1: Key milestones in SF’s ‘Getting to Zero’ Efforts

- New HIV diagnoses have decreased 71% since 2006; no children <13 years have been diagnosed since 2005.
- Three-year survival rates for people with stage 3 HIV have nearly quadrupled—88% from 2012-21, vs. 23% from 1980-89.
- HIV-related deaths are making up smaller proportions of all deaths; 26% of deaths in SF were HIV-related from 2018-2021, versus 41% of deaths from 2010-2013.
- Most HIV-related deaths are occurring among people ages 60 and older.
- PLWH are aging, with 2/3 of PLWH in SF 50 years and older and 30% 60 years and older.
- 97% of PLWH are aware of their HIV status.
- 90% of people newly diagnosed with HIV in 2022 were linked to care within 1 month of diagnosis; 80% of those newly diagnosed were virally suppressed within 1 year.
- Linkage to care is typically fast; from 2018-2021 the median time between diagnosis and first care visit was 1 day, and the median time to ART initiation was 0 days.

Exhibit 2. New HIV diagnoses in SF have decreased 70% (2006-22)

³SFDPH HIV Epidemiology Annual Report 2022: <https://www.sfdph.org/dph/comupg/oprograms/hivepisecc/hivepiseccreports.asp>SFDPH

Summary of HIV Epidemiology

The overall decline in new HIV diagnoses and improvements in HIV care outcomes are encouraging. However, persistent disparities by race/ethnicity, housing status, transmission risk group, gender, and mental health and substance use factors highlight the critical need to address the social determinants of health.

Exhibit 3. Select examples of persistent HIV-related disparities in SF*

Among the SF populations with the highest numbers of HIV diagnosis, Latina/o/e/x and Black/African American **cis men** and Black/African American **cis women** experience higher rates of new HIV diagnosis, compared to white cis men and women.

HIV diagnosis rates per 100,000 shown below (2022)

Black/African American San Franciscans experience high HIV mortality :

- Mortality among Black cis men was double the rate of white cis men and nearly triple that of Latino/e/x cis men in 2021.
- Mortality among Black cis women was 4.1x that of Latina/e/x cis women and 5.9x that of white cis women in 2021.

- 19% of new HIV diagnoses were among **PWID** in 2022, despite PWID making up ~3% of SF residents.
- Similarly, 17% of new diagnoses were among **PEH** in 2022, despite PEH making up <1% of SF residents.

- **MSM (including PWID)** made up 72% of new HIV diagnoses in 2022, despite making up 7.8% of the SF population.
- **Trans women** made up 3% of new HIV diagnoses in 2022, despite making up 0.1% of the SF population.

Viral suppression rates vary by race/ethnicity, gender identity, and injection drug use.

Percent virally suppressed shown below, 2022 (some groups overlap)

***PWID** = people who inject drugs; **PEH** = people experiencing homelessness; **MSM** = men who have sex with men; **AA** = African Americans; **TW** = trans women

HEPATITIS C (HCV)

Background

In 2019, researchers from *End Hep C SF*—SF’s collective impact HCV elimination initiative—estimated that 22,585 residents of SF (2.6% of all SF residents) had antibodies to HCV. This is higher than the U.S. seroprevalence estimate of 1.7%. *End Hep C SF* also estimated that 11,582 SF residents (1.3%) still have untreated, active HCV infection, which can transmit to others and progress towards liver disease.

Before 2014, HCV treatment was highly toxic, required almost a year to complete, and had a very low success rate. As a result, many people who knew they were living with HCV chose to forgo treatment options, risking severe liver damage from chronic HCV infection. Today, curative treatment for HCV is now widely available in SF, easy to take with short treatment regimens, and has exceptionally high cure rates. Thousands have been cured since the advent of the new treatments, but those with the greatest barriers to care continue to experience disparities in access to these treatments and are also disproportionately represented among HCV cases. Therefore, identifying and addressing remaining disparities is critical to equitable HCV elimination in SF.

Key to improving HCV treatment rates is ensuring that people living with HCV are aware of their status and linked to care. In 2022, 62.4% of chronic HCV cases newly reported to the health department had positive HCV antibody tests *without* confirmation of a positive HCV RNA test that would indicate current HCV infection. Reporting of both negative and positive HCV RNA tests by labs (currently being integrated into laboratory reporting processes) is a critical step towards better understanding the epidemiology of HCV in SF, and in guiding programmatic efforts to support linkage to care and curative treatment to those with confirmed, chronic HCV.

In 2022, the majority of SF’s reported HCV antibody positive cases were **not confirmed** with an HCV RNA test.

Notably, people with HIV are disproportionately impacted by HCV. In SF, it is estimated that 11.5% of PLWH are co-infected with HCV, with co-infection particularly high among MSM and PWID. Despite successful citywide efforts to increase HCV treatment uptake, there are still an estimated 500 to 1,000 San Franciscans who are co-infected with HIV/HCV who need HCV treatment. This includes approximately 130 people who are SF Health Network (SFHN) patients.

HCV Disparities and Health Inequities

Groups of people less likely to be engaged in medical care account for most people living with HCV in SF. Similar to HIV, the SF populations most disproportionately impacted by HCV include PWID, trans women, MSM, and people who are Black/African American (Exhibit 4, next page).

Summary of HCV Epidemiology

HCV elimination in SF is a reachable goal, given curative treatments, but barriers to treatment access must be addressed. SF’s HCV efforts prioritize reaching and effectively serving populations with the greatest disparities and highest barriers to treatment and cure. People co-infected with HCV and HIV are a priority, as people who are co-infected are more likely to experience adverse health consequences of HCV compared to those who are not also living with HIV.

Exhibit 4. Select examples of HCV-related disparities in SF***Many SF populations experience a disproportionate burden of HCV.**

- An estimated **63% of PWID** (10,468 people) have untreated active HCV infection in SF.
- Shown below, PWID make up a disproportionate percent of untreated, active HCV infections (left) and HCV cases overall (right), compared to their population size (middle).

- **An estimated 57% of low SES trans women** have untreated active HCV infections; these women account for 1.6% of untreated active infections despite making up 0.1% of the total SF population.
- 70% of SF chronic HCV cases reported to SFDPH in 2022 were among **men**. Among men, **MSM** are estimated to account for 11.7% of HCV cases and only 7.8% of the population; 1% of cases are estimated to still have untreated active infections.
- **People who are Black/African American** comprise 22.5% of all SF chronic HCV cases reported to SFDPH in 2022 but only 4.9% of the SF population.

Age trends in HCV

Most HCV cases in SF are older; however, younger people (<45 years old) are increasingly represented:

- Among all cases reported to SFDPH in 2022, 46.4% of all cases were born between 1945 and 1965 (“baby boomers”), compared to 32.8% of newly reported cases in 2022.
- Newly reported cases in 2022 were more likely to be born after 1984 when compared to all cases reported in 2022 (38 years or younger). The proportion of newly reported cases born after 1984 was 30.9%, compared to only 20.4% of all cases reported in 2022.

Neighborhoods with lowest median income have higher HCV rates.

The rate of newly reported cases in 2022 was highest for the Tenderloin, South of Market, and Treasure Island neighborhoods. The Tenderloin and Treasure Island neighborhoods have the second and third highest poverty rates in SF, respectively.

Top barriers to HCV care among people coinfecting with HIV and HCV

Among people coinfecting with HIV and HCV, those who experience the highest barriers to HCV care and cure often have **co-occurring medical and mental health diagnoses, and are often experiencing housing instability and other socioeconomic challenges.**

Percent of people coinfecting with HIV/HCV reporting the barrier at Zuckerberg San Francisco General Hospital HIV/AIDS clinic

*PWID = people who inject drugs; SES = socioeconomic status; MSM = men who have sex with men; PLWH = people living with HIV

SEXUALLY TRANSMITTED INFECTIONS

Background

SF has higher chlamydia, gonorrhea, and early syphilis rates compared to all of California and the U.S., as well as Los Angeles and New York City. From 2008 to 2018, while the number of new HIV diagnoses declined by over 60%, the rate of chlamydia increased 244%, the rate of gonorrhea increased 195%, and the rate of early syphilis increased 157%. However, in recent years (2017-2022), SF has seen decreased annual incidence rates for chlamydia, gonorrhea, and early syphilis. Between 2019-2022, citywide chlamydia rates declined by 32%, gonorrhea by 7%, and early syphilis by 26%, likely related to changes in sexual behaviors and disruptions in access to health services during the COVID-19 pandemic.

In San Francisco, cis men make up 95% of new early syphilis cases,¹ and about two-thirds of new early syphilis cases occur among gay, bi, and other men who have sex with men (MSM).⁵ However, **syphilis rates have been increasing rapidly among cis women in San Francisco**, mirroring a marked increase in reported cases of syphilis among women and congenital syphilis both nationally and in California. From 2017–2021, syphilis diagnoses among cis women in San Francisco increased by 200% (1582 to 1642) and **CS cases increased 333%** (13 cases) compared to the prior five-year period (3 cases). SFDPH focused efforts on identifying and prioritizing pregnant women with syphilis, and on better understanding the populations most impacted by female syphilis.

Since the national mpox outbreak in 2022, SF has recorded 940 total cases as of 4/12/24⁴ and the highest cumulative mpox case rate in the state. Cases have declined overall since 2022 (842 cases), with 91 cases reported in 2023; 96% of cases have been among men and the majority reported sex with other men. Cases have also disproportionately impacted people who are Hispanic/Latina/o/e/x and white.

The effects of doxycycline post-exposure prophylaxis (doxy-PEP) for STI prevention on rates of STIs are being monitored. Among MSM, chlamydia and syphilis cases have declined from 2022 to the end of 2023 - since the introduction of doxy-PEP in the last quarter of 2022. However, the number of chlamydia cases among cis women (for whom doxy-PEP is not recommended) have been increasing over the same time period.

Given the relatively high incidence of STIs in SF, SFDPH is prioritizing populations disproportionately impacted (Exhibit 7, next page), including: 1) gay, bisexual, and other MSM; 2) adolescents and young adults, particularly those who are BIPOC; 3) trans persons; and 4) cis women of reproductive age who are at risk for syphilis infection

Exhibit 5: Explaining STI rises (2008-18)

Paradoxically, increased STIs may have been driven by gains in HIV prevention. Decreases in HIV in SF are the result of scaled-up HIV testing, promotion of early and widespread HIV treatment, a strong linkage to care program, and access to pre-exposure prophylaxis (PrEP). As taking PrEP if HIV-negative or maintaining an undetectable HIV viral load if living with HIV can prevent sexual transmission of HIV, condom use has declined, facilitating transmission of gonorrhea, chlamydia, and syphilis.

Exhibit 6: Increases in syphilis in cis women and congenital syphilis

Female syphilis cases rose from 114 to 184 between 2018-21 and then plateaued from 2021-24. Among 186 female syphilis cases in 2022, 18 were known to be pregnant, including 6 who were experiencing homelessness, 4 who reported methamphetamine use, and 1 who reported heroin use. Of the 16 pregnancy outcomes known, 9 averted congenital syphilis, 4 resulted in spontaneous or therapeutic abortion, and 3 resulted in congenital syphilis.

⁴ <https://www.sf.gov/data/mpox-case-counts#cumulative-cases>

(and therefore newborns with congenital syphilis). Across all four of these populations, people who are Black/African American experience higher rates of STIs than any other racial/ethnic group and are therefore included as a prioritized population.

Summary of STI Epidemiology

- Syphilis rates are still high among cis women. Congenital syphilis is of concern and complex to address, given its overlap with substance use and homelessness among pregnant people.
- Declines in chlamydia, gonorrhea, and syphilis among MSM since the emergence of mpox and doxy-PEP are being evaluated.
- An uptick in mpox cases since July 2023 reflects the need for ongoing vaccine promotion and education.
- Persistent STI disparities among adolescents and young adults requires continued efforts to promote screening and education, particularly among BIPOC youth.

Exhibit 7. Select examples of STI-related disparities in SF

Among populations with at least 200 reported cases of chlamydia or gonorrhea and 100 cases of early syphilis in 2022, **Black/African American and Latina/o/e/x people experienced the highest rates of all three of these STIs.**

- **Gay men and other men who have sex with men** have the highest prevalence rates of gonorrhea, chlamydia, and early syphilis compared to other transmission groups.
- **Trans women** also have very high rates of STIs compared to other San Francisco residents; at SF City Clinic, STI positivity among trans women is similar to positivity among men who have sex men.

Chlamydia rates among women are extremely high among those who are Black/African American, followed by those who are Latina/e/x, compared to those who are white.

Chlamydia rates per 100,000 shown below (2022)

Among youth of all genders, Black/African American and Pacific Islander youth, followed by Latina/o/e/x youth, experience the highest chlamydia rates.

PRIORITY POPULATIONS

A key rationale for an integrated approach to HIV, HCV, and STIs is the strong (but not perfect) overlap in affected populations (Exhibit 8), because it creates numerous opportunities for programs to offer a comprehensive suite of prevention, testing, care, and treatment services that promote sexual health, harm reduction, and overdose prevention. Populations with **two or more** disparities in key epidemiologic indicators are deemed priority populations for ending the epidemics. Three common epidemiologic indicators of disparities are:

1. **High prevalence**, meaning that the percentage of people in the given population who are affected by HIV, HCV, or STIs is higher than for others. This indicator represents the disproportionate burden of disease carried by a population.
2. **Account for a disproportionate number of new infections**, meaning that the number of people newly acquiring HIV, HCV, or STIs is higher in a given population than would be expected given their representation in the overall SF population. For example, if there were 150 people in all of SF, and two-thirds of the population (n=100) was from population X and one-third (n=50) from population Y, you would expect that, all things being equal, population X would experience two-thirds of new infections and population Y one-third. If population X experienced more than two-thirds of new infections (or population Y experienced more than one-third of new infections), this would be considered a disparity.
3. **Less likely to be virally suppressed or experience other positive health-related outcomes**.

It is important to note that the highlighted priority populations are not the only ones in need of services. Limited data and/or small numbers for some populations, such as Native Americans, make it difficult to assess disparities that might exist. In addition, services are still needed for populations with low HIV/HCV/STI incidence and prevalence, to ensure that the low rates are sustained and to ensure equitable access to services for all. For example, while HCV and HIV prevalence and incidence are relatively low among youth, there are high rates of STIs among youth of color, and programs for youth are key opportunities for health education and support services. People who are incarcerated are also a critical population, although not separately highlighted as a priority population in this plan because PEH, PWU/ID, and Blacks/African Americans are disproportionately represented among this group. Lastly, Exhibit 8 does not represent the multiple intersectionalities of identity and experience, nor does it reflect the complexities of differences in health outcomes among population subgroups or the fact that a population can have positive outcomes with respect to some indicators and poorer outcomes with respect to others. All of these factors underscore the importance of tailored interventions that are data-informed, but also informed by community needs and experience.

Exhibit 8: Priority Populations for Ending the Epidemics

Population	HIV	HCV	STI
Blacks/African Americans	- Account for a disproportionate number of new infections - Less likely to be on PrEP or achieve viral suppression	Account for a disproportionate number of new infections	- Account for a disproportionate number of new infections - B/AA youth: High prevalence (GC, CT)
Latina/o/e/x	- Account for a disproportionate number of new infections - Less likely to achieve viral suppression		Latina/o/e/x youth: High prevalence (GC, CT)
Trans women	- High prevalence - Account for a disproportionate number of new infections	- High prevalence - Account for a disproportionate number of new infections	High prevalence
PWU/ID	- High prevalence - Account for a disproportionate number of new infections	- High prevalence - Account for a disproportionate number of new infections	Account for a disproportionate number of female syphilis cases
PEH	- Account for a disproportionate number of new infections - Less likely to be on PrEP or achieve viral suppression		Account for a disproportionate number of female syphilis cases
MSM	High prevalence	Account for a disproportionate number of new infections	- High prevalence (GC, CT, syphilis, mpox) - Account for a disproportionate number of new infections
Cis women	Less likely to be on PrEP or achieve viral suppression		Vertical transmission risk among cis women of reproductive age (syphilis)

3. Foundational Efforts Addressing HIV, HCV, and STIs

SF'S APPROACH

Integrated services and whole-person care approach

Given the overlap in the populations experiencing persistent disparities in SF, whenever appropriate, all three epidemics are approached jointly to ensure a whole-person care approach to HIV, HCV, and STI prevention, care, and treatment. This aligns with key values and principles in the SF EtE Plan.

- 1) **Integration of HIV, HCV, and STI prevention, care and treatment services, and harm reduction and overdose prevention.** Given the interconnectedness of these diseases and the broader drivers of the disparities such as substance use, mental health disorders, homelessness, poverty, racism, homophobia, sexism, and transphobia, to succeed at ending the epidemics, SF has committed to fully integrated systems and programs whenever appropriate that are person-, not disease-centered.
- 2) **Whole person care.** In the broadest sense, whole person care is predicated on the understanding that the best way to care for people with complex needs is to consider the full range of those needs – including physical, mental, social, and economic needs. SF's whole person care approach builds on an “ecosystem of care” model that emphasizes care coordination across medical, mental health, substance use, housing, and social needs.

An ideal integrated service model allows a person to get support for all their health and social service needs, whether it's HIV/HCV/STI testing or care, or, for example, other support for quitting smoking, benefits navigation, or substance use counseling. With this approach, the clients' experience and health outcomes are improved. SF's approach to integrated services and coordinated strategies is exemplified by Health Access Points and the Centers of Excellence.

SF's Foundational HIV/HCV/STI Efforts: Setting the Stage for Ending the Epidemics

The EtE initiative focuses on scaling up and implementing innovations in four science-based strategies—diagnosis, treat, prevent and respond—that together can end the HIV/HCV/STI epidemics. Starting on p. 18, SF's plans for scaling and innovating services are described. However, it is critically important to note that these efforts are layered on top of a strong foundation of strategically developed HIV, HCV, and STI services built over decades (in the case of HIV and STIs) and more recently (HCV). This section describes this foundation, its evolution, and how that groundwork is acting as a springboard to end the epidemics. The diagnose, treat, prevent, and respond pillars are a useful framework, but many of the existing foundational efforts cut across the pillars because many programs in SF already offer integrated testing, treatment, and prevention services. For the purposes of this plan, the services are described in the most relevant pillar.

Pillar 1: Diagnose

Over the last decade, SF's HIV testing providers—in both community and clinical settings—helped normalize HIV testing as part of regular health maintenance, especially among the most impacted communities, contributing

significantly to 97% status awareness among PLWH in SF. Chlamydia, gonorrhea, and syphilis testing has been available at SF City Clinic, in public and private primary care settings, and some community-based sites, but not all HIV testing locations offer STI testing. Community-based HCV testing, particularly for PWID and people experiencing homelessness, has scaled up dramatically since the advent of direct-active antivirals for HCV treatment, but requires the capacity for wide and deep reach into communities at risk, many of which do not access health care in traditional settings, or at all. Given the overlapping epidemics and risk factors, siloed testing represents lost opportunities for diagnosis, treatment, and education. SF aims to expand integrated HIV/HCV/STI testing in 2024-2026.

The infrastructure built to support CLIA-waived rapid HIV community-based testing and to routinize HIV screening in primary care and other clinical settings serving priority populations represents a solid foundation to achieve this aim. Successful integrated testing already exists at SF City Clinic and some other locations. This plan describes a number of activities to scale up HIV/HCV/STI integrated testing in the context of a broader effort to address the social determinants of health. For example, the new Health Access Points, which are tailored to specific populations experiencing disparities (described under Pillar 3 and throughout this plan) are required to offer integrated testing, and SFDPH's public health detailing program will be working to integrate HCV and STI testing in clinical settings where it makes sense given the population served.

Other innovative efforts identified for scale-up include pharmacy-based integrated testing, mobile testing, self-testing, and integrated testing in non-traditional settings where syndemic-affected populations can be reached, such as supportive housing, jails, and substance use treatment programs.

Pillar 2: Treat

HIV

SF is home to one of the first outpatient HIV clinics in the nation (ZSFG Ward 86). It was also the first city to establish a policy that ART should be universally offered to people upon HIV diagnosis, and is widely known for its rapid adoption of new advances in treatment. PHAST (Positive Health Access to Services and Treatment) is an interdisciplinary team at Ward 86 staffed by a registered nurse, clinician, and social worker who offer low-barrier access to RAPID ART and linkage to care support to patients coming into Ward 86 after a new HIV diagnosis or those re-engaging in care after being out of care. The PHAST team supports over 500 patients a year, primarily priority populations described above, by providing expedited clinic intake, nursing care coordination, and psychosocial stabilization to patients vulnerable to being lost to follow-up due to high rates of homelessness, mental illness, and active substance use. The PHAST model addresses the social determinants of patient health along with addressing the barriers to care.

SF has exceptional capacity for providing state-of-the-art HIV treatment, including through the Ryan White-funded HIV Centers of Excellence (CoEs). CoEs were created to serve severe-need clients and special target populations. The CoE model establishes primary medical care at the center of an integrated service delivery model offering integrated access to both primary medical care and critical services. At a minimum CoE must provide: 1) primary medical care, 2) medical case management, 3) psychiatric assessment and psychiatric medication monitoring, 4) treatment adherence and medication assistance, 5) outpatient mental health treatment, and 6) substance use assessment, counseling, and referral. Each multidisciplinary CoE, while open to all, is customized to serve a particular population that has unique or disproportionate barriers to care, needs additional or unique services, or requires a special level of expertise to maintain them in care:

- **Homeless Aging and Long-term Survivors (HALT) Center of Excellence**

Focuses on services for people experiencing housing instability and homelessness; men who have sex with men; Latina, African American and trans women; and immigrants, with a focus on undocumented Spanish-speaking persons.

- **HIV Integrated Services (HIV-IS)**

Focuses on the coordination of care for HIV-positive incarcerated and post-release people and serves the SF County jails.

- **Mission Center of Excellence**

Focuses on services for Latino/Latina populations, including monolingual Spanish speakers and immigrants, regardless of legal status.

- **Black Health Center of Excellence**

Focuses on services for underserved and uninsured Black/African Americans, including cis women and trans women.

- **Tenderloin Area Center of Excellence**

Focuses on homeless and marginally housed persons, active substance users; transgender persons, Asian/Pacific Islander groups, and prison populations.

- **Women's Center of Excellence**

Focuses on underserved and severe-need cis and transgender women.

There is also a vast network of services beyond the CoEs for people living with HIV, including job training, housing, benefits counseling, and much more.

SFDPH's LINC'S (Linkage, Integration, Navigation and Comprehensive Services) program is also a core part of SF's foundation for HIV treatment. LINC'S serves people newly diagnosed with HIV and prioritized individuals who are not-in-care, including those who access care intermittently, and supports them to engage in care. All people who newly test positive for HIV in SF are offered linkage to care and partner services through LINC'S. LINC'S, which is housed at SF City Clinic, maintains strong partnerships with HIV care sites throughout SF. One of LINC'S' closest partnerships is with the PHAST team, which as mentioned above supports PLWH in accessing expedited care and RAPID ART. The partnerships with PHAST and other clinical care sites allow for successful linkage and engagement by lowering barriers to care and offering care coordination, system and insurance navigation, and appointment tracking.

In summary, PLWH experience many barriers to HIV care engagement in SF, especially barriers related to the social determinants of health, but due in part to numerous high-quality, culturally tailored treatment options, SF has linkage to care and viral suppression rates that are higher than for CA and the U.S.

HCV

With the advent of direct-acting antiretrovirals in 2015, HCV became treatable in the primary care setting, whereas before it could only be treated in specialty settings (such as in liver clinics or by hepatologists). Shortly thereafter, SFDPH's primary care providers were offered training to treat HCV, and a clinical consultation line was established. HCV curative treatment is covered by Medi-Cal. This extraordinary medical advance made it possible to envision an end to HCV in SF, and in 2016, the End Hep C SF collective impact initiative was born. This group has engaged in advocacy, fundraising, provider training, research, and service provision to take advantage of this historic opportunity to eliminate HCV in SF. End Hep C SF began an HCV navigator program to link people to treatment, which is still in place today. LINC'S provides navigation to HIV/HCV-coinfected patients. A major gap is the provision of HCV treatment in the jail setting, because incarcerated people do not retain Medi-Cal while in jail, and the City currently only covers the cost of HCV treatment during incarceration for a limited number of people

each year; thus, there has been a dedicated jail health navigator for many years who works to link people to treatment upon release.

STIs

With SF's high rates of chlamydia, gonorrhea, and syphilis, easy access to diagnosis and treatment is a critical prevention strategy. SF City Clinic, SF's only municipal STI clinic, is a nationally recognized center of excellence in the provision of quality STI clinical services and serves as a critical access point for low-barrier, confidential, and culturally sensitive clinical STI diagnostics, prevention, and treatment, in addition to offering family planning, HIV care, PEP, and PrEP. STI diagnosis and treatment is also available in primary care settings in SF and at many CBOs. STIs have increased among MSM, making easy access to diagnosis and treatment critical. SF's collaboration with TakeMeHome, a national HIV/STI self-testing program, and doxycycline PEP (doxy-PEP), which can be taken after sex to prevent bacterial STIs, are two key efforts that have already begun and will scale up over the next several years.

Pillar 3: Prevent

In the decades prior to U=U⁵ and PrEP, SF's primary approach to HIV prevention involved providing health education and risk reduction to people at risk for HIV as well as people already living with HIV. In the early 2010s, we learned that HIV is virtually untransmissible if a person with HIV is virally suppressed or a person without HIV is on PrEP, and this was a game changer for HIV prevention. Since then, SF has invested heavily in universal and rapid HIV ART, PrEP, and HIV testing so people can learn their HIV status early on to improve outcomes. The results can be clearly seen with the significant decline in new diagnoses between 2012 and 2022. Similar treatment and testing strategies are also being heavily deployed throughout SF for HCV and STIs.

Syringe access and disposal and condom access continue to play a significant role in the HIV prevention landscape, with syringe access also a key HCV prevention strategy and condoms also protective for STIs. SF services aim to be non-stigmatizing, sex-positive, and harm reduction-focused.

In 2023, SFDPH implemented a new service model as part of the shift to a syndemic approach using an SDoH lens: Health Access Points (HAPs). The HAPs, funded and overseen by the CHEP Branch, are integrated low-barrier HIV/HCV/STI service models, where each HAP delivers services for a specific priority population—similar to the CoE model for care services. Each HAP is required to provide integrated testing, linkage to PrEP, HIV/HCV/STI treatment, harm reduction and overdose prevention services, health education, and referrals to services to meet basic needs (e.g., food, housing). The goal is to grow the HAPs into fully functioning “one-stop shops.” The HAPs are:

- LOTUS, serving Asians & Pacific Islanders
- Umoja, serving Blacks/African Americans
- Latina/o/e/x HAP
- MSM HAP
- The Lobby, serving PWUD
- Transitional age youth HAP
- STAHR, serving trans women

⁵ U=U means undetectable=untransmissible, a phrase that is used to denote the fact that studies have demonstrated that the risk of sexual HIV transmission is nearly 0 when the partner with HIV is virally suppressed.

Pillar 4: Respond

SFDPH is well-prepared to identify and respond to HIV transmission clusters and outbreaks. SFDPH offers partner services to all individuals newly diagnosed with HIV. This service includes assistance with notifying partners and linking them to testing, prevention and treatment if needed. Partner services can aid in the identification of epidemiologically linked or location-based clusters. SFDPH uses molecular HIV surveillance (MHS) to identify clusters of patients who have similar HIV genotypes. Large and closely connected clusters are reviewed to ensure that all individuals in the cluster are linked to care. SFDPH proactively meets with communities and organizations to keep them informed on MHS activities. This is especially important, given past and present harms committed by our medical, legal, and immigration systems, to address perceptions and respond to concerns that such activities could pose risks. In addition, SFDPH has processes in place to identify and reach out to people diagnosed with HIV who do not have recent evidence of medical care, such as a viral load test, in order to offer them linkage to care. Partner services are also important as a component of STI prevention and response. SFDPH offers partner services to prioritized patients with syphilis, as well as to patients with antibiotic-resistant gonorrhea.

4. Ending the Epidemics Plan

The SDoH have a disproportionate impact on BIPOC, economically fragile, and other vulnerable populations and drive the inequities in new infections and health outcomes for HIV, HCV, and STIs. For this reason, the SDoH are central to SF's ending the epidemics strategy, and therefore this plan is organized around that framework.

The six SDoH addressed in this plan are pictured below. Each SDoH has a section. The first page of the section is an introduction, describing the SF context, with SF's strategies listed on the bottom half of the page. The subsequent pages are a single table listing SF's activities related to that SDoH. The first column of the table lists the strategies related to each activity – including strategies that are part of other SDoH sections. This was necessary because the SDoH and therefore the activities are strongly interrelated. The *Related Strategies* column uses the SDoH abbreviations shown underneath the image below.

Lastly, the activities listed are either implemented or funded by SFDPH, unless another organization is listed at the end of the activity in [blue highlight](#).

Introduction

Inextricably linked to the stark racial disparities in HIV, HCV, and STIs in SF is the structural racism embedded in our systems and services, which exclude communities of color from economic opportunities, increasing their vulnerability and preventing them from experiencing optimal health. Structural racism persists because our systems were fundamentally, and in many cases intentionally, designed to benefit white people and to harm people of color. For example, the practice of redlining, in which neighborhoods where Blacks/African Americans (B/AA) lived were systematically denied financial lending opportunities. The effects of this practice were pervasive and severe; cutting off these neighborhoods resulted in reduced economic mobility for residents, spawning a cycle of intergenerational poverty, that today manifests as a stark wealth and income gap between B/AA San Franciscans and other groups. Systems designed to penalize immigrants, particularly Latina/o/e/x immigrants and other immigrants of color, represent barriers to accessing care, for fear that they may get deported and permanently separated from their family. The increase in hate crimes perpetrated against SF's A&PI residents in the wake of COVID-19 is yet another example of an unacceptable status quo. These realities represent chronic stressors that people of color must deal with, not to mention the stress and trauma resulting from the multitude of microaggressions they face in daily interactions, and an unimaginable host of other unjust circumstances from police brutality to inferior educational opportunities. It is no surprise that health outcomes across nearly all diseases are poorer among people of color.

The HIV, HCV, and STI sector, through thoughtful planning and implementation of services, is well-poised to break down barriers to access that cut across racial lines. Key strategies include transforming the composition of the workforce by increasing BIPOC representation, ensuring that funding and resources are allocated based on data and with an equity focus, and community engagement in planning and services delivery.

San Francisco Racial Equity Strategies

(see also *Economic Justice*)

- ✓ **Strategy 1: Leadership and Workforce Development**

Expand pathways and workforce development initiatives to increase the proportion of BIPOC public health staff, leadership, and administrators within SFDPH and funded HIV/HCV/STI community-based organizations.

- ✓ **Strategy 2: Racial and Ethnic Data Collection and Stratification**

Identify, collect, analyze, and publicly share data that reflects the specific trends, needs, and outcomes of HIV, HCV, and STIs for BIPOC communities, to inform resource allocation and identify community-based strategies and solutions.

- ✓ **Strategy 3: Equitable Distribution of Funding and Resources**

Review SFDPH HIV/HCV/STI policies, practices, and program decisions, such as processes related to contracts and budgets, with a racial justice lens, to advance equitable delivery of resources and opportunities to BIPOC.

- ✓ **Strategy 4: Community Engagement**

Forge strategic partnerships to ensure more diverse public outreach, involvement, and engagement processes to reframe the structure, funding, and policies of HIV, HCV, and/or STI services and messaging to all Californians.

- ✓ **Strategy 5: Racial and Social Justice Training**

Implement capacity building and training opportunities and requirements for SFDPH and its funded HIV, HCV, and STI service providers, to strengthen out movement towards achieving cultural humility, equity, and racial justice in our prevention, testing, treatment, and care services.

Related Strategy(ies)	Activities	2024	2025	2026 & beyond
RE1 EJ1 EJ3	New Deputy Director of Workforce Development. Strengthen SFDPH's workforce planning, systems, processes, and policies to improve hiring, retention, and training, under the leadership of a new permanent Deputy Director of Workforce Development for the SFDPH Population Health Division (initially funded through the CDC Project INVEST grant). This position will lead and collaborate with a Population Health Division-wide workforce development working group to promote creative options for pathways to new positions within SFDPH (e.g., short-term "residencies" in other branches/divisions), strengthen existing staff well-being programs, launch and maintain a leadership development fund for community health and public health leaders, and start a community of practice for Community Health Workers.	X	X	X
RE1	Coaching and leadership development at SF City Clinic. Develop a coaching and leadership development initiative focused on building leadership capacity among mid-level BIPOC managers.	X		
RE1 EJ1 EJ2 EJ4	Annual conference/training for frontline HIV/HCV/STI workers. Implement an annual conference to support workers, especially newly hired direct service workers, to keep up to date on the vast landscape of HIV/HCV/STI prevention and care services. Include training on the system of care, referral/linkage protocols, and networking opportunities.		X	X
RE1 EJ1 EJ2	Community Health Leadership Initiative (CHLI). Continue to implement CHLI, which provides training on sexual and drug user health and mentorship to people interested in entry-level roles in the field. CHLI also offers internships, funding for micro-grants for community members to launch innovative ideas (e.g., podcasts), workforce appreciation and networking events, and spaces for peer connection.	X	X	X
RE1	The Academy. Continue to implement the Academy, with a focus on developing trainings and curricula for supporting the onboarding of new staff, especially those from affected communities (e.g., BIPOC, people with lived experience of HIV/HCV/STIs) working in the HIV/HCV/STI programs and services.	X	X	X
RE1	Workforce Development Collective. Convene a multisector Workforce Development Collective that meets monthly, facilitated by the CHLI Program's Workforce Development Director to foster relationship building, organic collaborations, resource sharing, thought partnership, sharing and creating best practices, strategies for burnout prevention and workforce sustainability.	X	X	X
RE1 EJ2	SFDPH's HIV/HCV/STI counselor training. Leverage the counselor training to create pathways for meaningful employment by recruiting and supporting people with lived experience of HIV, HCV,	X	X	X

RACIAL EQUITY				
Related Strategy(ies)	Activities	2024	2025	2026 & beyond
	and STIs to participate in the training and pursue employment in the field.			
RE1 EJ1	End Hep C SF Leadership Development. Offer ongoing opportunities for professional and leadership development within the End Hep C SF initiative through supporting community leadership of workgroups, supporting community members to attend conferences and participate in trainings, and providing professional development mentorship to people with lived experience of HCV. <i>(End Hep C SF)</i>	X	X	X
RE1 EJ1 EJ2	SF HIV Frontline Workers Mentor Program (FMP). Continue to implement the FMP, which provides mentorship to people in entry-level roles who are new to the SF HIV Systems of Care. The FMP builds the capacity of new workers to effectively support their clients, stimulates collaborative cross-agency service delivery, and invests in the professional development of new and veteran workers alike.	X	X	X
RE1	Leverage current programs to increase workforce racial diversity. Work with existing workforce development programs, such as the HIV work re-entry program, to ensure that opportunities to support the next generation of HIV/HCV/STI providers better reflect the priority populations in terms of race/ethnicity.	X	X	X
RE2 RE3 RE4	Racial data stratification to inform resources and programs. Continue to stratify HIV, HCV, and STI data by race in monthly and annual surveillance reports and present this data to HCPC, Getting to Zero SF, End Hep C SF, and other community stakeholders to inform data-driven resource allocation and program planning.	X	X	X
RE3	Expand TakeMeHome, a mail order HIV and STI self-testing program. Expand partnership with TakeMeHome to promote self-testing for ETE priority populations via a variety of placements (websites, social media, through printed materials, via SMS).	X	X	X
RE4	SFDPH City Clinic Community Perspectives Assessment. Conduct a Community Perspectives Assessment with SFDPH City Clinic patients and community members to better understand why those who are most vulnerable to HIV infection, including MSM of color, trans women, people experiencing homelessness, and people who use/inject drugs do and do not seek services at City Clinic, to inform how to adapt and market SFCC services to ensure these communities feel well served.	X (conduct assmt.)	X (imple- ment recs.)	X (imple- ment recs.)
RE5	Participate in available cultural humility and racial justice trainings. Participate in CDPH's free cultural humility, equity, and racial justice training opportunities (when they become available), the SFDPH HIV Health Services Training Program's racial/culturally specific trainings, and the SFDPH's Black/African American Health Initiative (BAAHI) trainings. Encourage or require community-based providers to participate as training capacity allows.	X	X	X

Introduction

One of the most profound effects of San Francisco's economic shifts has been a surge in the number of San Francisco residents who are unhoused or unstably housed. It is important to note that this is not a monolithic group; it includes people who are temporarily sheltered, people who live outdoors, both individuals and families, and people with and without serious mental health diagnoses. This diversity means that tailored interventions are needed. In particular, the extremely high cost of housing has produced a wave of displacement that has pushed many middle- and working-class individuals and families from San Francisco, especially people of color, to outer areas of the region and has contributed to rapidly accelerating homelessness and housing instability. In San Francisco, people experiencing homelessness represent a large percentage of those diagnosed with HIV and HCV, and PEH are disproportionately represented among cis women with syphilis. Being homeless or marginally housed is strongly and unequivocally linked to poor health outcomes among people living with HIV (PLWH). Homelessness, mental health diagnoses, and substance use disorders frequently co-exist, compounding the challenges in serving this population effectively.

In SF, there are no easy solutions. While SF's HIV/HCV/STI programs cannot solve the housing crisis, SF can **greatly strengthen the connections between HIV/HCV/STI testing and treatment and housing-related services**. As the strategies below demonstrate, we envision this connection working in both directions—expanding HIV, HCV, and STI services in settings that serve people who are homeless or marginally housed while also strengthening access to housing supports such as coordinated entry, housing case management, housing subsidies and service linkages for individuals receiving HIV, HCV, or STI services.

San Francisco Housing First Strategies

(see also *Healthcare Access for All* and *Mental Health and Substance Use*)

- ✓ **Strategy 1: Data Collection and Use**

Improve the ability of local data systems to collect information on housing status so that we can better monitor differences in HIV, HCV, and STI rates and health outcomes by housing status and use this information to inform public health action.

- ✓ **Strategy 2: Strengthening Infrastructure**

Develop the collaborations necessary for integrated, multidisciplinary, whole-person services in order to effectively address the multiple and complex needs among people experiencing homelessness, including HIV/HCV/STI prevention, screening, and treatment; housing; harm reduction and substance use treatment; and mental health, medical, and social services.

- ✓ **Strategy 3: Street Medicine Strategies**

Expand and improve coordination of street-based and mobile programs (e.g., walking teams, medical vans, outdoor clinics) that provide medical and support services to people who are unhoused.

Social Determinant of Health HOUSING FIRST				
Related Strategy(ies)	Activities	2024	2025	2026 & beyond
HF1	Move towards a collective definition of homelessness across local data systems. Bring into alignment the multiple definitions of homelessness across EPIC (the SFDPH electronic health record), ARIES, HIV prevention data systems, HIV/HCV/STI surveillance, and Department of Homelessness and Supportive Housing (HSH), and other data systems.	X	X	
HF1	Aim to eliminate disparities in viral load suppression among PEH. SFDPH Health Services is implementing a CQI project aimed at eliminating the health outcome disparities (viral suppression) in people experiencing housing instability/homelessness for all clients receiving HIV medical care through SFDPH or an HHS funded agency. Data is reviewed on a quarterly basis to inform CQI strategies.	X	X	
HF2	HIV Homeless Outreach Mobile Engagement (HHOME). Ensure this program's continued capacity to provide intensive, community-based medical care and case management to PLWH experiencing homelessness who are not comfortable accessing four-walls clinics and to move them along the homelessness-to-housing continuum.	X	X	X
HF2	Tighten City systems to support smooth access to housing services. Work with the HIV Housing Workgroup to identify and address weak points in City systems that work together to support housing access, such as partnering with HSH to ensure people with HIV are prioritized during coordinated entry and expanding the impact of Transitional Residential Care Facilities to support housing readiness/independent living skills. <i>(Mayor's Office of Housing and Community Development)</i>	X	X	X
HF2 MHSU2	SF City Clinic staff training on SDoH referrals. Conduct ongoing training for the LINC team (DIS and navigators), clinicians, and nurses to strengthen skills in benefits navigation and referrals to housing, mental health, and substance use treatment services.	X	X	X
HF2 MHSU4	ZSFG pop-up clinic. Expand the new POP-UP clinic at the Positive Health Program on Ward 86 at Zuckerberg San Francisco General Hospital (ZSFGH). The clinic provides open-access, incentivized, comprehensive, relationship-centered care and enhanced outreach for PLWH not engaged in HIV medical care who are unhoused and not virologically suppressed. Other services include directly-observed therapy and medication pick-ups; behavioral health services, food, clothing, and hygiene kits; and referrals to social services, including vocational training, financial management, legal services, and transportation.	X	X	X
HF2 HAF2 MHSU4	Collaborate with HSH to ensure improved access to HIV, HCV, STI, and overdose prevention services. Work with HSH, supportive housing site managers, and tenant leaders to ensure that syringe services, overdose prevention and education, behavioral health, and sexual health services are available at shelters, navigation centers, supportive-housing sites, and single-room occupancy (SRO) hotels.	X	X	X

Social Determinant of Health HOUSING FIRST				
Related Strategy(ies)	Activities	2024	2025	2026 & beyond
HF2	Linkage and navigation systems. For PLWH, people with HCV, and people who are or can become pregnant experiencing homelessness, continue to improve linkage and navigation processes in hospitals, emergency departments, and jails to appropriate HIV primary care, biomedical HIV/STI prevention, and prenatal care destinations.	X	X	X
HF2	Programs for underrepresented minority (URM) patients. Support development of novel programs to target needs for URM patients and other special populations. Despite dropping rates of new HIV infections in San Francisco, the incidence of people newly diagnosed with HIV is rising in the Latine community. Getting to Zero SF is working to identify ways to improve the HIV prevention and care cascade for the Latine community. As described above, additional efforts are in place for the HAPs to focus on reaching specific populations (e.g., Black, Latino/a/x/e, PWU/ID, trans women, MSM, youth, etc.) in low-barrier settings. <i>(Getting to Zero SF)</i>	X		
HF2	Advocate for resources for pilot program for PLWH experiencing homelessness. Advocate for expanding successful evidence-based services like case management for PLWH experiencing homelessness. Identify and apply for funding from external sources to support pilot programs. <i>(Getting to Zero SF)</i>	X		
HF2	Further strengthen housing-related collaborations. SFDPH already has strong collaborations with the Mayor's Office of Housing and Community Development (MOHCD) and will continue to work with MOHCD to improve efficiencies in HOPWA-supported housing services.	X	X	X
HF2	Support housing navigation services. Fund an HIV Housing Navigator to collaborate with HSH and MOHCD to move Coordinated Entry Housing Referral Status clients with HIV through the placement process and ensure that HSH has a way to identify PLWH in the Coordinated Entry system.	X	X	X
HF3	Improve access to low-barrier programs. Streamline eligibility criteria for low-barrier and mobile-based HIV programs, and support movement between programs. Create a warm handoff referral guide for programs that focus on low-barrier care and access for PEH, including a small palm card with provider contacts. <i>(Getting to Zero SF)</i>	X		
HF3	Expand availability of long-acting injectable (LAI) ART and PrEP. Continue to work to expand access to LAI ART and PrEP in and outside of clinic environments, including through Health at Home, partnerships with behavioral health programs, and permanent supportive housing sites with nursing on site, and in collaboration with the Whole Person Integrated Care Initiative (WPIC) in shelters and navigation centers. <i>Getting to Zero SF</i> will also support development of pilot studies and research to assess acceptability, feasibility, and efficacy of LAI PrEP and ART, especially for people experiencing homelessness.	X	X	X

Social Determinant of Health HOUSING FIRST				
Related Strategy(ies)	Activities	2024	2025	2026 & beyond
HF3	Best practices for mobile care. Develop and disseminate toolkits for best practices regarding implementation in low-barrier, mobile care models. <i>(Getting to Zero SF)</i>	X		
HF3	Expand SFDPH capacity for mobile HIV/HCV/STI services. Develop a locally tailored, integrated, harm reduction-based mobile services model (“mobile HAP”) for HIV/HCV/STI testing and other prevention services, including overdose prevention and low-threshold access to medication-assisted treatments (MATs) such as naltrexone and buprenorphine. Priority neighborhoods include the Bayview and Mission, where a substantial percentage of the population is Black and Latina/o/e/x, respectively.	X	X	X

Introduction

San Francisco is known throughout the country and the world for its innovative models of HIV, HCV, and STI service delivery, including, but not limited to:

- Integrated, person-centered service models, such as the SFPD-funded Centers of Excellence and Health Access Points designed for specific populations
- Mobile and street-based health care and support services, provided by Whole Person Integrated Care (WPIC), which includes the Street Medicine Team, and other homeless outreach teams
- Extensive services delivered by peers with lived experience in HIV, HCV, and STI, such as End Hep C SF's HCV Community Health Navigator program
- Comprehensive sexual health services available to all at SF City Clinic

With these successes in mind, SF continues to innovate to break down the barriers to prevention and care access for communities affected by HIV, HCV, and STIs. SF is largely focused on expanding population-specific strategies, as opposed to “one-size-fits-all” models of care. This means making services quick, easy, and readily accessible, as well as redesigning service delivery to be more responsive to the needs of specific populations. Because the population-specific services SF offers are too numerous to name, the activities in this section focus on new and emerging population-specific models of care. In addition, we have highlighted programs that facilitate language access.

San Francisco Health Access for All Strategies

(see also *Housing First* and *Mental Health and Substance Use*)

- ✓ **Strategy 1: Redesigned Care Delivery**
Work with health care providers, local health departments, public and private insurers, and private industry to increase access to care statewide through mobile healthcare, pharmacy-based care, and at-home testing programs.
- ✓ **Strategy 2: Trauma-Informed and Responsive Services**
Train medical and public health service providers in trauma-informed approaches to create trauma-responsive care to minimize retraumatization of patients, clients, and providers.
- ✓ **Strategy 3: Fewer Hurdles to Healthcare Coverage**
Train more community-based organizations to support benefits enrollment in communities with high numbers of uninsured people.
- ✓ **Strategy 4: Culturally and Linguistically Relevant Services**
Improve capacity of public health and health care providers to offer HIV, HCV, and STI services that are responsive to diverse cultural health beliefs and practices, preferred languages, health literacy, and other communication needs.
- ✓ **Strategy 5: Collaboration and Streamlining**
Develop secure ways for clinical providers, local health jurisdictions, homeless services programs, and other community-based organizations to share information and resources to coordinate people's care while protecting their right to privacy.

Social Determinant of Health HEALTH ACCESS FOR ALL				
Related Strategy(ies)	Activities	2024	2025	2026 & beyond
HAF1A1	Implement point of care (POC) syphilis testing for people who are or could become pregnant. Conduct public health detailing for POC syphilis testing in clinical settings, and issue written guidance for community settings (e.g., HAPs) regarding HIV/HCV/STI testing for this population.	X	X	X
HAF1A1 SF4	Provider education. City Clinic staff will educate San Francisco Health Network providers to improve knowledge and comfort around sexual health care, including guidance and technical assistance on identifying risk factors and conducting appropriate screening and treatment for syphilis, as well as pregnancy and STI counseling.	X	X	X
HAF1A1 HAF1A5	Syphilis screening workflows. Develop workflows in the emergency department and urgent care that facilitate syphilis screening before discharge for all pregnant people, PEH, people with a history of meth use, and those receiving a HIV test.	X (develop)	X (imple- ment)	X (imple- ment)
HAF1A1 HAF1A5 SF4	Increase HIV, HCV, and STI screening, and PrEP prescribing at ZSFG. Through clinical education, consultation, and continuous QI efforts, clinical champions will work to implement the following improved protocols: 1) asking all hospitalized patients about HIV transmission risk factors to see if they qualify for PrEP counseling; 2) ordering HIV/HCV/STI testing; and 3) initiating or referring to PrEP if indicated.	X	X	X
HAF1A4	Advertising of sexual health services. City Clinic will create and disseminate public services video ads, in multiple languages, on social media and social networking sites aimed at increasing access to City Clinic testing, treatment, and vaccination services for HIV, STI, HCV, and Mpox.	X	X	X
HAF1A1	Accelerate efforts to increase PrEP use. We will implement a multi-layered strategy to address barriers to PrEP uptake, including regionally with Alameda County, with a focus on improving PrEP provision to people of color, trans women, PWUD, and people who are unhoused. Strategies will include expanding PrEP 2-1-1; mobile PrEP; making PrEP available at Mission Wellness pharmacy; and same-day PrEP models.	X	X	X
HAF1A1	Self-collection/home testing. SF is partnering with the TakeMeHome program to provide free mail order kits with the following: HIV dried blood spot test and STI self-test kits (oral, vaginal, and anal swabs, and urine for CT/GC and dried blood spot for syphilis). Users of networking apps, like Grindr, can access ordering links embedded within HIV-related app content and they will also be able to access their lab-based results through a secure portal. SFDPH will promote this program on websites and social media, through printed materials, and via mobile texts.	X	X	X
HAF1A1 HAF1A2	Improve low-threshold, trauma-informed, substance use harm reduction services in community settings. Integrate HIV/HCV/STI	X	X	X

Social Determinant of Health HEALTH ACCESS FOR ALL				
Related Strategy(ies)	Activities	2024	2025	2026 & beyond
MHSU2 MHSU4	prevention and care services, contingency management services to address methamphetamine use, and street-based/mobile behavioral health and harm reduction education, referrals and linkages.			
HAF3	Increase training and access to information on benefits enrollment. Train providers on current issues related to benefits enrollment, including complexities of navigating the AIDS Drug Assistance Program (ADAP), Office of AIDS-Health Insurance Premium Payment (HIPP) Assistance (OA-HIPP), Employer-Based HIPP (EB-HIPP), and Medicare Part D Premium Payment Assistance (MPPP). Develop client-facing materials to educate clients on these and other benefits options.	X	X	X
HAF4	Continue to improve language access to comprehensive services. SFDPH funds several programs where services can be accessed in Spanish and A&PI languages. Spanish services include outpatient mental health for PLWH. The following services are available through the COEs and HAPs in both Spanish and A&PI languages: HIV/HCV/STI testing, linkage and navigation, harm reduction and syringe access services, HIV/HCV/STI health education and prevention, services to meet basic needs (such as food security), HIV primary care, HIV PrEP, ART, HCV treatment, STI treatment, mental health services, and a host of wraparound services. SFDPH will continue to assess demand for services in other languages (such as Portuguese) and implement improvements as needed.	X	X	X
HAF5	Expand care coordination (CC). Continue to build on current CC efforts, such as weekly, cross-agency, multi-disciplinary care coordination calls (with follow-up via EPIC charting, chat, emails, and calls), including calls focused on pregnant people experiencing homelessness and HIV not-in-care.	X	X	X
HAF5	Make data systems that support making CC more accessible to community-based organizations and medical providers. In 2021, City Clinic transitioned to the SFDPH-wide enterprise electronic health record, EPIC, which has improved STI/HIV care coordination across SFDPH providers. SFDPH will continue to identify areas where data access would improve care, such as ensuring that all HIV/HCV/STI community-based providers have access to the One System—the Coordinated Entry System for housing services—as well as other key systems.	X	X	
HAF5	Develop a sustainable inventory of services, including eligibility criteria, location and hours, and referral procedures. Explore possible solutions to fragmented and duplicative resource lists and client referral procedures, such as collaborating with https://sfserviceguide.org/ to expand its resource inventory, leveraging the Frontline Organizing Group's listserv to provide	X	X	X

	regular updates to changes in services, and/or issuing a monthly newsletter to HIV/HCV/STI CBOs.			
HAF5	Streamline linkages for people released from jail. Expand HIV/HCV/STI treatment, care, and prevention navigation services to three HAP sites to establish a comprehensive, streamlined service model for people who are newly released from SF County Jail.		X	X

Introduction

The trifecta of homelessness, mental health, and substance use is one of the key drivers of new HIV, HCV, and STI infections, and has contributed to an alarming uptick of fatal overdoses in SF in recent years. In San Francisco, access to culturally appropriate mental health and substance use services is an essential component of HIV, HCV, and STI prevention and care. But that access is still limited for many of the people who most need it, despite Medi-Cal expansion, Mental Health SF and other attempts to increase access.

SF's success at addressing mental health and substance use will rely on the following overarching approaches:

- Improving and expanding options for harm reduction and substance use treatment, including low-barrier medication assisted treatment (MAT) and comprehensive syringe services programs, regardless of HIV, HCV, or STI status;
- Ensuring equitable access to naloxone and overdose prevention and response trainings; and
- Partnering with SFPD Behavioral Health Services (BHS) and the San Francisco Behavioral Access Center (BHAC) to work towards expanding availability of systemwide access to mental health services.

SAN FRANCISCO MENTAL HEALTH AND SUBSTANCE USE STRATEGIES

(see also **Housing First** and **Healthcare Access for All**)

✓ **Strategy 1: Overdose prevention in correctional settings**

Promote medication for opioid use disorder during incarceration in prison and jails and naloxone distribution and continuity of substance use disorder and medical care upon release.

✓ **Strategy 2: Mental health and substance use disorder treatment access through telehealth**

Leverage telehealth to increase access to mental health and SUD services, especially for people newly linked to stable housing and people who are monolingual in a language other than English.

✓ **Strategy 3: Build harm reduction infrastructure**

Expand syringe services in federally qualified health centers, hospitals, and SUD treatment facilities; build up staffing, brick and mortar locations, and comprehensive support services (health, legal, housing, benefits, employment) in existing syringe services programs.

✓ **Strategy 4: Expand low-threshold SUD treatment options**

Expand options for harm reduction-based treatment, including contingency management programs and easier access to buprenorphine and methadone, including in street medicine programs.

✓ **Strategy 5: Cross-Sector Collaboration**

Encourage collaboration between local and statewide mental health programs, substance use programs, and harm reduction and HIV/HCV/STI programs.

Social Determinant of Health MENTAL HEALTH AND SUBSTANCE USE				
Related Strategy(ies)	Activities	2024	2025	2026 & beyond
MHSU1	Comprehensive status-neutral sexual and drug user health services in jails, including naloxone. SFDPH's Jail Health Services provides HIV, HCV, and STI testing, naloxone, HIV primary care, and a wide range of other services to people experiencing incarceration. A goal for 2024-2026 is to move towards status-neutral services, where HIV care is not siloed from prevention so that all can benefit from the whole suite of services, including overdose prevention and HCV and STI services.	X	X	X
MHSU1	Comprehensive support for PLWH upon discharge from jail. Support comprehensive medical care and support services to people exiting SF jails, including case management, referral, and linkage to vital medical, behavioral health, and support services to people exiting jail. A navigator coordinates care and plans post-release services, meeting clients directly upon their release from jail (especially for those released at night, when regular services and support systems are unavailable) or as soon as possible. The navigator stays engaged with clients for at least 90 days following release.	X	X	X
MHSU3 MHSU4	Continue to provide comprehensive community-based drug user health services. The Health Access Point for people who use drugs provides comprehensive sexual and drug user health services, as do many other programs. In addition to the full suite of sexual health services, the following are also available: medication storage, safer injection and drug use supplies, harm reduction support, naloxone, drug sample testing, and substance use treatment.	X	X	X
MHSU5	Implement the most feasible recommendations from the HIV Mental Health Landscape Analysis. These recommendations will improve service access, delivery, and cross-referral for PLWH.	X	X	X
MHSU5	Collaborate with SAMHSA-funded programs. Increase collaboration and coordination with and among SAMHSA-funded programs in place at local CBOs.	X	X	X

 Social Determinant of Health
ECONOMIC JUSTICE

Introduction

In the last decade, SF has undergone dramatic economic transformation, resulting in rapidly growing economic inequality in the city and in the Greater Bay Area. The impact of this change on the lives of the city's most vulnerable communities cannot be overstated. This shift mirrors a trend toward income inequality throughout the entire state of California, whereby millions are consumed with the daily struggle of managing on extremely low incomes, while at the same time the incomes of higher income households continue to grow.

The sustainability of SF's rich network of high-quality HIV, HCV, and STI services relies on being able to hire and retain a highly qualified, diverse workforce. Anecdotally, sexual and drug user health nonprofits are having unprecedented challenges in filling positions, given the high cost of living in SF and the surrounding Bay Area. The San Francisco Living Wage Coalition estimates that in 2023, the minimum livable wage would be \$29.92/hour for a single adult with no children; yet, SF's legal minimum wage is \$18.07, with a modest increase to \$18.67 slated to go into place 7/1/2024.

At the same time, as of April 2024, SF City and County is facing a several billion dollar budget deficit, necessitating funding cuts across all city departments. In addition, in 2024, SFDPH received funding cuts from formula-based CDC awards due to a decline in the number of PLWH in SF. These economic realities make it even more challenging to successfully implement economic justice strategies such as wage equity initiatives.

SAN FRANCISCO ECONOMIC JUSTICE STRATEGIES

(see also *Racial Equity*)

- ✓ **Strategy 1: Workforce Development**
Create pathways to employment in public health for people from communities most affected by HIV, HCV, and STIs, including, but not limited to, offering paid internships and entry-level positions with clear opportunities for professional advancement.
- ✓ **Strategy 2: Employment for People with Lived Experience**
Encourage programs that employ people with lived experience in the communities the program serves, programs that can demonstrate frontline staff are paid a living wage, and/or programs that have BIPOC people serving in meaningful leadership positions.
- ✓ **Strategy 3: Equitable Hiring Practices and Fair Pay**
Examine state and local health jurisdiction hiring practices to promote equity and inclusion; look to remove barriers such as college and advanced degree requirements; offer extra pay to people who speak languages other than English or who have lived experience with HIV, HCV, STIs, substance use, mental health challenges, or homelessness.
- ✓ **Strategy 4: Leadership Development**
Fund and support pilot training programs for development of leadership and management skills among frontline and mid-level workers in HIV, HCV, and STI programs.
- ✓ **Strategy 5: Universal Hiring and Housing Policies**
Work with community partners and other State agencies to move toward universal "ban the box" hiring and housing policies in California, which remove questions about criminal history from the job application process until after a candidate has been given a chance to show whether they qualify for the position.

Social Determinant of Health ECONOMIC JUSTICE

EJ1 EJ2	Develop employment pathways for people with lived experience. Through CHLI, FOG, and other workforce initiatives, create pathways for people with lived experience to receive training, earn certificates, and be linked to potential job opportunities, with a special focus on PLWH who are looking to re-enter the workforce	X	X	X
EJ3 EJ5 RE1	Promote “Strengthening the HIV/HCV/STI Workforce.” This workforce equity resource guide for employers in the HIV, HCV, and STI sectors offers resources, examples, and best practices for recruitment, hiring, and retention of BIPOC and people with lived experience. There is a strong emphasis on wage equity, as well as information about hiring formerly incarcerated people. <i>(Workforce Development Collective)</i>	X	X	X
EJ3	Encourage CBO wage equity initiatives. Some community-based organizations are conducting compensation studies that lead to organizational changes toward wage equity.	X	X	X
EJ3	Explore innovative approaches to removing barriers to employment and retention. For both SFDPH and its funded CBOs, look for opportunities to remove barriers, such as not requiring advanced degrees for positions that do not need them, incorporating retention pay into benefits packages, or offering premium pay to workers who speak any of the non-English languages commonly spoken in SF.	X	X	X

Introduction

During the community engagement process that informed SF's 2020 Ending the Epidemics Plan, a recurring theme among participants was their experience of stigma. Stigma was a topic in every community engagement session, and in some cases was cited by participants as the largest barrier to accessing healthcare. Participants experience stigma from both providers and other community members related to HIV, race, gender, sexuality, immigration status, drug use, and homelessness. These stigmatizing actions take different forms: trans women described having to articulate that they are not "men who have sex with men" when being questioned around HIV risk; people experiencing homelessness feel unwelcome in healthcare facilities due to lack of access to spaces where they can clean themselves; PWUD describe having their complaints of pain ignored by providers. Particularly within communities of color, anti-gay stigma was felt to be a barrier to testing or treatment.

Participants named several approaches to help combat stigma in health care systems, and these are reflected in SF's strategies and activities:

- Provider education on delivering culturally appropriate sexual and drug user health services;
- Acknowledgment of and taking responsibility for past harms, and working toward ending current mistreatment; and
- Normalization of HIV/HCV/STI testing, as part of a larger health screening package that also includes screening for other conditions such as diabetes.

SAN FRANCISCO STIGMA FREE STRATEGIES

- ✓ **Strategy 1: Nothing About Us Without Us**
Meaningfully and consistently involve people living with HIV, HCV, and STIs in state and local planning, decision making, and service delivery.
- ✓ **Strategy 2: Reframe Policies and Messaging**
Work with communities to reframe the structure and policies of HIV, HCV, and STI services and associated messaging so they do not stigmatize people or behaviors.
- ✓ **Strategy 3: Positive, Accurate Information**
Ensure images and language used in communications show accurate and diverse depictions of communities, and do not reinforce stereotypes; speak out against and correct negative language.
- ✓ **Strategy 4: Acknowledge Medical Mistrust**
Recognize medical mistrust as a rational response to stigmatizing treatment, rather than a failure of individuals or communities; work to build trust and correct misperceptions by example.
- ✓ **Strategy 5: Ongoing Partnerships**
Use 'promotores' and other models of paid peer engagement by people from the communities being served to educate, support, advocate for, and link to care people who have historically been mistreated by public health services and the health care system.

Los Angeles County Integrated HIV Prevention and Care Plan, 2022-2026

December 2022

LOS ANGELES COUNTY
COMMISSION ON HIV

Acknowledgements

Our sincere appreciation to those who contributed to this project:

All of the members of the Los Angeles County Commission on HIV Priorities, Planning and Allocations (PP&A) Committee and Prevention Planning Work Group; Michael Green, Pamela Ogata, Julie Tolentino, Carla Ibarra, Ekow Sey, Mario J. Pérez, Wendy Garland, Sona Oksuzyan, Bret Moulton and Juli Carlos-Henderson of the Division of HIV and STD Programs (DHSP); Cheryl Barrit, Dawn P. McClendon, Lizette Martinez, Catherine Lapointe, Jose Rangel-Garibay, and Yeghishe (Josh) Nazinyan of the Los Angeles County Commission on HIV; Commissioners of the Los Angeles County Commission on HIV who provided community feedback on the draft document; key stakeholders across the County who assisted with the convening and/or facilitation of listening sessions, including Danielle Campbell, Greg Wilson, Bamby Salcedo, Maria Roman Taylorson, Timothy Zembek, Derek Murray, Mallery Robinson, Brian Risley, and Emmanuel Sanchez; and the many people living with and at risk for HIV who participated in listening sessions and/or completed surveys to inform the development of the Plan.

Special thanks to Cheryl Barrit, Executive Director of the LA County Commission on HIV and Kevin Donnelly, co-chair of the Commission's PP&A Committee, both of whom were steadfast champions of the planning process and essential to the Plan's completion.

This document was compiled by AJ King of Next-Level Consulting, Inc.

Section I: Executive Summary of Integrated Plan

The *Los Angeles County Integrated HIV Prevention and Care Plan, 2022-2026* is Los Angeles County's third integrated HIV services plan. Led by the Los Angeles County Commission on HIV's Priorities, Planning and Allocations (PP&A) Committee, this plan was developed in partnership with the Los Angeles County Department of Public Health Division of HIV and STD Programs (DHSP) and a vast array of community and organizational partners. The plan is developed in response to the *Integrated HIV Prevention and Care Plan Guidance, including the Statewide Coordinated Statement of Need, CY 2022-2026* disseminated by the Health Resources and Services Administration (HRSA) and the Centers for Disease Control and Prevention (CDC), and as such presents a blueprint for HIV service coordination along the entire spectrum of HIV prevention and care.

The Integrated Plan is designed to reflect local vision, values, needs and strengths. It is also designed to align with *California's Integrated Statewide Strategic Plan for Addressing HIV, HCV, and STIs from 2022-2026*, and *The National HIV/AIDS Strategy (2022-2025)*. In 2020, the *Ending the HIV Epidemic Plan for Los Angeles County, 2020-2025*¹ (EHE Plan) was developed and disseminated. As described in more detail below, this document served as the core of the Integrated Plan.

The Integrated Plan's seven priority populations are:

1. Latinx men who have sex with men (MSM)
2. Black/African American MSM
3. Transgender persons
4. Cisgender women of color
5. People who inject drugs (PWID)
6. People under the age of 30, and
7. People living with HIV who are 50 years of age or older

These populations were prioritized given the disproportionate impact of HIV and other STDs that they endure, as substantiated by the most current data, and as described in more detail throughout this document. With the exception of people living with HIV who are 50 years of age or older, these priority populations mirror the priority populations found in the EHE Plan. The latter category was included given the aging of the HIV-positive population and concerns related to the long-term impact of living with HIV and co-morbidities.

a. Approach

The EHE Plan formed the foundation for the Integrated Plan and provided Los Angeles County (LAC) an opportunity to add goals, objectives and strategies in response to newer data and more recent developments in the field since the EHE was originally crafted. The EHE Plan was also written and structured in accordance with the CDC's requirements and guidelines for *Notice of Funding Opportunity (NOFO) PS19-1906: Strategic Partnerships and Planning to Support Ending the HIV Epidemic in the United States Component B: Accelerating State and Local HIV Planning to End the HIV Epidemic* and does not include descriptions of the entire existing LAC HIV portfolio. The Integrated Plan herein contains sections of the EHE Plan, including the situational analysis and the goals and objectives, that have been updated and expanded since 2020.

¹<https://www.lacounty.hiv/wp-content/uploads/2021/04/EHE-Plan-Final-2021.pdf>

2. COMMUNITY ENGAGEMENT & PLANNING PROCESS

b. Documents submitted to meet requirements

The Integrated Plan fully meets submission requirements for each section (see Appendix 1 Checklist) through the use of existing materials, updated materials and newly developed materials, including the following:²

- Section I: Executive Summary of Integrated Plan: New material is submitted for this section.
- Section II: Community Engagement and Planning Process: A combination of new material and narrative from the EHE Plan are used in this section. The description of the Jurisdictional Planning Process includes material from the EHE Plan and a description of planning process steps that were taken since the EHE Plan was released.
- Section III: Contributing Data Sets and Assessments: The Data Sharing and Use subsection contains new material. The Epidemiological Snapshot is material largely based on the most recent HIV surveillance report, the *HIV Surveillance Annual Report 2021*,³ as well as STD data provided by DHSP. The Resource Inventory and Needs Assessment consists largely of new material, including new HIV testing data.
- Section IV: Situational Analysis: The Situational Analysis is updated material based on the EHE Plan with new narrative in some sections.
- Section V: 2022-2026 Goals and Objectives: Goals and Objectives are updated based on the EHE Plan.
- Section VI: 2022-2026 Integrated Planning Implementation, Monitoring and Jurisdictional Follow Up: The Integrated Planning Implementation, Monitoring and Jurisdictional Follow Up is new material.
- Section VII: Letters of Concurrence: The Letter of Concurrence is new material.

Section II: Community Engagement and Planning Process

Jurisdictional Planning Process: Because the EHE Plan forms the core of the Integrated Plan, the narrative below first describes the EHE community engagement process followed by the Integrated Plan community engagement process.

EHE Community Engagement Process: Prior to the launch of *Ending the HIV Epidemic: A Plan for America* (EHE), LAC developed and released its own jurisdictional plan in November 2017, the *Los Angeles County HIV/AIDS Strategy for 2020 and Beyond* (LACHAS), which offered a framework of policies, recommended strategies, and numerical targets that collectively we sought to achieve.

In February 2019, fifteen months after the release of LACHAS, the federal administration announced its plan to launch EHE, providing LAC with the opportunity to adapt and expand the goals and activities described in LACHAS and requiring LAC to align its current efforts with the national EHE initiative. LAC DHSP secured input and guidance on services and activities critical to LACHAS and necessary for EHE implementation through a series of listening sessions and planning meetings with community stakeholders. Stakeholders included the LAC Commission on HIV (local Ryan White Program (RWP) planning body), LAC Substance Abuse Prevention and Control (SAPC), LAC Acute Communicable Disease Control (ACDC), the California Department of Public Health Office of AIDS (California OA), the University

² See Appendix 1: *Integrated Prevention and Care Plan Guidance Checklist* for more information

2. COMMUNITY ENGAGEMENT & PLANNING PROCESS

of California at Los Angeles (UCLA) Center for HIV Identification, Prevention, and Treatment Services (CHIPTS), the local EHE Steering Committee,⁴ people living with HIV/AIDS (PLWH) and a broad network of community-based service providers. Planning meetings also took place in Oakland and San Diego. In addition, LAC DHSP engaged in meetings and site visits with multiple federal partners to inform local EHE efforts.

Local Prevention and Care Integrated Planning Body: The LAC Commission on HIV (Commission) is the local, federally mandated Ryan White Program community planning body that sets program priorities and funding allocations for HIV prevention, care, and treatment services throughout the County. The Commission is comprised of 36 members (all appointed by the Board of Supervisors) who represent the diversity of LAC and communities impacted by HIV. Currently, 42% of the commissioners identify as PLWH, 25% identify as Latinx MSM; 14% identify as women of color; and 6% identify as transgender. Other EHE and Integrated Plan priority populations are well represented on the various caucuses, including the Black/African American Caucus, the Transgender Caucus, the Aging Caucus, the Women's Caucus, and the Consumer Caucus.

After the release of the LAC HIV/AIDS Strategy (LACHAS), DHSP continued to collaborate with the Commission to disseminate, promote, and engage a broader set of community stakeholders to build knowledge and awareness of LACHAS strategies and goals, and to recruit new partners and voices into this effort. The Commission helped spearhead over a dozen call-to-action meetings, held in various communities and jurisdictions across the County, to inform, engage, and empower community stakeholders and residents to participate in LACHAS implementation. Through extensive outreach and promotion to the existing network of HIV planning, program and service partners as well as special invites to key stakeholders and elected officials not traditionally engaged in HIV efforts, over 750 community stakeholders were reached in the call-to-action meetings. Summary reports from these meetings included health district demographics, key takeaways, and top insights from the group discussions were developed and distributed to the community. The Commission was integral in promoting LACHAS, encouraging community involvement, and identifying non-traditional partners to join the movement to end the HIV epidemic. The ongoing community engagement and input conducted for LACHAS provided valuable perspectives on needed services and activities and helped drive the development of the EHE Plan.

In response to the announcement of EHE Plan, the Commission held an all-day community meeting in November 2019 with over 190 participants to: 1) Directly hear from community partners on an EHE Plan for LAC, 2) Determine the best way to engage the community moving forward while transitioning from LACHAS to the EHE Plan, and 3) Garner input on the leadership necessary to achieve EHE goals. Attendees included community stakeholders, PLWH, service providers, elected officials and/or their representatives, community clinics, County partners (Department of Mental Health, Department of Public Health, Department of Health Services and Substance Abuse and Prevention Control), universities, neighborhood associations, and faith-based organizations.

The meeting included a panel of representatives from the California OA; DHSP leadership; the Office of Assistant Secretary of Health's Region IX Prevention through Active Community Engagement (PACE) Team; UCLA CHIPTS, among other important HIV stakeholders. Key takeaways included the importance

⁴ http://publichealth.lacounty.gov/dhsp/EHE/Biosketches_EHE_SteeringCommittee_040521.pdf

2. COMMUNITY ENGAGEMENT & PLANNING PROCESS

of multi-sector commitment to achieve EHE goals, a commitment to being disruptively innovative with new and expanded interventions and policies, ensuring transparency and accountability from all partners, and lifting voices of communities most impacted by HIV.

In January 2020, the Commission reinforced its commitment to EHE efforts by providing dedicated space for Commissioners and members of the public to participate in discussions focused on innovative community engagement and mobilization efforts that include bringing new voices to the table to end the epidemic. Participants broke out into small groups to discuss and address several key questions, including: 1) How can community members take individual action in EHE efforts, 2) Which sectors should partners prioritize for new or increased mobilization around EHE, and 3) How can the development of a new EHE Steering Committee be used to support efforts to recruit new perspectives, enlist change agents and spur more action. As a follow up to these community-driven discussions, the Commission is also working to increase membership on its planning body with persons representing pharmaceutical companies, commercial health plans, and California's Medicaid program.

In September 2020, LAC DHSP released the draft EHE plan to community stakeholders as part of a 30-day public comment period and partnered with the Commission to ensure individuals and communities were aware of the input opportunity. In addition, Commissioners were provided an opportunity to submit written feedback as a complement to the listening sessions facilitated by Commission staff. The Commission submitted 13 pages of public comments to be considered for inclusion in the EHE Plan including recommendations from the Black/African American Community Taskforce.

Local Service Provider Partners: Local service providers, including those who represent federally qualified health centers (FQHCs), medical providers in private practices and community clinics, and a variety of community-based organizations (CBOs) are represented and engaged through various committees, coalitions, working groups, and networks across LAC. There is a strong network of LAC DHSP funded CBOs that serve people living with and affected by HIV in diverse communities across the County. In addition, there are several public facing listservs that disseminate information for trainings, webinars, and events related to HIV and the social determinants of health that impact HIV outcomes. Service providers are also represented on the Commission, the EHE Steering Committee, and Service Provider Networks (SPNs) in specific jurisdictions across the County. There are strong coalitions and groups in LAC such as the LAC PrEP/PEP Working Group and the Ending the Epidemic's Statewide Coalition that address policy and advocacy on the intersection between HIV, sexually transmitted diseases (STDs), and viral hepatitis. By actively working with these groups and coalitions, LAC DHSP gained input and guidance on HIV prevention, care, and treatment efforts. Service providers were actively engaged in the various community listening sessions and health district discussions that were facilitated as part of the development and release of LACHAS; and most were active in the development and refinement of the EHE Plan. LAC DHSP continues to partner and collaborate with two city health departments that exist within the County (Long Beach Department of Health and Human Services and the Pasadena Public Health Department) to advance EHE strategies. We collectively work to ensure that existing HIV plans, programs and related goals in these jurisdictions are aligned with the LAC EHE Plan.

In addition to the existing service provider network, LAC DHSP has been working to enlist its five Regional Health Offices that oversee all public health issues in specific geographic service planning areas throughout the county as well as the LAC Community Prevention and Population Health Task Force which focuses on the social determinants of health but has not yet identified HIV as a priority public health issue. New potential EHE partners were also identified through the UCLA CHIPTS Regional EHE

2. COMMUNITY ENGAGEMENT & PLANNING PROCESS

Coordination meeting held January 2020. In addition, LAC DHSP will continue to work with the LAC Departments of Mental Health and Health Services to develop systems and processes that more effectively align goals, strategies, and programming to optimize HIV-related services for clients and communities. The PACE Program has been an important resource to help advance local EHE community engagement efforts. Separately, the LAC DHSP HIV Medical Advisory Committee (which includes medical leadership from Ryan White Program-funded HIV Clinics across the County) and the Medical Care Coordination (MCC) Learning Collaborative (which provides feedback on all HIV prevention and treatment activities for high acuity clients in the MCC program) also provided valuable feedback and perspectives tied to the EHE Plan.

Integrated Plan Community Engagement Process: The development of the Integrated Plan was a collaborative process between the Commission on HIV (the local HIV planning council), LAC DHSP, and community stakeholders. As part of its existing structure, the Commission's Planning, Priorities and Allocations (PP&A) Committee leads needs assessment activities, planning, and resource allocations. As such, the PP&A Committee spearheaded the Integrated Plan planning process with the assistance of a contracted consultant. It was decided early on that, rather than have a dedicated task force to develop the plan, planning steps would be integrated into the overall work of the Commission.

The development of the Integrated Plan began in July of 2021 with a presentation at the Commission on HIV monthly meeting. During this meeting, the purpose and requirements of the Integrated Plan were presented to all attendees including Commission members and the public. The history of planning and the blueprint for plan development were also discussed, particularly given that many members had not previously been a part of any planning process. Following this initial meeting, the consultant leading the planning process met with numerous groups and individuals to develop each section of the plan, as described below.

To develop the needs assessment section, DHSP and Commissioners were hesitant to engage in any new assessment activities, given that much assessment had recently taken place to develop the EHE Plan and other local HIV/STD reports. However, as planning progressed, issues related to system and workforce capacity began to emerge as key barriers to achieving HIV-related goals. Thus, it was decided to take steps to assess this particular issue by developing and distributing an online survey in English and Spanish. The survey was developed with a team of stakeholders including PLWH, academic partners, and staff representing CBOs, FQHCs, and DHSP. To ensure that the voices and perspectives of priority population members and PLWH were reflected in the Integrated Plan, listening sessions were conducted with members of priority population groups (Black MSM, women of color, trans persons, people who inject drugs (PWID), people younger than 30 and PLWH 50 and older). The consultant worked with various community stakeholders to organize and facilitate these groups. For example, to convene a group of Black MSM, the consultant worked with staff at a community-based organization that primarily serves Black gay and bisexual men to recruit 16 participants. This listening session was co-facilitated by a staff member and the consultant. The other listening sessions were convened in a similar manner. These listening sessions attracted 86 community members, many of whom identified as PLWH. Survey and listening session findings, largely qualitative in nature, complimented the use of secondary data sources.

The EHE goals and objectives served as a foundational starting point to develop the Goals and Objectives section. A series of five workgroup meetings designed to capture ideas for additional goals, objectives, and strategies were convened. Workgroup participants included co-chairs of the Commission, the PP&A Committee, the Public Policy Committee, and community members, including PLWH.

2. COMMUNITY ENGAGEMENT & PLANNING PROCESS

- a. **Entities involved in process:** Representatives from the following entities and population groups met to develop the Integrated Plan:
- The Los Angeles County Department of Public Health, Division of HIV and STD Programs
 - The City of Long Beach Health Department
 - The City of West Hollywood Health Department
 - The California State Office of AIDS
 - The AIDS Coordinator for the City of Los Angeles
 - Service providers and Commission members that represented at least 20 different community-based organizations, hospitals or universities serving PLWH or at risk for HIV
 - People with HIV including members of a Federally recognized Indian tribe as represented in the population, and individuals co-infected with hepatitis C
 - Ryan White Program Part C and D HIV clinical providers
 - Ryan White Program Part F – AETC providers
 - Faith-based CBOs
 - Community health clinics and Federally Qualified Health Centers (FQHCs)
 - Substance use treatment providers
 - Hospital planning agencies and health care planning agencies
 - Mental health providers
 - Formerly incarcerated PLWH
 - Social services providers including housing and homeless services representatives
- b. **Role of the RWHAP Part A Planning Council/Planning Body:** The Los Angeles County Commission on HIV serves as the local Ryan White HIV/AIDS Program (RWHAP) Part A Planning Council. The Commission's Priorities, Planning and Allocations (PP&A) Committee spear-headed the development of the Integrated Plan. Commission staff and PP&A leadership met regularly with the consultant to oversee the development of the Integrated Plan. The consultant provided updates at the monthly Commission meeting and PP&A meeting.
- c. **Role of Planning Bodies and Other Entities:** Throughout the development of the Integrated Plan, the consultant and/or Commission leadership met with members of the EHE Steering Committee and DHSP staff that are tasked with implementation of the EHE Plan. EHE Steering Committee members expressed an interest in making sure that the Integrated Plan was aligned with the EHE Plan, that community stakeholders were engaged in the planning process and that the Integrated Plan reflected new developments in the field (e.g. the use of long acting injectables for PrEP and HIV treatment). The consultant and other planning team members also convened and/or participated in over 35 meetings to engage with a variety of groups, caucuses and task forces throughout the County including:
- The Commission on HIV's:
 - Aging Caucus
 - Women's Caucus
 - Transgender Caucus
 - Black/African American Community Task Force (Later renamed the Black Caucus)
 - Consumer Caucus

2. COMMUNITY ENGAGEMENT & PLANNING PROCESS

- Prevention Planning Work Group
 - Standards and Best Practices Committee
 - Public Policy Committee

 - Long Beach Community Planning Group
 - Service Planning Area (SPA) 2 HIV/AIDS Consortium Meeting
 - SPA 4 Provider Meeting
 - Los Angeles County Department of Public Health, DHSP
 - Los Angeles County Department of Public Health, Acute Communicable Disease Control (ACDC)
 - Community groups consisting of priority population members (outlined in more detail in the Needs Assessment section)
- d. **Collaboration with RWHAP Parts:** Providers from Ryan White HIV/AIDS Program Parts B, C, D and F were engaged in the planning process in a variety of ways. In early 2022, a meeting was convened with 12 representatives from seven different RWP Part C, D and F recipient organizations. Participants identified several key topics to be included in the Integrated Plan including a need to focus on social determinants of health and co-occurring disorders (especially syphilis, methamphetamine use and mental health issues); workforce development and capacity issues; culturally congruent services; and an aging population of PLWH.

Planning team members also met with stakeholders that were involved in the development of other Integrated HIV Plans within or inclusive of LAC in order to ensure alignment and avoid duplication of efforts. These plans included *California's Integrated Statewide Strategic Plan for Addressing HIV, HCV, and STIs from 2022-2026*; *the Long Beach HIV/STD Strategy, 2019-2021* and *the West Hollywood HIV Zero Strategic Plan, 2016-2021*. Although the time frame for the latter two plans had ended, it was important to meet with the planners to learn from their experiences and identify any priority areas to highlight in the LAC Integrated Plan. Key issues identified included a need to focus on stigma, social determinants of health and co-occurring disorders (including housing, mental health and meth use), and broadening harm reduction efforts.

- e. **Engagement of People with HIV:** PLWH were engaged in all stages of the planning process, including needs assessment, priority setting, development of goals and objectives, and development of the implementation plan. As noted above, 42% (or 15) of the 36 Commissioners are PLWH. Each of the six community listening sessions included PLWH and 57% of the community survey participants identified as PLWH. Priority setting took place at PP&A Committee meetings which are chaired by two PLWH. Goals and objectives and an accompanying implementation plan were developed over the course of several meetings, all of which included PLWH as active participants. In addition, the Integrated Plan was a key agenda item at the Commission's Annual Planning meeting with many people with HIV in attendance. There was also a public comment period of 30 days whereby PLWH and other key stakeholders were invited to review the Plan and provide feedback. All feedback obtained was used to help shape the final version of the Plan. The monitoring, evaluation and improvement of the Plan will be spearheaded by the PP&A Committee, with PLWH serving as active participants.
- f. **Priorities:** Key priorities that arose out of the planning and community engagement process included the need to:
- Embrace a status neutral approach to planning and implementation – equally respecting PLWH

3. CONTRIBUTING DATA SETS & ASSESSMENTS: DATA SHARING & USE

- and people at risk for HIV, their strengths, and their needs
- Address social determinants of health, especially housing
- Address co-occurring disorders including other STDs, mental health issues and meth use disorder
- Expand harm reduction services
- Address HIV-related disparities, particularly the disparities experienced by Black/African Americans
- Increase health literacy among PLWH and people at risk for HIV
- Increase workforce capacity
- Meet the needs of PLWH age 50 years old and older and/or long-term survivors
- Create more holistic services, especially for cisgender and transgender women
- Align funding streams and resources to ensure that PLWH and people at risk for HIV are able to seamlessly access high quality services

- g. **Updates to Other Strategic Plans Used to Meet Requirements:** As noted, portions of the LA County EHE Plan were utilized to develop the Integrated Plan. LA County uses surveillance data, assessment data, and the ongoing feedback of key stakeholders, including PLWH to update plans on a regular basis, typically annually.

Section III: Contributing Data Sets and Assessments

The *Contributing Data Sets and Assessments* section is comprised of four major sub-sections: (1) Data Sharing and Use; (2) Epidemiologic Snapshot; (3) HIV Prevention, Care and Treatment Resource Inventory; and (4) Needs Assessment.

DATA SHARING AND USE

Multiple data sources are utilized in LAC to monitor the HIV and STD epidemics, track service utilization, better understand service needs and assess progress in achieving county-wide and national HIV-related goals. The County uses the Electronic HIV Reporting System (eHARS), a CDC-developed information system for collecting, storing, and retrieving HIV surveillance data. In addition to eHARS, the main data sources include HIV incidence surveillance and molecular surveillance. Collectively, these data sources give LAC the ability to track the extent of the County's HIV epidemic including persons who are diagnosed and receiving care as well as those who are diagnosed and not in care. They also provide the data needed to develop the HIV Care Continuum measures, including the number of PLWH who are linked to care, in receipt of care, retained in care, and virally suppressed.

Data from population-based surveys conducted among key populations at increased risk for HIV and people living with HIV (PLWH) were also used to inform the Integrated Plan. This includes LAC data collected for the CDC-funded National HIV Behavioral Surveillance System from 2004 to 2019 and Medical Monitoring Project from 2015 to 2019.

National HIV Behavioral Surveillance (NHBS): LAC is one of 20 sites participating in this national CDC-funded HIV biobehavioral surveillance effort that allows state and local health departments to monitor HIV prevalence and risk behaviors among select populations at risk for HIV infection. These populations include men who have sex with men (MSM), persons who inject drugs (PWID), heterosexuals at increased risk for HIV infection (HET), and transgender (TG) women. NHBS participants were residents of

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

LAC and at least 18 years of age. Participants who provided informed consent completed an interviewer-administered anonymous standardized questionnaire about HIV-related behaviors and underwent confidential rapid HIV and standard Hepatitis B and C testing. In this document, key findings from NHBS available to date in LAC are reported. Results may not be generalizable to the broader population groups represented.

Medical Monitoring Project (MMP): The MMP is a national HIV surveillance system funded by the CDC and implemented by local health departments. The aim of MMP is to provide locally and nationally representative data on behavioral and clinical outcomes in a sample of persons receiving HIV medical care. MMP uses a two-stage probability-based sampling strategy that draws from the National HIV Surveillance System (NHSS) to select survey participants: the first stage is selecting the geographic areas to participate, and the second stage is selecting adults diagnosed with HIV and reported to NHSS within those participating areas. Sampled persons were recruited to participate in person, by telephone, or by mail. To be eligible for MMP, the person had to be living with diagnosed HIV infection, aged ≥ 18 years, and residing in an MMP project area. Participants were recruited via telephone, by mail, or in person. Interview questions include demographic information, health care use, met and unmet needs for ancillary services, sexual behavior, depression and anxiety, gynecologic and reproductive history (females only), drug and alcohol use, and use of prevention services.

Other datasets that LAC uses that contribute to the assessment of need and HIV-related health outcomes among people at risk for or living with HIV within the County include:

- (1) Ryan White Program (RWP) client and service utilization data through Casewatch (LAC's RWP client data system);
- (2) HIV testing data for testing conducted through DHSP's contracted providers;
- (3) STD Casewatch data; and
- (4) U.S. Census Bureau data, including data from the annual American Community Survey

LAC utilizes an evidence-based approach to planning that relies on an understanding of HIV surveillance and other sources of data. To ensure that planning participants, including Commission members and members of the community were well-versed in the most recent data, an HIV epidemiology training was conducted during the Planning, Priorities and Allocation Committee meeting in July 2022. This training presented key epidemiology terms as well as their application in examining the current LAC HIV epidemiology profile of PLWH, people at risk for HIV, and trends in the epidemic.

EPIDEMIOLOGIC SNAPSHOT

The Gabrielino Tongva, Fernandeño Tataviam, and Ventureño Chumash are the First People and original stewards of the land that today we call Los Angeles County, California. As the most populous county in the United States, LAC is home to an estimated 9,861,224 residents as of 2022. The County's urban, suburban and rural communities span over 4,000 square miles and comprise 88 incorporated cities and approximately 140 unincorporated areas. LAC is among the most ethnically and economically diverse regions in the nation with immigrants making up over a third of the County's population.⁵ An estimated 69,144 Angelenos are homeless on any given night⁶ and over 14,000 inmates are housed in county jails - the largest jail system in the U.S.⁷

⁷ <https://www.prisonpolicy.org/origin/ca/2020/report.html>

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

I. People Living with HIV in LA County

At the end of 2020, there was an estimated 59,400⁸ PLWH,⁹ aged 13 years and older in LAC, including 1,401 who had been newly diagnosed (in 2020) and an estimated 6,800¹⁰ persons who were unaware of their infection (Figure 1). As described in more detail below, HIV continues to be driven by social determinants of health and co-occurring disorders and disproportionately impacts some population groups more than others.

Figure 1: People Living with HIV in LA County, 2020

a) Geographic Distribution of People Living with Diagnosed HIV (PLWDH): The County is made up of 26 different health districts which overlay eight distinct Service Planning Areas (SPAs).¹¹ As depicted in Figure 2, HIV diagnoses and prevalence are unevenly distributed geographically across the County with the highest density of both those newly diagnosed with HIV (between 2016-2020) and all PLWDH found in the central and southern regions. Among all 26 Health Districts, Hollywood-Wilshire, Central, and Long Beach are considered the three epicenters for HIV, reporting the largest numbers of new HIV diagnoses (170, 126 and 92, respectively) and PLWDH at year-end 2021 (9,352, 6,708 and 4,237 respectively).

⁸ 95% Confidence Interval: 57,500 – 61,300

⁹ Throughout this document, "People Living with HIV," or "PLWH," is meant to denote *all* people living with HIV, whether or not they are diagnosed. This figure is always an estimation given that we are unsure of the exact number of people with HIV who are undiagnosed. By contrast, "People Living with Diagnosed HIV," or "PLWDH," is meant to denote all people who have been diagnosed with HIV and are living in LAC. This number does not include those who are undiagnosed.

¹⁰ 95% Confidence Interval: 4,800 – 8,700

¹¹ (1) SPA 1: Antelope Valley, (2) SPA 2: San Fernando Valley, (3) SPA 3: San Gabriel Valley, (4) SPA 4: Metro, (5) SPA 5: West, (6) SPA 6: South, (7) SPA 7: East, and (8) SPA 8: South Bay

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 2: Geographic Distribution of PLWDH at year-end 2021 & Persons Newly Diagnosed with HIV, 2016-2020, LA County

b) People Living with Diagnosed HIV in LA County, 2020: Of the 52,600 PLWDH in 2020, 87% were cisgender men, 11% were cisgender women and 2% were transgender persons (Figure 3). With respect to race/ethnicity, Latinx people make up the greatest proportion of PLWDH (46%), followed by the White population (26%), the Black/African American population (20%), the Asian population (4%), and those who identify as multi-racial (4%). The American Indian/Alaskan Native (AI/AN) and Native Hawaiian/ Pacific Islander (NH/PI) populations collectively make-up less than 1% of PLWDH. The Black/African American population is significantly over-represented among PLWDH, given that Black/African Americans make up 8% of the County's overall population, but 20% of the population of PLWDH. AI/AN people are also over-represented among PLWDH, given that they make up 0.2% of the overall population, but 0.6% of PLWDH (Figure 4).

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 3: People Living with Diagnosed HIV by Gender, LA County 2020**Figure 4:** Racial/Ethnic Composition of LA County,¹² 2020 Compared to Racial/Ethnic Composition of PLWDH in 2021

With respect to sex at birth and race/ethnicity (Fig. 5), the populations most impacted by HIV are Latinx males who represented 41% of all PLWDH followed by White males (24%) and Black males (17%). Combined, these groups represent 82% of all PLWDH in LAC. HIV disparities are even more pronounced when the population of PLWDH is compared to the overall population. For example, Latinx males represent 24% of the LAC population and 41% of PLWDH; Black males represent 4% of the population, and 17% of PLWDH; and White males represent 14% of the population and 24% of PLWDH. Altogether, AI/AN, NH/PI and multi-racial men and women represented less than 5% of PLWDH.¹³

¹² Based on the 2020 population estimates provided by LAC ISD & contracted through Hedderson Demographic Services.

¹³ PLWDH with unknown race/ethnicity were not presented in the graph (n=69). NH/PI and AI/AN represented less than 1% and were presented for males and females combined due to limited visibility on the graph. Population estimates for multi-racial persons are not available.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 5: Race/Ethnicity and Sex at Birth among LA County Residents, 2020, Compared to Race/Ethnicity and Sex at Birth among PLWDH in 2021

While Latinx people make up the largest *proportion* of PLWDH, AI/AN people have the highest *rates* of HIV.¹⁴ The Black/African American population also has extremely high rates of HIV per 100,000 population (1,392) compared to Latinx (579), White (559) and Asian (147) populations. Rates are also significantly higher among males (1,067) versus females (131); and among those aged 50-59 (1,154) and 40-49 (818) compared to other age groups (Fig. 6).

Rates for transgender people are not typically calculated, given the lack of reliable population estimates and the relatively small population size compared to cisgender men and women. However, the UCLA School of Law Williams Institute has recently published transgender population estimates based on data from the CDC's Behavior Risk Factor Surveillance System and Youth Risk Behavior Survey.¹⁵ They estimate that in California, among adults, 0.49% (150,100) identify as transgender and among youth ages 13 to 17 in the U.S., 1.93% (49,100) identify as transgender. They also report that of those that identify as transgender in the U.S., 38.5% are transgender women, 35.9% are transgender men, and 25.6% reported they are gender nonconforming. If we were to apply these percentages to LAC, we would find that there are approximately 38,050 people 18 or older in LAC that identify as transgender (7,765,339 people 18 or older in LAC x 0.49%); and that approximately 14,649 (38,050 x 38.5%) of them identify as transwomen, that 13,660 (38,050 x 35.9%) of them identify as transmen, and that 9,741 (38,050 x 25.6%) of them identify as gender nonconforming. Given that there are approximately 1,052 transgender PLWDH in LAC, the rate of HIV infection among trans persons would be 2,764 per 100,000 population. Assuming that approximately 90% of all transgender PLWDH are transwomen (1,052 x 90% = 947), the HIV rate among transwomen would be 6,464.

¹⁴ Given the relatively small population size of AI/AN people, rates may not be fully accurate.

¹⁵ Herman, J., Flores, A. & O'Neill, K. (2022). *How Many Adults and Youth Identify as Transgender in the United States?* The Williams Institute, UCLA, Los Angeles, CA.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 6: Rates for PLWDH by Gender, Race/Ethnicity and Age Group, LA County, 2020

c) People Newly Diagnosed with HIV: In 2020, 1,401 persons aged 13 years and older were newly diagnosed with HIV, down from 1,560 persons in 2019. Since 2016, the overall diagnosis rate has decreased from 22 (per 100,000 population) to 16. The gap between male and female new diagnoses rates has also decreased slightly although the rate among males is still ten times that of females (Figure 7). Rates have also decreased across all race/ethnicities although Black/African Americans continue to have the highest rates compared to other groups (Figure 8). Those aged 20-29 and 30-39 also continue to have the highest rates compared to other age groups (Figure 9).

Figure 7: HIV Diagnoses Rate by Sex at Birth¹⁶, LA County, 2016-2020**Figure 8: HIV Diagnoses Rate by Race/Ethnicity¹⁷, LA County, 2016-2020**

¹⁶ Rates are not available for trans persons given their small population size

¹⁷ Rate is unknown for AI/AN in 2019

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 9: HIV Diagnoses Rate by Age Group, LA County, 2016-2020

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 10: New HIV Diagnoses by Gender, LAC 2020

Cisgender men made up most of the new HIV diagnoses in 2020 (N=1,201, 86%). Cisgender women (N=143) and transgender persons (N=57) represented 10% and 4% respectively of new HIV diagnoses in 2020 (Figure 10). Among the 57 transgender persons newly diagnosed with HIV in 2020, notably, all identified as transgender women.

In 2020, among males, those aged 20-29 (65) and 30-39 (48); and Black/African Americans (76) had the highest rates of new HIV diagnoses. Among females, those aged 30-39 (7) and Black/African Americans (10) had the highest rates of new HIV diagnoses (Figures 11 and 12).

Figure 11: HIV Diagnoses Rates among Males & Females by Age Group, LAC 2020

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 12: HIV Diagnoses Rates among Males & Females by Race/Ethnicity, LAC 2020

In 2020, the primary HIV transmission risk for newly diagnosed males was having sex with other men (90%), followed by IDU (5%), MSM/IDU (4%) and heterosexual contact (1%). The primary HIV transmission route among females newly diagnosed with HIV was heterosexual contact (69%). In 2020, the percentage of cases with IDU as the primary transmission route among females increased to 31% compared to 25% in the previous year (Figure 13).

Figure 13: Transmission Risk Among Males & Females Newly Diagnosed with HIV, LAC 2020

Perinatal Transmission: In LAC, although the number of HIV-positive pregnant women has decreased over time, the number of perinatal HIV transmissions is increasing. In 2020 there were four infants who acquired HIV perinatally resulting in a rate of 8 per 100 HIV-exposed infants. Notably, common maternal risk factors included meth use (n=3), being unhoused (n=3), mental illness (n=3), syphilis (n=3) and a history of incarceration (n=2).

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Unhoused: Since 2011, the percentage of persons newly diagnosed with HIV who were unhoused has more than doubled from 4.2% to 9.4%. In 2020, among 132 unhoused persons with a new HIV diagnosis, 73% were cisgender men, 19% were cisgender women and 8% were transgender. However, the HIV diagnoses rates of the unhoused have been relatively stable over this time, indicating that the increase in the unhoused population likely explains the increases in HIV diagnoses (Figure 14).

Figure 14: Number of Unhoused PLWDH by Gender and Percentage of Persons Newly Diagnosed and Unhoused at time of Diagnosis, LA County, 2020

Stage of HIV disease among Newly Diagnosed: Information on stage of HIV disease at the time of diagnosis provides direct insight into the timeliness of an HIV diagnosis. The HIV surveillance case definition of HIV has four stages: Stage 0, 1, 2, and 3. Stage 0 includes those with acute infection at diagnoses (Acute HIV) and those with no evidence of acute infection at diagnosis. Acute HIV is based on the difference in days between the first HIV-positive test result and last HIV-negative test result. If the difference falls within 60 days, HIV is classified as acute HIV.¹⁸ The criterion for Stage 1 disease is CD4 $\geq$ 500 cells/ μ L within 90 days of diagnosis. Stage 2 is CD4 between 200-499 cells/ μ L within 90 days of diagnosis. Stage 3 criteria include either CD4 < 200 cells/ μ L within 90 days of HIV diagnosis or a diagnosis of an opportunistic illness within 90 days of HIV diagnosis.

In 2020, 15% of new HIV diagnoses were diagnosed at Stage 0, with over half of those diagnosed at Stage 0 having acute HIV at diagnosis (Figure 15). The proportion of PLWDH with acute HIV was highest among men, persons aged 20-29 years, and MSM. One in five new HIV diagnoses presented with CD4+ T-cells < 200 cells/ μ L at the time of diagnosis in 2020, indicative of late-stage HIV disease. The proportion of PLWDH with late-stage disease (Stage 3) was highest among females, those who identified as Latinx or multi-racial, those over 40 years of age, and those with IDU or heterosexual transmission risk (Figure 16).

¹⁸ The number of newly diagnosed persons with stage 0 are likely underestimated due to under-reporting of HIV-negative test results.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 15: Stage of HIV Disease among Newly Diagnosed PLWH, LA County 2020**Figure 16:** Percentage of Newly Diagnosed Presenting with Late-Stage Disease (Stage 3) at Time of Diagnosis, by Gender, Race/Ethnicity, Age Group and Transmission Category, LAC 2020

*Stage 3: Either CD-4 <200 w/in 90 days of diagnosis or diagnosis of opportunistic illness w/in 90 days

High Priority Cluster Areas: Federal guidelines for the care and treatment of PLWDH recommend HIV viral genotype testing at initiation of HIV care to determine whether an individual's HIV strain is resistant to certain drugs. The genotype testing, which results in a genetic sequence report reflecting an individual's HIV viral strain, is reported to DPH along with other HIV laboratory and clinical test results.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Molecular HIV Surveillance is the collection and analysis of HIV genotype data generated through HIV drug resistance testing. Through a comparison of the viral genotype reports of PLWDH in the local area, it can be determined if there are multiple people with a highly similar HIV strain. Because HIV's genetic sequence constantly evolves, people whose viral strains are highly similar are likely to be in the same social HIV transmission network (i.e., transmission cluster).¹⁹ Transmission clusters with numerous newly HIV diagnosed individuals may indicate that recent and rapid HIV transmission is occurring among a group of individuals. When a cluster is identified, it can inform the delivery of services and interventions to minimize transmission in a geographic area and prioritize efforts to those who need them the most.

In 2020, 7% of persons newly diagnosed with HIV were associated with a priority transmission cluster. These persons were more likely to be aged 13-29 years, Latinx, and have MSM transmission risk compared with persons newly diagnosed with HIV who were not associated with a priority cluster. Persons associated with a priority transmission cluster were also more likely to reside in the Southeast, San Antonio, Northeast, and Antelope Valley Health Districts; report methamphetamine use and anonymous partners; and have syphilis co-infection. The geographic distribution of the transmission clusters and priority level for follow-up are presented below in Figure 17. The blue clusters are low priority (< 5 persons with new HIV diagnoses between 2018-2020), the green as medium priority (≥ 5 persons with new HIV diagnoses between 2018- 2020), and the red as high priority (≥ 5 cases diagnosed in 2020).

Figure 17: Molecular HIV Cluster by Zip Code and Priority, LA County, 2020

d) New HIV Infections²⁰: The annual number of new HIV infections reflect infections acquired in a

¹⁹ It is important to note that this information cannot be used to determine either direct transmission or the direction of transmission between any two individuals.

²⁰ HIV incidence is approximated using CDC's CD4 depletion model, which uses HIV surveillance data and the first CD4 value after HIV diagnosis to estimate HIV incidence, HIV prevalence, and percentage of undiagnosed HIV. The date of HIV acquisition is estimated for each person with a CD4 test using the model. To account for persons without a CD4 test result, persons with CD4 test results are assigned a weight based on the year of HIV diagnosis,

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

calendar year. Some new infections are diagnosed soon after acquiring HIV, but the majority are not. When the number of new HIV infections is high, HIV continues to spread, because most people with a new infection are not aware they are living with HIV. New infections provide information on recent transmission and serve as a barometer to assess whether HIV prevention strategies are reducing transmission. Trends in new infections generally track with trends in new diagnoses unless transmission is very low or high in the population. An estimated 1,400 persons aged 13 years and older acquired HIV in 2020. These new infections may or may not have been diagnosed that year.²¹ Estimates are not considered true values and should be interpreted along with a range of values that is likely to contain the true value with a certain degree of confidence (such as a 95% confidence interval). In 2020, the 95% confidence interval for the estimated number of new infections ranged from a low of 900 infections to a high of 1,990 infections. The number of persons newly diagnosed and the estimated number of persons who acquired HIV (new infection) have declined between 2010 and 2020. In 2010, there were an estimated 2,300 new infections and 2,186 new HIV diagnoses. In 2020, 1,404 persons were newly diagnosed with HIV, reflecting both new and old infections. An estimated 1,400 persons acquired HIV in 2020, reflecting new infections, some of whom were not diagnosed.

e) People Living with Undiagnosed HIV: In 2020, an estimated 11% of PLWH, or 6,800, were unaware of their HIV status.²² Since 2010, awareness of HIV has increased among PLWH from 82% to 89% (Fig. 18), however, since 2019, awareness of HIV-positive status decreased across all age, sex and race/ethnicity categories, with the largest decrease observed among cisgender women (-6 percentage points).

Figure 18: Percentage of PLWH that were Aware of their HIV Status, 2010, 2015, 2020

— Bolded line indicates the EHE Plan and Integrated Plan goal of 95% awareness by 2025

sex, race/ethnicity, transmission category, age at diagnosis, disease classification, and vital status at the end of the specified year.

²¹ The annual number of new HIV diagnoses is the number of PLWH who received an HIV diagnosis in a calendar year. A new HIV diagnosis is *not* equivalent to a new infection that was acquired in a calendar year. Many people live years before they are diagnosed while some are diagnosed soon after acquiring HIV. Based on local data, the majority of new HIV diagnoses each year were infections acquired over a year ago.

²² Estimated using the CD4-based model developed by the Centers for Disease Control and Prevention.
https://journals.lww.com/jaids/Fulltext/2017/01010/Using_CD4_Data_to_Estimate_HIV_Incidence,.2.aspx.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Among PLWH in 2020, the largest gaps in knowledge of HIV-positive status existed for younger persons, where approximately 42% of persons aged 13-24 years and 25% of persons aged 25-34 years with HIV were not aware of their HIV-positive status. Females and people who were Latinx or Black were also more likely to be unaware of their status compared to other groups (Figure 19).

Figure 19: Awareness of HIV-Positive Status among PLWH by Sex at Birth, Age Group and Race/Ethnicity, LAC 2020

The percentage of PLWH who were aware of their HIV-positive status also varied by location. There were five Health Districts with at least 90% of PLWH aware of their HIV status - Hollywood-Wilshire, West, Central, Northeast and Pasadena. Conversely, the five Health Districts with the least percentage of PLWH aware of their status were Compton, Southeast, Whittier, El Monte and Pomona (Figure 20).

Figure 20: Percentage of PLWH who were aware of their HIV Status by Health District, LA County 2020

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

II. Clinical & Behavioral Characteristics of PLWH and People at Risk for HIV

Clinical and behavioral characteristics of PLWH and people at-risk for HIV are largely compiled through the use two biobehavioral surveillance efforts, the National HIV Behavioral Surveillance (NHBS) and the Medical Monitoring Program (MMP).

Since 2016, the NHBS has surveyed four different population groups: MSM, persons who inject drugs (PWID), heterosexuals at increased risk for HIV and transgender women. Across all NHBS participants living with HIV, 83% of MSM and 80% of transwomen were aware of their HIV-positive status. In contrast, only 63% of PWID were aware of their status²³.

MSM: Among MSM, over the course of five rounds of NHBS spanning over a decade, HIV prevalence has consistently been highest among Black MSM. In the most recent surveillance round (2017), 36% of Black MSM were living with HIV compared with 18% of Latinx MSM and 15% of White MSM. In 2017, HIV testing within the previous 12 months was high among MSM of all race/ethnicity groups, with 90% of White MSM reporting testing, and 83% of both Latinx and Black MSM reporting testing. Reports of condomless anal sex ranged from 71% among Black MSM to 79% among Latinx MSM. Twenty-eight percent of Black MSM, 25% of Latinx MSM and 24% of White MSM reported having an STD diagnosis. Exchanging sex for money or drugs was also highest among Black MSM (11%), compared to Latinx (7%) and White MSM (7%). Knowledge of PrEP was high (>92%) among MSM irrespective of race/ethnicity. Among participants who reported HIV-negative or unknown HIV status, 36% of White MSM had used PrEP within the past 12 months compared with 29% of Latinx MSM and 22% of Black MSM. Among MSM, the overlapping epidemic of meth use contributes to increased risk of HIV acquisition. Methamphetamine use is frequently associated with increased unsafe sexual activity and meth-using MSM are much more likely to have multiple sexual partners and report inconsistent condom use than MSM who do not use meth.

Transgender Women: NHBS data found that in 2019, transwomen had the highest HIV positivity rate (1 in 3 were HIV-positive) compared with other populations at elevated risk of HIV, with Black transwomen having the highest positivity rate (52%), compared with Latinx (30%) and White (9%) transwomen. Black transwomen were more likely to practice condomless anal sex and exchange sex for drugs or money but less likely to test recently for HIV than their Latinx and White counterparts. Meth use was also high among transwomen, with 33% of White transwomen, 28% of Black transwomen, and 17% of Latinx transwomen reporting use. PrEP knowledge was also high, however use of PrEP among HIV-negative transwomen in the past 12 months was low. The majority (91%) of HIV-negative transgender women had heard of PrEP and a little over half (55%) had discussed PrEP with a healthcare provider. Twenty-seven percent had taken PrEP in the last 12 months and 21% were PrEP persistent. Most respondents (70%) in the 2019 cycle reported a household income at or below the FPL and 42% were currently unemployed. Nearly 1 out of 2 participants (47%) reported being homeless at the time of the interview and 23% had been incarcerated in the previous 12 months. Over half of participants reported anal sex without a condom in the past 12 months (57%) and 35% reported having sex in exchange for food, shelter, money, or drugs. Nearly 2 out of 3 transwomen participating in NHBS reported having experienced verbal harassment over the last 12 months because of their gender identity or presentation. One out of 5 participants reported having seriously considered suicide. Recent sexual abuse was also reported by nearly 1 out of 5 respondents.

²³ Results for PWID may be unstable due to small numbers and should be interpreted with caution.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

People Who Inject Drugs (PWID): Substantial disparities exist among PWID along the diagnosis and care cascade. About one in three PWID living with HIV did not know they were infected (compared to one in five transwomen and one in six MSM). Once diagnosed, PWID had lower levels of receipt of care, retention in care and viral suppression than those with MSM and heterosexual contact transmission risk. A higher percentage of PWID aged 18-29 years reported sharing syringes or injection equipment (50% and 74%) compared with PWID aged >30 years (32% and 56%). Conversely, 15% of those 30 or older and 10% of those 18-29 reported exchanging sex for money or drugs. Injection of methamphetamines during the past 12 months increased from 59% in the 2015 IDU NHBS cycle to 68% in the 2018 IDU cycle. Non-injection use of methamphetamine also increased significantly (32% to 75%).

At-Risk Heterosexuals: In the 2016 heterosexual cycle, a total of 526 persons $\geq$ age 18 who reported having vaginal or anal sex with a partner of the opposite sex in the past 12 months were surveyed. Of these, 54% were male and 46% female. Of the women surveyed, 57% were Black, 36% Latina and 2% were White. Eighty-three percent reported no more than a high school diploma/GED and 82% reported a household income at or below the FPL. Eighty-four percent had health insurance, 11% reported being homeless at the time of the interview, and 14% had been incarcerated in the previous 12 months. Heterosexual cisgender women were more likely to have tested for HIV and STDs than heterosexual men. Among women, more Black women reported condomless sex with a casual partner, receiving money or drugs in exchange for sex, and having concurrent sexual partnerships than Latinx women. More recently, data suggest that meth is also contributing to increased HIV risk among heterosexual people with syphilis.

III. Other STDs²⁴

In recent years, STD rates have dramatically increased in LAC. According to provisional 2021 data, 28,115 gonorrhea cases and 5,746 early syphilis cases were reported to LAC - continuing the overall trend of increases in annual cases. In the last decade, there has been an 847% increase in syphilis rates among females and a 128% increase among males. Alarming, the number of reported congenital syphilis cases increased over 20 times between 2012 and 2021.

Chlamydia: In 2021, of the 52,121 cases, more than half were seen in cisgender females (56%) and 20-29 years old (54%). Hollywood-Wilshire (959 cases per 100,000), Central (1,035 cases per 100,000), South (987 cases per 100,000) and Southwest (956 cases per 100,000) Health Districts had rates about two times the rate of infection in LAC (545 cases per 100,000).

Gonorrhea: In 2021, the rate among African Americans (769 per 100,000) was more than four times that of Whites and Latinx people (168 and 185 per 100,000, respectively). The Hollywood-Wilshire and Central Health Districts had rates (906 and 796 per 100,000, respectively) that were approximately three times the rate of infection in LAC (294 per 100,000). Most of the gonorrhea case were among cisgender males (71%) and those aged 20-34 (63%).

Syphilis: In LAC, 5,746 early syphilis cases were reported in 2021 with a rate of 60 per 100,000, reflecting a 2% rate increase compared with the 2019²⁵ rate and a 161% increase compared with 2012. Rates were

²⁴ All 2021 data are provisional, and 2020 population estimates were used as a proxy for 2021

²⁵ Due to underreporting of STDs in 2020 due to the COVID-19 pandemic, a comparison with 2020 STD data may be unreliable.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

higher among males (99 per 100,000) compared to females (18 per 100,000); however, from 2019 to 2021, there was a 64% increase in early syphilis rates among females compared to a 5% decrease among males. Transgender individuals represented 3.4% of the early syphilis cases. Rates were highest in persons aged 25-29 among females (56 per 100,000) and among males aged 30-34 (265 per 100,000). The rate among African Americans (142 per 100,000) was more than three times that of Whites (46 per 100,000) and more than four times that of Latinos (60 per 100,000). Hollywood-Wilshire and Central Health Districts had a rate (205 per 100,000) that was more than three times the rate of infection in LAC (60 per 100,000). Increasing rates of syphilis among MSM/W, women and newborns (congenital syphilis) represent a concurrent epidemic with meth use disorder in LAC. As syphilis rates increase rapidly among women, LAC has reported 113 and 123 congenital syphilis (CS) cases in 2020 and 2021, respectively. After a rapid decline since 2006, LA County also had a perinatal HIV transmission rate of 7% in 2020, the highest ever seen, with three of the four babies also co-infected with CS. Maternal risk factors for congenital syphilis include meth use, unstable housing, mental illness, and lack of prenatal care.

STD and HIV Co-infection: Persons with syphilis, gonorrhea, and/or chlamydia are at an increased risk of acquiring HIV due to biological and behavioral factors. STDs among PLWH can also increase HIV viral load and the risk of forward HIV transmission. The percentage of persons newly diagnosed with HIV who had one or more STDs in the same year nearly doubled from 25% in 2012 to 46% in 2021. In 2012, 11% of those newly diagnosed with HIV had chlamydia in the same year; 11% had gonorrhea and 12% had syphilis. By 2021, those percentages grew to 18%, 22% and 26%, respectively. This reflects a rapid rise in the total number of syphilis cases in LAC over the same period (Figure 21).

Figure 21: Percentage of Persons Newly Diagnosed with HIV who had Syphilis, Gonorrhea and/or Chlamydia in the Same Calendar Year as HIV Diagnosis, LA County, 2012 and 2021

In 2021, percentages of syphilis, gonorrhea and/or chlamydia co-infections among people newly diagnosed with HIV were highest in the transgender population. Among both cisgender women and cisgender men with newly diagnosed HIV, syphilis co-infection was higher than co-infection with other STDs. By age group, syphilis co-infection was highest among people aged 30-49 years old, while co-infection with gonorrhea and chlamydia was highest among people aged 13-29 years (Figure 22).

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 22: Percentage of persons newly diagnosed with HIV who had syphilis, gonorrhea, and/or chlamydia in the same calendar year as HIV diagnosis by STD, gender and age group, LAC (excluding Long Beach and Pasadena) 2021

Hepatitis C Virus: In the U.S., the majority of persons become infected with hepatitis C virus (HCV) by sharing needles or other equipment used in injecting drugs.²⁶ In 2019, among the 1,952 (47%) reported acute cases in the U.S. that included risk information for injection drug use, 1,302 (67%) reported injection drug use. Since the early 2000s there have been notable increases in HCV incidence among young people (15–29 years old), mostly associated with increases in opioid and injection drug use (IDU).²⁷ Subpopulations with higher injection drug use typically include unhoused persons and criminal justice-involved individuals. In the most recent (2018) NHBS survey cycle targeting PWID, of the 510 people screened for HCV, HCV antibody prevalence was 58% and the prevalence of HCV and HIV co-infection was 1%. PLWDH who are co-infected with HCV are more likely than those with HCV alone to develop end-stage liver disease, and higher viral loads for both HIV and HCV results in increased transmission risks.

COVID-19: Between January 2021 to March 2022, there were 6,048 cases of COVID-19 among PLWDH, representing a rate of 1,249 cases of COVID-19 and HIV co-infection per 10,000 PLWD.³ Rates of COVID-19 and HIV co-infection among PLWDH were highest among females, persons aged 18-29 years, Latinx persons, residents of SPA 8 (South Bay), persons with MSM/IDU transmission risk and unhoused persons. Persons with HIV and COVID-19 co-infection had higher levels of hospitalization, intensive care

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

unit admission, intubation, and death compared with all COVID-19 patients, regardless of COVID-19 vaccination status. However, COVID-19 vaccination reduced the risk of these severe outcomes for both HIV and COVID-19 co-infected patients and COVID-19 patients.

IV. HIV Care Continuum

The HIV Care Continuum is a series of steps starting from when a PLWH receives a HIV-positive diagnosis through the achievement of viral suppression. The HIV care continuum includes the following: (1) among persons receiving a diagnosis of HIV in a given calendar year, the percentage of persons who were linked to HIV care within 1 month of diagnosis (defined as ≥ 1 CD4/VL/Genotype test reported within 1 month of HIV diagnosis); and (2) among all persons living with diagnosed HIV, the percentage of persons who (a) received HIV care (defined as ≥ 1 CD4/VL/Genotype test per year)²⁸, (b) were retained in HIV care (defined as ≥ 2 CD4/VL/ Genotype tests at least three months apart per year), and (c) were virally suppressed (defined using most recent viral load) per year. The base population for measuring linkage to HIV care is persons who received a HIV-positive diagnosis in a given calendar year, whereas the base population for the downstream steps in the continuum of care is all persons who were diagnosed with HIV through the prior calendar year and living in LAC with diagnosed HIV in the current year. The latter ensures that there is at least one year of follow-up to measure receipt in care, retention in care, and viral suppression.

Figure 23: HIV Care Continuum, LA County 2020 and 2021

As depicted in Figure 23, 76% of people newly diagnosed with HIV in 2020 were linked to care within one month; and among all PLWDH in 2021, 68% received HIV care at least once in the calendar year, 48% were retained in care, and 61% were virally suppressed. Table 1 provides an overview of HIV Care Continuum outcomes across different characteristics of PLWDH, with the poorest outcomes in each group highlighted in red font.

²⁸ "Receipt of Care" and "Engagement in Care" are synonymous terms

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Table 1: HIV Care Continuum Outcomes among Select Characteristics of PLWDH, 2020-21

Characteristic	Linked to Care within 1 month	Engaged in Care	Retained in Care	Virally Suppressed
Men	77%	68%	48%	61%
Women	67%	67%	47%	59%
Transgender	81%	69%	49%	56%
13-19	63%	85%	59%	78%
20-29	76%	74%	45%	64%
30-39	78%	68%	43%	59%
40-49	73%	66%	47%	59%
50-59	78%	68%	50%	62%
60+	76%	67%	51%	62%
Black	71%	63%	42%	54%
Latinx	79%	68%	49%	61%
White	73%	69%	48%	63%
Asian	90%	72%	51%	68%
NH/PI	--	73%	47%	63%
AI/AN	86%	66%	42%	57%
Multi-race	69%	81%	55%	71%
MSM	78%	69%	48%	62%
IDU	75%	57%	40%	48%
MSM/IDU	67%	67%	47%	56%
Heterosexual	66%	66%	48%	60%
Total	76%	68%	48%	61%

Linkage to Care: Linkage to HIV care is typically tracked as being linked to HIV care within one month of HIV diagnosis. However, initiating HIV care services should occur faster, ideally within one week, to ensure that HIV treatment can start immediately. Though timeliness of linkage to care has improved, only 76% of persons who were newly diagnosed in 2020 were linked to HIV care within one month and only 54% were linked to HIV care within one week. Among persons aged 13 years and older newly diagnosed with HIV in 2020, groups that were least likely to be linked to care within one month of diagnosis were cisgender women (67%), Black/African Americans (71%), those whose race/ethnicity was classified as “Other” (71%), persons aged 13-19 years (63%), and persons with heterosexual (66%) and MSM/IDU (67%) transmission risk (Figure 24).

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 24: Linkage to Care within 1 Month of Diagnosis, among PLWDH, LAC 2020

Receive Care/Retained in Care/Viral Suppression: Once linked to HIV care, performance along the HIV care continuum remains low. In 2021, only seven in ten PLWDH received care services, five in ten were retained in care, and six in ten were virally suppressed. The percentage of PLWDH who were receiving HIV care and retained in care were similar across gender groups, while the percentage who were virally suppressed was slightly lower among transgender persons. Adolescents had better HIV care outcomes than their counterparts, while persons aged 30-49 had the poorest outcomes across all age groups. With respect to race/ethnicity, Blacks/African Americans had the worst HIV care outcomes compared with other groups. Persons whose transmission risk was IDU had the lowest levels of receipt of care, retention in care and viral suppression. The greatest disparities in viral suppression were among Black sub-populations, cisgender women and transgender persons, persons aged 30-49 years, and persons whose transmission risk included injection drug use (Figure 26). By geographic area, unsuppressed viral load was highest in the Central Health District, followed by the South, Southeast, Harbor, Hollywood-Wilshire, West, and Northeast.

Figure 25: HIV Care Continuum, LA County, 2021

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 26: Viral Suppression among PLWDH, LA County 2021**Figure 27:** Unsuppressed Viral Load²⁹ by Census Tract among persons diagnosed through 2020 and living in LAC at year-end 2021 (N=1,687)*

²⁹ Unsuppressed viral load: numerator includes PLWDH whose last VL test in 2021 was unsuppressed (HIV-1 RNA ≥ 200 copies/mL; denominator includes PLWDH diagnosed through 2020 and living in LAC at year-end 2021 based on most recent residence. PLWDH without a VL test in 2021 were considered virally unsuppressed. Analysis excludes PLWDH diagnosed through 2020 and living at year-end 2021 who (1) had missing census tract information, (2) were receiving care but never had a viral load test, (3) were not receiving care for >12 months at year-end 2021, or (4) were in census tracts with small sample sizes. Exclusions represented 68% of PLWDH diagnosed through 2020 and living in 2021 whose last viral load was unsuppressed.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Timeliness of Care and Viral Suppression: Among persons newly diagnosed with HIV in 2020 with treatment information included in their case reports, 74% had initiated treatment within one month of diagnosis and 89% within three months of diagnosis. Timeliness from HIV diagnosis to viral suppression has improved over time, but early viral suppression is lagging. In 2021, only 51% of PLWDH were virally suppressed within three months of diagnosis while 76% of PLWDH were virally suppressed within 12 months of diagnosis.

Unhoused: Persons living with HIV who are unhoused continue to experience suboptimal outcomes along the HIV care continuum. Compared with housed persons, unhoused persons had lower rates of receiving HIV care, retention in care, and achieving viral suppression in 2021.

Figure 28: HIV Care Continuum among Persons Unhoused at Time of Diagnosis, LAC, 2020-21

V. Social Determinants of Health

Key social determinants of health including housing status, poverty, and recent incarceration, increase the risk of HIV acquisition and transmission. While data for social determinants of health are not as widely or consistently collected as demographic information, it is critically important to understand how these factors contribute to the experience of people at increased risk for HIV and those living with HIV. As depicted in the figure below, compared to both the state of California and the U.S., LAC fares worse with respect to key social determinants of health. LAC has a higher unemployment rate, a higher percent of its population living in poverty, and a lower percentage of its adult population that has graduated high school.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: EPI SNAPSHOT

Figure 29: Select Social Determinants of Health, LA County Compared to California and U.S., 2021

Limited socio-economic data is collected on the HIV case report forms that are used to populate the population-level case surveillance, therefore, additional data from the MMP, NHBS, and RWP Part A programmatic data are utilized to better understand the impact of social determinants of health on people at risk for and living with HIV in LAC. The MMP data is intended to be representative of all PLWDH in LAC. The RWP Part A data is representative of PLWDH in LAC who received at least one RWP-funded service in Year 31 (March 1, 2021-February 28, 2022). A total of 21,877 clients, or approximately two out of every five PLWDH in LAC, received at least one core or support RWP service in Year 31.

Poverty: Based on data collected in MMP, it was estimated that nearly half of PLWDH in LAC from 2015-19 were living at or below the Federal Poverty Level (FPL) in the past 12 months. Among RWP clients in Year 31, 64% were living at or below FPL. RWP subpopulations who were the most impacted by poverty were those recently incarcerated (85.4%), transgender persons (78.4%), and cisgender women (75.7%). Of the 501 transgender women who participated in the LAC NHBS in 2019, 70% reported living in poverty in the past year. Likewise, of the 511 PWID who participated in the LAC NHBS in 2018, 75% reported a household income below the federal poverty level.

Housing Status: Based on estimates from MMP, approximately 11% of PLWDH in 2015-19 experienced homelessness in the past 12 months. Among RWP clients experiencing homelessness, most (80%) were living at or below FPL in the past 12 months and nearly half were MSM of color (47%). The largest percentages of RWP clients experiencing homelessness were among recently incarcerated (33%), trans persons (25%), and PWID (23%). Among the transgender NHBS participants, 47% had experienced homelessness in the past year; and 64% of the PWID participants were currently homeless.

Experience with the Justice System: MMP estimates that approximately 2% of PLWDH in 2015-19 were incarcerated in the past 12 months. Information on experience with the justice system for RWP clients is collected as “recent incarceration” (in the past 24 months) and “ever-incarcerated,” and in Year 30 was reported for 16,656 clients. Of these, 8% were recently incarcerated and 18% were ever-incarcerated. Among clients who were recently incarcerated, 85% were living at or below FPL in the past 12 months and one-third were experiencing homelessness. The largest percentages of RWP clients recently incarcerated were among those experiencing homelessness, using injection drugs, and identify as transgender. Twenty-three percent of the transgender NHBS participants and 46% of the PWID participants reported recent incarceration (within past 12 months).

VI. Priority Populations

Based on HIV and STD disparities detailed above, the priority populations for the Integrated HIV Prevention and Care Plan, 2022-2026 are: Black MSM; Latinx MSM; Women of Color; Persons of Trans Experience; PLWH Aged 50 and Older; Persons Under 30; and PWID. This mirrors the EHE priority

3. CONTRIBUTING DATA SETS & ASSESSMENTS: RESOURCES INVENTORY

populations, with the added category of PLWH Aged 50 and Older. These priority populations are also aligned with the National HIV/AIDS Strategy: 2022–2025 priority populations: gay, bisexual, and other men who have sex with men, in particular Black, Latino, and American Indian/Alaska Native men; Black women; transgender women; youth aged 13–24 years; and people who inject drugs.

HIV PREVENTION, CARE AND TREATMENT RESOURCE INVENTORY

The LAC HIV Prevention, Care and Treatment Resource Inventory is depicted in Table 2. Los Angeles County has identified an estimated \$425,945,143 in HIV-related funding, 57% of which is attributed to Medi-Cal (\$242,424,556) expenditures. Although comprehensive in nature, the inventory is a point-in-time estimate and is still incomplete, given that some financial data are not available (e.g. Medicare and private insurance companies' financial data are not available). As local private fundraising can vary dramatically from year to year, this information was not collected and is also excluded from this report.

Organizations and Agencies Providing HIV Care and Prevention Services in Los Angeles County: There are at least 52 organizations/agencies that are not a part of the County system and at least 14 different County departments that provide HIV care and/or prevention services in LAC.

HRSA and CDC Funding Sources: HRSA and CDC funding is detailed in Table 2 and summarized below:

HRSA Funding:

- Part A: \$42,142,230 for RWP Year 32 -Year 1 of a 3-year award. The direct recipient of Part A funding, DHSP, contracts with 27 subrecipients to deliver Part A core and support services. All Ryan White funds are used as 'payor of last resort' and are designed to fill the gaps where other resources are insufficient or do not exist at all. Ryan White Part A funds are an integral part of LAC's safety net of services targeting PLWH at all stages of the HIV Care Continuum. Part A grant funds core and support services for PLWH including AOM, Oral Health, Early Intervention Services (EIS), Emergency Financial Assistance Services, Home and Community Based Health Services, Mental Health Services, Medical Case Management (Medical Care Coordination or MCC), Non-medical Case Management (Benefits Specialty), Food Bank and Home Delivered Meals, Housing Services - Residential Care Facility for the Chronically Ill (RCFCI) and Transitional Residential Care Facility (TRCF), Legal Services, Linguistic Services, Medical Transportation, and Outreach Services (Linkage and Reengagement Program). The Commission on HIV conducts a priority setting and resource allocation process in which they review existing and anticipated funding from all other public and private sources, including other Ryan White funds (Parts B, C, D, and F). DHSP manages funds from local, state, and federal sources to avoid duplication. Client eligibility screening for Ryan White services is entered into LAC's current Ryan White client database, Casewatch. This client-level data system enables service providers to ensure that Part A funds are used as a last resort. Using non-medical case management funding, LAC funds "Benefits Specialty" services, which help PLWH identify the non-Ryan White resources for which they are eligible.
- Minority AIDS Initiative (MAI) - \$3,780,205, March 1, 2022-February 28, 2023 - Year 1 of a 3-year award. DHSP, the direct recipient of MAI funds, contracts with subrecipients to provide Housing (permanent supportive housing), and Non-medical Case Management (Transitional Case Management) in LAC.
- Part B: \$5,446,809, April 1, 2022- March 31, 2023 - Year 4 of a 5-year award. DHSP receives Part B base grant funds, and contracts with subrecipients to fund Housing Services (RCFCI and TRCF), and Substance Use Residential services. The Commission on HIV allocates Part A and Part B funds

3. CONTRIBUTING DATA SETS & ASSESSMENTS: RESOURCES INVENTORY

together through its priority and allocation process.

- Part C-Early Intervention Services (EIS): \$5,859,855. HRSA provides Part C-EIS funds directly to 13 organizations throughout LAC. As many of these organizations also receive Part A funds, DHSP requires that they allocate Part C and Part A resources individually for services supported by both funding streams, and they are required to provide detailed budgets for each to prevent overlap. Part C EIS funds provide comprehensive outpatient primary health care to PLWH. Appropriate use of Part C funds includes HIV counseling and testing; monitoring of disease progression; treatment of HIV; diagnosis and treatment of related infections; and case management and assistance accessing other federal, state, and local programs that could provide needed health and support services to PLWH.
- Part D: Women, Infants, Children, and Youth: \$1,777,658. HRSA directly funds three organizations in Los Angeles County to provide Part D services targeting women, infants, children, and youth (Table 2). Part D funds can be used similarly to Part A and C funds with the difference being the intended target population of women, infants, children, and youth. Similar to Part C, the three organizations funded for Part D also receive Ryan White Part A funding. DHSP requires that funding allocations and services delivered are tracked separately to ensure there is no duplication.
- Part F – Dental Reimbursement Program: \$1,975,156. HRSA directly funds three dental schools in Los Angeles County. For the schools that also receive Part A funding for oral health services, DHSP requires that Part A and Part F funds do not duplicate services.
- Part F – AIDS Education and Training Center (AETC): \$788,056.00. The Los Angeles office of the Pacific AETC provides a wide variety of training and education to healthcare providers. DHSP and the Commission on HIV collaborate with the AETC in training sessions, conferences, and consultations on various topics, and plan on working closely with the AETC to build workforce capacity and educate providers about emerging issues as part of its work over the next five years.
- Part F – Special Projects of National Significance: \$410,000 – September 30, 2022 – September 29, 2023 – Year 3 of a 3-year grant. Two CBOs in LAC were funded with this grant: Building Capacity to Implement Rapid Start to Improve Care Engagement Initiative, the purpose of which is to accelerate the initiation of ART and entry into HIV medical care for people with HIV who are newly diagnosed, new to care, or out of care.
- Ending the HIV Epidemic - \$6,168,850, March 1, 2022-February 28, 2023 - Year 3 of a 5-year grant. HRSA's EHE grant awarded to DHSP supports 1) data system infrastructure development and systems linkages; 2) surveillance improvements and building organizational capacity, 3) emerging practices, evidence-informed and evidence-based interventions for diagnosis and rapid linkage to care; 4) reengagement in care and viral suppression; and 5) community engagement, information dissemination specifically calling attention to the activities for PLWH who are not virally suppressed.
- Ending the HIV Epidemic- Primary Care HIV Prevention - \$8,159,376 –April 1, 2022-March 31, 2023. Year 1 or Year 2 of a 2-year grant. In LAC, 17 FQHCs were awarded EHE funding in 2021 and 7 were awarded EHE funding in 2022 (15 other FQHCs were awarded funds in 2020, but those grant terms have ended). This grant is used to expand access to medication to prevent HIV (including PrEP and related services), connect people to care, and ensure care services are well coordinated. Funds are

3. CONTRIBUTING DATA SETS & ASSESSMENTS: RESOURCES INVENTORY

also used to strengthen partnerships with community organizations such as HRSA's Ryan White HIV/AIDS Program-funded organizations and health departments.

CDC Funding:

- Ending the HIV Epidemic - \$3,360,658 – August 1, 2022-July 31, 2023 – Year 3 of a 5-year grant. This grant supports HIV prevention strategies, including 1) HIV self-testing; 2) community engagement; 3) increased access to syringe services; 4) increased screening for PrEP; 5) HIV prevention media campaigns; and 6) improved surveillance data for real-time HIV cluster detection and response.
- Integrated HIV Surveillance and Prevention - \$17,950,095 – January 1, 2022-December 31, 2022 – Year 5 of a 5-year grant. This grant awarded to DHSP supports 11 HIV surveillance and prevention strategies including active and passive surveillance; outbreak investigation; data management, analysis and reporting; comprehensive individual-level and community-level HIV-related prevention services; and data-driven planning.
- HIV Treatment Improvement Demonstration Project - \$597,083 - January 1, 2022-December 31, 2022 - Year 5 (1-year extension in 2022) of a 4-year grant. The two goals of this project are 1) increase infrastructure to improve classification of provider-level HIV surveillance data and 2) provide technical assistance on quality improvement to increase viral suppression, retention in care, and durable viral suppression among low performing providers in Los Angeles County.
- National HIV Behavioral Survey & TG supplement - \$716,168 - January 1, 2022-December 31, 2022 - Year 1 of a 5-year grant. This grant supports Los Angeles County's participation in this four-cycle national survey (MSM, IDU, Heterosexuals, and TG). Survey findings are used for the planning purposes, program development, and resource allocation.
- Medical Monitoring Project - \$728,648 - June 1, 2022-May 31, 2023 - Year 3 of a 5-year grant. This grant supports Los Angeles County's participation in the national surveillance project designed to learn more about the experiences and needs of PLWH (in and out of care).
- Strengthening STD Prevention and Control for Health Departments - \$3,356,049 - January 1, 2022-December 31, 2022 - Year 4 of a 5-year grant. This grant is used to support five strategy areas: STD surveillance, disease investigation and intervention, screening and treatment, promotion and policy, and data management and utilization. No more than 10% of grant funds support contracts.
- STD Prevention and Control for Health Departments –Disease Investigation Specialist (DIS) Workforce Development Infrastructure - \$6,598,516 - January 1, 2022-December 31, 2022 – Year 2 of a 5-year grant. This grant supports expanding, training, and sustaining local DIS workforce to support increased capacity to conduct disease investigation, linkage to prevention and treatment, case management and oversight, and outbreak response for COVID-19 and other infectious diseases.
- Gonococcal Isolates Surveillance Project - \$15,000 - August 1, 2019-July 31, 2020. This Epidemiology and Laboratory Capacity (ELC) grant supports participation in the national sentinel surveillance system to monitor trends in antimicrobial susceptibilities of *Neisseria gonorrhoeae* strains in the US among selected STD clinics and covers salary, fringe benefits and supplies.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: RESOURCES INVENTORY

- Transgender Status-Neutral Community-to-Clinic Models to End the HIV Epidemic (CDC-RFA-PS22-2209) - \$500,000 – September 30, 2022 – September 29, 2023, Year 1 of a 4-year grant. This grant was awarded to St. John's Well Child and Family Center to develop a community-to-clinic model for integrated status-neutral HIV prevention and care services, gender-affirming services including hormone therapy, and primary health care. Navigation will also be used to link TG persons to services as needed for mental health and substance use disorder and other essential support services. This model will increase use of HIV prevention and treatment by TG persons to decrease HIV transmission and improve overall health and wellbeing.
- Comprehensive High-Impact HIV Prevention Programs for YMSM and YTG Persons of Color (CDC-RFA-PS22-2203) - \$2,500,000 – April 1, 2022 – March 31, 2023 – Year 1 of a 5-year grant. Four CBOs in LAC were awarded with funding to implement comprehensive high-impact HIV prevention programs to address health disparities among YMSM of color, YTG persons of color, and their partners with the goal of reducing HIV transmission and HIV-associated morbidity and mortality.
- Comprehensive High-Impact HIV Prevention Programs for CBOs (CDC-RFA-PS21-2102) - \$3,000,000 – July 1, 2022 – June 30, 2023 – Year 1 of a 5-year grant. Six CBOs in LAC were awarded with funding to implement comprehensive high-impact HIV prevention programs to enhance their capacity to increase HIV testing and referrals to Partner Services, link PLWH to HIV medical care and ART, provide or refer prevention and essential support services, including SSPs, for persons with HIV and persons at risk for acquiring HIV, and increase program monitoring and accountability.

Additional Funding Sources: Additional sources of HIV funding include HUD's HOPWA program, Substance Abuse and Mental Health Services Administration (SAMHSA) programs, and funding from the State of California:

HUD:

- HOPWA Program – \$27,323,580 - Fiscal Year 2021 -The City of Los Angeles receives HOPWA funding for Short-term Rent, Mortgage and Utility assistance payments, Tenant-based Rental Assistance, Transitional Housing Units and Permanent Housing Units.

SAMHSA:

- MAI: SUD Treatment for Racial/Ethnic Minority Populations at High Risk for HIV/AIDS - \$2,999,994 – September 30, 2022 – September 29, 2023 – Year 1 of a 5-year grant. Six CBOs in LAC are funded with this grant to increase engagement in care for racial and ethnic underrepresented individuals with substance use disorders (SUD) and/or co-occurring substance use and mental disorders (COD) who are at risk for or living with HIV/AIDS and receive HIV/AIDS services/treatment.
- MAI: High Risk Populations- \$1,500,000 – September 30, 2022 – September 29, 2023 – Year 1 of a 5-year grant. Three CBOs in LAC are funded with this grant to increase engagement in care for racial and ethnic underrepresented individuals with substance use disorders (SUD) and/or co-occurring substance use and mental disorders (COD) who are at risk for or are living with HIV/AIDS and receive HIV/AIDS services/treatment.
- The Substance Abuse and HIV Prevention Navigator Program- \$3,177,012– September 30, 2022 – September 29, 2023 – Year 1 of a 5-year grant. Fifteen CBOs in LAC are funded with this grant to provide services to those at highest risk for HIV and substance use disorders. The program proposes to use a navigation approach (Community Health Workers, Neighborhood Navigators, and Peer

3. CONTRIBUTING DATA SETS & ASSESSMENTS: RESOURCES INVENTORY

Support Specialists) to expedite services for these populations.

- Capacity Building Initiative for Substance Abuse and HIV Prevention Services for At-Risk Racial/Ethnic Minority Youth and Young Adults- \$1,582,000– August 30, 2022 – August 29, 2023 – Year 1 of a 5-year grant. Eight CBOs in LAC are funded with this grant to build solid foundations for delivering and sustaining quality and accessible state of the science substance abuse and HIV prevention services.
- MAI: Service Integration- \$485,000– September 30, 2022 – September 29, 2023 – Year 1 of a 5-year grant. One CBO in LAC is funded with this grant to reduce the co-occurring epidemics of HIV, Hepatitis, and mental health challenges through accessible, evidence-based, culturally appropriate treatment that is integrated with HIV primary care and prevention services.
- TCE-HIV: High Risk Populations- \$500,000– September 30, 2022 – September 29, 2023 – Year 1 of a 5-year grant. One CBO in LAC is funded with this grant to focus on high risk populations including racial/ethnic minority populations, such as black young men who have sex with men (YMSM) (ages 18-29), and other high-risk populations such as Latino YMSM and men who have sex with men (MSM) (ages 30 years and older), and gay, bisexual, and transgender individuals who have a SUD or COD who are HIV positive or at risk for HIV/AIDS.
- Harm Reduction Program- \$1,196,880 – September 30, 2022 – September 29, 2023 – Year 1 of a 3-year grant. Two CBOs and DPH-SAPC in LAC are funded with this grant to support community-based overdose prevention programs, syringe services programs, and other harm reduction services.

State of CA:

- DPH State Block Grant - HIV Surveillance CA Surveillance - \$1,972,378.00 - July 1, 2022-June 30, 2023. This grant supports active and passive HIV surveillance, data management, analysis and reporting.
- STD General Funds Allocation - \$547,050- July 1-June 30 - Year 4 of a 5-year grant. These funds support CT/GC Patient Delivered Partner Therapy (PDPT) Demonstration Project, condom distribution, training for PHNs and PHIs and DHSP staff.
- STD Management and Collaboration Project - \$1,952,013 - July 1, 2022-June 30, 2023 - Year 4 of 5-year grant. These funds support condom distribution, rapid syphilis test kits, and screening and treatment of new STD infections among persons at high risk for HIV. These include, but are not limited to; MSM, MSM that report substance use, Cis-gender women of color, Transgender Individuals and Young Men of color.

Strategy for coordinating the provision of substance use prevention and treatment services: DHSP works very closely with the Department of Public Health's Substance Abuse and Prevention Control (SAPC) division to coordinate the provision of substance use disorder prevention and treatment services. Examples of ongoing collaborations with SAPC include cross-training staff in integrating HIV and STD testing in harm reduction and substance use prevention and treatment programs; addressing methamphetamine and HIV in outreach, services, and policy interventions; and working with the City of Los Angeles to expand safe consumption sites.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: RESOURCES INVENTORY

Services and activities provided by organizations in the jurisdiction; and how services will maximize the quality of health and support services available to people at-risk for or with HIV: Collectively, the CBOs, FQHCs, clinics, faith-based organizations, universities, hospitals, and County departments provide comprehensive HIV prevention and care services including: HIV testing and treatment, STD screening and treatment, HCV screening and treatment, linkage to and reengagement in care, medication adherence, retention in care, PrEP/PEP, social marketing, health education and risk reduction, case management, partner services, medical care coordination, syringe services, sexual and reproductive health, substance use disorder treatment, harm reduction, mental health, housing, transportation, legal services, and more.

The Commission on HIV and DHSP are responsible for planning the continuum of HIV prevention and care services in Los Angeles County. As part of this responsibility, they conduct various needs assessment activities to understand the extent of need for services, as well as barriers to accessing those services. They also gather as much financial data that is available regarding HIV-related resources to identify gaps in current resources and are responsible for prioritizing and allocating Ryan White Part A and CDC funding to address service gaps, of which DHSP is the grantee. Through these oversight and coordination processes, DHSP and the Commission on HIV work in tandem to maximize the quality of health and support services available to people at-risk for or with HIV.

- a. **Strengths and Gaps:** The strength and resilience of the Los Angeles County HIV service system has been demonstrated over the past few years as we continue to weather complex public health and social challenges. These challenges include competing public health crises that tax our systems (e.g. COVID-19, Mpox, overdose, etc.); HIV and STD disparities across multiple domains; waning workforce capacity to meet the needs of the HIV, STD, behavioral health syndemic; and persistent social struggles, including the housing crisis and racial and reproductive injustice. In spite of these challenges, we have maintained high-quality HIV and STD continuity of care, we have tested and adopted new models of service delivery (e.g. HIV self-test kits, telehealth, etc.), and we have expanded the number and diversity of HIV service partners. We have also witnessed technological and administrative advances in the field, including the arrival of long-acting injectables, and the expansion of revenue streams (e.g. Medi-Cal and EHD funding).
- b. **Approaches and Partnerships:** Most of the data gathered to complete the HIV prevention, care and treatment inventory is publicly available online through various websites (e.g., CDC, HRSA, SAMHSA, etc.). The State of California Medi-Cal data for HIV positive individuals was also obtained online. Additional follow-up with individual grantees was conducted to obtain information regarding funding amount, contract period, services delivered, and/or impact along the HIV continuum to complete missing data. Additional information was obtained by talking to a number of key partners to understand the nature of some of their projects as well as to learn how they contribute currently to the continuum of services in Los Angeles County. These partners included the Cities of Los Angeles, West Hollywood and Long Beach, and the Pacific AIDS Education and Training Center, Los Angeles Region. The Division of HIV and STD Programs (DHSP) provided more detailed data on their funding for contracted services.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

NEEDS ASSESSMENT

Needs Assessment Activities and Data/Information Used to Inform Goals and Objectives: To assess the needs of PLWH and persons at risk for HIV in LAC, multiple assessment activities and methods were utilized. In addition to the review and analysis of secondary data listed below, primary qualitative data were collected for planning purposes via facilitated listening sessions for six priority population groups; an online survey to assess the capacity of the HIV workforce and service system from both provider and community member perspectives (HIV Workforce Capacity and Service System Survey); and facilitated stakeholder meetings (see c. Approach, below). The numerous secondary data sources and reports that were reviewed include, but are not limited to:

- (1) Local and national HIV surveillance data, including various reports presenting data from LAC's National HIV Behavioral Survey (NHBS) and Medical Monitoring Project (MMP);
- (2) HIV Care Continuum measures for LAC by subpopulation;
- (3) Sexually Transmitted Disease (STD) surveillance data;
- (4) LAC PrEP data;
- (5) 2021 HIV testing data for DHSP publicly funded testing;
- (6) 2020 Unmet Need report;
- (7) Ryan White Program Year 31 Care Utilization Data;
- (8) Black/African American Taskforce PrEP Focus Groups Report³⁰;
- (9) DHSP-Funded Biomedical Prevention Services, Year 6 Report;
- (10) Project Fierce Community Survey on STD Prevention Needs of Young Women of Color;
- (11) Assessment of Unmet Mental Health Needs of PLWH; and
- (12) CHIPTS' Study on Optimizing PrEP Delivery to Immigrant Latino MSM

Informing a Status-Neutral Approach to Develop Goals and Objectives: LAC is committed to a status neutral approach to addressing the needs of PLWH and of those at high-risk for HIV. This means that although the *types* of services that both groups need may vary, the *commitment* to making sure that people are able to access and remain engaged in those services is equal and unwavering, regardless of their HIV status. *Status neutral* also means that LAC is committed to providing high-quality services, regardless of a person's HIV status. Summarized below are the needs and barriers related to the services necessary to access HIV testing, to engage in prevention activities (for those who test negative), and to link to and remain engaged in HIV care and prevention (for those who test positive). Data analysis also rendered needs and barriers that were applicable *across pillars*. These include the need to address mental health challenges, substance use disorders and social determinants of health; and build the capacity of the HIV workforce.

Services People Need to Access HIV Testing: The need for HIV testing is clear as it is the first step to accessing necessary and appropriate prevention and/or treatment services, ultimately resulting in reduced transmission and improved health outcomes. Analysis of LAC NHBS data tells us that 15% of transgender respondents had *not* tested for HIV in the past 12 months; nor had 16% of MSM; 45% of PWID and 70% of high-risk heterosexuals. Testing rates varied across race/ethnicities with lower testing rates found among Black transgender respondents (80%); Latino and Black MSM (83%); White PWID (47%); and Latino heterosexuals (27%). HIV status awareness also differed across population groups with 83% of MSM, 80% of trans persons, 63% of PWID and 0% of heterosexuals³¹ aware of their HIV-positive status (Table 3).

³⁰ Prepared by Equity & Impact Solutions

³¹ However, only 1 person in the HET category was HIV-positive

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

Table 3: HIV Prevalence, Status Awareness, Testing & PrEP Use by NHBS Participants, LAC, 2017-19

	MSM	PWID	HET	TG
Survey Year	2017	2018	2019	2019
Sample Size	525	511	509	497
HIV Prevalence	21%	1.6%	0.2%	33%
Aware of Status Among HIV+	83%	63%	0%	80%
Tested Ever	99%	90%	73%	98%
Tested Past 12 Months	84%	55%	30%	85%
Current PrEP Use	29%	1%	0%	26%

In LAC, people living with undiagnosed HIV need low-barrier access to a variety of testing modalities in both clinical and non-clinical settings.

Clinical HIV Testing: HIV screening within clinical settings is crucial to increasing the number of PLWH who are aware of their status. In 2006, the Centers for Disease Control and Prevention (CDC) issued recommendations that screening for HIV should be performed routinely for all patients aged 13 to 64 years at least once in their lifetime, and at least once a year for those at higher risk. While typically the HIV positivity rates of routine screening programs in clinical settings is much lower than targeted HIV testing modalities that focus services on individuals with elevated HIV rates, they remain an important way to destigmatize HIV testing and infection. In LAC, clinical HIV testing takes place in primary care clinics, emergency departments, and sexual and reproductive health clinics.

Non-Clinical HIV Testing: Since the beginning of the epidemic, community members have advocated for non-clinical testing venues as settings in which individuals can seek HIV testing, sexual health education, and other services in a culturally affirming and confidential space. Settings include storefronts; mobile testing units; commercial sex venues, syringe service programs; and jails. Non-clinical HIV testing also increasingly relies on the distribution of HIV self-test kits. Targeted HIV testing identifies priority populations based on risk of acquiring HIV and often taps into social and sexual networks to do so. Through this model, community-based organizations (CBOs) leverage their relationships with community members and can utilize a wide range of outreach modalities to reach priority populations. County of Los Angeles-contracted HIV testing providers are selected for their expertise and strong track record of successfully reaching priority populations. All contracted providers are expected to provide 1) targeted HIV testing services, 2) hands-on assistance with linkage to HIV care for people testing HIV positive, and 3) education and referrals to PrEP and other prevention services for those who test negative but are at elevated risk of acquiring HIV. In 2021, DHSP-funded HIV testing had a 1.3% overall new HIV positive rate among the total 51,713 tests conducted in that year. However, this rate ranged by type of testing. Testing in healthcare settings rendered a 1.0% overall seropositive rate, while non-clinical testing rendered a 1.9% seropositive rate. Within the healthcare test setting, hospitals and primary care clinics had the highest positivity rates with 2.5% and 1.8%, respectively. Within non-clinical testing settings, HIV testing sites and community settings had the highest new positive rates, 2.4% and 1.3%, respectively (Table 4).

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

Table 4: DHSP Contracted Agencies HIV Testing³² Volume, Positivity, Linkage to Care by Test Setting, 2021

Test Setting	HIV Test Events		Positive HIV Tests – All Diagnoses			
	No. Tests	%	No. Positive Tests	%	Test Positivity %	LTC w/in 30 days %

Mobile Test Setting	2,641	5%	29	4%	1.1%	17%
Overall	51,713	100%	694	100%	1.3%	46%

HIV Self-Test Kits: Self-test kits provide an important low barrier option for individuals to confirm their HIV status. At the beginning of the COVID-19 pandemic, DHSP increased its investment in self-testing options by participating in a national self-test kit program, Take Me Home, and purchasing self-test kits for distribution through local providers. TakeMeHome provides an online platform by which health departments can provide free HIV self-tests. Between August 2020 to August 2022, 2,938 HIV self-test kits were requested via the TakeMeHome website. Among those that requested a test, over one-third reported to have never been tested for HIV; of those individuals, over 80% identified as men, and approximately 49% were under 30 years old. To date, over 15,000 self-test kits have been distributed.

Late Diagnoses: The number and percentage of late diagnoses among people newly diagnosed with HIV is indicative of a gap with respect to HIV testing. Late diagnosed HIV is based on the first CD4 test result (<200 cells/mL or a CD4 percentage of total lymphocytes of <14) or documentation of an AIDS-defining condition ≤ 3 months after a diagnosis of HIV infection. Among the 1,404 new diagnoses in LAC between January 1, 2020, and December 31, 2020, 286 (20.4%) were late diagnoses (Table).

- Among each of the three geographic epicenters of HIV: 15% of PLWDH in Hollywood-Wilshire Health District, in Central Health District, and in Long Beach Health District had a late diagnosis.
- The majority of late diagnoses were male (84%). Within each gender category 20% of males, 30% of females, and 7% of trans persons had a late diagnosis.
- Latinx were the largest racial/ethnic group among persons who were diagnosed late (62%); the highest percentages within each racial/ethnic group were among Latinx (24.1%) and those who identified as multiracial (23.8%).
- The highest number of late diagnoses were in people ages 25-34 years old, but the proportion of persons diagnosed late within each age group increased with age with 30% of persons 45-54, 31% of persons 55-64 years, and 44% of persons aged 65 or older being diagnosed late.

³² Data from DHSP Contracted Agencies HIV Testing Programs as of November 10, 2022

* Number of PLWDH reflects those who have had an HIV diagnosis, or any lab data reported over the last 5 years

To reach the estimated 6,800 people living with undiagnosed HIV, it will require at least 850,000 HIV tests at a 0.8% seropositive rate. This estimate, however, assumes that testing will reach undiagnosed individuals and that all have equitable access to HIV testing. Unfortunately, there are many barriers that prevent this equitable access, as described below in the *Barriers* section.

Services People At-Risk for HIV Need to Stay HIV Negative: For individuals who test negative for HIV, the testing encounter provides an opportunity to reenforce prevention behaviors and facilitate access to prevention tools and interventions including pre-exposure prophylaxis (PrEP), post-exposure prophylaxis (PEP) and syringe services programs (SSPs).

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

PrEP/PEP: DHSP estimates that 76,000 people in LAC could benefit from PrEP, 72% of whom (54,500) are Black and/or Latinx. Using several data sources, DHSP estimates that, overall, 39% of people in priority populations with an indication for PrEP are currently prescribed PrEP.

An assessment of PrEP knowledge, attitudes and behaviors among Black MSM, Latino MSM, and transgender persons was conducted between 2016-2020 via an app-based survey for the CDC PrIDE initiative.³³ Participants were asked about their awareness of PrEP, willingness to use PrEP, and PrEP use in the past 12 months. Between 2016-2020, awareness of PrEP increased from 86% to 92%, willingness to take PrEP increased from 73% to 93% and PrEP use increased from 20% to 31% collectively. PrEP awareness significantly increased among Latino MSM and trans persons through 2020 but remained relatively unchanged among Black MSM.

PrEP/PEP Centers of Excellence: In 2016, DHSP funded nine PrEP/PEP Centers of Excellence (COE) across LAC with the primary goal of increasing access to and use of PrEP among Black/ African American and Latino MSM, transgender persons and cisgender women. Today, there are 12 COEs funded by DHSP that offer multiple services, including insurance application assistance, medication adherence support, primary medical care, and referrals to other services (Figure 30). Through March 2022, 9,810 unique clients had received biomedical services through one or more COEs with 73% receiving PrEP services, 21% receiving PEP services, and 6% receiving both PrEP and PEP (Figure 31).

Analysis of utilization data gives us insights into the PrEP/PEP needs of at-risk individuals in LAC. According to the DHSP-Funded Biomedical Prevention Services Year 6 Report, between July 1, 2020-June 30, 2021, 3,235 clients were prescribed PrEP at a COE, including 2,250 new enrollees. The majority of PrEP clients were Latino (53%), MSM (88%) (Table 6). Fifty-three percent of enrolled clients were retained in PrEP services at a COE clinic for at least six months. Retention rates were impacted by both the type and duration of services accessed. For example, those who were retained, on average, received 25 minutes of education activities, 34 minutes of adherence activities and 57 minutes of retention activities. Comparatively, those who were lost to follow-up only received about half as many service minutes with an average of 12, 13 and 28 minutes, respectively.

Figure 30: PrEP/PEP Centers of Excellence

Figure 31: Biomedical Services Provided at COEs

³³ <https://www.cdc.gov/hiv/research/demonstration/projectpride.html>

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

Table 6: Centers of Excellence: Clients Prescribed PrEP between 7/1/20-6/30/22 (N=3,235)

HIV RISK GROUP				AGE GROUP						RACE/ETHNICITY				
MSM	Trans	PWID	HET	13-19	20-24	25-29	30-34	35-39	40+	Latino	B/AA	White	Asian	Other*
88%	12%	1%	1%	<1%	7%	21%	27%	19%	25%	53%	18%	15%	12%	<2%

*“Other” includes American Indian/Alaskan Native (<1%) & Native Hawaiian/Pacific Islander (1%)

Among the PrEP priority populations, retention rates and adherence rates were worse for Latino MSM, trans persons and cisgender women than they were for Black MSM.

- Among Black MSM, 538 were screened for biomedical HIV prevention, including 465 screened for PrEP only, 32 screened for PEP only, and 41 screened for PEP and PrEP. The top three indicators for PrEP were multiple partners, condomless receptive sex and anogenital STD. Forty-three percent of Black MSM were retained in PrEP services at a COE for at least 6 months.
- Among Latino MSM, 1,560 were screened for biomedical HIV prevention, including 1,377 screened for PrEP only, 69 screened for PEP only, and 69 screened for PEP and PrEP. The top three indicators for PrEP were multiple partners, condomless receptive sex and anogenital STD. Forty percent of Latino MSM were retained in PrEP services at a COE for at least six months.
- Among trans persons, 462 were screened for biomedical HIV prevention, including 374 screened for PrEP only, 63 screened for PEP only, and 25 screened for PEP and PrEP. The top three indicators for PrEP were multiple partners, condomless receptive sex and previous PEP and ongoing behavioral risk. Thirty-six percent of trans persons were retained in PrEP services at a COE for at least 6 months.
- Of the 377 people between the ages of 14-24 that were screened for PrEP, the top three indicators were multiple partners; condomless receptive sex; and anogenital STD/syphilis.

Harm Reduction and Syringe Services Programs

Harm reduction is a set of practical strategies and ideas aimed at reducing negative consequences associated with drug use. It is also a movement for social justice built on a belief in, and respect for, the rights of people who use drugs.³⁴ Syringe Services Programs (SSPs) are excellent vehicles for harm reduction. Despite consistent evidence that SSPs, and needle-exchange in particular, work to reduce infections and save lives,³⁵ there remains a great deal of misinformation and stigma surrounding their existence. Contrary to some beliefs, SSPs do *not* increase the number of used syringes in communities, the use of drugs, or drug-related crimes. In addition to providing access to and disposal of syringes and injection equipment, SSPs are comprehensive community-based prevention programs that often provide vaccination, testing, education, case management and linkage to care, substance use treatment and PrEP. SSPs also serve as an important overdose prevention mechanism by providing low-barrier access to Medically Assisted Treatment (MAT) for opioid use disorder, and overdose prevention and response trainings; and distributing Naloxone kits and fentanyl information and test strips. Although there was a ban on using federal funds for syringe exchange until 2016, the City of Los Angeles has provided funding for syringe services since 1994 and the County of Los Angeles since 2006. Because SSPs provide a comprehensive set of services, as described above, the County now refers to the SSPs they fund as *Engagement and Overdose Prevention (EOP) Hubs* to more fully reflect the scope of the work they do. DPH-SAPC currently funds seven EOPs across the County that distribute close to a million sterile syringes and thousands of Naloxone kits every year. EOP services are provided through storefronts, street-based mobile sites and outreach efforts. In LAC, EOPs funded by the County are required to provide:

³⁴ <https://harmreduction.org/about-us/principles-of-harm-reduction/>

³⁵ Fernandes RM, Cary M, Duarte G, et al. Effectiveness of needle and syringe programmes in people who inject drugs – An overview of systematic reviews. BMC Public Health. 2017;17(1):309. doi:10.1186/s12889-017-4210-2.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

- Needs-based/low threshold access to syringes
- Sharps containers and education on disposal
- Naloxone
- Safe injection supplies (tourniquets, alcohol swabs, water, band aids, cotton balls, cookers)
- Safe smoking supplies (pipes, lip balm, straight shooters)
- Wound care supplies
- Direct or referred testing for: HIV and HCV
- Referrals for treatment for HIV/HCV, substance use treatment, specialized mental health, or medical care.

In 2021, among the six³⁶ EOPs that were operating in LAC:

- 924,164 clean syringes were distributed (a 32% increase from 2017)
- All provided injection supplies and safer sex supplies;
- 5 out of 6 provided overdose treatment (e.g. Naloxone), and HIV risk reduction counseling; a
- 4 out of 6 provided HIV testing

The majority of clients served were 30 years of age or older (90%) and cisgender males (76%). Thirty-nine percent were Latinx, 36% were White, 20% were Black/African American, and 5% were classified as “Other” race. In addition to the EOPs there are three SSPs in LAC that are certified by DPH-SAPC but not currently funded by them bringing the total amount of EOPs/SSPs operating in LAC to ten. Although the majority of EOPs and SSPs provide HIV testing, only two currently provide HIV, STD and HCV testing.

Services People Need to Rapidly Link to HIV Care: Linkage to care is an essential step to ensuring viral suppression. In 2020, 54% of people newly diagnosed with HIV were linked to care within seven days and 76% were linked within one month of diagnosis. Populations with lowest linkage to care rates were cisgender women (67%), Black/African Americans (71%) and those classified as “multi-racial” (69%), persons 13-19 years old (63%) and persons whose transmission risk included heterosexual contact (66%) or MSM/IDU (67%). Populations with the highest linkage to care rates were transgender persons (81%), those aged 30-39 and 50-59 (78%), Asians (90%), AI/ANs (86%) and those whose transmission risk was MSM (78%).

HIV testing providers assume primary responsibility for linking a newly diagnosed person to HIV care by setting up appointments and following up with the client until the first appointment is completed. As depicted in Table 4, the percentages of those newly diagnosed with HIV who were linked to care within 30 days varied by test setting. The highest percentages were found among primary care clinics (78%), followed by community STD clinics (69%) and hospitals (64%). Conversely, the test settings that had the lowest linkage to care percentages were mobile test settings (17%), HIV testing sites (27%) and community settings (33%).

In addition to HIV testing services, linkage to care is achieved through other targeted programs. One such program is DHSP’s Linkage and Re-engagement Program (LRP) designed to identify HIV-positive persons out of care, and their partners for linkage/re-engagement to HIV care. LRP receives referrals from a broad base of countywide partners and also uses data-to-care reports to identify potential LRP clients. LRP often works to locate persons hardest to find and acts as a service of last resort after all other outreach efforts have failed. Because LRP clients are not on ART it is essential that they are located and connected to care in order to improve their health outcomes and prevent transmission of HIV. With LRP clients reaching undetectable levels, partners are less likely to contract and further

³⁶ One more EOP was recently funded in 2022 to bring the total to seven.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

transmit HIV. Furthermore, partners are then able to receive support to get tested and take actions to address their status, whether negative or positive. LRP also supports Partner Services follow-up by taking on cases of clients who have been difficult to locate.

Services PLWH Need to Stay in HIV Care and Treatment and Achieve Viral Suppression: Once initially linked to care, it is imperative that HIV-positive persons remain engaged in care to improve their health outcomes and prevent transmission. Concerted efforts are also needed to re-engage into care PLWH who are diagnosed but not in care. The use of surveillance data to identify those who are lost to care is critical. Since the inception of the Ryan White Program, HRSA has funded a comprehensive set of medical and related services targeting low-income PLWH. Although the local utilization rates of Ryan White services don't tell us the complete picture of the needs of all PLWH, they serve as a starting point for examining needs related to engagement in care. Ryan White Program clients totaled 21,877 in Year 31 (3/1/21-2/28/22), representing 41% of all PLWDH in LA County. The services most utilized by RWP clients were Medical Outpatient (70%), Medical Care Coordination (38%), and Non-Medical Case Management (24%) (Table 7).

Table 7: Ryan White Program Services Utilization, 3/1/21-2/28/22

Service Category	Unique Clients	Percentage of RW Clients	Units Per Client
Total Unduplicated Clients*	21,877	--	--
Medical Outpatient	15,272	69.8%	3
Supplemental AOM Procedures	10,396	47.5%	25
Medical Outpatient	15,272	69.8%	3
Medical Care Coordination	8,244	37.7%	14
Non-Medical CM	5,181	23.7%	4
Benefits Specialty	4,658	21.3%	4
Transitional CM – Jails	563	2.6%	6
Oral Health Care	4,153	19.0%	11
General Oral Health	3,849	17.6%	7
Specialty Oral Health	3,477	15.9%	5
Nutrition Support	1,988	9.2%	193
Food Bank	1,582	7.2%	97
Delivered Meals	560	2.6%	410
Mental Health Services	756	3.5%	7
Home-Based Case Management	280	1.3%	321
Case Management	279	1.3%	43
Homemaker	184	0.8%	354
Nutrition	54	0.3%	108

Substance Abuse Services – Residential	90	0.4%	123
Outreach Services (LRP Program)	26	0.1%	11

*Receiving Fundable RW Program Services

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

Los Angeles County is also funded through HRSA's Minority AIDS Initiative (MAI) and has selected three subpopulations of focus based on local epidemiologic and programmatic data: cisgender men of color aged 30 or older who have sex with men (MSM of color); cisgender men of color aged 18-29 years who have sex with men (YMSM of color); and transgender persons of color (Trans clients). MAI subpopulations totaled 11,721, representing 55% of clients receiving at least one RWP service in Year 31. The top four services that were disproportionately utilized (compared to their population size) by the MAI population were benefits specialty (60%), mental health (58%), non-medical case management (58%), and oral health care (56%).

As depicted in Figure 32, HIV Care Continuum outcomes for RWP patients were better than for the larger population of PLWDH. However, disparities persist among certain subpopulations, again speaking to the need to target services to these populations. Among the RWP clients in Year 31, engagement in care rates were lowest for those who were homeless (90%), recently incarcerated (91%), people aged 18-29 (92%) and African Americans (92%). Retention in care rates were lowest for those between the ages of 18-29 (59%), currently homeless (60%), recently incarcerated (65%) and African American (66%). Viral suppression rates were lowest among currently homeless (67%), recently incarcerated (70%), people who inject drugs (77%) and people aged 18-29 (77%).

Fig. 32: HIV Care Continuum Outcomes: PLWDH in LAC, 2021 Compared to RWP Clients, 2021-22

Unmet Need (Not in Care): Based on the five-year population estimate (2016-2020) of 44,090 PLWDH in LAC, 7,279 (17%) were estimated to have unmet need (not in HIV medical care) as indicated by there being no evidence of a viral load or CD4 reported in 2020 (Table 5).

- Among each of the three epicenters of HIV: 19% of PLWDH in Central, 17% of PLWDH in Hollywood-Wilshire, and 15% of PLWDH in Long Beach had unmet need.
- The majority of persons with unmet need were male (87%). Within each gender category 16% of males, 17% of females, and 17% of trans persons were aware of their HIV status and did not receive recent laboratory testing.
- Within each racial/ethnic group, Native Hawaiian/Pacific Islander Non-Hispanic had the highest percentage of PLWDH with unmet need (30%), followed by Blacks/African Americans (21%), and American Indian and Alaskan Natives (18%).

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

- The percentage of unmet need was highest within younger age groups; 23% of PLWDH 25-34 years, 21% of PLWDH 13-24, and 20% of PLWDH age 35-44 years.

In Care, Not Virally Suppressed (VS): Among the 36,811 PLWDH who were in care, 4,563 (12%) were not virally suppressed (viral load ≥ 200 copies/mL on the most recent test reported) between January 1, 2020, and December 31, 2021.

- Among the three epicenters of HIV: 17% of PLWDH in Central, 14% of PLWDH in Hollywood-Wilshire, and 10% of PLWDH in Long Beach were not virally suppressed.
- More than one out of five transgender persons (18%) were in care, but not virally suppressed compared to 12% of cisgender males and 13% of cisgender females.
- Within each racial/ethnic group, Black/African Americans had the highest percentage of PLWDH in care and not virally suppressed (16%), followed by multiracial (not Hispanic) group (14%) and Native Hawaiian/Pacific Islanders (13%).
- The percentage of unsuppressed viral load was highest within younger age groups; 18% of PLWDH 13-24 years, 16% of PLWDH 25-34 years, and 14% of PLWDH age 35-44 years.

Barriers to Services

The HIV Workforce Capacity and Service System Survey³⁷ respondents, both providers and community members, were asked to rank a set of barriers to accessing or remaining engaged in a variety of HIV-related services including HIV testing, PrEP and HIV care, and to add any other significant barriers not listed. Listening session participants were also asked to discuss any barriers related to diagnosing HIV and accessing HIV treatment and prevention services.

Top Five Barriers to Accessing HIV Testing

	Providers	Community
1	Lack of culturally appropriate services	Substance use
2	Substance use	Lack of accurate information about testing
3	Mental health	They don't believe they're at risk
4	They don't believe they're at risk	Mental health
5	Lack of accurate information about testing	Lack of culturally appropriate services

Other related barriers that respondents identified included:

- (Lack of) awareness of free services
- (Lack of) awareness of testing locations and hours
- Fear of finding out they're infected
- Isolation
- Stigma/Internalized homophobia
- PTSD

In addition to the barriers listed above, survey and listening session participants identified barriers relating to lack of urgency about HIV, not having enough testing sites, concern about HIV stigma and lack of health literacy or knowing they're at risk.

³⁷ Workforce Capacity and Service System Survey is described in more detail in the Approach section below.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

“We should learn from COVID – they had testing on every corner. Why can’t we do that with HIV?”

“I already experience stigma for being Black and Gay. I don’t want to add to that by being HIV positive.”

“A lot of people still don’t know they can get HIV – and once they’re positive, they don’t understand a lot of the language. U equals U means nothing to them.”

Top Five Barriers to Accessing PrEP

	Providers	Community
1	Mental health	Concern they won’t be able to pay for PrEP
2	Substance Use	Substance use
3	Lack of culturally appropriate services	Lack of accurate information about PrEP
4	Lack of stable housing	Mental health
5	Lack of accurate information about PrEP	Trauma

Other/related barriers included:

- Lack of social support and not having role models who take PrEP
- Stigma/Internalized homophobia

PrEP Needs among Black/African American MSM, Transgender and Cisgender Women

In 2019, the Commission on HIV’s Black/African American Task Force developed a set of recommendations that included developing a targeted PrEP marketing campaign for Black/African American communities, given less than optimal PrEP uptake. In response to this recommendation, a series of focus groups were held for Black/African American MSM, transwomen and cisgender women to inform the development of a PrEP campaign.³⁸

Among MSM, common barriers to accessing PrEP included:

- Provider barriers – difficulty getting a provider to prescribe PrEP; not having providers close by; and not a lot of people in the clinics who “look like us”
- Miseducation and mistrust – not knowing where and how to get PrEP and not fully understanding PrEP and its side effects
- Mental fatigue – having to constantly take medication can be overwhelming; having to take medications to have sex reinforces there is shame in having sex

Among transwomen, common barriers to accessing PrEP included:

- Discrimination - trans and nonbinary people face an extreme amount of discrimination in trying to not only utilize PrEP, but in every aspect of life
- Providers/Access – poor access to facilities; lack of eligibility for PrEP/cost; lack of Black trans/nonbinary people who work at facilities.
- Side effects: physical and mental – including a recognition that even preparing to take meds is challenging
- Stigma - association of PrEP use with being promiscuous

Among cisgender women, common barriers to accessing PrEP included:

- Stigma - questions about number of partners can feel shaming; scared family or friends might find out they’re taking it; they might be stereotyped for using PrEP

³⁸ Facilitated by *Equity & Impact Solutions*

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

- Access - can't afford it if it's not free; not the same availability that MSM have
- Pill Burden - taking a pill everyday can be burdensome
- Social Determinants - having to deal with poverty, housing insecurity, etc., makes it hard to focus on PrEP
- Medical Mistrust - believing the medications only work for MSM; believing only HIV+ people take medications; not understanding why PrEP takes longer to work in women than men
- Lack of Support - no PrEP support groups in LA for Black cis women
- Messaging/Marketing - not enough campaigns with Black cis women in clinics and publicly
- Lack of holistic focus - not enough focus on general well-being, access to healthcare and social support services everyone deserves

Optimizing PrEP Delivery to Immigrant Latino MSM in LAC: The Center for HIV Identification, Prevention and Treatment Services (CHIPTS) recently led a collaborative research project to understand the barriers to PrEP access, and to develop strategies to enhance PrEP delivery, among immigrant Latino MSM (LMSM) in LAC. Given that LMSM comprised the largest percentage (51%) of all new HIV infections among MSM of all racial/ethnic groups in LAC in 2019, and that nationally, since 2010, foreign born LMSM have comprised the majority of new annual HIV infections among LMSM, researchers were intent to understand any additional barriers to accessing HIV prevention services immigrant LMSM may face that are not experienced by US-born LMSM. The study included in-depth interviews with 15 Spanish-speaking and 10 English-speaking immigrant LMSM, 7 key informant in-depth interviews and a concept mapping process³⁹ with 19 panelists.⁴⁰ Key barriers were identified at the agency-, and client-level, including:

Agency-Level Barriers

Language

- Lack of Spanish-speaking staff and PrEP navigators
- Lack of services offered in Spanish
- Lack of properly translated Spanish language materials
- Difficulty completing English language forms
- No standardized way to talk about PrEP in Spanish

Provider bias/knowledge/comfort

- Not receptive to providing PrEP services
- Hold perception that PrEP will lead to promiscuity
- Lack knowledge of PrEP
- Not proactive about offering PrEP to this population
- Not comfortable delivering PrEP to this population

Outreach doesn't reflect population

- Lack of PrEP outreach materials or public awareness campaigns tailored for immigrant LMSM
- Outreach materials are not intentionally created for immigrant Latino MSM

³⁹ Concept mapping is a mixed methods approach that integrates qualitative perspectives of individuals with multivariate statistical methods to visually depict the composite thinking of the group.

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5451901/>

⁴⁰ Key informant and concept mapping participant inclusion criteria: Staff member from a medical care facility or community-based organization that provides PrEP services to immigrant Latino MSM; Person with experience working with or advocating on behalf of immigrant Latino MSM; Person with knowledge of issues affecting access to HIV prevention services such as PrEP among immigrant Latino MSM.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

Client-Level Barriers**Lack of knowledge about PrEP and available PrEP services**

- Unaware of PrEP
- Don't know that PrEP is for them
- Don't know where or how to access PrEP
- Unaware of medication assistance programs (e.g., Gilead's Advancing Access Program, PrEP-AP)

Structural/logistical barriers

- Lack of health insurance
- Cost of services not covered by assistance programs
- Lack of transportation
- Unable to get release time to attend medical appointments
- Clinic hours (i.e., no weekends or evening hours)

Language

- Difficulty communicating with non-Spanish speaking providers
- Not enough services offered in Spanish
- Unaware of where to access services in Spanish

Cultural

- Don't use healthcare services unless absolutely necessary and don't use preventive services
- Uncomfortable talking about sexual behaviors with providers
- Homophobia in the Latinx community (e.g., needing to hide sexuality)

Immigration status

- Fear that information about use of PrEP services and/or HIV testing will be reported to immigration authorities
- Fear that use of public benefits will impact immigration process
- Fear of deportation if accessing PrEP services

PrEP-related stigma

- PrEP is only for gay men or men who are promiscuous
- Fear of being outed when accessing PrEP
- Fear of family, friends, or partners finding a PrEP bottle
- Fear of being thought of as HIV-positive

Individual perceptions/beliefs

- Fear of side effects
- Don't recognize their own HIV risk
- Providers assume they are having sex with women because some immigrant LMSM identify as heterosexual

The concept mapping process was used to develop implementation strategies to enhance PrEP delivery to immigrant LMSM. After identifying a list of strategies, the top five that were determined to be most feasible and important were recommended for prioritization:

1. Provide immediate access to and enrollment in PrEP services (e.g., same-day PrEP, PrEP walk-in clinic), so that there isn't a delay in receiving services.
2. Gather testimonials from immigrant Latino MSM who have buy-in to PrEP services and are willing to showcase their stories on social media.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

3. Deliver comprehensive PrEP education and training to every staff member at the clinic, from front desk staff to providers.
4. Provide support to help undocumented individuals enroll in insurance programs that cover PrEP services.
5. Develop campaigns informing people that they can access PrEP (e.g., through PrEP-AP) regardless of their current documentation status and without affecting their future chances for documentation.

Additional themes identified from survey and listening session participants related to accessing PrEP included discomfort/ unfamiliarity with taking medication when you're not sick, thinking PrEP is for other people because of lack of authentic advertising, and not being able to store the medication because of being unhoused.

"We only go to the doctor when we're sick."

"I don't see any pictures of people that look like me on those billboards that I drive by every day."

"How can I take medication every day? Where am I supposed to keep it when I'm on the street?"

Top Five Barriers to Linkage to Care

	Providers	Community
1	Substance use	Substance use
2	Lack of accurate information about LTC	Mental health
3	Lack of culturally appropriate services	Concern that they won't be able to pay for HIV care
4	Lack of stable housing	Lack of accurate information about LTC
5	Trauma	Lack of stable housing

Other:

- Lack of HIV-positive peers to talk to
- Need a warm hand-off and walked to services without having to wait
- Stigma
- Transportation
- Unfriendly insensitive waiting rooms
- Fear of people thinking they're gay

Survey and listening session participants expressed not wanting to access care due to bad experiences with providers in the past and not feeling comfortable in the clinic's physical space. They also expressed concern over administrative hurdles.

"I've had bad experiences with providers before. Why would I go back to be judged again?"

"When I'm in the waiting room, I feel like I'm in someone else's space."

"If it were easy to see the doctor, I think more people would do it, but I think there are too many administrative and logistic barriers. Right now, it feels like the opposite of "express" linkage."

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

Top Five Barriers to Remaining Engaged in Care

	Providers	Community
1	Substance use	Substance use
2	Mental health	They don't feel sick
3	Trauma	Mental health
4	Lack of stable housing	Lack of stable housing
5	Lack of accurate information about HIV care	Trauma

Other:

- Lack of appointment time options
- Don't want to take medication or go to doctor's office
- Lack of peer support and treatment advocates
- Lack of respect in waiting areas, reception for drug users, homeless and other downtrodden
- Stigma
- Transportation

Participants also identified barriers related to medical mistrust, not having providers who look like them, lack of transportation and childcare and the need for peer advocates.

"We need to have a list of providers that are people of color and LGBT and we need to have more of them."

"There are a lot of reasons why we don't remain in care – we need help with transportation and help with childcare. And I need to see a provider who gets me."

"Doctor appointments are fifteen minutes. If I want to know what my labs mean, or why I'm given a particular pill, or how to manage side effects, I go to my peer-led support group, which is not funded by the County or by my health insurance. We need peer advocates. We need treatment advocates."

Co-occurring Disorders, Social Determinants of Health and Stigma

Across all categories of service, the top two barriers identified were substance use and mental health challenges. We also recognize that HIV disparities in LA County, like the rest of the nation are fueled by stigma and social determinants, including housing instability and incarceration. Each of these is described in more detail below.

Mental Health Disorders: Mental health disorders can affect the progression of HIV disease, medication adherence and the likelihood of engaging in high-risk behaviors that may result in HIV transmission.⁴¹ Based on 2015-2019 Medical Monitoring Project (MMP) data, between 10.4% -16.5% of PLWDH in LA County report moderate to severe depressive symptoms. Effective treatment of mental health disorders requires regular screening and diagnosis. Using a subset of RWP clients, we compared diagnosis and screening data to describe the prevalence of undiagnosed depressive disorder among Medical Care Coordination (MCC) services patients from 2013- 2019. As part of routine assessment, patients were screened for depressive symptoms using the Patient Health Questionnaire (PHQ-9) and their medical record reviewed for any depressive disorder diagnosis. Among the 9,178 MCC clients, 29% met the screener criteria for a depressive disorder and 33% had

⁴¹ Remien RH, Stirratt MJ, Nguyen N, Robbins RN, Pala AN, Mellins CA. Mental health and HIV/AIDS: the need for an integrated response. AIDS. 2019 Jul 15;33(9):1411-1420.

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

been previously diagnosed. Among those with depressive symptoms, only 57% had a corresponding diagnosis. Compared to patients with depressive symptoms and a concurrent diagnosis, those with symptoms and no diagnosis were more likely to be male, younger (12-24 years compared to 24- 39 years of age), higher assessed acuity, and have unsuppressed viral load in the past six months.

Assessment of Unmet Mental Health Needs of PLWH

A recent key accomplishment under the EHE Initiative was a formal assessment of the unmet mental health needs of PLWH and the LAC mental health services and delivery system. Conducted by HMA Community Strategies, the assessment sought to identify barriers at the systems-, provider-, and client-level. Key stakeholder interviews (15 agencies), surveys (35 provider and 29 client respondents), and a review of secondary data rendered the following key findings and recommendations:

KEY FINDINGS	RECOMMENDATIONS
DATA LIMITATIONS	
•There is a lack of access to data and a lack of integrated data across the BH system – prevents comprehensive analysis of service utilization among PLWH. •Within the DMH data set, SOGIE was unknown for a slight majority of patients with both HIV and a BH diagnosis. This SOGIE data gap make it more difficult to tailor public health messaging and interventions.	•Establish a data infrastructure that enables the extraction and analysis of client-level data across county departments to identify who and which subgroups are not receiving services •Develop data sharing protocols and/or platforms that would allow patient health information to be more efficiently shared between DMH, DHS and DPH to avoid delays in data request •Add sexual orientation/gender identity and expression (SOGIE) data fields to ongoing data collection and data systems •Collect comorbid health condition data as part of the data collection to track other major life stressors of PLWH in order to provide client-centered, whole person care.
ELIGIBILITY AND SERVICE UTILIZATION	
•The increase of health care coverage and decline in aggregate HIV incidence result in a decline of the number of individuals eligible for Ryan White; fewer PLWH are eligible under current guidelines. •The current system is more successful in reaching Hispanic/Latinx population despite the prevalence of HIV being more prominent in the Black community.	•Revise regulations to allow Ryan White services to individuals who are Medi-Cal eligible •Reduce the administrative burden on providers and clients by minimizing or streamlining intake and reporting requirements •Encourage and incentivize providers to hire peers, community health workers (CHWs) or navigators to assist with insurance and paperwork
SERVICE DELIVERY AND COORDINATION	
•Linkages between MH and primary care remain an issue for many providers. •Most providers have difficulty ensuring PLWH can receive timely referrals to MH services, as well as difficulties referring clients to both psychiatric and SUD services. •Many providers reported difficulty matching PLWH to a licensed clinician on their staff with whom they identify	•Modify screening tools to enhance alignment with Trauma Informed Care and Gender Affirming Care •Improve cross agency referrals by using the Los Angeles Network for Enhanced Services (LANES) to have more accurate patient data and facilitate referral communication. •Design and convene forums that bring together providers to discuss and plan improvements (e.g.,

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

•Providers have difficulty coping with rules and regulations that limit how they can staff clinical care for PLWH. •Many MH service clients not currently accessing received MH services via telehealth indicated they would be interested in starting services via telehealth. •Clients often experience difficulties navigating the current MH system. •Clients lack awareness of the services available and experience long wait times and excessive paperwork to access these services.	how to strengthen implementation of “No Wrong Door”). •Develop a resource guide that provides detailed information on providers’ services, capacity, and specialty services to enhance cross-agencies referrals.
FINANCE AND FUNDING	
•Many MH providers do not receive Ryan White funding, nor do they have a DMH contract to provide MH services. •Providing wrap-around services is unsustainable for most providers. •Providers are challenged by the current billing system; the opaque nature of reimbursement poses a significant barrier for service providers.	•Develop and offer training to providers intended to clarify and standardize reimbursement policies, including guidance on CPT codes, rates, and proper documentation. •Advocate for subsidizing BH services for individuals who are above the RW eligibility threshold but do not have other sources as payment of last resort.
WORKFORCE AND STAFF CAPACITY	
•Staff retention is a significant issue at both the provider and systems levels; excessive turnover and inability to recruit and retain staff is a barrier to provision of MH services to PLWH. •Nearly all providers have difficulty assessing relevant staff training resources and/or staff training opportunities. •There is a need for more professional development of the MH workforce, as well as reconsideration of the content and emphasis of training efforts.	•Leverage current efforts of the <i>Zeroing In: Ending the HIV</i> consortium and other EHE capacity building organizations to provide better quality, relevant workforce training opportunities that prioritize the following: •Models of collaborative, holistic care •Co-occurring disorders (e.g., the intersection of HIV and SUD) •SMI/high acuity mental health conditions •Advanced trauma-informed care and practices •Innovations in telehealth •Resources to improve workforce retention •Coordinate training offerings among DHSP, DMH, SAPC, and the clinical provider organizations •Explore whether LMFTs could be cross credentialed to provide services now restricted to LCSWs •Collect data on the diversity and lived experience of staff working with PLWH •Expand Spanish-language providers

STDs: Project Fierce Community Survey

Project Fierce is a community-based project funded by the CDC designed to reduce STD disparities and promote sexual health among young (18-24) cisgender and transgender women of color in LAC. As a project of Community Health Councils and WeCanStopSTDsLA, the Project Fierce Community Advisory Board implemented a community survey in 2021 to better understand the sexual health

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

needs of young women of color. The 27 survey respondents identified as cisgender women (82%) and transgender/gender non-conforming (18%); straight/heterosexual (63%), bisexual (19%), and pansexual/queer (13%); Latinx (70%), Black/African American (22%), Asian (7%), and American Indian/Indigenous (7%). Key findings included:

- 73% were offered an STD screening by a healthcare provider; 27% were not offered one
- 52% would be more likely to get screened for STDs if it was mailed to their home rather than walking into a clinic; 33% would be equally likely; and 15% would be less likely
- 26% would be more likely to get screened for STDs if it was offered through mobile services rather than walking into a clinic; 41% would be equally likely; and 33% would be less likely
- 33% had never been tested for STDs. Of those that were tested: 37% had previously been tested for chlamydia; 30% for HIV; 22% for gonorrhea; and 15% for HPV
- 30% reported that their healthcare provider had never educated them on STIs, associated risks, and ways to stay healthy
- 33% were not sure which questions to ask their provider during appointments
- Factors that influenced their likelihood of discussing their sexual health history and concerns with their provider included: having a consistent healthcare provider (67%); the healthcare provider's age (48%), gender identity (48%), race/ethnicity (33%), and experience (26%).
- 48% reported that they never (26%) or not very often (22%) have a consistent healthcare provider
- 52% reported that celebrities, social media, and media influencers shaped their view or understanding of sex and sexual relations
- 29% reported that they had felt/been pressured to have unprotected sex in a monogamous relationship

Substance Use Disorder (SUD) and the Meth Epidemic: In contrast to other parts of the U.S. where the HIV epidemic is driven significantly by sharing of needles and other equipment among PWID and other substances⁴², the nexus between substance use and HIV in LAC centers on unprotected sex while under the influence of alcohol or other drugs. Based on MMP data (2015-2019), it is estimated that between 33.9% and 42.1% of PLWDH used non-injection drugs, and 1.9% to 4.9% used injection drugs in the past 12 months. Among a subset of 9,021 RWP clients receiving MCC services in LAC from 2013-2018 who were screened, approximately one out of five had indication of a SUD.

In LAC an estimated 18% of young adults aged 18-25 and 8.4% of adults aged 26 and older were estimated to have a SUD. Based on data from the LAC SAPC program, approximately 1 in 5 people treated for SUDs in the county are treated for meth use disorder and only 47% of these clients successfully completed treatment.

In the U.S, the increased risk of adverse outcomes associated with meth use (vs. non-use), include depression (1.3 times), HIV infection (1.5 times) and HCV infection (3.4 times). Between 2010 and 2020, meth-related overdose deaths in LAC have increased 1,185% and percent of all drug deaths has increased by 345%. Latinos made up the majority of patients with primary meth problem admitted to a treatment facility (65%), while Blacks had the highest rate (223). Patients admitted to treatment whose primary drug problem was meth had higher rates of STDs than clients with other primary drug problems. The difference was greatest with respect to syphilis, with 1.2% of those with meth as a primary problem having syphilis compared to 0.3% of those with other drugs as a primary problem – a five-fold difference.⁴³ The connection between meth use and syphilis is further illustrated through the analysis of Partner Services (PS) data. Between 2011 and 2019: meth use

⁴² Syringes and equipment may also be shared to administer hormones, steroids and/or vitamins

⁴³ <http://www.publichealth.lacounty.gov/sapc/MDU/MDBrief/MethBrief.pdf>

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

among the early syphilis cases referred to PS increased among men who have sex with women, by 7 to 22%, and women who have sex with men, by 0% to 21%.

Among MSM in LAC, meth use is frequently associated with increased unsafe sexual activity. Meth-using MSM are much more likely to have multiple sexual partners and report inconsistent condom use than MSM who do not use meth. Meth users have numerous clinical challenges such as poor treatment engagement rates, high drop-out rates, high relapse rates, severe paranoia, and declining oral health. The medical and psychiatric aspects of meth dependence often exceed the capabilities of existing SUD programs, requiring significant cost for training and education for staff to improve service delivery.

Homeless/Unstably Housed: There are more than 69,000 homeless persons in LA County on any given night.⁴⁴ Since 2019, there has been a 12.7% increase in the homeless population in LA County and over 70% of the homeless were unsheltered. Nearly half (44%) of the homeless people in the county were found in areas with the highest rates of HIV/ AIDS, poverty, and uninsured. Approximately 41% percent of LA County's homeless were chronically homeless, 2% had HIV/AIDS, 26% had a SUD, and 25% had a serious mental illness. Nine percent of RWP clients in Year 31 were experiencing homelessness. Among clients enrolled in MCC services at Ryan White clinics from 2013-2019 (n=8,438), 24% reported experiencing homelessness in the past six months at enrollment. Clients who reported recent homelessness were significantly more likely to be Black/African American, recently incarcerated (in the past six months), have depressive symptoms, and have used injection drugs in the past six months compared to clients who did not report recent homelessness. In addition, those who reported recent homelessness were more likely to be male and heterosexual, live below the federal poverty level (FPL), be US natives, and have less than a high school diploma compared to clients who did not report recent homelessness. These data suggest that MCC clients experiencing homelessness were from communities disproportionately impacted by HIV (e.g., persons of Black race/ethnicity), impacted by multiple determinants of health (e.g., experience with the justice system, low educational attainment, poverty) and comorbid conditions (e.g., mental health and IDU). Of particular interest is that these clients were more likely to be non-MSM and IDU – both populations in which HIV prevalence has historically been lower but could contribute to potential HIV clusters or outbreaks.

Incarceration: Incarceration is associated with harmful effects on viral suppression, lower CD4+ T-cell counts, and accelerated disease progression.⁴⁵ HIV prevalence among men in LA County jails is estimated to be between 1% and 2% and approximately 300 PLWH are housed in the jails at any one time. Based on the MMP data from 2015-2019, between 1.1% and 3.2% of PLWDH reported being incarcerated in the past year. Among RWP clients in 2021, 8% had been incarcerated in the past two years. High percentages of these clients were living at or below FPL (85%), experiencing current homelessness (33%), MSM of color (44%), and African American (36%). These clients also had some of the lowest levels of engagement and retention in care and viral suppression.

Beyond the direct association of incarceration and poor health outcomes among PLWH, we also recognize incarceration as a force in LA and across the country that destabilizes communities, disrupts family relationships, and magnifies the accumulation of health and social disadvantage for already marginalized populations. The LA County Sheriff's Department (LASD) operates the largest municipal jail system in the US, and the US, in turn "imprisons more people than any other nation on

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

Earth.”⁴⁶ There are more than 250,000 people who cycle through the county justice system annually, roughly 14,500 daily, and 500 inmates classified each day. In addition to the sheer volume of people in LA County jails, there are stark racial disparities. Black/African Americans, while making up only 9% of the LA County population, represent over 29% of the jail population. The justice system is clearly ill-equipped to deal with the thousands of people it imprisons who are typically struggling with poverty, homelessness, substance use disorders and mental health challenges. As a result, people cycle in and out of jail, not able to get the care they need to live healthy and productive lives.

In 2020, LA County voters approved Measure J, which dedicated no less than ten percent of the County’s locally generated unrestricted funding to address the disproportionate impact of racial injustice through community investments such as youth development, job training, small business development, supportive housing services and alternatives to incarceration.⁴⁷ As a result, the LA County Board of Supervisors adopted the Care First Community Investment spending plan⁴⁸ (aka Measure J), an unprecedented \$187.7 million spending package to advance its care first, jails last vision with a series of direct community investments and funding for alternatives to incarceration—accelerating the transformative process of creating a more just and equitable Los Angeles County for all residents. The plan was developed with an equity lens with a primary focus on chronically under-resourced communities to address negative outcomes caused by racially-driven criminal justice inequities and long-term community economic disinvestment. As such, the plan supports a wide range of programs including interim and permanent supportive housing, grants to community-based organizations, and employment opportunities for adults and youth. Highlights of the funding plan include:

- \$42 million to support the closure of Men’s Central Jail
- \$16 million for housing and related services to meet a variety of needs including for people experiencing homelessness with complex health needs and people with substance use disorder;
- \$15 million to support residents returning to the community after incarceration

Stigma: Since the beginning of the epidemic, stigma in all its forms has served as a constant barrier to people being able to access HIV care and prevention services. HIV-related stigma is compounded by stigma associated with LGBTQ identities and sexual behaviors, using drugs, injecting drugs, mental health disorders, being homeless and being incarcerated. Given its pervasiveness and sometimes insidious nature, stigma is hard to pinpoint and even harder to address. A recent example of how stigma impacts the lives of PLWH and the communities most impacted by HIV is the messaging and reaction to Monkeypox. In late 2022, LA County, like many urban areas across the country, is struggling to combat the monkeypox virus as we continue to grapple with COVID-19. To date, the vast majority of the 1,836 monkeypox cases have been identified among cisgender men (97%), most of whom identify as gay/bi or other MSM. However, risk is not limited to MSM, given that available evidence suggests that those who are most at risk are those who have had close physical contact with someone with monkeypox. Unfortunately, early messaging about monkeypox may have inadvertently led to people believing they are not at risk if they are not gay or transgender identified. There is also concern locally and globally that some communications and commentary on monkeypox have used language and imagery that reinforce homophobic and racist stereotypes and

⁴⁸ In response to recommendations put forth by the *Measure J Reimagine LA Advisory Committee*, since transformed into the *Care First and Community Investment Advisory Committee*

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

exacerbate stigma.⁴⁹ We recognize that such stigma and misinformation can severely undermine outbreak response. Indeed, we are reminded of the early days of the HIV epidemic when racism, homophobia, transphobia and stigma led to the failure to prioritize the communities most impacted by HIV/AIDS – gay men, people of color, trans persons and PWID - early on in the course of the epidemic. This resulted in the steady and deadly spread of HIV/AIDS most profoundly in these groups and a failure to - as of yet - end the HIV epidemic nationally.

The monkeypox outbreak creates both another health burden and another social burden for the LGBTQ population and for people living with HIV. The evolution of monkeypox remains to be seen, but even after the current wave of this particular health threat subsides, we likely will not be spared from future outbreaks, epidemics or pandemics of other infectious diseases. To protect PLWH and the communities most impacted by HIV from both the health and social burdens brought about by current and future pandemics, we urge public health leaders and elected officials to respond to outbreaks with an approach that avoids stigma and blame. To do so, we encourage the infusion of community voices and perspectives, particularly among those most impacted, in the development of such responses and messaging. We need to ensure that public health leaders and governments work with communities to find local solutions. Disproportionately impacted populations must not bear the brunt of increased stigma and discrimination as a result of any health threat or the response to it. Moving forward, we will work to ensure that these key principles⁵⁰ guide future public health responses in LA County:

- Affected communities must be actively engaged in identifying and implementing strategies in response to threats to their health and well-being.
- Stigma and fear are constant companions of infectious disease pandemics; proactive steps must be taken to minimize their negative consequences.
- To reduce health disparities, proactively identify groups and communities at disproportionate risk of developing disease or poor health outcomes and design interventions to reduce these disparities and to promote health equity.

Overall Service System and Workforce Capacity

Additional data were captured through assessment activities that pertained to the HIV service system and workforce capacity. Participants cited numerous strengths with the HIV service system in LA County, including addressing the epidemic through a social justice lens, multiple free and accessible services, and the dedication of those who work in the field.

“The HIV workforce tends to be comprised of passionate and committed workers. They feel their job is meaningful and believe in helping others to the best of their ability.”

“It’s beginning to acknowledge the impact of systemic racism in all aspects of care and as a driver of health disparities.”

Relatedly, community members who had received HIV-related services over the past year had mostly positive feedback about the services they received:

- 98% either strongly agreed or agreed that they were treated with respect;

⁴⁹https://www.unaids.org/en/resources/presscentre/pressreleaseandstatementarchive/2022/may/20220522_PR_Monkeypox

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

- 93% either strongly agreed or agreed that they did not feel judged;
- 97% either strongly agreed or agreed that the staff made them feel welcome and comfortable
- 97% either strongly agreed or agreed that the provider met their needs and answered their questions.

Needs/Areas for Improvement

Community members appreciated when their providers treated them more holistically, but some reported frustration with having to advocate to be screened for STDs, not being able to receive whole-person care, and not receiving culturally competent services.

"My clinic screen for other issues I may have and that was important to me."

"I used to be screened for STDs every three months. Now that I see my ID doc twice a year, the tests have been added to my labs once, at my request."

"My HIV provider used to be the only doctor I saw. My current and past physician is no longer willing to treat my cholesterol or other non-HIV issues. As an older person with HIV, I'm also dealing with other comorbidities. My healthcare is siloed, I'm taking ten different medications and I only see doctors who advocate for their disease, with no one advocating for the whole person."

"The location was cyberspace, so I didn't visit the therapist's office. I took three months to see the therapist. The therapist had no experience working with gay men, HIV, or cancer survivors."

"Case managers spend more time doing paperwork than servicing clients. LA County loves data driven programs, but all that paperwork means some people are denied access to services or have to wait three months."

The majority (79%) of respondents strongly agreed or agreed that there needs to be more people living with HIV delivering HIV-related services. Among those who identified as HIV-positive, the percentage jumped to 93%. Additionally, 80% of respondents strongly agreed or agreed that "there needs to be more people who look like me delivering HIV-related services." This included 86% of respondents who identified as Black/African American and 88% who identified as Latinx.

In addition to increasing the diversity of the workforce, the greatest needs with respect to the workforce and service system included addressing provider burnout; addressing turnover that stems from a variety of issues; the need for expedited services, especially for those with complex needs; training needs; building a better pipeline for providers; and addressing administrative barriers.

"Hire more people, more staff that look like us and can relate to our needs. Don't require a Master's degree in social work. Let people with an Associate's degree take a little training. If you hire more people that are HIV and give them training, you'll get better results."

"Do they employ members of the populations in positions other than outreach? For example, do they have trans front desk staff or a gay black MA? Or do these folks only get hired to do outreach to their "target" population?"

"They (providers) are overworked / forced to wear multiple hats and many of them have unhealed trauma that directly impacts the quality of their services."

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

“The turnover in organizations is high due to low pay and other factors. More free training is needed that offers certification and licensing. Experience is frequently underappreciated vs college degrees.”

“What we really need are housing resources, access to expedited mental health services and substance use disorder resources, linkage to care of vulnerable populations especially those experiencing homelessness.”

“The greatest need is to cross train programs regarding their services and systems to connect clients to services.”

“(There are) no clear pipelines or educational training programs (in colleges or in the community) to prepare for positions in the HIV field (HIV counselors, HIV prevention workers, PrEP navigators, Linkage to Care, Case Managers, Case Watch Data Managers, ADAP enrollers, Benefits Counselors, etc.).”

“At meetings, it often feels like there is adequate resource allocation especially for housing, yet as a provider, it feels that those resources are difficult to obtain or are not available in real time. There is so much red tape and ultimately, the patients suffer or there is delay in receiving care. This also applies to mental health resources.”

“(We need) one database for all services, once registered data like income can be updated and people get automatically enrolled for needed services like affordable housing.”

a. Priorities – The needs assessment process helped us to identify the following key priorities:

- Integration and streamlining of services
- Address mental health needs of PLWH and at-risk for HIV
- Address SUD, especially meth use disorder
- Address needs and gaps in the HIV workforce
- Clear marketing and messaging about services and risks to reach priority populations
- Need to increase health literacy

b. Actions Taken - In response to needs and barriers identified during the development of both the Integrated Plan and the EHE, LA County has undertaken a number of activities, including:

- Distributed over 15,000 HIV self-test kits
- An Assessment of Unmet Mental Health Needs of PLWH
- Assessment activities to develop PrEP campaigns in the Black/African American community
- Began initial activities for comprehensive workforce capacity assessment
- Increased Tele-PrEP capacity for PrEP/PEP Centers of Excellence
- DHSP began implementing *Addressing Implicit Bias & Medical Mistrust, and Cultural Humility* training
- Emergency Financial Assistance for PLWH – developed for clients at risk of losing housing or in need of one-time or short-term financial assistance
- Exploring ways to improve Partner Services efforts
- Development of a Cluster Detection and Response Community Advisory Board
- Community meetings and trainings on Cluster Detection and Response
- DHSP implemented EHE community mobilization project through a partnership with the AMAAD Institute, focused on highly impacted populations
- Implemented iCARE Contingency Management project
- Implemented Rapid and Ready Linkage to Care project

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

c. Approach - At the onset of planning, stakeholders expressed concern related to “over-assessing” both community members and providers, and that we should strive to utilize the data, recommendations and reports that had recently been collected and compiled through various means. For example, the recent development of the LA County EHE, the local *Act Now Against Meth* campaign; and the recommendations from the Commission’s Black/African American Task Force, Women’s Caucus, Transgender Caucus, Consumer Caucus, Prevention Planning Workgroup, and Aging Task Force rendered useful information for our planning purposes. In addition to the analysis of existing reports and data, we also collected primary qualitative data from priority populations, community members and providers through listening sessions, an online survey and facilitated stakeholder meetings.

Listening Sessions: To ensure the voices and perspectives of communities most impacted by HIV were used to drive the Integrated Plan’s goals and objectives, we conducted facilitated “listening sessions” with priority population groups. A total of 86 participants attended the listening sessions for Black MSM; People of Trans Experience; Cisgender Women of Color; People who Inject Drugs and their Stakeholders; PLWH 50 years of age and Older; and People Under 30 years of age. The listening sessions were 90-120 minutes long and included discussions about what the HIV service system does well; and barriers and solutions related to each pillar. Participants each received a \$25 gift card for their participation.

Survey: Two online surveys were also disseminated to capture perspectives from providers and community members (defined as anyone who had accessed any type of HIV-related service in LA County in the past 12 months). Community members each received a \$25 gift card for completing the survey and providers had the option of entering a raffle to win one of two \$50 gift cards. Both the provider and community surveys were available in English and Spanish. Fifty-one community members completed the survey, however, only 13 providers responded to the survey, which may be due to being “over-assessed” as described above. The demographic profile of community survey participants include:

3. CONTRIBUTING DATA SETS & ASSESSMENTS: NEEDS ASSESSMENT

Facilitated Stakeholder Meetings: To capture feedback from key stakeholders, the planning team (PP&A leadership, Commission staff and Consultant) facilitated a number of structured discussions to ascertain how to build upon the existing EHE to develop the new Integrated Plan. Stakeholders represented the following entities and/or population groups:

- EHE Steering Committee members
- Community-based organizations serving PLWH and at-risk for HIV
- Health department staff from LA County, the CA State Office of AIDS, and the Cities of Long Beach, and Pasadena
- People living with HIV, including members of a Federally recognized Indian tribe and individuals co-infected with hepatitis C
- Members from priority population groups including Black MSM, Latinx MSM, Women of Color, Trans and nonbinary persons, PWID, people 50 and older, people under 30
- Health department epidemiologists
- HIV clinical care providers including those who represent RWHAP Part C and D
- Providers from STD clinics
- Non-elected community leaders including faith community members and business/labor representatives
- FQHC and Community Health Centers
- Substance use treatment providers
- Hospital planning agencies and health care planning agencies
- Mental health providers
- Individuals (or representatives) with an HIV diagnosis during a period of incarceration (within the last three years) at a federal, state, or local correctional facility
- HOPWA Coordinator
- City of Los Angeles AIDS Coordinator
- Social services providers including housing and homeless services representatives*
- Service Planning Area (SPA) 2 (San Fernando Valley) HIV and social service providers
- SPA 4 (Metro) HIV and social service providers
- Long Beach HIV Community Planning members
- City of West Hollywood HIV service coordinators/staff
- Part F/AETC

Section IV: Situational Analysis

Overall, the LA County HIV prevention and care system has many strengths and providers, advocates, consumers and community members can be proud of key achievements over the course of the HIV epidemic that have undoubtedly saved lives and improved the quality of life for those living with or at-risk for HIV. More recently, although COVID-19 has devastated Angelinos and greatly stretched the public health infrastructure, the HIV system has shown great resiliency and continues to diagnose and treat people living with HIV and prevent HIV transmission through the provision of high-quality services. Although the number of people living with HIV continues to climb, the number of annual HIV infections continue to decrease, as does the HIV death rate.

Unfortunately, HIV-related disparities persist across race/ethnicity, gender identity, sexual orientation and age group. These disparities are driven largely by structural and systemic issues including housing status, poverty, recent incarceration, and co-morbid conditions such as STD coinfection, substance use disorders and mental health disorders. Our commitment to ending HIV means we must also be committed to confronting harmful practices and oppressive systems that fuel these disparities.

a. Diagnose all People with HIV as early as Possible: An HIV diagnosis as close to the period of infection as possible is a crucial first step to achieving optimal HIV-related health outcomes and reducing the likelihood of HIV transmission. In LA County, an estimated 6,800 people or 11% of all people living with HIV, are undiagnosed and therefore unaware of their status. Additionally, one out of five people who were newly diagnosed with HIV in 2020 were diagnosed in the “late stage” of the disease, increasing the risk of transmission and poorer health outcomes. To increase the proportion of people living with HIV who are diagnosed to at least 95%, and to increase the timeliness of diagnosis, LA County DPH, community health clinics, non-traditional community-based HIV testing partners, and other private and public entities must jointly support a robust and widespread HIV testing strategy, including testing in new and innovative ways. Critical in this effort is increasing the number of testing services access points to meet clients where they are in their readiness to engage in testing services in clinical, non-clinical and other community settings.

LA County DPH supports a cross-section of organizations to conduct HIV testing in a variety of settings, including non-clinical venues that serve priority populations, community-based HIV/STD clinics, social and sexual network testing programs, and commercial sex venues. Overall, DPH supports 42 HIV testing providers with annual goals to provide over 80,000 HIV tests and with the goal of diagnosing more than 800 individuals with HIV each year. In addition, LAC DPH staff directly provides HIV testing in the county jails and STD Clinics. These public-sector supported HIV testing and diagnosis efforts are an important complement to private sector HIV testing efforts supported by commercial health plans.

Routine HIV Testing: Expanding routine HIV testing within emergency departments, hospitals in highly HIV impacted geographic areas, FQHCs, and other clinical settings is crucial to meet HIV testing goals. While targeted testing often provides the highest positivity rate, implementing routine testing in health care settings is an important component to not only move towards destigmatizing HIV, but also allowing individuals who do not recognize their HIV risk to be tested for HIV. Given the co-occurrence of HIV and other STDs and substance use, it is essential that we continue to promote HIV testing as a part of routine STD screenings and at substance use disorder treatment facilities and SSPs. Routine testing in a subset of clinical settings can have an acceptable yield while leveraging multiple revenue streams, including public and private health plans, to cover testing costs. Despite these opportunities and benefits, launching new routine HIV testing programs in healthcare settings in LAC has been difficult. To catalyze routine HIV testing, a variety of policy changes are needed

4. SITUATIONAL ANALYSIS

including changes that require low barrier reimbursement for HIV screening and strong annual screening mandates. In addition, we must address several non-financial routine HIV testing barriers, including broad scale training and technical assistance of routine HIV testing staff, broad scale adaptation of electronic medical records to incorporate HIV testing prompts and export critical HIV testing data, the development of protocols to ensure the immediate linkage of newly-diagnosed HIV- positive persons to care, and incentives to recruit and maintain a county-wide cadre of health care settings based routine HIV testing “champions.”

Primary Care Clinics: As part of the national EHE initiative, since 2020 39 FQHCs and community health clinics were funded directly by HRSA’s Bureau of Primary Health Care to adopt routine HIV screening, increase PrEP provision, and implement other HIV prevention services within their clinics. LA County DHSP works with the funded clinics in partnership with the Community Clinic Association of Los Angeles County to support these efforts.

Emergency Departments (EDs), Urgent Care Centers and Hospitals: EDs are entry points into healthcare services for many individuals, including people living with diagnosed and undiagnosed HIV. Thus, EDs, urgent care settings, and hospitals are important locations to offer HIV testing, especially for those who don’t access primary care. Routine HIV screening in these settings is also conducive to the identification of persons with acute HIV infection and high linkage to care rates. In 2020, DPH received HIV case reports for a total of 2,338 new HIV diagnoses, and 2,006 cases were matched to a reporting health care facility. Approximately three out of every five new diagnoses were identified at one of the top eight HIV diagnosing hospitals or outpatient clinics.

Sexual & Reproductive Health Clinics: Screening sexually active persons for HIV when they present for STD testing is imperative, particularly given that HIV and other STDs often co-occur. Sexual health providers in LA County include community and DPH STD clinics, family planning providers, and HIV PrEP clinics. DPH currently operates 11 STD clinics and funds four community-based LGBT focused STD clinics that provide no-cost specialized STD and HIV services in a confidential, non-judgmental setting. Family planning providers include Planned Parenthood as well as a network of many smaller clinics. These providers have and continue to provide comprehensive STD and family planning services to patients of all genders for uninsured or underinsured persons. Since 2012, the number of clinics offering PrEP either in a separate PrEP focused clinic or integrated into their regular services has increased. Increased PrEP use results in increased HIV testing given CDC guidelines that clients prescribed PrEP should be tested for HIV every three months. The top six sexual and reproductive health clinics diagnosed nearly one-third (30%) of all new diagnoses in 2020.

In the past, DHSP has conducted Public Health Detailing (a method of targeting and reaching providers who will benefit from a short, focused public health message) related to HIV, PrEP, and syphilis among women to influence practice patterns for established community medical providers. This effective intervention, however, remains both resource and time intensive for a jurisdiction the size of LAC. A more targeted approach of connecting with medical schools and training programs, including residency programs, nurse practitioner and physician assistant training programs, may be a more cost- effective way to support sustained clinical practices with public health benefit. By reaching clinicians at the beginning of their healthcare training and careers, the importance of HIV prevention and HIV testing can be included as a fundamental element of routine clinical practice that spans the life of medical careers and can be used to identify and develop HIV champions.

Rescreening individuals with elevated HIV risk: Both national and local data indicate that many people at higher risk for HIV infection are not screened according to clinical guidelines (e.g. CDC recommendation of at least once per year). Among CDC’s NHBS participants, 15% of transwomen, 16% of MSM and 45% of PWID had not had a test in the past 12 months; and a lower proportion of

4. SITUATIONAL ANALYSIS

persons with ongoing HIV risk received an HIV test every three or six months as recommended by the CDC.

The link between STDs and elevated HIV risk is clear, and we must ensure that health care providers are not missing opportunities to conduct HIV testing with clients who are seeking STD screening, diagnosis and treatment services. The wide-scale adoption of technology to allow HIV testing providers to track and communicate with clients via text or a secure portal when they are due for repeat testing in an automated fashion and could accelerate efforts to ensure that clients who are newly diagnosed are promptly linked to care. The adoption of this technology and the use of digital forms of communications is congruent with how younger individuals prefer to exchange information, particularly given their ease and the higher levels of confidentiality they provide.

Self-Test Kits: Alternative HIV testing approaches are necessary to ensure that HIV diagnoses continue among individuals who may be HIV-positive but who may be less inclined to seek in-person services. The U.S. Food and Drug Administration (FDA) has approved HIV self-test kits, that while less sensitive than other rapid tests, provide an important low barrier option for individuals to confirm their HIV status. In response to this alternate testing strategy, LA County DHSP joined the multi-jurisdictional Take Me Home initiative. Take Me Home is a timely and innovative HIV self-test kit ordering program that centralizes advertising, data collection, and test kit distribution to clients, relieving health departments from coordinating and hiring staff during the COVID crisis. As a strategy to promote linkage to care efforts, DHSP has also made available HIV self-test kits to community-based partners who also offer video or phone assistance and support by trained test counselors and who prioritize providing linkage to care services to persons testing HIV-positive. TakeMeHome is working to expand its reach and diversify its users by implementing active social media strategies and partnering with local credible messengers to increase the recognition of and trust in the program. Providing the opportunity for no-cost self-test kits is a strategy to increase access to HIV testing services with minimal staff support. Since January 2021, Public Health has distributed over 15,000 kits to contracted HIV prevention agencies, other community partners, and through community events. DPH plans to expand self-test kit distribution through programs that serve people who inject drugs, transitional aged youth, and people experiencing homelessness. LA County is also pursuing distribution options through non-traditional partners such as barbershops, religious institutions, mutual aid groups, as well as through large scale community events.

In addition to HIV self-testing, the “I Know” program (dontthinkknow.org), first developed by LAC DPH in 2009, was the second free home STD testing program in the U.S. offered by a public health agency, and the very first to offer clients online access to test results. The program offers free testing for chlamydia and gonorrhea to females and trans males in LAC ages 12-24, using the Aptima Combo 2 vaginal swab. Chlamydia and gonorrhea together cause more than 25,000 infections in young women in LA County annually. Most of these infections are asymptomatic, making routine testing essential to timely treatment and preventing further transmission. “I Know” expands testing by removing common barriers to clinic-based testing, including time, stigma, and lack of nearby facilities. Re-launched in April 2022 on a new more powerful software platform, “I Know” has now also expanded to six other CA counties, with support from CA Department of Public Health.

The County welcomes traditional and non-traditional partners to further explore HIV testing opportunities that allows for the highest impact in increased testing access points, reduced barriers for clients, and integration of routine “syndemic” testing that includes viral hepatitis and STDs. DHSP will continue to expand or support the existing HIV testing portfolio especially for populations where HIV rates are rising and is committed to partnering with agencies such as homeless service providers conducting street outreach to further increase HIV testing opportunities, given their expertise of the communities and clients they serve.

b. Treat People with HIV Rapidly and Effectively to Reach Sustained Viral Suppression: By leveraging a combination of federal, state, and local funds, LA County supports a network of HIV providers and more than 30 DHSP funded HIV medical homes, where referrals, linkage assistance, medical care, and medications are available regardless of insurance status. For years, DHSP, the Commission and a network of providers have worked to reduce barriers to care so that PLWDH can be readily linked to and be retained in HIV medical care. Despite these efforts, at the end of 2020, linkage to care, engagement in care, and viral suppression rates remain far below targets for a significant subset of patients.

Linkage to care: Since 2011, DHSP has incentivized timely linkage to HIV medical care for its network of community-based HIV testing providers. HIV testing providers assume primary responsibility for linking a newly diagnosed person to HIV care by setting up appointments and following up with the client until the first appointment is completed. While this incentive structure initially produced significant improvements in initial linkage to care, more recently performance has generally plateaued. Only 76% of persons who were newly diagnosed in 2020 were linked to HIV care within one month and only 54% were linked to HIV care within one week. This is likely due to a combination of factors, such as denial or competing life demands, and structural barriers, such as lengthy financial screening requirements and administrative paperwork. The current system must evolve to make rapid initiation of antiretroviral therapy (ART) the easiest choice for both the provider and the patient. DHSP, together with HIV prevention and medical providers, must restructure its approach to linkage to care, must treat new HIV diagnoses with more urgency, and must ensure that providers receive technical assistance to make same day linkage referrals a standard practice. In addition, DHSP will utilize its position as funder to provide technical assistance to clinics to reduce unnecessary administrative barriers for patients and improve the client experience. An exciting LTC project recently launched by DHSP is the Rapid and Ready program focusing on same-day linkage to care which has received 52 referrals to date, of which, 50% have been linked to care.

Engagement and Retention in Care: In 2013, LAC DHSP implemented the *Medical Care Coordination (MCC)* program in Ryan White Program-funded HIV medical homes with the goal of addressing the unmet psychosocial and medical needs of patients at risk for or already experiencing poor health outcomes. Comprised of a Registered Nurse, a Social Worker, a Case Manager, and a Retention Outreach Specialist, the MCC teams help patients with a range of psychosocial, behavioral, and medical issues that may impact their treatment adherence. A robust evaluation of the MCC program demonstrated that PLWH who utilize MCC services experience significantly improved health outcomes after 12 months. In 2016, DHSP established the *Linkage and Re-engagement Program (LRP)* as a complement to the MCC program to identify, reach, and re-engage patients who have fallen out of care, and then expanded MCC to additional HIV clinics in 2017. Given that the path to consistent, ongoing HIV care and reaching viral suppression is not always a linear experience for clients (for multiple reasons), the Linkage and Re- engagement Program was developed as a specialty linkage program to work with clients who have had challenges linking to care or have fallen out of care and cannot be reached. LRP utilizes experienced DHSP-based health navigators, who have access to a wide-range of LA County data systems in order to locate and follow-up with clients who are often not well served by traditional medical and support service models, including those without a cell phone or who are unstably housed, or who have not been located or responsive to service providers' attempts to engage them in care. While the engagement and retention in care of clients remains a primary responsibility of the clinic, the LRP program is intended to serve as a complementary option of last resort to focus efforts on locating and connecting with clients and subsequently facilitating a warm hand-off to clinics and MCC teams.

In August of 2022, a contingency management program known as iCARE (Incentives for Care, Adherence, Retention, and Engagement) was launched. iCARE is an incentive-based program that seeks to support engagement in care and viral suppression among youth and young people under the age of 30 using principles of contingency management, an evidence-based behavioral intervention. This pilot program consists of two cohorts (youth under 30 years and women from DHSP's Linkage and Re-engagement Program).

It is clear that despite the availability of these programs, many PLWH struggling with financial concerns, housing instability, mental health diagnoses, and SUDs, also struggle to not only access care, but remain in care and achieve viral suppression over long periods of time.

Cal-AIM⁵¹: The California Department of Health Care Services (DHCS) has recently begun rolling out a multi-year initiative to improve the quality of care provided to Medi-Cal members by implementing broad delivery system, program, and payment reform across the Medi-Cal Program. The goals of the California Advancing and Innovating Medi-Cal (CalAIM) initiative are to identify and manage member risk and need through whole-person care approaches and addressing social determinants of health; move Medi-Cal to a more consistent and seamless systems by reducing complexity and increasing flexibility; and improve quality outcomes, reduce health disparities and drive delivery systems transformation and innovation through value-based initiatives, modernization of systems, and payment reform. Under CalAIM, Enhanced Care Management (ECM) is a care coordination benefit for the highest need and/or high-cost members. This new Medi-Cal managed care plan benefit would provide intensive care management for both medical and non-medical needs for high-need Medi-Cal members. Eligible populations include people experiencing homelessness, people at risk of institutionalization and people transitioning from incarceration with complex health needs. Because a key focus of CalAIM is addressing the challenges facing people with complex and unmet needs, we are hopeful that CalAIM will help support the needs of PLWH who have fallen out of care or are at risk of falling out of care. For these reasons, we will carefully monitor the roll-out of the new initiative and work to ensure the system supports the needs of PLWH.

Addressing the Meth Epidemic: In LA County, the SAPC Program leads and facilitates the delivery of prevention, treatment, and recovery support services intended to reduce the impact of substance use, abuse, and addiction county-wide. The LAC DPH Division of HIV and STD Programs collaborates with SAPC to connect clients to HIV and STD-related services. Given the consistent increase in methamphetamine use over time and its well-established intersection with HIV, syphilis, and poor HIV-related health outcomes, it is imperative that LA County facilitates greater integration and synergy of HIV and substance use disorder services. Stronger partnerships among HIV service providers and SUD providers must include strategies that address meth use and its role with sexual HIV risk behavior, must promote adherence to PrEP or ART, and must prioritize the expansion of contingency management services coupled with these biomedical HIV prevention tools. More broadly across the substance using spectrum, programs that promote harm reduction, mitigate the sharing of injection equipment and promote syringe services programs must be prioritized, including geographic areas with high rates of HIV transmission but devoid of SSPs. The LA-based Act Now Against Meth Coalition, a long-standing community mobilization and awareness effort launched to address the alarming increase in meth use among gay and bisexual men has recently developed the Los Angeles County Platform Addressing the Meth Epidemic. The platform includes a list of recommendations for meth prevention, treatment, and policy, some of which we have folded into our goals and objectives. Separately, SAPC has launched a Countywide Meth Task Force to inform meth prevention and treatment strategies and address both the upstream drivers of meth use and abuse. DHSP actively participates in both the Prevention and Treatment Committees of the Meth

⁵¹ <https://www.dhcs.ca.gov/calaim>

Task Force.

Aging with HIV: As we enter the fifth decade of the HIV epidemic, those who are aged 50 and older make up an increasingly larger percentage (51%) of PLWDH, with people 50-59 years old making up 30% of all PLWHD and people 60 and older making up 21%. By comparison, people 50 and older make up only 33% of LA County's general population. It is estimated that by 2030, people 50 and older will comprise 70% of all PLWH. Additionally, among new HIV diagnoses in 2020, 34% of people aged 50-59 and 31% of people 60 and over were diagnosed at Stage 3 of HIV disease, indicative of late HIV disease (compared to 20% among all diagnoses).

Advances in treatment have greatly improved the health and well-being of all PLWH. As HIV treatments continue to improve and the general population continues to age, the number of older PLWH will continue to increase. Relatedly, according to a recent modeling project,⁵² by 2030, over 25% of people taking HIV treatment will be over the age of 65; over half will be over the age of 53; and 36% of people taking ART are expected to have multimorbidity – at least two physical co-morbidities in addition to HIV. A recent study finds that accelerated aging occurs within just two to three years of infection.⁵³ With age and the cumulative effects of HIV, older PLWH and some long-term survivors experience exacerbated age-related health vulnerabilities and comorbid conditions. Older PLWH face a range of challenges to their physical and mental health, in addition to the usual effects of aging, even when HIV disease is well-controlled.^{54, 55}

Physical challenges may include exacerbation of widespread, chronic inflammation associated with normal aging; multimorbidities and their interactions, and side effects of ART and other medications. Mental challenges and challenges to overall well-being may include HIV-associated neurocognitive disorders; depression; trauma and loneliness.

As the needs of older PLWH and long-term survivors come more into focus and grow more urgent, it is imperative that our service system adapts to ensure strategies for long-term viral suppression, continuous access to ART, and prevention and care for comorbid physical and mental conditions. In 2020, the Commission on HIV's Aging Task Force (now Caucus) developed a set of recommendations to address the broad health needs of those over 50 years old living with HIV and long-term survivors. The Task Force is currently revisiting the recommendations to better respond to the aging needs of long-term survivors under 50 and individuals who acquired HIV perinatally. Aligned with these recommendations, as well as California's Master Plan on Aging, DHSP has begun to develop plans to address the needs of those PLWH 50 and older, as reflected in our goals and objectives.

The current safety net in LAC to address the needs of PLWH with multiple health and/or life circumstances (e.g., substance use disorder, homeless, mentally ill, other co-morbidities, and chronic health conditions) persons living with HIV is fraught and complex. Navigating the healthcare system and identifying accessible and quality mental health and SUD services, particularly for low-income persons, can be difficult; at the same time, mental health services specifically designed for PLWH remain underutilized in parts of LAC. To ensure that we improve the health outcomes of PLWH who have not achieved viral suppression, disruptive programming that provides supportive services with an emphasis on education, emotional support, trauma informed care and stigma reduction; and improves the lives of people experiencing financial hardship, homelessness, mental illness, and SUD are greatly needed. New and unconventional programming, such as conditional financial incentives,

⁵⁴ <https://www.hiv.gov/hiv-basics/living-well-with-hiv/taking-care-of-yourself/aging-with-hiv>

⁵⁵ <https://www.medicalnewstoday.com/articles/growing-old-with-hiv>

also known as contingency management, must be expanded, as well as advances in antiretroviral therapy such as long acting injectables, particularly for individuals facing the most complex life circumstances. For communities most impacted by HIV, the importance of addressing barriers to care and ensuring PLWH are informed and able to easily access various programs and resources will be important.

c. Prevent New HIV Transmissions by Using Proven Interventions, Including PrEP/PEP & SSPs

PrEP/PEP: Increasing the number of people who take advantage of and have access to clinical preventive services, such as PrEP, continues to be a major public health challenge. Despite widely available PrEP resources and providers, less than four in ten persons with an indication for PrEP report taking it. Significant progress has been made to limit PrEP associated costs as a barrier to uptake; most health insurance plans now cover most PrEP associated health care costs, with public and private programs available to cover out-of-pocket costs based on income. Unfortunately, assistance programs require eligibility screening and paperwork, which can deter some clients. Clear and direct messaging about PrEP from appropriate community stakeholders is greatly needed to address mistrust and combat misleading information. Health care systems must adapt to make PrEP initiation and its continued use as easy as possible so that individuals with a continued indication are retained in care.

Mistrust of new pharmacologic interventions and medical providers in communities of color are understandable and justifiable given the history of mistreatment of Black Americans, Native Americans, and other people of color, as unwilling subjects of medical research and continued racial biases in access to and the delivery of health care services. Unsurprisingly, the uptake of PrEP among Black and Latinx MSM and transgender persons has consistently been lower compared to their White counterparts. In addition, many individuals incorrectly believe that PrEP will be too expensive and therefore inaccessible. While federal, state, and local programs that support PrEP at low to no-cost remain in place; community-based organizations, medical providers, and public health departments all have a role to play to help address misinformation and mistrust as a step towards deconstructing institutional racism and improving healthcare access patterns. The Commission's *Black/African American (AA) Community Task Force*⁵⁶ recommended increasing culturally sensitive PrEP advertising designed with input from the very communities it is attempting to reach, including Black/African American cisgender women, transgender individuals and MSM. In addition, voices of influential individuals through social media and marketing may help destigmatize both HIV and PrEP use and could potentially activate some individuals to take action.

For PrEP to reach the individuals who would most benefit from this prevention tool, health care partners across all sectors and disciplines must not only understand its clinical use, but, more importantly, be mindful and comfortable in their approach to discussing sexual behaviors with patients, ideally in an open non-judgmental manner. The network of LAC PrEP Centers of Excellence (COEs) was launched in 2016 with the goal of creating culturally competent access points where patients can also receive assistance navigating PrEP-related cost and health insurance coverage issues. Since the FDA approval of PrEP, the number of medical providers in LAC who report being a PrEP provider has steadily increased.¹² Recently, 39 Federally Qualified Health Centers (FQHCs) in LAC were funded directly through the federal Ending the HIV Epidemic initiative to expand their PrEP and HIV prevention efforts. Additionally, recent California legislation and policy changes have further expanded PrEP access points to include pharmacies⁵⁷ and telemedicine providers.

⁵⁶ Now the Black/African American Caucus of the LA County Commission on HIV

⁵⁷ With the passing of California's Senate Bill 159, pharmacists are now allowed to directly provide PrEP and post exposure prophylaxis (PEP).

An outstanding concern regarding PrEP uptake is its duration of use among individuals with continued risk. Discontinuation of PrEP is likely due to multiple factors, including pill fatigue, administrative barriers, and competing life demands. To ensure consistent, sustained access for clients at highest risk for HIV and other STDs in sexual health and prevention services and PrEP services, providers must develop more systematic and innovative ways of staying engaged with their clients. PrEP providers can reduce barriers to care for follow up appointments by offering telemedicine visits and allowing patients to come in only when laboratory work is needed. Expansion of technology to allow for accurate and sensitive home or self-collected HIV and STD tests will be a significant step toward further minimizing the frequency and length of time for medical visits and ensuring PrEP adherence. Many clients, especially younger individuals, prefer digital forms of communication and care, yet many community health centers still lack secure technology platforms to facilitate easier communication with patients.

DHSP and stakeholders must continue to promote all PrEP access points to further increase uptake. Studies have demonstrated that the “2-1-1” PrEP regimen⁵⁸ (where an individual takes two pills 2 to 24 hours before sex, one pill 24 hours after the initial dose, and one final pill 24 hours later), as well as long-acting injectable PrEP options, are important alternatives to oral daily PrEP. These alternate regimens have the added benefit of being attractive for individuals with pill fatigue or those struggling with adherence issues. Lastly, providers must be aware of clients who have or continue to utilize PEP, the use of antiretroviral drugs for people who are HIV- negative after a single high-risk exposure to stop HIV acquisition. Clients utilizing PEP should be connected to PrEP service providers to further prevent HIV transmission and acquisition. Although providers must acknowledge that for some clients, repeated use of PEP overtime may be the most beneficial form of biomedical prevention.

Syringe Services Programs: Historical data in LAC have shown injection drug use (IDU) to be a consistent, but less common risk factor for HIV transmission, accounting for less than 5% of HIV cases annually. However, recent increases in opioid and methamphetamine use via both injection drug use and non-injection drug use is concerning. Additionally, the rise of conditions that contribute to drug use, such as economic inequality, homelessness and untreated mental illness are pervasive in LAC, increasing our susceptibility to an IDU outbreak. Fortunately, syringe services programs (SSPs) are legal under California law, but programs in LAC experience fragmented or insufficient support from County and City of Los Angeles partners. In addition, LAC DPH funded SSPs continue to be small in scale, including only nine agencies funded at modest levels through the DPH SAPC program. Of the nine currently funded EOP agencies, only two currently provide HIV, STD, and hepatitis C (HCV) testing. Unfortunately, there is limited data and an absence of an in-depth analysis to confirm the impact of the LAC DPH-supported SSP programs, including data tied to linking clients to testing, other HIV prevention and care resources as well as Hepatitis and substance use disorder services. LAC has recently increased our investment in this area and we plan to continue to enhance the SSP service portfolio to ensure clients are linked to HIV prevention and treatment services and allow for more robust data collection. Despite recent legislative setbacks, we will also continue to support the creation of supervised drug consumption sites and services. Supervised Consumption Sites (SCS) are designated sites where people can use pre-obtained drugs under the safety and support of trained personnel. SCS have been implemented across over 200 sites in countries around the world and have been proven to save lives.⁵⁹

⁵⁸ There is scientific evidence that the “2-1-1” schedule provides effective protection for cisgender MSM when having anal sex without a condom, however, to date, we don’t know how “on-demand” PrEP works for heterosexual cisgender men and women, people who inject drugs, and transgender persons.

⁵⁹ Gostin LO, Hodge JG, Gulinson CL. Supervised injection facilities: legal and policy reforms. *JAMA*. 2019; 321(8):745-746.

d. Respond Quickly to Potential HIV Outbreaks to Get Needed Prevention and Treatment Services to People who Need Them:

The use of client-level data reported to the public health department to identify and target PLWH for contact tracing and linkage to services has a long precedent that continues today. The use of this client data for expanded HIV prevention and outreach efforts, however, is relatively recent. For decades, national guidelines and state laws restricted access and use of client-level HIV surveillance data to traditional surveillance functions, such as generating aggregated reports to describe population-based trends among PLWDH. While these limits on the use of surveillance data in the early days of the HIV epidemic as a way to protect the privacy of PLWH were understandable, these laws severely limited the ability of public health staff to use available information to further advance outbreak investigation efforts. Fortunately, we find ourselves in a different era where data driven HIV public health strategies, such as data-to-care, the use of geospatial analysis, and molecular cluster analysis are available (and required) and can be leveraged to ensure that the HIV public health response is more targeted and timely, and has the greatest impact. These activities require real-time access to client-level surveillance data and will be carried out regularly to not only identify individuals who need enhanced services, but to also detect and rapidly respond to early clusters or outbreaks of HIV in the community.

Partner Services: The CDC describes Partner Services as a continuum of clinical evaluation, counseling, diagnostic testing, and treatment designed to increase the number of infected persons brought to treatment and to reduce transmission among sexual networks.⁶⁰ Partner services is a key strategy for identifying people with HIV infection—those with undiagnosed infection and those with diagnosed infection who are not receiving HIV medical care—and helping them access care and treatment. All persons with newly diagnosed HIV infection should receive Partner Services to help them identify sex and needle-sharing partners who may also be infected or may be at very high risk for becoming infected. These partners can then be notified of their potential exposure and offered HIV testing. Those who test positive for HIV can then be linked to HIV medical care and other services. Those who test negative can then be linked to PrEP, SSP and other prevention services.

DPH employs Public Health Investigators (PHI, aka Disease Intervention Specialists) to implement both HIV and STD Partner Services (PS) activities. Currently, LAC's integrated HIV/STD disease investigation and PS program is implemented by staff who work within two separate divisions within the Department of Public Health: DHSP and Community and Field Services (CFS). DHSP PHIs, based at a centralized office, focus on syphilis and HIV partner services while CFS PHIs, based in 12 district offices throughout LAC, focus on HIV/STD and other communicable diseases assigned by the DPH.

While the Partner Services program in LAC has been mostly successful in interviewing newly diagnosed clients, there is opportunity to further expand the program's capacity to ensure all newly diagnosed clients and their partners are being interviewed in a timely and more efficient manner. In LAC, improved data system integration, easier data access, and increased staffing will improve the ability of LAC DHSP to reach all newly diagnosed persons with HIV. The latest estimate suggests that 73% of newly diagnosed persons with HIV in LAC receive an offer of Partner Services around the time of their diagnosis, but only 46% of those newly diagnosed are interviewed and only 10% name contacts. There is an opportunity to build staff capacity within the Partner Services program as well as expand partnerships with providers at high volume HIV/STD clinical testing sites to 1) establish more on-site counseling and education for persons testing positive within clinics, 2) promote rapid linkage to care and treatment efforts, and 3) reinforce community driven service sites that support and empower clients to prioritize their wellness and connect identified partners with critical HIV testing and/or PrEP. In addition, Partner Services will need to adapt to new technologies in order to respond to the use of web-based platforms, mobile apps, and other internet-based modalities that facilitate identifying and connecting with partners to testing, prevention, or care.

⁶⁰ <https://www.cdc.gov/std/treatment-guidelines/clinical-partnerServices.htm>

4. SITUATIONAL ANALYSIS

In response to the steady increase of syphilis cases and the increasingly scarce human and financial resources available to aggressively investigate all cases and interrupt the transmission of new infections, DPH has employed and implemented a priority setting process to further improve local disease investigation efforts, in particular HIV partner services. The three-point plan to improve HIV partner services includes HIV surveillance system improvements, organizational restructuring and enhanced HIV training for PHIs.

In 2021, DHSP hired seven new Public Health Investigator Trainees. The County will also hire additional PHIs to move closer towards meeting the large needs based on the high HIV and syphilis rates. Key to expanding and improving the local infrastructure is updating the existing training curriculum and adding more mentoring and hands-on training to provide better disease intervention for the very complex, high priority HIV and syphilis cases. Additional improvements are planned in quality improvement and epidemiological analysis to inform the current needs and practices as well as to inform incident trends; ultimately, to use data-to-care/action strategies in real time to detect, intervene, and prevent new cases. One other important upgrade is a new data management system, IRIS, which will enhance the workflow and case management system in comparison to the current system, STD Casewatch. IRIS will also integrate data systems that allows for efficiencies in conducting searches in HIV surveillance and other key databases.

Linkage Re-engagement Program: At DHSP, the Linkage and Re-engagement Program (LRP) is staffed by a team of health navigators and supervised by a social worker. LRP provides intensive case management and longitudinal support to PLWDH who are out of care, who are facing challenging life circumstances, and who have multiple co-morbid, mental health or SUD conditions. While linkage and re-engagement activities are the primary contracted responsibility of clinics and organizations that provide direct services to clients, LAC DHSP offers LRP as a complementary service designed to locate and connect the hardest to reach clients to the health care system. The majority of clients served by LRP are referred by their medical provider after they have fallen out of care and have been lost to follow-up. Other clients in need of LRP services are identified through data-to-care analyses, because they are high need for intensive case management such as pregnant women, individuals recently released from jail, and individuals who are identified as part of a growing HIV transmission cluster.

HIV Molecular Cluster Detection: In 2018, LAC adopted the use of the CDC's HIV TRACE program to identify priority molecular clusters (defined as a group of 5 or more persons whose HIV genotype is identified as being highly similar and a transmission cluster requiring additional review and intervention.) Because HIV has a high mutation frequency, individuals whose HIV genotypes are highly similar are likely connected through recent sexual or social networks where there is ongoing HIV transmission. In addition, there is a high likelihood that persons who may be part of new cluster are unaware of their HIV status or know their status but are not virally suppressed. LAC staff perform molecular cluster analysis of available surveillance and programmatic data to determine if the individuals are in care, virally suppressed, and if they need contact and engagement from linkage to care, re-engagement or partner services/notification teams. Given the novel nature of molecular cluster detection, in late 2019 LAC DPH launched an effort to engage community stakeholders regarding its use and assess potential unintended consequences. LAC DHSP provided an overview of molecular surveillance to the Commission on HIV to provide background information, address community concerns, address misperceptions related to the use of data, and review the potential legal ramifications and privacy issues. Planned activities for further community dialogue were put on hold due to the deployment of staff to the local COVID-19 response, however they have recently resumed. As a part of continued community engagement and awareness on molecular cluster detection and the monitoring of cluster outbreaks, DHSP will develop a communication strategy for community members and organizations in 2022 and beyond.

More recently, LAC DHSP has begun to identify emerging HIV diagnosis trends using a complementary methodology called time-space cluster analysis using case surveillance data. Time-space alerts determine whether the number of new cases in the prior 12 months is greater than expected baseline levels across different geographic areas and sub-populations, providing insight into where and among whom to prioritize early investigation and interventions to prevent onward transmission.

As we continue to move forward with EHE and develop new or strengthen existing partnerships with community stakeholders and service providers, LAC DHSP will continue to adopt common language and improve understanding of the Respond Pillar. This will be important to advance strategies designed to support the adoption of this new technology, more efficiently serve clients in need, and prevent outbreaks. Successful EHE efforts are strongly dependent on the extensive partnerships between LAC's HIV medical homes, Medical Care Coordination teams, vast network of HIV support services providers, leaders from the most impacted communities, and a broad-based coalition of non-traditional service partners. An integrated data management system for case management and surveillance data is foundational to future programmatic enhancements. LAC DPH's Informational Technology branch has begun to add HIV and STDs to its new surveillance data system for all communicable diseases; the new system will offer large-scale improvements to overall data management, facilitate data linkages across diseases, and improve timely access to surveillance data for staff working with clients. We are hopeful that the social acceptance of contact tracing for COVID-19, and the societal shift in understanding its importance in disease investigation will translate into improved HIV case-finding efforts under the Respond Pillar.

Priority Populations: Based on epidemiologic and needs assessment data, the priority populations for the Integrated Plan are: Black/African American MSM, Latinx MSM, women of color, people who inject drugs, transgender persons, youth under 30 years of age and PLWH aged 50 and older. These populations are inclusive of the priority populations in the EHE with the addition of the 50 and older population group. Although these populations will be prioritized, the County's HIV portfolio will continue to support *all* populations affected by HIV and will not diminish efforts to prevent, diagnose, and treat HIV for populations who remain a critical concern, including people experiencing unstable housing or homelessness, among others.

Capacity Building & HIV Workforce: For many years, there has been a resounding call from frontline HIV service providers and others to provide the HIV workforce with the tools, resources, and support to maintain their health and wellbeing while continuing to diligently serve people affected by and living with HIV. The jurisdiction is committed to exploring additional opportunities to support frontline workers by addressing staff burnout, identifying and addressing training needs, and supporting continued professional development and advancement, all of which will improve the quality of services and strengthen the local HIV response. LAC DHSP will continue to work with the AETCs and the California Prevention Training Center to identify trainings to support the HIV workforce, with a particular focus on client-centered and trauma-informed approaches to HIV care. Given recent events and persistent social injustices, including COVID-19, a housing crisis, and worsening economic, racial and social injustice, the emotional and physical capacity of individuals, organizations, and the HIV workforce continues to be strained and tested. We recognize the need to support programs and services that 1) address intersectional issues that go beyond HIV prevention, care and treatment needs, 2) support PLWH with meeting basic human needs and 3) better support the HIV workforce. We will continue to encourage organizations to diversify the HIV workforce by hiring diverse employees to promote cultural competency, mirror the populations most impacted by the HIV epidemic, and combat systemic racism as we operationalize all Pillars.

Section V: Goals and Objectives

The EHE Plan forms the core of the Integrated Plan's goals, objectives and strategies. In addition to the four pillars: diagnose, treat, prevent and respond, we have added key foundational and cross-pillar elements that are essential to supporting each pillar's strategies and activities and our broader HIV-related goals. As depicted in Figure 33, these foundational elements include Building Workforce Capacity; System and Service Integration; and Equity, Social Determinants of Health and Co-Occurring Disorders.

Figure 33: Four Key Pillars and a Strong Foundation Necessary to Achieve HIV-Related Goals

Pillar I: Diagnose

Goal: Diagnose all people with HIV as early as possible

Objectives:

1. By 2025, increase the percentage of PLWH who are aware of their status to 95%, from a baseline of 89%.
2. By 2025, reduce the number of undiagnosed PLWH from an estimated 6,800 to an estimated 3,067.⁶¹
3. By 2026, decrease the proportion of people newly diagnosed with HIV who are in the late stage⁶² of HIV disease at time of diagnosis from 20% to 15%.

Strategy 1A: Expand or implement routine opt-out HIV screening in healthcare and other settings, such as emergency departments (EDs) and community health centers (CHCs) in high prevalence communities.

Activity 1A.1: Assess and monitor the degree that HIV testing is occurring county-wide. Identify infrastructure and healthcare system issues to determine the feasibility of expanding routine opt-out testing.

Activity 1A.2: Expand the number of EDs and CHCs in high prevalence communities performing routine opt-out HIV screening.

Activity 1A.3: Identify additional opportunities in healthcare and non-healthcare settings where HIV testing can be included, such as routine STD screening sites and substance use treatment centers, among others.

Strategy 1B: Develop locally tailored HIV testing programs to reach persons in non-healthcare settings including home/self-testing.

Activity 1B.1: Assess and monitor the degree that HIV testing is occurring county-wide (see Strategy 1A). Identify infrastructure and healthcare system issues to determine the feasibility of launching a county-wide rapid HIV self-test program.

Activity 1B.2: Develop guidance on HIV self-testing, including linkage to care and prevention services, a quality assurance protocol, and assess readiness of providers to implement self-testing.

Activity 1B.3: Assess Take Me Home self-testing initiative utilization, barriers and facilitators and make improvements as necessary.

Activity 1B.4: Expand use of HIV self-testing among at risk individuals unlikely to receive traditional in-person HIV testing by developing and expanding other types of self-testing (in addition to Take Me Home) to ensure equitable access.

Strategy 1C: Increase the rate of annual HIV re-screening among persons at elevated risk for HIV in both healthcare & non-healthcare settings. Implement technology to help providers identify clients due for HIV re-screening & increase ways of maintaining communication with clients.

Activity 1C.1: Develop provider-to-patient communication tools to support providers in identifying at risk clients who are due for HIV re-screening and increase systematic ways of maintaining communication with clients.

Activity 1C.2: Develop a plan for evaluating impact of the provider-to-patient communication tools on client re-screening.

Activity 1C.3: Expand implementation & use of provider-to-patient communication tools among LAC DHSP funded HIV prevention providers.

⁶¹ Estimated based on 59,400 PLWH in 2021 and assuming 4,450 new infections and 2,500 deaths by 2025 = $\sim 61,350 \times 5\% = 3,067$ Undiagnosed PLWH in 2025

⁶² Late stage is Stage 3 HIV disease, the criteria being either CD4 < 200 cells/ μ L within 90 days of HIV diagnosis or a diagnosis of an opportunistic illness within 90 days of HIV diagnosis

5. GOALS & OBJECTIVES

Activity 1C.4: Explore the use of client incentives to maintain re-screening adherence.
Strategy 1D: Increase the timeliness of HIV diagnoses from point of infection by increasing access to testing and increasing awareness of risk
Activity 1D.1: Increase integration of HIV testing/screening with other STDs and HCV
Activity 1D.2: Increase the number of STD & HIV express clinics in LAC, especially in Health Districts disproportionately impacted by HIV
Activity 1D.3: Increase community awareness of HIV testing options through advertising and promotional events in multiple languages
Activity 1D.4: Work with SAPC to ensure that all syringe service programs (SSPs) provide integrated testing/screening (HIV, STDs, HCV) and linkage to care
Activity 1D.5: Explore utilizing a Promotores/Community Health Worker model to increase sexual health literacy and awareness of HIV risk in priority populations
Activity 1D.6: Increase the capacity of Partner Services and Cluster Detection and Response to quickly identify and contact people who may be at risk of HIV/STD/HCV and direct them to testing services (see Respond Pillar activities)
Key Partners: FQHCs & Community Health Centers, Emergency Departments, HIV & STD testing providers, HIV prevention providers, private providers, academic medical provider training programs including colleges and universities, LAC Dept. of Health Services (DHS), LAC Dept. of Mental Health (DMH), LAC Sherriff's Department, homeless service providers, City of Long Beach and City of Pasadena Health Departments, LAC DPH Substance Abuse Prevention and Control Program (SAPC) and other DPH programs and divisions.
Potential Funding Resources: CDC EHE Program Implementation; HRSA RWP Part A; CDC Integrated HIV Surveillance and Prevention; State OA HIV Surveillance; SAPC Non-Drug Medi-Cal; EHE funding to FQHCs, Academic Institutions/Research, and AIDS Education and Training Centers
Outcomes: • Increased routine opt-out HIV screenings in healthcare and other institutional settings • Increased local availability of and accessibility to HIV testing services • Increased HIV screening and re-screening among persons at elevated risk for HIV infection • Increased knowledge of HIV status • Increased HIV diagnoses • Improved timeliness between HIV infection and diagnosis
Monitoring Data Source: DHSP HIV Surveillance (eHARS)
Expected Impact on HIV Care Continuum: Increase the percentage of PLWH who know their HIV status by 6% (89% to 95%).
Alignment with NHAS Goals: ☒ Prevent New HIV Infections ☒ Improve HIV-Related Health Outcomes for PLWH ☒ Reduce HIV-Related Disparities & Health Inequities ☐ Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic among All Partners & Interested Parties

Pillar II: Treat

Goal: Treat people with HIV rapidly and effectively to reach sustained viral suppression	
Objectives:	
1. By 2025, increase the proportion of people diagnosed with HIV who are linked to HIV care⁶³ within one month of diagnosis from 76% to 95%. 2. By 2026, increase the proportion of people diagnosed with HIV who are linked to care within 7 days from 54% (2020) to 65%. 3. By 2025, increase the proportion of PLWDH who are virally suppressed from 61% to 95%.	
Strategy 2A: Ensure rapid linkage to HIV care and antiretroviral therapy (ART) initiation for all persons newly diagnosed with HIV.	
Activity 2A.1:	Increase county-wide capacity to provide same-day rapid linkage to care during expanded hours and days for persons newly diagnosed with HIV.
Activity 2A.2:	Develop a network of HIV care providers who offer same day appointments with rapid ART disbursement.
Strategy 2B: Support re-engagement and retention in HIV care and treatment adherence	
Activity 2B.1:	Expand the use and capacity of peer navigators and/or community health workers for PLWH to increase health literacy, access services and address social determinants of health (housing, food insecurity, etc.)
Activity 2B.2:	Increase knowledge & awareness among both providers & community members about long acting injectables and other biomedical advances
Activity 2B.3:	Create and distribute list of clinical providers of color and LGBTQ culturally competent providers
Activity 2B.4:	Create and expand medical and supportive services for cisgender women living with HIV/AIDS. This includes services such as family housing, transportation, mental health, childcare, and substance abuse
Activity 2B.5:	Create and expand medical and supportive services for transgender persons living with HIV/AIDS
Activity 2B.6:	Advocate for appropriate allocation and maintenance of funding for the Trans, Gender Nonconforming and Intersex (TGI) Equity Fund created by the passage of AB-2521
Strategy 2C: Support re-engagement and retention in HIV care and treatment adherence, especially for persons who are not eligible for Ryan White Program-supported services, persons with mental illness, persons with substance use disorders, and unhoused persons.	
Activity 2C.1:	Comprehensively assess unmet mental health needs of PLWH and identify gaps and areas of improvement in the mental health provider network in LAC.
Activity 2C.2:	Develop partnerships to meet the SUD (particularly meth use disorder) needs of persons at risk for HIV or PLWH and improve the capacity of SUD providers to address the sexual health needs of clients and ensure access to HIV-related services, as needed.
Activity 2C.3:	Develop a report that summarizes critical gaps in the current system and makes recommendations for improvement and investment of County resources, including Ryan White Program funds.

⁶³ Linked to HIV care is defined as ≥ 1 CD4/VL/Genotype test reported

5. GOALS & OBJECTIVES

Activity 2C.4: Leverage and monitor CalAIM to ensure their programs are appropriate and effective for PLWH
Activity 2C.5: Develop transitional case management programs that help PLWH transition from Ryan White Program into Medi-Cal, Medicare and CalAIM, and develop case management services that can monitor if care and support services are meeting the needs of PLWH post-transition.
Activity 2C.6: Expand the use of street medicine for unhoused PLWH and at-risk for HIV
Strategy 2D: Expand the promotion of Ryan White Program services to increase awareness, access to, and utilization of available medical care and support services for PLWH
Activity 2D.1: Assess how clients are currently learning about available RWP services. Identify existing and new resources to assist with promotion and educational outreach including, but not limited to, print materials and online resources
Strategy 2E: Develop and fund a housing service portfolio that provides rental subsidies to prevent homelessness among PLWH
Activity 2E.1: Determine processes and program operations for housing assistance that are aligned with federal funding guidance and restrictions
Activity 2E.2: Identify potential housing partners positioned to serve PLWH and implement an expanded housing program.
Strategy 2F: Explore the impact of conditional financial incentives to increase adherence to treatment for high acuity out-of-care PLWH
Activity 2F.1: Develop processes and program operations for a pilot program that is acceptable to clients and is aligned with federal funding guidance and restrictions
Activity 2F.2: Identify potential clinical sites, train staff on pilot processes, and implement program
Activity 2F.3: Develop a robust evaluation plan to determine continued use of financial incentives and potential for expansion to other populations
Strategy 2G: RFP: EHE Priority Populations Interventions
Activity 2G.1: Develop and release RFP to fund 7-10 contracts for identified interventions
Strategy 2H: Expand capacity to provide whole-person care to PLWH who are age 50 and older and long-term survivors⁵⁹
Activity 2H.1: Identify, implement, and evaluate models of care that meet the needs of people with HIV who are aging and ensure quality of care across services ⁶⁴
Activity 2H.2: Identify and implement best practices related to addressing psychosocial and behavioral health needs of older PLWH and long-term survivors including substance use treatment, mental health treatment, and programs designed to decrease social isolation ⁵⁹
Activity 2H.3: Review/update diagnostic screenings to include age-related conditions (i.e. screen for loneliness, ACEs, depression, anxiety, experiences of discrimination), using LA County Commission on HIV's Aging Task Force recommendations as a guide
Activity 2H.4: Screen patients for comprehensive benefits analysis and financial screening; and assess access to caregiving support

⁶⁴ Adapted from the NHAS, 2022-2025

Activity 2H.5: Review Home-Based Case Management service standards for alignment with OT and PT assessments
Key Partners: RWP-supported HIV service providers, HIV medical providers outside of RWP network, FQHCs and Community Health Centers, HIV and STD Testing Providers, HOPWA, CA Dept. of Healthcare Services; LAC DHS Housing for Health program, LAC Homeless Services Authority (LAHSA), additional housing and homeless service providers, immigrant rights groups, public and private health plans, LAC DMH, LAC DHS, and City of Long Beach and City of Pasadena Health Departments.
Potential Funding Resources: HRSA EHE; HRSA CARES; HRSA RWP Part A; HRSA RWP Part B; HRSA RWP Minority AIDS Initiative; CDC Medical Monitoring Project; EHE funding to FQHCs, Academic Institutions/Research, and AIDS Education and Training Centers.
Outcomes: • Increased rapid linkage to HIV medical care • Increased early initiation of ART • Increased support to providers for linking, retaining, and re-engaging PLWH to care and treatment • Increased capacity to serve PLWH 50 and older and long-term survivors • Increased utilization of RWP core services among PLWH • Increase viral suppression among PLWH
Monitoring Data Source: HIV Casewatch, DHSP HIV Surveillance (eHARS), Medical Monitoring Project (MMP)
Expected Impact on HIV Care Continuum: Increase the percentage of PLWDH who are linked to HIV care within 90 days by 19% & and who are linked to HIV care within 7 days by 11%. Increase viral suppression rate by 34% (from 61% to 95%).
Alignment with NHAS Goals: ☒ Prevent New HIV Infections ☒ Improve HIV-Related Health Outcomes for PLWH ☒ Reduce HIV-Related Disparities & Health Inequities ☐ Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic among All Partners & Interested Parties

Pillar III: Prevent

Goal: Prevent new HIV transmissions by using proven interventions, including PrEP and syringe services programs (SSPs)	
Objectives:	
1. By 2025, increase the proportion of persons prescribed PrEP with an indication for PrEP to at least 50%, from a 2022 baseline of 39%. 2. By 2025, increase the proportion of Black/African American persons prescribed PrEP with an indication for PrEP to at least 50%, from a 2022 baseline of 25%. 3. By 2025, increase the proportion of Latinx persons prescribed PrEP with an indication for PrEP to at least 50%, from a 2022 baseline of 38%. 4. By 2026, increase the percentage of EOPs and SSPs that provide HIV/STD testing and HCV screening from 20% to 80%.	
Strategy 3A: Accelerate efforts to increase PrEP use (particularly for populations with the highest rates of new HIV diagnoses and low PrEP coverage rates) by adopting new strategies at LAC funded PrEP Centers of Excellence tied to client retention, PrEP navigation, community education, supporting alternatives to daily PrEP, and expanding PrEP support groups; and promoting recent innovations	
Activity 3A.1:	Conduct an in-depth landscape analysis of current PrEP resources and services among primary care providers in high morbidity areas, among providers who serve transgender persons, women's health providers, and SUD providers.
Activity 3A.2:	Implement systematic and innovative strategies at LAC DHSP-funded PrEP Centers of Excellence for enhanced client communication to promote retention in PrEP and sexual health services.
Activity 3A.3:	Increase capacity of LAC DPH staff to provide more robust PrEP navigation services to clients served through County STD clinics, Partner Services, and those receiving PrEP/PEP at community pharmacies.
Activity 3A.4:	Disseminate simple fact-based social marketing PrEP messaging to increase knowledge and awareness of PrEP, alternatives to daily PrEP, how to access PrEP/PEP under SB 159, ⁶⁵ and help combat misinformation regarding cost, access, and safety.
Activity 3A.5:	Work with local stakeholders to identify the potential role for PrEP support groups or PrEP ambassadors to support new and continued PrEP use in affected communities.
Activity 3A.6:	Finalize PrEP campaigns for Black/African American MSM, transwomen and cisgender women, per the LA County Commission on HIV's Black/African American Community Task Force's Recommendations.
Activity 3A.7:	Increase knowledge & awareness among both providers & community members about long acting injectables and other biomedical advances (See 2.B.2).
Activity 3A.8:	Help build the capacity of pharmacies to prescribe PrEP/PEP and create a directory of pharmacies that have capacity to prescribe PrEP/PEP under SB159, potentially to be integrated into the GetPrEPLA website.
Activity 3A.9:	Develop a public health detailing campaign to expand the number of oral PrEP prescribers in LAC.

⁶⁵ SB 159 authorizes pharmacists to furnish PrEP and PEP without a physician prescription and prohibits insurance companies from requiring prior authorizations in order to obtain PrEP coverage.

5. GOALS & OBJECTIVES

Strategy 3B: Increase availability, use, and access to comprehensive syringe services programs (SSPs) and other harm reduction services.	
Activity 3B.1:	Collaborate with the Los Angeles County Substance Abuse Prevention and Control Program to identify opportunities to increase the capacity of SSPs, improve the provision or linkage of SSP clients to HIV and STD prevention and treatment services, and expand the availability of contingency management services to persons with substance use disorder, including meth use.
Activity 3B.2:	Explore ideas for alternate models of prevention service delivery (e.g., vouchers which can be taken to pharmacies in exchange for clean syringes and HIV self-test kits).
Activity 3B.3:	Distribute information about the efficacy of SSPs to increase the health literacy of HIV providers and community members
Activity 3B.4:	Destigmatize syringe services/needle exchange and further integrate SSP providers into HIV-related work
Activity 3B.5:	Promote safe consumption/injection sites
Key Partners: FQHCs and Community Health Centers, PrEP Centers of Excellence, HIV and STD Testing Providers, LAC STD clinics, LAC SAPC; County of Los Angeles and City of Los Angeles-funded SSPs, pharmacies, general practitioners and private healthcare providers, family planning clinics (including Planned Parenthood), schools and colleges, community leaders and advocates, and Region IX PACE Program.	
Potential Funding Resources: CDC EHE Program Implementation; HRSA RWP Part A; HRSA RWP Part B; HRSA RWP Minority AIDS Initiative; CDC National HIV Behavioral Survey & TG Supplement; CDC Integrated HIV Surveillance and Prevention; State OA HIV Surveillance; SAPC Non-Drug Medi-Cal; County/City of LA SSP Funding; EHE funding to FQHCs, Academic Institutions/Research, and AIDS Education and Training Centers.	
Outcomes: • Increased referral and linkage of persons with indications for PrEP • Increased PrEP prescriptions compared to number with indications overall and in areas with high HIV diagnosis rates • Decreased racial and ethnic disparities in PrEP uptake • Increased capacity of SSP service providers to directly provide or link clients to HIV prevention and care services • Reduced new HIV infections	
Monitoring Data Source: Multiple PrEP monitoring and evaluation data, DHSP HIV Surveillance (eHARS), National HIV Behavioral Surveillance.	
Expected Impact on HIV Care Continuum: Increase the percentage of people with an indication for PrEP who access PrEP by 11%.	
Alignment with NHAS Goals: ☒ Prevent New HIV Infections ☐ Improve HIV-Related Health Outcomes for PLWH ☒ Reduce HIV-Related Disparities & Health Inequities ☐ Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic among All Partners & Interested Parties	

Pillar IV: Respond

Goal: Respond quickly to potential HIV outbreaks to get vital prevention and treatment services to people who need them	
Objectives:	
1. By 2026, provide/disseminate at least 5 educational trainings/workshops or educational materials to increase awareness/knowledge related to cluster and outbreak detection and response 2. By 2025, increase the total proportion of persons newly diagnosed with HIV who are assigned for Partner Services (PS) to 95% from a 2021 baseline of 73% 3. By 2025, increase the total proportion of persons newly diagnosed with HIV who are interviewed for PS to 75% from a 2021 baseline of 46%	
Strategy 4A: Refine processes, data systems, and policies for robust, real-time cluster detection, time- space analysis, and response	
Activity 4A.1:	Develop a protocol, training materials, and standard operation plan.
Activity 4A.2:	Continue community engagement regarding the use of HIV molecular surveillance for cluster detection to inform its best use and identify and mitigate any unintended consequences.
Activity 4A.3:	Expand routine epidemiological analysis of recent infection by person, place, and time to identify hot-spot locations and sub-populations associated with recent infection to inform rapid investigation and intervention.
Activity 4A.4:	Educate HIV providers about the use and effectiveness of cluster detection
Strategy 4B: Refine current processes to increase capacity of Partner Services to ensure people newly diagnosed are interviewed and close partners are identified and offered services in a timely and effective manner.	
Activity 4B.1:	Increase capacity of LAC DHSP to provide Partner Services to all newly diagnosed persons in LAC.
Activity 4B.2:	Implement new STD surveillance system to enhance the identification and assignment of new HIV cases to LAC DPH staff for timely follow-up and Partner Services.
Activity 4B.3:	Educate HIV providers about the use and effectiveness of Partner Services
Activity 4B.4:	Explore increased use of community-embedded Partner Services
Strategy 4C: Data to Care RFP	
Activity 4C.1:	Develop and release RFP to fund up to 5 contracts for Data to Care activities.
Key Partners: California Office of AIDS, City of Long Beach and City of Pasadena Health Departments, HIV and STD Service Providers; CBA	
Potential Funding Resources: HRSA EHE; CDC Integrated HIV Surveillance and Prevention; EHE funding to Academic Institutions/Research	
Outcomes:	
• Increased number of newly diagnosed people with HIV interviewed by Partner Services staff • Improved data systems and surveillance data for real-time cluster detection and response • Improved policies and funding mechanisms to respond to and contain HIV clusters and outbreaks • Improved knowledge of networks to contain HIV transmission clusters and outbreaks	

5. GOALS & OBJECTIVES

• Increased number of testing providers offering HIV recent infection testing • Increased new HIV diagnoses
Monitoring Data Source: Partner Services data (STD Casewatch), Local HIV clusters
Expected Impact on HIV Care Continuum: Increase the number of people in networks affected by rapid transmission who know their HIV status, are linked to HIV medical care, and who are virally suppressed, and/or who are engaged in appropriate prevention services.
Alignment with NHAS Goals: ☒ Prevent New HIV Infections ☒ Improve HIV-Related Health Outcomes for PLWH ☒ Reduce HIV-Related Disparities & Health Inequities ☐ Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic among All Partners & Interested Parties

Workforce Capacity

Goal: Increase the capacity of the HIV workforce to diagnose and treat PLWH, prevent new HIV infections and reduce HIV-related disparities
Objectives: 1. By 2024, conduct a comprehensive assessment of the HIV workforce identifying strengths, needs and potential solutions, including an assessment of the true costs of services and how those services might be financed. 2. By 2026, implement training, technical assistance and necessary policy changes to increase workforce capacity as outlined in assessment findings and guided by the strategies below.
Strategy 5A: Increase the diversity and capacity of the workforce that delivers HIV prevention, care and supportive services to optimally reflect and serve the populations most impacted by HIV
Activity 5A.1: Conduct an assessment of Black/African American led agencies providing HIV services to identify training/technical assistance (TA) needs
Activity 5A.2: Provide TA and/or training for Black/African American led agencies to provide a more equitable playing field to successfully compete for solicitations, based on assessment findings
Activity 5A.3: Increase inclusion of peers/paraprofessionals in the workforce through training, mentorship, certification, supervision, reimbursement, and team functioning to assist with HIV, STD, HCV, and mental health and SUD service provision ⁵⁹
Activity 5A.4: Develop inventory of both formal and informal pipeline programs to prepare workers to work in the HIV/health field
Activity 5A.5: Train and expand a diverse HIV workforce by further developing and promoting opportunities to support the next generation of HIV providers including health care workers, researchers, and community partners, particularly from underrepresented populations ⁵⁹

5. GOALS & OBJECTIVES

Activity 5A.6: Based on results of workforce capacity assessment, review and revise service standards as necessary
Activity 5A.7: Engage, employ, and provide public leadership opportunities at all levels for people with or who experience risk for HIV
Strategy 5B: Ensure that the workforce is adequately prepared to deliver high-quality services in a culturally responsive manner
Activity 5B.1: Include harm reduction principles and the provision of trauma-informed care across provider trainings
Activity 5B.2: Provide gerontology training to Ambulatory Outpatient Medical, Oral Health, Medical Care Coordination and Mental Health services providers to improve awareness and understanding of age-related inequities in care and treatment
Activity 5B.3: Ensure that health care professionals and front-line staff complete education and training on stigma, discrimination, and unrecognized bias toward populations with or who experience risk for HIV, including LGBTQI+ people, immigrants, people who use drugs, and people involved in sex work ⁵⁹
Activity 5B.4: Identify and make available succession planning and leadership development trainings/programs
Key Partners: AETC; CBAs; FQHCs and Community Health Centers, HIV and STD Testing Providers, HIV prevention providers, private providers, academic medical provider training programs including colleges and universities, LAC DHS, LAC DMH, LAC SAPC.
Potential Funding Resources: CDC, HRSA, SAMHSA
Outcomes: • Increased capacity to provide culturally responsive services to PLWH and people at-risk for HIV
Expected Impact on HIV Care Continuum: Increased number of PLWH who know their status; Increased number of PLWDH that are linked to care within 30 days, retained in care and virally suppressed.
Alignment with NHAS Goals: ☒ Prevent New HIV Infections ☒ Improve HIV-Related Health Outcomes for PLWH ☒ Reduce HIV-Related Disparities & Health Inequities ☒ Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic among All Partners & Interested Parties

System and Service Integration

Goal: Integrate systems and services to address the syndemic of HIV, STDs, viral hepatitis, and substance use and mental health disorders in the context of social and structural/institutional factors including stigma, discrimination, and violence⁵⁹

Objectives:

1. By 2026, the LA County Division of HIV and STD Programs (DHSP) and/or the Commission on HIV (COH) will implement at least three internal (within LAC system) efforts to advance system and service integration
2. By 2026, DHSP and/or the COH will implement at least three external efforts to advance system and service integration

Strategy 6A: Increase cross-training and TA opportunities across fields/disciplines

Activity 6A.1: Enhance the ability of the HIV workforce to provide naloxone and educate people on the existence of fentanyl in the drug supply to prevent overdose and deaths and facilitate linkage to substance use disorder treatment and harm reduction programs⁵⁹

Activity 6A.2: Expand opportunities and mechanisms for information sharing and peer-to-peer technical assistance amongst HIV/STD/MH/SUD/Housing providers⁵⁹

Activity 6A.3: Support training for housing service providers on needs of PLWH and LGBTQI persons to improve cultural competencies among staff

Activity 6A.4: Increase HIV awareness, capability, and collaboration of service providers to support older people with HIV, including in settings such as aging services, housing for older adults, substance use treatment, and disability and other medical services⁵⁹

Activity 6A.5: Increase capacity of FQHCs that provide HIV-related services to screen for and treat HCV / Increased integration of HIV and HCV services

Strategy 6B: Leverage the Alliance of Health Integration initiative to integrate services within LA County publicly funded care systems.

Activity 6B.1: Strive to align strategic planning efforts on HIV, STIs, viral hepatitis, substance use disorders, and mental health care across national, state, and local partners⁵⁹

Activity 6B.2: Optimize RWP, Medicaid, Medicare, and other health systems to ensure they are used in a manner to deliver the highest quality of care for PLWH.

5. GOALS & OBJECTIVES

Key Partners: RWP, Medi-Cal, Medicare, LAC Acute Communicable Disease Control (ACDC); LAC DHS, DMH, SAPC and other DPH programs
Potential Funding Resources: CDC, HRSA, SAMHSA
Outcomes: • Increased system and service integration
Expected Impact on HIV Care Continuum: Increased number of PLWH who know their status; Increased number of PLWDH that are linked to care within 30 days, retained in care and virally suppressed.
Alignment with NHAS Goals: ☒ Prevent New HIV Infections ☒ Improve HIV-Related Health Outcomes for PLWH ☒ Reduce HIV-Related Disparities & Health Inequities ☒ Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic among All Partners & Interested Parties

Equity, Social Determinants of Health and Co-Occurring Disorders

Goal: Achieve health equity by addressing social determinants of health, stigma, & co-occurring disorders that fuel the HIV epidemic and HIV disparities
Objectives: 1. By 2026, increase the number of services and programs available to address meth use disorder by at least 25% 2. By 2026, increase the availability of mental health services for PLWH and at-risk for HIV by at least 25% 3. By 2026, reduce the rates of syphilis, gonorrhea, chlamydia and HCV in LA County by at least 25% 4. By 2026, reduce the rates of syphilis, gonorrhea, chlamydia and HCV among Black/African Americans in LA County by at least 25% 5. By 2026, increase the number of evidence-based or evidence-informed practices/programs that address SDH by at least 20%.
Strategy 7A: Advocate for an effective countywide response to SUDs, especially methamphetamine disorder
Activity 7A.1: Assess providers' ability to recognize and address meth use disorder
Activity 7A.2: Advocate for services and programs associated with methamphetamine use and HIV transmission
Activity 7A.3: Expand and enhance mental health services for people living with, affected by, or at risk of contracting HIV/AIDS.
Activity 7A.4: Support the building of community-based mental health services.
Strategy 7B: Advocate for an effective countywide response to the Sexually Transmitted Disease (STD) epidemic
Activity 7B.1: LA County Commission on HIV Public Policy Committee (PPC) will submit a letter to the Board of Supervisors (BOS) that will outline priorities/recommendations to improve the countywide STD response (based on a DPH report previously submitted to the BOS)
Activity 7B.2: The PPC will request a formal letter of support from the BOS to support the EHE budget request to the State of California
Strategy 7C: Address social determinants of health and stigma
Activity 7C.1: Create funding opportunities that specifically address social & structural drivers of health as they relate to BIPOC communities

5. GOALS & OBJECTIVES

Activity 7C.2: Implement effective, evidence-based and evidence-informed interventions that address stigma and SDHs among PLWH or at risk for HIV
Activity 7C.3: Work with communities to reframe HIV services and HIV-related messaging so that they do not stigmatize people or behaviors. ⁵⁹
Activity 7C.4: Ensure that the voices/perspectives of PLWH and people at-risk for HIV are represented in pandemic planning and response (
Activity 7C.5: Monitor and advocate for policies that support the following: • 7C.5a: Support the efforts of Measure J, the Alternatives to Incarceration and closure of Men's Central Jail and seek increased funding for services and programming through Measure J as well as through redistribution of funding for policing and incarceration. • 7C.5b: Improve systems, strategies and proposals that prevent homelessness, expand affordable housing, as well as prioritize housing opportunities for people living with, affected by, or at risk of transmission of HIV/AIDS, especially LGBTQ people • 7C.5c: Promote family housing and emergency financial assistance as a strategy to maintain housing • 7C.5d: Increase coordination among housing agencies to include intergenerational housing options • 7C.5e: Blend funding to support housing and rental assistance for seniors living with HIV • 7C.5f: Advocate for women's bodily autonomy in all areas of health care services including and not limited to full access to abortions, contraception, fertility/infertility services and family planning • 7C.5g: Eliminate discrimination against or the criminalization of people living with or at risk of HIV/AIDS including those who exchange sex for money (e.g., Commercial Sex Work).
Strategy 7D: Identify root causes and directly call-out systematic racist practices that have adversely affected Black/African American communities.
Activity 7D.1: Standardize the collection of race-based stratified program evaluation data
Activity 7D.2: Disseminate analysis of race-based stratified data via presentations and informational materials
Activity 7D.3: Implement cultural humility training among healthcare providers
Activity 7D.4: Address social and structural barriers with evidence-based interventions
Activity 7D.5: Build the capacity of Black-led organizations (see 5A.1 and 5A.2)
Strategy 7E: Add Quality of Life (Q of L) Indicators for PLWH to the Integrated Plan by 2023
Activity 7E.1: Examine the newly released Q of L Indicators for PLWH included in NHAS 2022-2025 Implementation Plan and decide which ones are applicable to LAC
Activity 7E.2: Identify baseline data for each QoL indicator from local MMP data and determine performance metrics to be added to Integrated Plan

5. GOALS & OBJECTIVES

Key Partners: FQHCs and Community Health Centers, HIV and STD Testing Providers, HIV prevention providers, private providers, academic medical provider training programs including colleges and universities, LAC DHS, LAC DMH, homeless service providers, and City of Long Beach and City of Pasadena Health Departments, LAC SAPC; Act Now Against Meth Coalition (ANAM).

Potential Funding Resources: CDC, HRSA, SAMHSA

Outcomes:

- Increase the number of services and programs available to address meth use disorder
- Increase the availability of mental health services for PLWH and at-risk for HIV
- Reduce the rates of syphilis, gonorrhea, chlamydia and HCV in LA County
- Reduce the rates of syphilis, gonorrhea, chlamydia and HCV among Black/African Americans in LA County
- Increase the number of evidence-based or evidence-informed practices/programs that address SDH

Monitoring Data Source: DHSP HIV Surveillance (eHARS)

Expected Impact on HIV Care Continuum: Increase the number of PLWH who know their HIV status; who are linked to HIV care within 90 days; who are retained in care and who are virally suppressed.

Alignment with NHAS Goals:

- ☒ Prevent New HIV Infections
- ☒ Improve HIV-Related Health Outcomes for PLWH
- ☒ Reduce HIV-Related Disparities & Health Inequities
- ☒ Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic among All Partners & Interested Parties

6. IMPLEMENTATION, MONITORING & FOLLOW-UP

Section VI: 2022-2026 Integrated Planning Implementation, Monitoring and Jurisdictional Follow Up Integrated Planning Approach

a. Implementation: To ensure that the Integrated Plan's goals and objectives are achieved, a detailed implementation plan has been developed which includes performance measures, responsible parties, and a timeline related to each activity (see Appendix 2). In addition to DHSP and the COH there are many key partners that will need to be engaged if the County's ambitious goals are to be reached. These partners include various departments and programs within the LAC system (e.g. DHS, DMH, SAPC, Sheriff's Department, etc.) as well as entities that are external to the LAC system (e.g. HIV service providers, academic institutions, FQHCs, AETC, CBA, HOPWA, etc.). Community members across the County, especially PLWH and people from priority populations also play a key role in the implementation and monitoring of the Integrated Plan. COH and DHSP will work together to coordinate the efforts of these partners by maintaining open lines of communication, information sharing, and closely monitoring progress towards achievement of activities.

The Integrated Plan provides guidance and direction to *all* stakeholders across the County that are invested in ending the HIV epidemic, regardless of the source(s) of funding that supports their work. Thus, the Plan's goals, objectives, strategies and activities can and should be utilized by all stakeholders to coordinate services and programs and align agency-specific plans.

b. Monitoring: The Commission on HIV, in collaboration with DHSP, will be responsible for monitoring progress towards achieving the Plan's goals and objectives. Specifically, the COH's Planning, Priorities and Allocations (PP&A) Committee will take the lead in monitoring progress, trouble-shooting barriers and leading the process for updating the Plan as needed. The COH has a dedicated staff person who will lead these efforts with PP&A. Two PP&A meetings every year will include a formal update on progress towards goals and objectives. In addition, the COH and DHSP will monitor progress yearly using the targets outlined in Table 8. This progress will be used to inform the annual update of the plan.

As noted, the Integrated Plan has been built upon the LAC EHE plan to ensure coordination and no duplication of efforts. DHSP provides regular EHE updates to the COH and also communicates EHE progress and updates through the use of a listserv. To facilitate the monitoring of both the EHE and the Integrated Plan, these activities will continue for the next five years.

c. Evaluation: To evaluate progress on the Integrated Plan's goals and objectives, the COH will carefully monitor each performance measure listed in Table 8 in addition to key data related to the SMART objectives. Analysis of the performance measures will be conducted twice per year by PP&A and findings will be presented to the Commission on HIV and community stakeholders at public meetings twice per year.

6. IMPLEMENTATION, MONITORING & FOLLOW-UP

Table 8: Yearly Performance Measure

GOALS & OBJECTIVES	2022	2023	2024	2025	2026
Diagnose all people with HIV as early as possible					
Increase the percentage of PLWH who are aware of their status to 95% by 2025. 2021 Baseline: 89%	90%	92%	94%	95%	95%
Reduce the number of undiagnosed PLWH from an estimated 6,800 to an estimated 3,067 by 2025. 2021 Baseline: 6,800	5,867	4,934	4,001	3,067	3,067
Decrease the proportion of people newly diagnosed with HIV who are in the late stage of HIV disease at time of diagnosis from 20% to 15% by 2026. 2020 Baseline: 20%	19%	18%	17%	16%	15%
Treat people with HIV rapidly and effectively to reach sustained viral suppression					
Increase the proportion of people diagnosed with HIV who are linked to HIV care w/in 1 month of diagnosis from 76% to 95% by 2025. 2020 Baseline: 76%	83%	87%	91%	95%	95%
Increase the proportion of people diagnosed with HIV who are linked to care within 7 days from 54% (2020) to 65% by 2026. 2020 Baseline: 54%	57%	59%	61%	63%	65%
Increase the proportion of diagnosed PLWH who are virally suppressed from 61% to 95% by 2025. 2021 Baseline: 61%	66%	73%	83%	95%	95%
Prevent new HIV transmissions by using proven interventions, including PrEP and SSPs					
Increase the proportion of persons prescribed PrEP with an indication for PrEP to at least 50% by 2025. 2022 Baseline: 39%	39%	42%	46%	50%	50%
Increase the proportion of Latinx persons prescribed PrEP with an indication for PrEP to at least 50% by 2025. 2022 Baseline of 38%.	39%	42%	46%	50%	50%
Increase the proportion of Black/African American persons prescribed PrEP with an indication for PrEP to at least 50% by 2025. 2022 Baseline of 25%.	30%	35%	40%	45%	50%
Increase the percentage of EOPs and SSPs that provide HIV/STD testing and HCV screening to 80%. 2022 Baseline: 20%	25%	35%	50%	75%	80%
Respond quickly to potential HIV outbreaks to get vital prevention and treatment services to people who need them					
Provide/disseminate at least 5 educational trainings/workshops or educational materials to increase awareness/knowledge related to cluster and outbreak detection and response.	1	1	1	1	1

6. IMPLEMENTATION, MONITORING & FOLLOW-UP

By 2025, increase the total proportion of persons newly diagnosed with HIV who are assigned for Partner Services (PS) to 95%. 2021 Baseline: 73%.	77%	83%	89%	95%	95%
By 2025, increase the total proportion of persons newly diagnosed with HIV who are interviewed for PS to 75%. 2021 Baseline: 46%.	53%	60%	67%	75%	75%
Increase the capacity of the HIV workforce to diagnose and treat PLWH, prevent new HIV infections and reduce HIV-related disparities					
By 2024, conduct a comprehensive assessment of the HIV workforce identifying strengths, needs and potential solutions, including an assessment of the true costs of services and how those services might be financed.			Assessment Completed		
By 2026, implement training, technical assistance and necessary policy changes to increase workforce capacity as outlined in assessment findings.			Activities implemented per assessment		
Integrate systems and services to address the syndemic of HIV, STDs, HCV, and substance use and mental health disorders in the context of social and structural/institutional factors including stigma, discrimination, and violence					
By 2026, the LA County Division of HIV and STD Programs (DHSP) and/or the Commission on HIV (COH) will implement at least three internal efforts to advance system and service integration		1 effort	1 effort	1 effort	
By 2026, DHSP and/or the COH will implement at least three external efforts to advance system and service integration		1 effort	1 effort	1 effort	
Achieve health equity by addressing social determinants of health, stigma, and co-occurring disorders that fuel the HIV epidemic and HIV disparities					
By 2026, increase the number of services and programs available to address meth use disorder by at least 25%	5%	10%	15%	20%	25%
By 2026, increase the availability of mental health services for PLWH and at-risk for HIV by at least 25%	5%	10%	15%	20%	25%
By 2026, reduce the rates of syphilis, gonorrhea, chlamydia and HCV in LA County by at least 25%	5%	10%	15%	20%	25%
By 2026, reduce the rates of syphilis, gonorrhea, chlamydia and HCV among Black/African Americans in LA County by at least 25%	5%	10%	15%	20%	25%
By 2026, increase the number of evidence-based or evidence-informed practices/programs that address SDH by at least 20%	5%	10%	15%	20%	20%

6. IMPLEMENTATION, MONITORING & FOLLOW-UP

d. Improvement: The Integrated Plan is meant to be a working document that is responsive to emerging issues in the field and data that reflect current realities. The COH, in collaboration with DHSP, will use the most current data as they become available to monitor progress and make improvements to the plan as necessary. CDC and HRSA program officers will be informed of any issues that may require revisions and plans to make improvements/adjustments will be vetted by them. In addition, the COH and DHSP will continuously seek feedback from community stakeholders, especially PLWH and those who represent priority populations to guide any proposed revisions.

PP&A will lead the process to update the Plan. Suggestions for revisions will be discussed at the two PP&A meetings dedicated to the Plan's review. The final decisions to update the Plan will be made by the Executive Committee, full COH planning body, and DHSP.

e. Reporting and Dissemination: The Commission on HIV meets monthly, which includes an annual meeting in the fall/winter. As all meetings are open to the public, they will be one of the primary vehicles through which Commissioners and community stakeholders, including PLWH, are updated on the progress of the plan. Formal updates will be scheduled at least two times per year, which will include progress on achieving the goals and SMART objectives outlined in the Integrated Plan, noting any barriers or facilitators to implementing planned activities.

As part of the regular Commission on HIV meetings, there are often presentations from our research partners which are opportunities for additional education for Commissioners. Every year, the Commission on HIV will use a minimum of two research presentations to focus on key aspects of the plan's implementation (e.g., PrEP uptake, street medicine, etc.). Individuals attending the presentations will be asked to complete a presentation evaluation form, which will include at least one question on the information presented regarding the plan. COH staff will collate the responses from these evaluations and present to the PP&A and Executive committees for review. This feedback will inform the annual update of the plan.

In addition to these meetings, the Commission on HIV has a website which will be used for updates on the plan. The COH will post any presentation materials from the updates. They will also maintain a link to the progress report, reflecting progress towards achieving the SMART objectives outlined in the plan. This will be updated as progress is reported, twice per year. Throughout the implementation and monitoring process, the COH and DHSP will work in tandem to coordinate activities with the EHE Steering Committee and the EHE Plan.

Section VII: Letter of Concurrence

LOS ANGELES COUNTY
COMMISSION ON HIV

510 S. Vermont Ave, 14th Floor • Los Angeles, CA 90020 • TEL (213) 738-2816 • FAX (213) 637-4748
HIVCOMM@LACHIV.ORG • <https://hiv.lacounty.gov>

December 1, 2022

Mario J. Pérez, MPH, Director
Division of HIV and STD Programs (DHSP)
Department of Public Health,
County of Los Angeles
600 South Commonwealth Avenue, 10th Floor
Los Angeles, CA 90005

Dear Mr. Pérez:

The Los Angeles County Commission on HIV (Commission), the integrated prevention and care HIV planning council for the Los Angeles County Eligible Metropolitan Area (EMA), concurs with the following submission by the Department of Public Health, Division of HIV and STD Programs (DHSP) in response to the guidance set forth for health departments and HIV planning groups funded by the Centers for Disease Control and Prevention's (CDC's) Division of HIV/AIDS Prevention (DHAP) and Health Resources and Services Administration's (HRSA's) HIV/AIDS Bureau (HAB) for the development of an Integrated HIV Prevention and Care Plan, locally referred to as the Comprehensive HIV Plan (CHP).

The Los Angeles County Integrated HIV Prevention and Care Plan, 2022-2026 is Los Angeles County's third integrated HIV services plan. Led by the Los Angeles County Commission on HIV's Priorities, Planning and Allocations (PP&A) Committee, this plan was developed in partnership with DHSP and a vast array of community and organizational partners. The plan is developed in response to the Integrated HIV Prevention and Care Plan Guidance, including the Statewide Coordinated Statement of Need, CY 2022 and as such presents a blueprint for HIV services along the entire spectrum of HIV prevention and care. LA County's Integrated Plan was also developed to align with the California statewide integrated plan, and The National HIV/AIDS Strategy (2022–2025), and Ending the HIV Epidemic Plan for Los Angeles County, 2020-2025 (EHE Plan). The Commission concurs that the Integrated HIV Prevention and Care Plan submission fulfills the requirements described in the CDC/HRSA Integrated HIV Prevention and Care Plan Guidance.

The Commission has reviewed the Integrated HIV Prevention and Care Plan submission to the CDC and HRSA and affirms that it enumerates the populations most impacted by HIV, describes co-occurring conditions and social determinants that drive the HIV epidemic, and articulates local objectives and activities that align with the overarching goals of the National HIV/AIDS Strategy and the Ending the HIV

Epidemic federal initiative.

To develop the plan, planning steps were integrated into the overall work of the Commission. Integrated planning began in July of 2021 with a presentation at the Commission on HIV monthly meeting. Between July 2021 and November 2022, diverse community stakeholders were engaged in plan development through individual consultations, online surveys, focus groups, and various meetings with Commission subgroups and community coalitions such as the Service Provider Network meetings and the Long Beach HIV Planning Group, to name a few. In addition, the plan underwent a public comment period to harness feedback from the community at large. Moving forward, the tracking and monitoring of the plan will be led by the PP&A Committee, with an annual report developed to highlight successes and challenges.

We appreciate this opportunity to express our concurrence with the local planning efforts and activities and we look forward to continued collaboration to end the HIV epidemic.

Sincerely,

Bridget Gordon

Bridget Gordon, Co-Chair

Danielle Campbell

Danielle Campbell, Co-Chair

Luckie Alexander Fuller

Luckie Alexander Fuller, Co-Chair Elect

Appendix 1: CY 2022 – 2026 CDC DHAP and HRSA HAB Integrated Prevention and Care Plan Guidance Checklist

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
Section I: Executive Summary of Integrated Plan and SCSN	<u>Purpose:</u> To provide a description of the Integrated Plan, including the SCSN and the approach the jurisdiction used to prepare and package requirements for submission Tips for meeting this requirement 1. Be sure to write the summary with enough detail to ensure the reader understands how you have met Integrated Plan requirements. 2. If you are using a combination of new and existing materials, be sure to describe how submitted materials relate to each other.		
1. Executive Summary of Integrated Plan and SCSN	Provide an overall description of the Integrated Plan, including the SCSN, and the extent to which previous/other plans/SCSNs inform this plan/SCSN, or provide an overall description of an existing plan/SCSN that meets all requirements and includes the information below.	New material submitted	

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
a. Approach	Describe approach to preparing the Integrated Plan submission (e.g., updated previously submitted plan, integrated sections of existing plans or other documents, developed an entirely new plan, etc.).	New material submitted	
b. Documents submitted to meet requirements	List and describe all documents used to meet submission requirements, including existing materials and newly developed materials used for each requirement.	New material submitted	2
Section II: Community Engagement and Planning Process	<u>Purpose:</u> To describe how the jurisdiction approached the planning process, engaged community members and stakeholders, and fulfilled legislative and programmatic requirements including: 1. SCSN 2. RWHAP Part A and B planning requirements including those requiring feedback from key stakeholders and people with HIV 3. CDC planning requirements Tips for meeting this requirement 1. Review of the HIV National Strategic Plan and the updated HIV strategy, when released. 2. This requirement may include submission of portions of other submitted plans including the EHE plan submitted as a deliverable for PS19-1906. 3. Be sure to provide adequate detail to confirm compliance with legislative and programmatic planning requirements.		

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
	4. The community engagement process should reflect the local demographics. 5. The planning process should include key stakeholders and broad-based communities that include but are not limited to: people with HIV, funded-service providers, and stakeholders, especially new stakeholders, from disproportionately affected communities. See <i>Appendix 3</i> for required and suggested examples of stakeholders to be included. 6. Explain how the jurisdiction will build collaborations among systems of prevention and care relevant to HIV in the jurisdictions (e.g., behavioral health and housing services). 7. Include community engagement related to “Respond” and support of cluster detection activities.		
1. Jurisdiction Planning Process	Describe how your jurisdiction approached the planning process. Include in your description the steps used in the planning process, the groups involved in implementing the <u>needs assessment</u> and/or developing planning goals and how the jurisdiction incorporated data sources in the process. Describe how planning included representation from the priority populations. This may include sections from other plans such as the EHE plan. Please be sure to address the items below in your description	New material submitted	2

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
a. Entities involved in process	List and describe the types of entities involved in the planning process. Be sure to include CDC and HRSA-funded programs, new stakeholders (e.g., new partner organizations, people with HIV), as well as other entities such as HOPWA-funded housing service providers or the state Medicaid agency that met as part of the process. See <i>Appendix 3</i> for list of required and suggested stakeholders	New material submitted	6
b. Role of the RWHAP Part A Planning Council/Planning Body (not required for state-only plans)	Describe the role of the RWHAP Part A Planning Council(s)/Planning Body(s) in developing the Integrated Plan.	New material submitted	6
c. Role of Planning Bodies and Other Entities	Describe the role of CDC Prevention Program and RWHAP Part B planning bodies, HIV prevention and care integrated planning body, and any other community members or entities who contributed to developing the Integrated Plan. If the state/territory or jurisdiction has separate prevention and care planning bodies, describe how these planning bodies collaborated to develop the Integrated Plan. Describe how the jurisdiction collaborated with EHE planning bodies. Provide documentation of the type of engagement occurred. EHE planning may be submitted as long as it includes updates that describe ongoing activities.	New material submitted	6

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
d. Collaboration with RWHAP Parts – SCSN requirement	Describe how the jurisdiction incorporated RWHAP Parts A-D providers and Part F recipients across the jurisdiction into the planning process. In the case of a RWHAP Part A or Part B only plan, indicate how the planning body incorporated or aligned with other Integrated Plans in the jurisdiction to avoid duplication and gaps in the service delivery system.	New material submitted	7
e. Engagement of people with HIV – SCSN requirement	Describe how the jurisdiction engaged people with HIV in all stages of the process, including needs assessment, priority setting, and development of goals/objectives. Describe how people with HIV will be included in the implementation, monitoring, evaluation, and improvement process of the Integrated Plan.	New material submitted	7
f. Priorities	List key priorities that arose out of the planning and community engagement process.	New material submitted	7
g. Updates to Other Strategic Plans Used to Meet Requirements	If the jurisdiction is using portions of another local strategic plan to satisfy this requirement, please describe: 1. How the jurisdiction uses annual needs assessment data to adjust priorities. 2. How the jurisdiction incorporates the ongoing feedback of people with HIV and stakeholders. 3. Any changes to the plan as a result of updates assessments and community input. 4. Any changes made to the planning process as a result of evaluating the planning process.	New material submitted	8

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
Section III: Contributing Data Sets and Assessments	<u>Purpose:</u> To analyze the qualitative and quantitative data used by the jurisdiction to describe how HIV impacts the jurisdiction; to determine the services needed by clients to access and maintain HIV prevention, care and treatment services; to identify barriers for clients accessing those services; and to assess gaps in the service delivery system. This section fulfills several legislative requirements including: 1. SCSN 2. RWHAP Part A and B planning requirements including those requiring feedback from key stakeholders and people with HIV 3. CDC planning requirements Tips for meeting this requirement 1. This requirement may include submission of portions of other submitted plans including the EHE plan submitted as a deliverable for PS19-1906. <i>Please ensure that if using a previously developed plan that the data included describes the entire jurisdiction and not just a subsection of the jurisdiction such as an EHE priority county.</i> 2. Be sure to provide adequate detail to confirm compliance with legislative and programmatic planning requirements. 3. Include both narrative and graphic depictions of the HIV-related health disparities in the area including information about HIV outbreaks and clusters.		

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
	4. The data used in this section should inform both the situational analysis and the goals established by the jurisdiction. 5. <i>Appendix 4</i> includes suggested data resources to assist with this submission including the Epidemiologic Snapshot.		
1. Data Sharing and Use	Provide an overview of data available to the jurisdiction and how data were used to support planning. Identify with whom the jurisdiction has data sharing agreements and for what purpose.	New material submitted	8
2. Epidemiologic Snapshot	Provide a snapshot summary of the most current epidemiologic profile for the jurisdiction which uses the most current available data (trends for most recent 5 years). The snapshot should highlight key descriptors of people diagnosed with HIV and at-risk for exposure to HIV in the jurisdiction using both narrative and graphic depictions. Provide specifics related to the number of individuals with HIV who do not know their HIV status, as well as the demographic, geographic, socioeconomic, behavioral, and clinical characteristics of persons with newly diagnosed HIV, all people with diagnosed HIV, and persons at-risk for exposure to HIV. This snapshot should also describe any HIV clusters identified and outline key characteristics of clusters and cases	New material submitted	9

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
	linked to these clusters. Priority populations for prevention and care should be highlighted and align with those of the HIV National Strategic Plan. Be sure to use the HIV care continuum in your graphic depiction showing burden of HIV in the jurisdiction.	New material submitted	

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
3. HIV Prevention, Care and Treatment Resource Inventory	Create an HIV Prevention, Care and Treatment Resource Inventory. The Inventory may include a table and/or narrative but must address all of the following information in order to be responsive: • Organizations and agencies providing HIV care and prevention services in the jurisdiction. • HRSA (must include all RWHAP parts) and CDC funding sources. • Leveraged public and private funding sources, such as those through HRSA's Community Health Center Program, HUD's HOPWA program, Indian Health Service (IHS) HIV/AIDS Program, Substance Abuse and Mental Health Services Administration programs, and foundation funding. • Describe the jurisdiction's strategy for coordinating the provision of substance use prevention and treatment services (including programs that provide these services) with HIV prevention and care services. • Services and activities provided by these organizations in the jurisdiction and if applicable, which priority population the agency serves. • Describe how services will maximize the quality of health and support services available to people at-risk for or with HIV.	New material submitted	33

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
a. Strengths and Gaps	Please describe strengths and gaps in the HIV prevention, care and treatment inventory for the jurisdictions. This analysis should include areas where the jurisdiction may need to build capacity for service delivery based on health equity, geographic disparities, occurrences of HIV clusters or outbreaks, underuse of new HIV prevention tools such as injectable antiretrovirals, and other environmental impacts.	New material submitted	38
b. Approaches and partnerships	Please describe the approaches the jurisdiction used to complete the HIV prevention, care and treatment inventory. Be sure to include partners, especially new partners, used to assess service capacity in the area.	New material submitted	38

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
4. Needs Assessment	Identify and describe all needs assessment activities or other activities/data/information used to inform goals and objectives in this submission. Include a summary of needs assessment data including: 1. Services people need to access HIV testing, as well as the following status neutral services needed after testing: a. Services people at-risk for HIV need to stay HIV negative (e.g., PrEP, Syringe Services Programs) – Needs b. Services people need to rapidly link to HIV medical care and treatment after receiving an HIV positive diagnosis - Needs 2. Services that people with HIV need to stay in HIV care and treatment and achieve viral suppression – Needs 3. Barriers to accessing existing HIV testing, including State laws and regulations, HIV prevention services, and HIV care and treatment service – Accessibility	New material submitted	46
a. Priorities	List the key priorities arising from the needs assessment process.	New material submitted	68

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
b. Actions Taken	List any key activities undertaken by the jurisdiction to address needs and barriers identified during the needs assessment process.	New material submitted	68
c. Approach	Please describe the approach the jurisdiction used to complete the needs assessment. Be sure to include how the jurisdiction incorporated people with HIV in the process and how the jurisdiction included entities listed in <i>Appendix 3</i> .	New material submitted	69
Section IV: Situational Analysis	<u>Purpose:</u> To provide an overview of strengths, challenges, and identified needs with respect to several key aspects of HIV prevention and care activities. This snapshot should synthesize information from the Community Engagement and Planning Process in Section II and the Contributing Data sets and Assessments detailed in Section III. Tips 1. New or existing material may be used; however, existing material will need to be updated if used. 2. This section not only provides a snapshot of the data and environment for goal-setting but meets the RWHAP legislative requirement for the SCSN. 3. Jurisdictions may submit the Situational Analysis submitted as part of their EHE Plan to fulfill this requirement. <i>However, it must include information for the entire HIV prevention and care system and not just the EHE priority area or service system.</i> If using EHE plans to fulfill this		

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
	requirement, be sure to include updates as noted below.		
1. Situational Analysis	Based on the Community Engagement and Planning Process in Section II and the Contributing Data Sets and Assessments detailed in Section III, provide a short overview of strengths, challenges, and identified needs with respect to HIV prevention and care. Include any analysis of structural and systemic issues impacting populations disproportionately affected by HIV and resulting in health disparities. The content of the analysis should lay the groundwork for proposed strategies submitted in the Integrated Plan's goals and objective sections. The situational analysis should include an analysis in each of the following areas: <u>Diagnose</u> all people with HIV as early as possible <u>Treat</u> people with HIV rapidly and effectively to reach sustained viral suppression <u>Prevent</u> new HIV transmissions by using proven interventions, including pre-exposure prophylaxis (PrEP) and syringe services programs (SSPs) <u>Respond</u> quickly to potential HIV outbreaks to get needed prevention and treatment services to people who need them	New material submitted	71

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
	<i>Please note jurisdictions may submit other plans to satisfy this requirement, if applicable to the entire HIV prevention and care service system across the jurisdiction.</i>		
a. Priority Populations	Based on the Community Engagement and Planning Process in Section II and the Contributing Data Sets and Assessments detailed in Section III, describe how the goals and objectives address the needs of priority populations for the jurisdiction.	New material submitted	81
Section V: 2022-2026 Goals and Objectives	<u>Purpose:</u> To detail goals and objectives for the next 5 years. Goals and objectives should reflect strategies that ensure a unified, coordinated approach for all HIV prevention and care funding. Tips for meeting this requirement: - Recipients may submit plans (e.g., EHE, Getting to Zero, Cluster and Outbreak Detection and Response plan) for this requirement as long as it sets goals for the entire HIV prevention and care delivery system and geographic area. - Goals and objectives should be in SMART format and structured to include strategies that accomplish the following: - Diagnose all people with HIV as early as possible - Treat people with HIV rapidly and effectively to reach sustained viral suppression - Prevent new HIV transmissions by using proven interventions, including pre-exposure		

Requirement	Requirement Detail	Please indicate whether the jurisdiction created new material and/or the Title/File Name of any existing material attached to meet requirement	Page(s) Where Requirement is Addressed
	prophylaxis (PrEP), post-exposure prophylaxis (PEP) and syringe services programs (SSPs) d. <u>Respond</u> quickly to potential HIV outbreaks to get needed prevention and treatment services to people who need them. 4. The plan should include goals that address both HIV prevention and care needs and health equity.		
1. Goals and Objectives Description	List and describe goals and objectives for how the jurisdiction will diagnose, treat, prevent and respond to HIV. Be sure the goals address any barriers or needs identified during the planning process. There should be at least 3 goals and objectives for each of these four areas. See <i>Appendix 2</i> for suggested format for Goals and Objectives. <i>Please note jurisdictions may submit other plans to satisfy this requirement as long as they include goals that cover the entire HIV prevention and care service delivery system and geographic area.</i>	New material submitted	82
a. Updates to Other Strategic Plans Used to Meet Requirements	If the jurisdiction is using portions of another local strategic plan to satisfy this requirement, please describe any changes made as a result of analysis of data.		N/A

Section VI: 2022-2026 Integrated Planning Implementation, Monitoring and Jurisdictional Follow Up	<u>Purpose:</u> To describe the infrastructure, procedures, systems, and/or tools that will be used to support the key phases of integrated planning. In this section jurisdictions will detail how best to ensure the success of Integrated Plan goals and objectives through the following 5 key phases: 1. Implementation 2. Monitoring 3. Evaluation 4. Improvement 5. Reporting and Dissemination Tips for meeting this requirement 1. This requirement may require the recipient to create some new material or expand upon existing materials. 2. Include sufficient descriptive detail for each of the 5 key phases to ensure that all entities understand their roles and responsibilities, and concur with the process. 3. If you are submitting portions of a different jurisdictional plan to meet this requirement, you should include updates that describe steps the jurisdiction has taken to accomplish each of the 5 phases.		
1. 2022-2026 Integrated Planning Implementation Approach	1. Describe the infrastructure, procedures, systems or tools that will be used to support the 5 key phases of integrated planning to ensure goals and objectives are met	New material submitted	97

a. Implementation	2. Describe the process for coordinating partners, including new partners, people with HIV, people at high risk for exposure to HIV, and providers and administrators from different funding streams, to meet the jurisdictions Integrated Plan goals and objectives. Include information about how the plan will influence the way the jurisdiction leverages and coordinates funding streams including but not limited to HAB and CDC funding.	New material submitted	97
b. Monitoring	3. Describe the process to be used for monitoring progress on the Integrated Plan goals and objectives. This should include information about how the jurisdiction will coordinate different stakeholders and different funding streams to implement plan goals. If multiple plans exist in the state (e.g., city-only Integrated Plans, state-only Integrated Plans), include information about how the jurisdiction will collaborate and coordinate monitoring of the different plans within the state to avoid duplication of effort and potential gaps in service provision. Be sure to include details such as specific coordination activities and timelines for coordination. <i>Note: Recipients will be asked to provide updates to both CDC and HRSA as part of routine monitoring of all awards.</i>	New material submitted	97
c. Evaluation	4. Describe the performance measures and methodology the jurisdiction will use to evaluate progress on goals and objectives. Include information about how often the jurisdiction conducts analysis of the performance measures and presents data to the planning group.	New material submitted	97

d. Improvement	5. Describe how the jurisdiction will continue to use data and community input to make revisions and improvements to the plan. Be sure to include how often the jurisdiction will make revisions and how those decisions will be made.	New material submitted	100
e. Reporting and Dissemination	6. Describe the process for informing stakeholders, including people with HIV, about progress on implementation, monitoring, evaluation and improvements made to the plan.	New material submitted	100
f. Updates to Other Strategic Plans Used to Meet Requirements	If the jurisdiction is using portions of another local strategic plan to satisfy this requirement, please describe: 1. Steps the jurisdiction has already taken to implement, monitor, evaluate, improve, and report/disseminate plan activities. 2. Achievements and challenges in implementing the plan. Include how the jurisdiction plans to resolve challenges and replicate successes. 3. Revisions made based on work completed.	New material submitted	100
Section VII: Letters of Concurrence	Provide letters of concurrence or concurrence with reservation. Each letter should specify how the planning body was involved in the Integrated Plan development. Include a letter of concurrence for each planning body in the state/territory or jurisdiction. See <i>Appendix 6</i> for a sample Letter of Concurrence.		101
1. CDC Prevention Program Planning Body Chair(s) or Representative(s)		New material submitted	101
2. RWHAP Part A Planning Council/Planning Body(s) Chair(s) or Representative(s)		New material submitted	101

3. RWHAP Part B Planning Body Chair or Representative		N/A	
4. Integrated Planning Body	If submitting an EHE plan, please ensure that the EHE planning body concurs.	N/A	
5. EHE Planning Body	If submitting an EHE plan, please ensure that the EHE planning body concurs.	N/A	

Appendix 2: Implementation Plan

Pillar I: Diagnose

Goal: Diagnose all people with HIV as early as possible

Objectives:

1. By 2025, increase the percentage of PLWH who are aware of their status to 95%, from a baseline of 89%.
2. By 2025, reduce the number of undiagnosed PLWH from an estimated 6,800 to an estimated 3,067.⁶⁶
3. By 2026, decrease the proportion of people newly diagnosed with HIV who are in the late stage⁶⁷ of HIV disease at time of diagnosis from 20% to 15%.

Strategy 1A: Expand or implement routine opt-out HIV screening in healthcare and other settings (such as emergency departments and community health centers) in high prevalence communities.

Activity	Responsible Party	Performance Measure	Timeframe
1A.1: Assess and monitor the degree that HIV testing is occurring county-wide. Identify infrastructure and healthcare system issues to determine the feasibility of expanding routine opt-out testing.	DHSP	Written report/documentation	By 2023
1A.2: Expand the number of emergency departments and community health centers in high prevalence communities performing routine opt-out HIV screening.	DHSP; EDs; FQHCs	Number of EDs and CHC's performing routine opt-out HIV screening	By 2026
1A.3: Identify additional opportunities in healthcare and non-healthcare settings where HIV testing can be included, such as routine STD screening sites and substance use treatment centers, among others.	DHSP	Written report/documentation	By 2023

Strategy 1B: Develop locally tailored HIV testing programs to reach persons in non-healthcare settings including home/self-testing.

Activity	Responsible Party	Performance Measure	Timeframe
1B.1: Assess and monitor the degree that HIV testing is occurring county-wide (see Strategy 1A). Identify infrastructure and healthcare system issues to determine the feasibility of launching a county-wide rapid HIV self-test program.	DHSP	Written report/documentation	By 2023
1B.2: Develop guidance on HIV self-testing, including linkage to care and prevention services, a quality assurance protocol, and assess readiness of	DHSP	Written guidance	By 2023

⁶⁶ Estimated based on 59,400 PLWH in 2021 and assuming 4,450 new infections and 2,500 deaths by 2025 = $\sim 61,350 \times 5\% = 3,067$ Undiagnosed PLWH in 2025

⁶⁷ Late stage is Stage 3 HIV disease, the criteria being either CD4 < 200 cells/ μ L within 90 days of HIV diagnosis or a diagnosis of an opportunistic illness within 90 days of HIV diagnosis

providers to implement self-testing.			
1B.3: Assess Take Me Home self-testing initiative utilization, barriers & facilitators	DHSP	Written documentation	By 2023
1B.4: Expand use of HIV self-testing among at risk individuals unlikely to receive in-person HIV testing by promoting other types of self-testing (in addition to Take Me Home), as available and appropriate, to ensure equitable access.	DHSP	Report/ documentation	By 2023
Strategy 1C: Increase the rate of annual HIV re-screening among persons at elevated risk for HIV in both healthcare & non-healthcare settings. Implement technology to help providers identify clients due for HIV re-screening & increase ways of maintaining communication with clients.			
Activity	Responsible Party	Performance Measure	Timeframe
1C.1: Develop provider-to-patient communication tools to support providers in identifying at risk clients who are due for HIV re-screening and increase systematic ways of maintaining communication with clients.	DHSP; HIV prevention providers	Number of provider-to-patient communication tools	By 2023
1C.2: Develop a plan for evaluating impact of the provider-to-patient communication tools on client re-screening.	DHSP; HIV prevention providers	Evaluation Plan	By 2023
1C.3: Expand implementation & use of provider-to-patient communication tools among LAC DHSP funded HIV prevention providers.	DHSP; HIV prevention providers	Number of HIV prevention providers using new tools	By 2024
Activity 1C.4: Explore the use of client incentives to maintain re-screening adherence.			
Strategy 1D: Increase the timeliness of HIV diagnoses from point of infection by increasing access to testing and increasing awareness of risk			
Activity	Responsible Party	Performance Measure	Timeframe
1D.1: Increase integration of HIV testing with STD and HCV screening	DHSP	Number of CBOs/clinics that have integrated testing	By 2026
1D.2: Increase the number of STD & HIV express clinics in LA County, especially in Health Districts disproportionately impacted by HIV	DHSP; HIV clinics	Number & location of STD/HIV express clinics	2022-2026
1D.3: Increase community awareness of HIV testing options through advertising and promotional events in multiple languages	DHSP; HIV/STD testing providers	Number & type of advertisements and promotional events by languages	2022-2026
1D.4: Work with SAPC to ensure that all syringe service programs (SSPs) provide integrated testing/screening (HIV, STDs, HCV) and rapid linkage to care	DHSP; SAPC	Number of SSPs that provide integrated testing and LTC rate	2022-2026

1D.5: Explore utilizing a Promotores/Community Health Worker model to increase sexual health literacy and awareness of HIV risk in priority populations	DHSP; COH	Documentation of efforts	By 2023
1D.6: Increase the capacity of Partner Services and Cluster Detection and Response to quickly identify and contact people who may be at risk of HIV/STD/HCV and direct them to testing services (see Respond Pillar activities)	DHSP	Number of people reached through PS and CDR	By 2026

Pillar II: Treat

Goal: Treat people with HIV rapidly and effectively to reach sustained viral suppression

Objectives:

1. By 2025, increase the proportion of people diagnosed with HIV who are linked to HIV care⁶⁸ within one month of diagnosis from 76% to 95%.
2. By 2026, increase the proportion of people diagnosed with HIV who are linked to care within 7 days from 54% (2020) to 65%.
3. By 2025, increase the proportion of PLWDH who are virally suppressed from 61% to 95%.

Strategy 2A: Ensure rapid linkage to HIV care and antiretroviral therapy (ART) initiation for all persons newly diagnosed with HIV.

Activity	Responsible Party	Performance Measure	Timeframe
2A.1: Increase county-wide capacity to provide same-day rapid linkage to care during expanded hours and days for persons newly diagnosed with HIV.	DHSP - Quality Improvement Group	Number of people provided with same-day rapid LTC	By 2026
2A.2: Develop a network of HIV care providers who offer same day appointments with rapid ART disbursement.	DHSP	Established network	By 2023

Strategy 2B: Support re-engagement and retention in HIV care and treatment adherence

Activity	Responsible Party	Performance Measure	Timeframe
2B.1: Expand the use and capacity of peer navigators and/or community health workers for PLWH to increase health literacy, access services and address social determinants of health (housing, food insecurity, etc.)	DHSP; Service Providers	Number of agencies reporting increased use of PNs/CHW	By 2026
2B.2: Increase knowledge & awareness among both providers & community members about long acting injectables and other biomedical advances	AETC; DHSP; Providers	Number of trainings & educational materials	By 2026
2B.3: Create and distribute list of clinical providers of color and LGBTQ culturally competent providers	COH	Documented list	By 2023
2B.4: Create and expand medical and supportive services for cisgender women living with HIV/AIDS. This includes services such as family housing, transportation, mental health, childcare, and substance abuse	DHSP; COH; Providers	Number of services for cisgender women	By 2026

⁶⁸ Linked to HIV care is defined as ≥ 1 CD4/VL/Genotype test reported

2B.5: Create and expand medical and supportive services for transgender persons living with HIV/AIDS	DHSP; COH; Providers	Number of services for trans persons	By 2026
2B.6: Advocate for appropriate allocation and maintenance of funding for the Trans, Gender Nonconforming and Intersex (TGI) Equity Fund created by the passage of AB-2521	COH-Public Policy Committee & Trans Caucus	Meeting minutes	2022-2026
Strategy 2C: Support re-engagement and retention in HIV care and treatment adherence, especially for persons who are not eligible for Ryan White Program-supported services, persons with mental illness, persons with substance use disorders, and unhoused persons.			
Activity	Responsible Party	Performance Measure	Timeframe
2C.1: Comprehensively assess unmet mental health needs of PLWH and identify gaps and areas of improvement in the mental health provider network in LAC.	DHSP; DMH	Report on Unmet Mental Health needs	By 2022
2C.2: Develop partnerships to meet the SUD (particularly meth use disorder) needs of persons at risk for HIV or PLWH and improve the capacity of SUD providers to address the sexual health needs of clients and ensure access to HIV-related services, as needed.	DHSP; SAPC	Number & type of partnerships & capacity-building efforts	2022-2026
2C.3: Develop a report that summarizes critical gaps in the current system and makes recommendations for improvement and investment of County resources, including Ryan White Program funds.	DHSP	Written Report	By 2023
2C.4: Leverage and monitor CalAIM to ensure their programs are appropriate and effective for PLWH	DHSP & COH	Documentation of efforts to leverage and monitor	2022-2026
2C.5: Develop transitional case management service standards that help PLWH transition from RWP into Medi-Cal, Medicare and CalAIM, and develop case management service standards that can monitor if care and support services are meeting the needs of PLWH post-transition.	COH- Aging Caucus	Documented service standards	2022-2026
2C.6: Expand the use of street medicine for unhoused PLWH and those at-risk for HIV	DHSP	Street medicine units of service	2022-2026
Strategy 2D: Expand the promotion of Ryan White Program services to increase awareness, access to, and utilization of available medical care and support services for PLWH			
Activity	Responsible Party	Performance Measure	Timeframe
2D.1: Assess how clients are currently learning about available RWP services. Identify existing and new resources to assist with promotion and educational outreach including, but not limited to, print materials and online resources	DHSP	Documentation of assessment findings	By 2023
Strategy 2E: Develop and fund a housing service portfolio that provides rental subsidies to prevent homelessness among PLWH			
Activity	Responsible Party	Performance Measure	Timeframe

Activity 2E.1: Determine processes and program operations for housing assistance that are aligned with federal funding guidance and restrictions	DHSP	Written findings	By 2023
Activity 2E.2: Identify potential housing partners positioned to serve PLWH and implement an expanded housing program.	DHSP	Number of partners identified	By 2023
Strategy 2F: Explore the impact of conditional financial incentives to increase adherence to treatment for high acuity out-of-care PLWH			
Activity	Responsible Party	Performance Measure	Timeframe
2F.1: Develop processes and program operations for a pilot program that is acceptable to clients and is aligned with federal funding guidance and restrictions	DHSP	Written processes & program operations	By 2023
2F.2: Identify potential clinical sites, train staff on pilot processes, and implement program	DHSP	Documentation of pilot program	By 2023
2F.3: Develop a robust evaluation plan to determine continued use of financial incentives and potential for expansion to other populations	DHSP	Evaluation Plan	By 2023
Strategy 2G: RFP: EHE Priority Populations Interventions			
Activity	Responsible Party	Performance Measure	Timeframe
2G.1: Develop and release RFP to fund 7-10 contracts for identified interventions	DHSP	Number of contracts	By 2023
Strategy 2H: Expand capacity to provide whole-person care to PLWH who are age 50 and older and long-term survivors⁴			
Activity	Responsible Party	Performance Measure	Timeframe
2H.1: Identify, implement, and evaluate models of care that meet the needs of people with HIV who are aging and ensure quality of care across services ⁴	DHSP; COH Aging Caucus	Written findings	By 2023
2H.2: Identify and implement best practices related to addressing psychosocial and behavioral health needs of older PLWH and long-term survivors including substance use treatment, mental health treatment, and programs to decrease social isolation ⁴	DHSP; research partners; providers	Identification of best practices and efforts to implement	2022-2026
2H.3: Review/update diagnostic screenings to include age-related conditions (i.e. screen for loneliness, ACEs, depression, anxiety, experiences of	Providers; Clinics; COH Aging Caucus	Screening tools developed and utilized	By 2024

⁴ Adapted from the NHAS, 2022-2025

discrimination), using Commission on HIV's Aging Task Force recommendations as a guide			
2H.4: Screen patients for comprehensive benefits analysis and financial screening; and assess access to caregiving support	Providers; Clinics; COH Aging Caucus	Screening tools developed and utilized	By 2024
2H.5: Review Home-Based Case Management service standards for alignment with OT and PT assessments	COH – SBP Committee	Documented review	By 2023

Pillar III: Prevent

Goal: Prevent new HIV transmissions by using proven interventions, including PrEP and syringe services programs (SSPs)

Objectives:

1. By 2025, increase the proportion of persons prescribed PrEP with an indication for PrEP to at least 50%, from a 2022 baseline of 39%.
2. By 2025, increase the proportion of Black/African American persons prescribed PrEP with an indication for PrEP to at least 50%, from a 2022 baseline of 25%.
3. By 2025, increase the proportion of Latinx persons prescribed PrEP with an indication for PrEP to at least 50%, from a 2022 baseline of 38%.
4. By 2026, increase the percentage of EOPs and SSPs that provide HIV/STD testing and HCV screening from 20% to 80%.

Strategy 3A: Accelerate efforts to increase PrEP use (particularly for populations with the highest rates of new HIV diagnoses and low PrEP coverage rates) by adopting new strategies at LAC funded PrEP Centers of Excellence tied to client retention, PrEP navigation, community education, supporting alternatives to daily PrEP, and expanding PrEP support groups; and promoting recent innovations

Activity	Responsible Party	Performance Measure	Timeframe
3A.1: Conduct an in-depth landscape analysis of current PrEP resources and services among primary care providers in high morbidity areas, among providers who serve transgender persons, women's health providers, and SUD providers.	DHSP	Report on landscape analysis	By 2023
3A.2: Implement systematic and innovative strategies at LAC DHSP-funded PrEP Centers of Excellence for enhanced client communication to promote retention in PrEP and sexual health services.	DHSP; PrEP COEs	Documentation of strategies implemented	2022-2026
3A.3: Increase capacity of LAC DPH staff to provide more robust PrEP navigation services to clients served through County STD clinics, Partner Services, and those receiving PrEP/PEP at community pharmacies.	DHSP	Increased capacity	2022-2026
3A.4: Disseminate simple fact-based social marketing PrEP messaging to increase knowledge and awareness of PrEP, alternatives to daily PrEP, how to access PrEP/PEP under SB 159, and help combat misinformation regarding cost, access, and safety.	DHSP; PrEP COEs and providers	Number of SM tools developed and disseminated	2022-2026

3A.5: Work with local stakeholders to identify potential role for PrEP support groups/PrEP ambassadors to support new & continued PrEP use in affected communities.	DHSP; COH; PrEP COEs	Number of PrEP support groups and ambassadors	2022-2026
3A.6: Finalize PrEP campaigns for Black/African American MSM, transwomen and cisgender women, per the Commission on HIV's Black/African American Community Task Force's Recommendations.	DHSP; COH-B/AA TF	Development of PrEP campaigns	By 2023
3A.7: Increase knowledge & awareness among both providers & community members about long acting injectables & other biomedical advances (See 2.B.2)	CBA; DHSP; PrEP providers	Number of trainings, TA; educational materials	2022-2026
3A.8: Help build the capacity of pharmacies to prescribe PrEP/PEP and create a directory of pharmacies that have capacity to prescribe PrEP/PEP under SB159, potentially to be integrated into the GetPrEP website.	DHSP; CBAs	Number pharmacies provided with assistance	2022-2026
3A.9: Develop a public health detailing campaign to expand the number of oral PrEP prescribers in LAC.	DHSP	Number of oral PrEP providers in LAC	2023-2026
Strategy 3B: Increase availability, use, and access to comprehensive syringe services programs (SSPs) and other harm reduction services.			
Activity	Responsible Party	Performance Measure	Timeframe
3B.1: Collaborate with the LAC SAPC Program to identify opportunities to increase the capacity of SSPs, improve the provision or linkage of SSP clients to HIV, STD and HCV prevention and treatment services, and expand the availability of contingency management services to persons with substance use disorder, including meth use.	DHSP; SAPC	Documented efforts to increase capacity of SSPs and expand contingency mngmt.	2022-2026
3B.2: Explore ideas for alternative models of prevention service delivery (e.g., vouchers which can be taken to pharmacies in exchange for clean syringes and HIV self-test kits).	DHSP; COH SAPC	Number of alternative models	2022-2026
3B.3: Distribute information about the efficacy of SSPs to increase the health literacy of HIV providers and community members	DHSP; SAPC; providers	Educational materials developed	2022-2026
3B.4: Destigmatize syringe services/needle exchange and further integrate SSP providers into HIV-related work	DHSP; SAPC; providers	Documented efforts	2022-2026
3B.5: Promote safe consumption/injection sites	DHSP; SAPC; COH; providers	Documented efforts	2022-2026

Pillar IV: Respond**Goal: Respond quickly to potential HIV outbreaks to get vital prevention and treatment services to people who need them****Objectives:**

1. By 2026, provide/disseminate at least 5 educational trainings/workshops or educational materials to increase awareness/knowledge related to cluster and outbreak detection and response
2. By 2025, increase the total proportion of persons newly diagnosed with HIV who are assigned for Partner Services (PS) to 95% from a 2021 baseline of 73%
3. By 2025, increase the total proportion of persons newly diagnosed with HIV who are interviewed for PS to 75% from a 2021 baseline of 46%

Strategy 4A: Refine processes, data systems, and policies for robust, real-time cluster detection, time- space analysis, and response

Activity	Responsible Party	Performance Measure	Timeframe
4A.1: Develop a protocol, training materials, and standard operation plan (SOP).	DHSP	Written protocol, curricula and SOP.	By 2023
4A.2: Continue community engagement regarding the use of HIV molecular surveillance for cluster detection to inform its best use and identify and mitigate any unintended consequences.	DHSP	Number of community engagement efforts	2022-2026
4A.3: Expand routine epidemiological analysis of recent infection by person, place, and time to identify hot-spot locations and sub-populations associated with recent infection to inform rapid investigation and intervention.	DHSP	Expansion of routine epidemiological analysis	2022-2026
4A.4: Educate HIV providers about the use and effectiveness of cluster detection	DHSP	Number of trainings/ educational materials developed	2022-2026

Strategy 4B: Refine current processes to increase capacity of Partner Services to ensure people newly diagnosed are interviewed and close partners are identified and offered services in a timely and effective manner.

Activity	Responsible Party	Performance Measure	Timeframe
4B.1: Increase capacity of LAC DHSP to provide Partner Services to all newly diagnosed persons in LAC	DHSP	Number of PS staff; training of PS staff	2022-2026
4B.2: Implement new STD surveillance system to enhance the identification and assignment of new HIV cases to LAC DPH staff for timely follow-up and Partner Services	DHSP	New STD surveillance system	2023
4B.3: Educate HIV providers about the use and effectiveness of Partner Services	DHSP; CBA	Number of trainings & educational materials	2022-2026

4B.4: Explore increased use of community-embedded Partner Services	DHSP	Documented efforts	2023
Strategy 4C: Data to Care RFP			
Activity	Responsible Party	Performance Measure	Timeframe
4C.1: Develop & release RFP to fund up to 5 contracts for Data to Care activities.	DHSP	Number of contracts	By 2023

Workforce Capacity

Goal: Increase the capacity of the HIV workforce to diagnose and treat PLWH, prevent new HIV infections and reduce HIV-related disparities			
Objectives: 1. By 2024, conduct a comprehensive assessment of the HIV workforce identifying strengths, needs and potential solutions, including an assessment of the true costs of services and how those services might be financed. 2. By 2026, implement training, technical assistance and necessary policy changes to increase workforce capacity as outlined in assessment findings and guided by the strategies below.			
Strategy 5A: Increase the diversity and capacity of the workforce that delivers HIV prevention, care and supportive services to optimally reflect and serve the populations most impacted by HIV.			
Activity	Responsible Party	Performance Measure	Timeframe
5A.1: Conduct an assessment of Black/African American led agencies providing HIV services to identify training/technical assistance (TA) needs	COH-Black/AA Task Force	Assessment report	By 2023
5A.2: Provide TA and/or training for Black/African American led agencies to provide a more equitable playing field to successfully compete for solicitations, based on assessment findings	DHSP, in collaboration w/ Black/AA TF	Number of Black/AA led agencies that receive TA/trainings	By 2023
5A.3: Increase inclusion of peer/paraprofessionals ⁶⁹ in the workforce through training, mentorship, certification, supervision, reimbursement, and team functioning to assist with HIV, STD, HCV, and MH and SUD service provision ⁴	DHSP, AETC, COH-SBP Committee	Increased # of peer/paraprofessionals in the workforce.	By 2026
5A.4: Develop inventory of both formal and informal pipeline programs to prepare workers to work in the HIV/health field	AETC	Report	By 2023
5A.5: Train and expand a diverse HIV workforce by further developing and promoting opportunities to support the next generation of HIV providers including health care workers, researchers, and community partners, particularly	CBOs; AETC; Universities/med. & dental schools	Number of people trained/in training	2022-2026

⁶⁹ Peer/paraprofessionals defined as people who reflect the population(s) being served (e.g. PLWH, people of color, trans persons, etc.) and who may not have formal education/licensure.

from underrepresented populations ⁴			
5A.6: Based on results of workforce capacity assessment, review and revise service standards as necessary	COH-SBP Committee	Revised standards	2022-2026
5A.7: Engage, employ, and provide public leadership opportunities at all levels for people with or who experience risk for HIV	CBOs; DHSP; COH	Number of PLWH & people from priority pops in leadership positions	2022-2026
Strategy 5B: Ensure that the workforce is adequately prepared to deliver high-quality services in a culturally responsive manner			
Activity	Responsible Party	Performance Measure	Timeframe
5B.1: Include harm reduction principles and the provision of trauma-informed care across provider trainings	DHSP; AETC; CBA; SAPC	Number of curricula that include harm reduction & trauma-informed care	2022-2026
5B.2: Provide gerontology training for Ambulatory Outpatient Medical, Oral Health, Medical Care Coordination and Mental Health service providers to improve awareness and understanding of age-related inequities in care and treatment	DHSP	Number of providers trained on gerontology	By 2025
5B.3: Ensure that health care professionals and front-line staff complete education and training on stigma, discrimination, and unrecognized bias toward populations with or who experience risk for HIV, including LGBTQI+ people, immigrants, people who use drugs, and people involved in sex work ⁴	DHSP; DHS; AETC; CBA	Number of providers trained on listed topics	2022-2026
5B.4: Identify and make available succession planning and leadership development trainings/programs	AETC; CBA; DHSP; COH	Number of providers trained on topics	2022-2026

System and Service Integration

Goal: Integrate systems and services to address the syndemic of HIV, STDs, HCV, and substance use and mental health disorders in the context of social and structural/institutional factors including stigma, discrimination, and violence⁴

Objectives:

1. By 2026, the LA County Division of HIV and STD Programs (DHSP) and/or the Commission on HIV (COH) will implement at least three internal (within LAC system) efforts to advance system and service integration
2. By 2026, DHSP and/or the COH will implement at least three external efforts to advance system and service integration

Strategy 6A: Increase cross-training and TA opportunities across fields/disciplines

Activity	Responsible Party	Performance Measure	Timeframe
6A.1: Enhance the ability of the HIV workforce to provide naloxone and educate people on the existence of fentanyl in the drug supply to prevent overdose and deaths and facilitate linkage to substance use disorder treatment and harm reduction programs ⁴	DHSP; DHS; SAPC	Number of trainings provided	2022-2026
6A.2: Expand opportunities and mechanisms for information sharing and peer-to-peer technical assistance amongst HIV/STD/MH/SUD/Housing providers ⁴	DHSP; COH; SAPC; DMH	Number and type of info sharing/TA	2022-2026
6A.3: Support training for housing service providers on needs of PLWH and LGBTQI persons to improve cultural competencies among staff	HOPWA; COH; DHSP; LAHSA	Number of trainings provided	2022-2026
6A.4: Increase HIV awareness, capability, and collaboration of service providers to support older people with HIV, including in settings such as aging services, housing for older adults, substance use treatment, and disability and other medical services ⁴	Dept. on Aging; COH; SAPC	Number and type of service providers reached	2022-2026
6A.5: Increase the integration of HIV and HCV services including increasing the capacity of FQHCs that provide HIV-related services to screen for and treat HCV	ACDC; DHSP FQHCs	Number of integration mtgs held	2022-2026

Strategy 6B: Leverage the Alliance of Health Integration initiative to integrate services within LA County publicly funded care systems

Activity	Responsible Party	Performance Measure	Timeframe
6B.1: Strive to align strategic planning efforts on HIV, STIs, HCV, substance use disorders, and mental health care across national, state, and local partners ⁴	COH	Number of strategic plans reviewed	2022-2026
6B.2: Optimize RWP, Medicaid, Medicare, and other health systems to ensure they are used in a manner to deliver the highest quality of care for PLWH.	DHS; DHSP	Documentation of efforts	2022-2026

Equity, Social Determinants of Health and Co-Occurring Disorders

Goal: Achieve health equity by addressing social determinants of health, stigma, and co-occurring disorders that fuel the HIV epidemic and HIV disparities

Objectives:

1. By 2026, increase the number of services and programs available to address meth use disorder by at least 25%
2. By 2026, increase the availability of mental health services for PLWH and at-risk for HIV by at least 25%
3. By 2026, reduce the rates of syphilis, gonorrhea, chlamydia and HCV in LA County by at least 25%
4. By 2026, reduce the rates of syphilis, gonorrhea, chlamydia and HCV among Black/African Americans in LA County by at least 25%
5. By 2026, increase the number of evidence-based or evidence-informed practices/programs that address SDH by at least 20%.

Strategy 7A: Advocate for an effective countywide response to SUDs, especially methamphetamine disorder

Activity	Responsible Party	Performance Measure	Timeframe
7A.1: Assess providers' ability to recognize and address meth use disorder	DHSP; SAPC	Assessment completed	By 2023
7A.2: Advocate for improved and additional services and programs associated with methamphetamine use and HIV transmission	COH; CBOs; ANAM	Documentation of efforts taken	2022-2026
7A.3: Expand and enhance mental health services for people living with, affected by, or at risk of contracting HIV/AIDS.	DMH; DHS; DHSP; COH; CBOs	Number of mental health services available	2022-2026
7A.4: Support the building of community-based mental health services.	DMH; COH-Consumer Caucus; CBOs	Number of community-based mental health services	2022-2026

Strategy 7B: Advocate for an effective countywide response to the Sexually Transmitted Disease (STD) epidemic

Activity	Responsible Party	Performance Measure	Timeframe
7B.1: Commission on HIV Public Policy Committee (PPC) will submit a letter to the Board of Supervisors (BOS) that outlines priorities/recommendations to improve the countywide STD response (based on a DPH report previously submitted to the BOS)	COH-PPC	Submitted Letter to BOS	By 2023
7B.2: The PPC will request a formal letter of support from the BOS to support the EHE budget request to the State of California	COH-PPC	Request	By 2023

Strategy 7C: Address social determinants of health and stigma

Activity	Responsible Party	Performance Measure	Timeframe
----------	-------------------	---------------------	-----------

7C.1: Create funding opportunities that specifically address social and structural drivers of health as they relate to BIPOC communities	DHSP	Number of funding opportunities that address SDH in BIPOC communities	2022-2026
7C.2: Implement effective, evidence-based and evidence-informed interventions that address stigma and SDHs among PLWH or at risk for HIV	DHSP; HIV service providers	Number of evidence-based /evidence-informed interventions implemented	2022-2026
7C.3: Work with communities to reframe HIV services and HIV-related messaging so that they do not stigmatize people or behaviors. ⁴	DHPS; Providers	Documented efforts	2022-2026
7C.4: Ensure that the voices/perspectives of PLWH and people at-risk for HIV are represented in pandemic planning and response (e.g., Monkeypox messaging)	DPH	Documented efforts	2022-2026
7C.5: Monitor and advocate for policies that support the following:			
7C.5a: Support the efforts of Measure J, the Alternatives to Incarceration and closure of Men's Central Jail and seek increased funding for services and programming through Measure J as well as through redistribution of funding for policing and incarceration.	COH – Public Policy Committee (PPC)	Documented efforts and PPC meeting minutes	2022-2026
7C.5b: Improve systems, strategies and proposals that prevent homelessness, expand affordable housing, as well as prioritize housing opportunities for people living with, affected by, or at risk of transmission of HIV/AIDS, especially LGBTQ people			
7C.5c: Promote family housing and emergency financial assistance as a strategy to maintain housing			
7C.5d: Increase coordination among housing agencies to include intergenerational housing options			
7C.5e: Blend funding to support housing and rental assistance for seniors living with HIV			
7C.5f: Advocate for women's bodily autonomy in all areas of health care services including and not limited to full access to abortions, contraception, fertility/infertility services and family planning			
7C.5g: Eliminate discrimination against or the criminalization of people living with or at risk of HIV/AIDS including those who exchange sex for money (e.g., Commercial Sex Work).			

Strategy 7D: Identify root causes and directly call-out systematic racist practices that have adversely affected Black/African American communities.			
Activity	Responsible Party	Performance Measure	Timeframe
7D.1: Standardize the collection of race-based stratified program evaluation data	HIV service providers; DHSP	Standardized evaluation measures	2022-2026
7D.2: Disseminate analysis of race-based stratified data via presentations and informational materials	DHSP; Cities of Long Beach, Pasadena, W. Hollywood	Number of presentations/materials that include race-based analysis	2022-2026
7D.3: Implement cultural humility training among healthcare providers	DHSP; AETC	Number of trainings provided	2022-2026
7D.4: Address social and structural barriers with evidence-based interventions	DHSP; Research Partners; CBOs	Number of interventions implemented	2022-2026
7D.5: Build the capacity of Black/African American-led organizations (see 5A.1 and 5A.2)	DHSP	Number of Black/African American led agencies that access training/TA	2022-2026
Strategy 7E: Add Quality of Life (Q of L) Indicators for PLWH to the Integrated Plan by 2023			
Activity	Responsible Party	Performance Measure	Timeframe
7E.1: Examine the newly released Q of L Indicators for PLWH included in NHAS Implementation Plan and decide which ones are applicable to LAC	COH; DHSP	Documented efforts	2023
7E.2: Identify baseline data for each QoL indicator from local MMP data and determine performance metrics to be added to Integrated Plan	COH; DHSP	Performance measures created	2023

Appendix 3: Glossary & Abbreviations

AIDS	Acquired Immune Deficiency Syndrome
AIAN	American Indian and Alaska Native
ART	Antiretroviral therapy
COVID-19	Coronavirus Disease 2019
CDC	Centers for Disease Control and Prevention
DHSP	Division of HIV and STD Programs
EHARS	Enhanced HIV/AIDS Reporting System
EHE	Ending the HIV Epidemic
FQHC	Federally Qualified Health Center
HET	Heterosexuals at increased risk for HIV
HIV	Human Immunodeficiency Virus
HUD	U.S. Department of Housing and Urban Development
IDU	Injection drug use
LAC	Los Angeles County
MHS	Molecular HIV Surveillance
MSM	Men Who Have Sex with Men
NB	Non-Binary
NHPI	Native Hawaiian and Pacific Islander
OMB	Office of Management and Budget
PEP	Post-Exposure Prophylaxis
PLWH	Persons Living with HIV
PLWDH	Persons Living with Diagnosed HIV
PrEP	Pre-Exposure Prophylaxis
PWID	Persons who Inject Drugs
SPA	Service Planning Area
TG	Transgender Persons
US	United States
VL	Viral load

Epidemic – an increase above the usual or expected occurrence of a disease within a population

Prevalence - the total number of cases of disease existing in a population.

Incidence – total number of new infections in a given period of time (usually one year).

Diagnosed Cases – number of cases reported to DHSP or the state. This may contain reports or results that were previously reported.

Number of People Living with HIV in LA County – total number of cases in a given period of time who have HIV and have a Los Angeles County address, and who are not deceased.

Rate – the number of new cases of a disease that occur during a specified period of time in a population at risk for developing the disease. Usually calculated per 100,000 people. Rates take the size of the population into account and are used in order to make comparisons.

of new cases during a specified period of time/# of persons who are at risk for the disease during that same period of time, multiplied by 100,000

95% confidence interval – a lower and upper range of values for a measure/variable of interest which contains the true value of the variable 95% of the time.

| 8. Co-chair Report | 1:22 PM—1:30 PM |
| a. November and December Meetings | |

Commission on HIV | Planning, Priorities, and Allocations (PP&A)**October 21, 2025**

9. Division on HIV and STD Programs (DHSP) Report 1:31 PM—2:21 PM
 a. Program Year 34 (PY34) Ryan White Program Utilization Report – Support Services

V. DISCUSSION

2:22 PM—2:54 PM

10. Women’s Caucus Recommendations for Women-Centered Programming
 11. 2026 PP&A Committee Calendar

VI. NEXT STEPS

2:55 PM – 2:57 PM

12. Task/Assignments Recap
 13. Agenda Development for the Next Meeting

VII. ANNOUNCEMENTS

2:58 PM – 3:00 PM

14. Opportunity for members of the public and the committee to make announcements.

VIII. ADJOURNMENT

3:00 PM

15. Adjournment for the meeting of October 21, 2025.

PROPOSED MOTIONS	
MOTION #1	Approve the Agenda Order, as presented or revised.
MOTION #2	Approve the Planning, Priorities and Allocations Committee minutes, as presented or revised.

HYBRID MEETING GUIDELINES, ETIQUETTE & REMINDERS

(Updated 7.15.24)

- ☐ This meeting is a **Brown-Act meeting** and is being recorded.
 - Turn off your ringers/notifications on your smart devices so as not to disrupt the meeting.
 - Your voice is important and we want to ensure that it is captured accurately on the record. Please be respectful of one another and minimize crosstalk.
- ☐ The **meeting packet** can be found on the Commission's website at <https://hiv.lacounty.gov/meetings/> or accessed via the QR code provided. Hard copies of materials will not be provided in compliance with the County's green initiative to recycle and reduce waste.
- ☐ Please comply with the **Commission's Code of Conduct** located in the meeting packet.
- ☐ **Public Comment** for members of the public can be submitted in person, electronically @ https://www.surveymonkey.com/r/public_comments or via email at hivcomm@lachiv.org. *Please indicate your name, the corresponding agenda item, and whether you would like to state your public comment during the meeting; if so, staff will call upon you appropriately. Public comments are limited to two minutes per agenda item. All public comments will be made part of the official record.*
- ☐ For individuals joining in person, to mitigate any potential streaming interference for those joining virtually, we respectfully ask that you **not simultaneously log into the virtual option of this meeting via WebEx.**
- ☐ Committee members invoking **AB 2449 for "Just Cause" or "Emergency Circumstances"** must communicate their intentions to staff and/or co-chairs no later than the start of the meeting. Members requesting to join pursuant to AB 2449 must have their audio and video on for the entire duration of the meeting and disclose whether there is a person over the age of 18 in the room in order to be counted toward quorum and have voting privileges. For members joining virtually due to "Emergency Circumstances", a vote will be conducted by the Committee/COH for approval.
- ☐ Members will be required to explicitly state their agency's **Ryan White Program Part A and/or CDC prevention conflicts of interest** on the record (versus referring to list in the packet). A list of conflicts can be found in the meeting packet and are recorded on the back of members' name plates, courtesy of staff.

If you experience challenges in logging into the virtual meeting, please refer to the WebEx tutorial [HERE](#) or contact Commission staff at hivcomm@lachiv.org.

LOS ANGELES COUNTY COMMISSION ON HIV

Approved by COH

CODE OF CONDUCT

The Commission on HIV welcomes commissioners, guests, and the public into a space where people of all opinions and backgrounds are able to contribute. In this space, we challenge ourselves to be self-reflective and committed to an ongoing understanding of each other and the complex intersectionality of the lives we live. We create a safe environment where we celebrate differences while striving for consensus in the fights against our common enemies: HIV and STDs. We build trust in each other by having honest, respectful, and productive conversations. As a result, the Commission has adopted and is consistently committed to implementing the following guidelines for Commission, committee, and associated meetings.

All participants and stakeholders should adhere to the following:

- 1) We approach all our interactions with compassion, respect, and transparency.**
- 2) We respect others' time by starting and ending meetings on time, being punctual, and staying present.**
- 3) We listen with intent, avoid interrupting others, and elevate each other's voices.**
- 4) We encourage all to bring forth ideas for discussion, community planning, and consensus.**
- 5) We focus on the issue, not the person raising the issue.**
- 6) Be flexible, open-minded, and solution-focused.**
- 7) We give and accept respectful and constructive feedback.**
- 8) We keep all issues on the table (no "hidden agendas"), avoid monopolizing discussions and minimize side conversations.**
- 9) We have no place in our deliberations for racist, sexist, homophobic, transphobic, and other discriminatory statements, and "-isms" including misogyny, ableism, and ageism.**
- 10) We give ourselves permission to learn from our mistakes.**

In response to violation of the Code of Conduct which results in meeting disruption, Include provisions of SB 1100 which states in part, "... authorize the presiding member of the legislative body conducting a meeting or their designee to remove, or cause the removal of, an individual for disrupting the meeting Removal to be preceded by a warning to the individual by the presiding member of the legislative body or their designee that the individual's behavior is disrupting the meeting and that the individual's failure to cease their behavior may result in their removal." Complaints related to internal Commission matters such as alleged violation of the Code of Conduct or other disputes among members are addressed and resolved in adherence to Policy/Procedure #08.3302." (Commission Bylaws, Article VII, Section 4.)

APPROVED BY OPERATIONS COMMITTEE ON 05/25/23; COH 06/08/23

Approved (11/12/1998); Revised (2/10/2005; 9/6/2005); Revised (4/11/19; 3/3/22, 3/23/23; 5/30/23)

LOS ANGELES COUNTY
COMMISSION ON HIV

COMMISSION MEMBER "CONFLICTS-OF-INTEREST"

Updated 9/2/25

In accordance with the Ryan White Program (RWP), conflict of interest is defined as any financial interest in, board membership, current or past employment, or contractual agreement with an organization, partnership, or any other entity, whether public or private, that receives funds from the Ryan White Part A program. These provisions also extend to direct ascendants and descendants, siblings, spouses, and domestic partners of Commission members and non-Commission Committee-only members. Based on the RWP legislation, HRSA guidance, and Commission policy, it is mandatory for Commission members to state all conflicts of interest regarding their RWP Part A/B and/or CDC HIV prevention-funded service contracts prior to discussions involving priority-setting, allocation, and other fiscal matters related to the local HIV continuum. Furthermore, Commission members must recuse themselves from voting on any specific RWP Part A service category(ies) for which their organization hold contracts. ***An asterisk next to member's name denotes affiliation with a County subcontracted agency listed on the addendum.**

*Some participants may not have been captured electronically. Attendance can be corrected by emailing the Commission.

*Members of the public may confirm their attendance by contacting Commission staff at hivcomm@lachiv.org.

*Meeting minutes may be corrected up to one year from the date of approval.

Meeting agenda and materials can be found on the Commission's website. Click [HERE](#).

I. ADMINISTRATIVE MATTERS

1. CALL TO ORDER AND MEETING GUIDELINES/REMINDERS

K. Donnelly, Planning, Priorities and Allocations (PP&A) co-chair, called the meeting to order at approximately 1:08pm.

2. ROLL CALL & CONFLICT OF INTEREST STATEMENTS

C. Barrit, Executive Director, conducted roll call and committee members were reminded to state their conflicts.

ROLL CALL (PRESENT): A. Ballesteros, K. Donnelly, F. Gonzalez, W. King, R. Lester, M. Martinez, I. Salamanca, H. San Agustin, S. Saunders, L. Spencer, C. Vega-Matos

Planning, Priorities and Allocations Committee

August 19, 2025

Page 2 of 5

3. Approval of Agenda

MOTION #1: Approve the Agenda Order (✓Passed by Consensus)

4. Approval of Meeting Minutes

MOTION #2: Approval of Meeting Minutes (✓Passed by Consensus)

II. PUBLIC COMMENT

5. Opportunity for members of the public to address the Committee on items of interest that is within the jurisdiction of the Committee.

Robert Boller of Project Angel Food made the following statement:

I just want to thank the PP&A committee. You guys have our back, and I was very happy to see that you supported Nutrition Support services. It's very important and it's an evidence-based program that saves money, reduces the healthcare costs, proves health outcomes and client satisfaction - the three aims of healthcare reform. But I also know that the Commission, as a whole, voted to do deeper cuts to nutrition support. So, I just wanted to remind everyone that in the 1st May meeting, there's a letter that we submitted that kind of goes into details of the evidence-based nutrition support, and I hope the commission and the public at large can meet that and again thank you very much. I also want to reiterate our commitment to people living with HIV/AIDS as well as the community at large. We are actually in talks with APLA to help them with their delivery of NOLP groceries. It's something we've been wanting to get into and we're seeing this as an opportunity to help. Thank you very much.

J. Green announced that the Executive Committee will be reviewing the proposed bylaws changes including the 49 public comments that were received at their meeting next week on August 28 from 1pm-3pm at the Vermont Corridor. He noted that there are several important comments that need to be discussed and one of them is the recommendation from DHSP to unintegrate the Commission (to remove prevention and focus solely on Ryan White Care).

III. COMMITTEE NEW BUSINESS

6. Opportunity for Committee members to recommend new business items for the full body or a committee-level discussion on non-agendized matters not posted on the agenda, to be discussed and (if requested) placed on the agenda for action at a future meeting, or matters requiring immediate action because of an emergency situation, or where the need to take action arose subsequent to the posting of the agenda.

There was no committee new business.

IV. REPORTS

7. Executive Director/Staff Report

- C. Barrit, reiterated that the Executive Committee will be reviewing the proposed changes to the Commission on HIV (COH) bylaws and public comment to the proposed changes at their

Planning, Priorities and Allocations Committee
 August 19, 2025
 Page 3 of 5

next meeting on August 28 from 1pm-3pm at the Vermont Corridor. See Executive Committee [meeting page](#) on the COH website for meeting agenda and additional details.

- C. Barrit reminded the group that the Commission is going through staff changes and transitions with her retirement at the end of the month and asked the group to work with each other to assess staff capacity around Commission activities and goals. She noted that the COH is still waiting for approval and feedback from DHSP regarding the COH's proposed budget for the year. The COH did cut over 30% which is in alignment with the directive for all DHSP funded contractors to adjust budgets at a 30 % reduction. She noted there is a smaller pool of money for operational costs, but staff are prepared to ensure the duties of the COH are fulfilled.

8. Co-chair Report

- K. Donnelly reminded the committee that the public comment period for the Patient Support Services service standards is open and the deadline to submit any feedback or questions is September 30, 2025. Proposed service standards and instructions for submitting public comment can be found [here](#). The Standards and Best Practices Committee will review public comments at their next meeting on October 7, 2025 meeting.

9. Division of HIV and STD Programs Report

a. Program Year 34 (PY34) Ryan White Program Utilization Report

- DHSP staff, S. Oksuzyan, provided a PY34 Ryan White Program Utilization Report to the committee; see [meeting packet](#) for presentation slides.
- The report showed that the Ryan White Program (RWP) is reaching and serving LAC priority populations. The highest expenditures per client were attributed to the Linkage and Re-Engagement Program, followed by Housing and Home-Based Case Management services. The lowest expenditures per client were seen in Benefit Specialty, Mental Health and Nutrition Support services.
- Engagement, retention in care and viral suppression percentages were higher in RWP clients when compared to people living with HIV (PLWH) in Los Angeles County for PY34.

b. 2027-2031 Integrated HIV Plan Updates

- P. Ogata reported that DHSP has been in conversations with the California Department of Public Health's Office of AIDS (OA) around planning for the 2027-2031 Integrated HIV Plan. DHSP has decided to align with the California OA plan and the state plan will include a section specific to Los Angeles County. Commission staff will work with DHSP to determine COH contributions to the plan.

c. Program Years 35 (March 1, 2025-February 28, 2026) Reallocations

- P. Ogata provided a report on current DHSP funding and outlined recommended

Planning, Priorities and Allocations Committee
 August 19, 2025
 Page 4 of 5

reallocations based on funding and need. She reported that DHSP received their final notice of award for Ryan White Part A and Minority AIDS Initiative (MAI) funding for Program Year 35 (PY35) from the Health Services and Resources Administration (HRSA) as well as final award for HRSA Ending the HIV Epidemic (EHE) funding and final award for Centers for Disease Control and Prevention (CDC) PCHD grant. To date, DHSP has received all funding from the federal government for PY35.

- The final Ryan White Part A funding totaled approximately \$42.5 million and MAI award of approximately \$3.7 million with a final notice of award of approximately \$46.295 million for PY35. There was a reduction of approximately 0.08% in funding from PY34. The total award amount for direct services is \$37.6 million from Part A and \$3.3 million from MAI. Ten percent of the full award amount was reserved for administrative fees as well as approximately \$750,000 for legislatively mandated clinical quality management (CQM) activities. See [meeting packet](#) for more details.
- P. Ogata reviewed the key action items DHSP took as the program worked to plan around uncertain funding including the layoff or reassignment of 78 DHSP staff, numerous meeting the stakeholders and contracted providers and aligning contract obligations with projected federal funding/revenue for the fiscal year resulting in a 30% reduction of all HIV care and treatment contracts. See [meeting packet](#) for more details.
- D. Russell requested clarity on DHSP staff cuts that were impacted by HRSA Ryan White Program (RWP) funding. He also commented that some RWP clients have noted that under nutrition services, food delivery services were no longer available. P. Zamudio noted that this is a specific add-on services that was implemented by one provider using a DoorDash food delivery model for clients. The service is not required but due to the 30% reduction in funding contracts it is no longer being implemented by that particular agency that was utilizing the DoorDash food delivery service. Clients can still access foodbank services.
- Lingering uncertainties were outlined including the portion of the \$65 million dollars from the California Department of Public Health's Office of AIDS (OA) that was earmarked to help various counties deal with HIV related funding gaps for 2025-2026. DHSP continues to meet with the OA monthly. There is additional uncertainty around the County budget and available funding as the County continues to see loss in revenue due to Executive Orders and the federal budget. See [meeting packet](#) for more details.
- DHSP noted a reallocation was needed for PY35 to allocate funds to a new service – Patient Support Services – that was under solicitation when the committee originally completed their priority setting and allocation for PY35 in September 2024. To maximize funding, DHSP also recommended allocating Part A funds for Residential Care for the Chronically Ill (RCFCI) housing which has been historically supported by HRSA Part B funds and transfer Transitional Residential Care Facility (TRCF) housing to Part B funds. There was an additional recommendation to support home delivered meals within Nutritional Support services with Part A funds. Last year, home delivered meals was supported with EHE funds, but this service has been typically funded under Part A. See [meeting packet](#) for proposed reallocations and more details.

Planning, Priorities and Allocations Committee

August 19, 2025

Page 5 of 5

- K. Nelson, member of the public, asked if the reallocation for an annual RWP Part A application and if the reallocation will have an impact of the 30% cuts to contracted providers. P. Ogata noted the reallocation is not for an application but rather a Program Terms Report that is due to HRSA in early October and that the reallocation aligns with the 30% funding cut in contracts and contract obligations.
- M. Martinez asked why Early Intervention Services is only funded through June. P. Zamudio mentioned that some of the Public Health Clinics may close due to lack of funding, in general, so there is uncertainty if testing services will continue to be offered.

MOTION #3 - Approve the Ryan White Program Year 35 (PY35) Allocations, as presented or revised and provide DHSP the authority to make adjustments of 10% greater or lesser than the approved allocations amount, as expenditure categories dictate, without returning to this body.

A. Ballesteros – Y, K. Donnelly - Y, F. Gonzalez - Y, W. King - Y, R. Lester - Y, M. Martinez - Y, I. Salamanca - Y, H. San Agustin - Y, S. Saunders - Y, L. Spencer - Y

V. NEXT STEPS

10. Task/Assignments Recap

- a. Commission staff will work with co-chairs to develop the agenda for the September PP&A Committee meeting.
- b. Allocations will move forward to the Executive Committee for review and approval.

11. Agenda Development for the Next Meeting

- a. DHSP to provide a report on PY34 RWP core services utilization.

VII. ANNOUNCEMENTS

12. Opportunity for Members of the Public and the Committee to Make Announcements

There were no announcements.

VIII. ADJOURNMENT

13. Adjournment for the Regular Meeting of August 19, 2025.

The meeting was adjourned by K. Donnelly at 2:56pm.

II. PUBLIC COMMENT

5. Opportunity for members of the public to address the Committee on items of interest that is within the jurisdiction of the Committee.

There was no public comment.

III. COMMITTEE NEW BUSINESS

6. Opportunity for Committee members to recommend new business items for the full body or a committee-level discussion on non-agendized matters not posted on the agenda, to be discussed and (if requested) placed on the agenda for action at a future meeting, or matters requiring immediate action because of an emergency situation, or where the need to take action arose subsequent to the posting of the agenda.

There was no committee new business.

IV. REPORTS

7. Commission on HIV Staff Report

- L. Martinez reported that the Executive Committee will be continuing their review of public comment to the proposed changes to the Commission on HIV (COH) bylaws and at their September 25th meeting from 1pm-3pm at the Vermont Corridor. All interested parties are invited to attend and provided additional public comment, if applicable. See Executive Committee [meeting page](#) on the COH website for meeting agenda and additional details.
- L. Martinez reminded the group that the next COH will be held on October 9, 2025 at 9am at Jessie Owens Park Auditorium. Meeting details will be forthcoming. She noted that the proposed final recommendations for the restructuring of the COH will be presented at the October meeting.

8. Co-chair Report

a. September 18th Executive Committee Special Meeting

- K. Donnelly reported that the Executive Committee will be having a special meeting on Thursday, September 18 from 1pm-3pm at the Vermont Corridor. The focus of the meeting is to discuss the Commission's role in prevention planning as an integrated HIV planning body and shared strategies on how to improve prevention planning efforts and strengthen partnerships as the COH transitions into a new structure. See [meeting packet](#) for more details,

b. September 19th Power of Aging Event

- K. Donnelly announced that the Aging Caucus will be hosting the Power of Aging Event on

Planning, Priorities and Allocations Committee
 September 16, 2025
 Page 3 of 4

Friday, Sept. 19th in recognition of National Aging and HIV Awareness Day. The event will take place at the Vermont Corridor from 9am to 3pm and will focus on navigating services in times of uncertainty. See [event flyer](#) for more details.

c. September 26th California HIV/HCV/STI Strategic Plan's Implementation Blueprint Webinar

- K. Donnelly announced that the California Department of Public Health, Office of AIDS (CDPH-OA) will be hosting an informational webinar on the California HIV/HCV/STI Strategic Plan's Implementation Blueprint on September 26th, 2025, at 10:30 AM. This webinar will review the syndemic approach taken in California's Strategic Plan Implementation Blueprint, provide a refresher on the background and content, and help participants gain understanding of why this is important now. See [webinar registration](#) to register.

9. Division of HIV and STD Programs Report

a. Program Year 34 (PY34) Ryan White Program Utilization Report – Core Services

- DHSP staff, S. Oksuzyan, provided a PY34 Ryan White Program Utilization Report to the committee focusing on core Ryan White Program services; see [meeting packet](#) for presentation slides.
- The report showed a decreased utilization in Ambulatory/Outpatient Medical (AOM) services, Home-Based Case Management services and Mental Health services and an increased utilization in Medical Care Coordination services and Oral Health services. The highest expenditures per client were attributed to Housing and Home-Based Case Management services. The lowest expenditures per client were seen in Mental Health services and AOM services.
- Engagement, retention in care and viral suppression percentages were higher in RWP clients using Oral Health services, Home-Based Case Management services and Mental Health services.

10. Ryan White Program Year 36 (PY36) Reallocations

- DHSP staff requested the Committee review their PY36 allocations and reallocate percentages to include the new Partner Support Services within Non-Medical Case Management Services. Initial PY36 allocations did not include funding for this new service because it was under the solicitation process at the time of allocation.
- The Committee recommended aligning PY36 reallocations with PY35 allocations with the intent to revisit the allocations at a later date once more data and expenditure reports are available.

MOTION #3 - Approve the Ryan White Program Year 35 (PY35) Allocations, as presented or revised and provide DHSP the authority to make adjustments of 10% greater or lesser than the approved allocations amount, as expenditure categories dictate, without returning to this body. (No vote was held; quorum was not reached.)

V. NEXT STEPS

11. Task/Assignments Recap

Planning, Priorities and Allocations Committee

September 16, 2025

Page 4 of 4

- a. Commission staff will work with co-chairs to develop the agenda for the October PP&A Committee meeting.
- b. PY36 Allocations will move forward to the Executive Committee for review and approval.

12. Agenda Development for the Next Meeting

- a. DHSP to provide a report on PY34 RWP support services utilization.
- b. Review recommendations from the Women's Caucus.
- c. DHSP to provide a response to the proposed PY35-37 Directives.

VII. ANNOUNCEMENTS

13. Opportunity for Members of the Public and the Committee to Make Announcements

There were no announcements.

VIII. ADJOURNMENT

14. Adjournment for the Regular Meeting of September 16, 2025.

The meeting was adjourned by K. Donnelly at 2:27pm.

Ryan White Program Utilization Summary Year 34: Support Services (March 1, 2024-February 28, 2025)

Sona Oksuzyan, Supervising Epidemiologist

Amanda Wahnich, Supervising Epidemiologist

Monitoring and Evaluation Unit

Division of HIV and STD Programs

October 21, 2025

Agenda

- Support Services Overview
- Support Services Deep Dive Framework
- Support Services Expenditures
- Key Takeaways

Overview of Support Services

Emergency Financial Assistance (EFA)

2 contracted agencies (DHS, APLA)

Provides **limited one-time or short-term payments to assist RWP clients with an urgent need for rent.**
Annual cap was \$5,000.

Housing Service (HS)

4 contracted sites (APLA, DHS, Project New Hope, Salvation Army Alegria)

Provides **temporary or permanent housing with supportive services** for RWP clients

Benefit Specialty Services (BSS)

12 contracted sites

Provide **coordination, guidance and assistance in accessing multiple services** (medical, social, community, legal, financial, employment, vocational, and/or other needed services) and additional public and private programs (if eligible)

Nutrition Support (NS)

3 contracted sites (APLA, Bienestar, and Project Angel Food)

Provides **food to RWP clients**, improving and sustaining nutrition, food security and quality of life

Substance Use Residential (SUR)

1 contracted site (Tarzana Treatment Center)

Provides **outpatient treatment services for substance use disorders**

Linkage and Re-engagement Program (LRP)

DHSP: DCS Health Navigators

Assists **people newly diagnosed or living with HIV who are lost or returning to treatment to re-engage in care** (medical and psychosocial services).

In Year 34, Benefits Specialty Services (BSS) and Nutrition Services (NS) were the most highly utilized support services.

COUNTY OF LOS ANGELES
Public Health

Utilization of RWP Support Services, Year 34
(Total RWP clients N=15,843)

Support Service Category Deep Dive Framework

Overall Service Utilization and Expenditure Summary

- Client Served
- Service Units (Total and Per Client)
- Expenditures (Total and Per Client)

Client Demographics

- Gender
- Race
- Age

Priority Population Engagement

- Latinx MSM
- Black/AA MSM
- Age $\geq$ 50 years
- Women of color
- Transgender Clients
- Age 13-29 clients
- People who inject drugs (PWID)
- Unhoused < 12 months

Health Determinants

- Primary language
- Income
- Primary insurance
- Housing Status
- Incarceration history

HIV Care Continuum Outcomes

- Engaged in Care
- Retained in Care
- Suppressed Viral Load

Emergency Financial Assistance (EFA)

↑ 18% increase in service utilization in Year 34 compared to Year 33

↑ 14% increase in expenditures in Year 34 compared to Year 33

COUNTY OF LOS ANGELES
Public Health

- A total of **730 unique clients** received EFA services, representing **4% of RWP clients**
- There was an **overall increase in EFA utilization and expenditures** over the last four years

EFA Clients

EFA Expenditures

EFA Service Utilization & Expenditures Summary, Year 34

Service Category	Unique Clients Served	Service Unit(s)	Total Service Units	Units per client	Expenditures	Expenditures per client
EFA	730	Dollars	2,873,110	3,936	\$2,975,974	\$4,077

Funding Source:

- Part A - \$1,539,288
- HRSA EHE - \$765,693
- HIV NCC - \$670,993

EFA clients were predominantly men, Latinx, and RWP clients aged 50 and older

COUNTY OF LOS ANGELES
Public Health

EFA Client Demographics, Year 34, N=730

LAC Priority Populations* Accessing EFA, Year 34

COUNTY OF LOS ANGELES
Public Health

- Over half of EFA clients were **aged 50 and older**, representing the largest group
- **Latinx MSM** represented almost a third of EFA clients
- **Black MSM** represented about a quarter of EFA clients

*Priority population groups are not mutually exclusive, they may overlap

Most EFA clients were English speakers, living ≤ FPL, had private insurance, were permanently housed, and had no incarceration history

COUNTY OF LOS ANGELES
Public Health

EFA Client Health Determinants, Year 34, N=730

HIV Care Continuum in EFA clients, Year 34

COUNTY OF LOS ANGELES
Public Health

- Engagement^a, retention in care^b, and viral load suppression^c percentages were higher for EFA clients compared to RWP clients overall, Year 34
- EFA clients did not meet the EHE target of 95% for viral suppression. However, they met the local target of 95% for engagement in care.

^a**Engagement in Care** defined as 1 ≥ viral load, CD4 or genotype test reported in the 12-month period based on HIV laboratory data as of 5/5/2025

^b**Retention in care** defined as 2 ≥ viral load, CD4 or genotype test reported >30 days apart in the 12-month period based on HIV laboratory data as of 5/5/2025

^c**Viral suppression** defined as most recent viral load test <200 copies/mL in the 12-month period based on HIV laboratory data as of 5/5/2025

— 95% Target

Data source: HIV Casewatch as of 5/1/2025

Housing Services (HS)

↑ 18% increase in service utilization in Year 34 compared to Year 33

↑ 26% increase in expenditures in Year 34 compared to Year 33

COUNTY OF LOS ANGELES
Public Health

- A total of **292 unique clients** received HS, representing **2% of RWP clients** in Year 34
 - Permanent Supportive Housing (H4H): **193** clients
 - Residential Care Facilities for the Chronically Ill: **68** clients
 - Transitional Residential Care Facilities: **39** clients
- HS utilization and expenditures **increased** in the last 4 years.

- Engagement^a, retention^b, and viral load suppression^c percentages were higher for BSS clients compared to RWP clients overall, Year 34
- BSS clients did not meet the EHE target of 95% for viral suppression. However, they met the local target of 95% for engagement in care.

^a**Engagement in Care** defined as 1 ≥ viral load, CD4 or genotype test reported in the 12-month period based on HIV laboratory data as of 5/5/2025

^b**Retention in care** defined as 2 ≥ viral load, CD4 or genotype test reported >30 days apart in the 12-month period based on HIV laboratory data as of 5/5/2025

^c**Viral suppression** defined as most recent viral load test <200 copies/mL in the 12-month period based on HIV laboratory data as of 5/5/2025

95% Target

Data source: HIV Casewatch as of 5/1/2025

Nutrition Support Services (NS)

↑ 22% increase in service utilization in Year 34 compared to Year 33

↑ 1% increase in expenditures in Year 34 compared to Year 33

- A total of **3,010 unique clients** received NS, representing **19% of RWP clients**
 - Delivered Meals* – 457 clients
 - Food Bank* – 2,700 clients
- NS utilization and expenditures increased** in the last four years

NS Service Utilization & Expenditures Summary, Year 34

Service Category	Unique Clients Served	Service Unit(s)	Total Service Units	Units per client	Expenditures	Expenditures per client
NS	3,010	Various	507,949	169	\$3,928,501	\$1,305
Delivered Meals	457	Meals	270,390	592	\$2,597,212	\$5,683
Food Bank	2,700	Bags of groceries	237,559	88	\$1,331,289	\$493

Funding Source:

- Part A - \$2,597,212
- HRSA EHE - \$1,000,000
- HIV NCC - \$331,289

Most NS clients were men, Latinx and were aged 50 and older

COUNTY OF LOS ANGELES
Public Health

NS Client Demographics Year 34, N=3,010

LAC Priority Populations* Accessing NS, Year 34

COUNTY OF LOS ANGELES
Public Health

- **Clients age ≥ 50** represented most NS utilization clients (including subservices)
- **Latinx MSM** clients were the second highest NS utilization clients (including subservices)

*Priority population groups are not mutually exclusive, they may overlap

Most of NS clients were English-speakers, lived ≤ FPL, had public insurance, were permanently housed, and had no history of incarceration

Strengthening HIV Programs for Women in Los Angeles County: Women-Centered HIV Care and Prevention Recommendations

Background

Women living with HIV in Los Angeles County face unique challenges shaped by stigma, trauma, systemic inequities, and gaps in supportive services. Listening sessions with Spanish-speaking women, South LA women, and transgender women revealed common themes of resilience and advocacy alongside unmet needs in healthcare access, mental health, and social support. These insights underscore the importance of developing programming that is inclusive, culturally competent, trauma-informed, and responsive to the realities of women's lives.

Key Findings

- **Mental Health Gaps:** Women experience depression, trauma, and stigma, yet lack access to consistent, culturally and linguistically appropriate mental health providers. Provider turnover also disrupts continuity of care.
- **Healthcare Inconsistencies:** Access to Pap smears, mammograms, STI testing, contraception, and maternal health is inconsistent across providers.
- **Stigma and Discrimination:** Stigma within families, communities, and healthcare settings discourages disclosure and limits trust. Transgender women face compounded stigma, misgendering, and outright denial of care.
- **Need for Women-Centered and Trans-Affirming Spaces:** Participants across sessions emphasized the value of women-only and trans-led spaces for safety, healing, and empowerment.
- **Structural Barriers:** Transportation, housing instability, employment challenges, and immigration-related fears limit access to consistent care.
- **Lack of Inclusive Sexual Health Education:** Heterosexual women often do not see themselves reflected in HIV prevention campaigns, and transgender women face gaps in care that integrates HIV services with gender-affirming treatment.

Recommendations

1. **Expand Mental Health Services**
 - Increase trauma-informed, culturally competent, and language-specific mental health providers.
 - Integrate mental health within HIV care.

2. **Develop Women-Centered Clinics and Programs**
 - Create dedicated women's clinics, where feasible.
 - Fund women-only (cis and trans) support groups.
3. **Strengthen Peer and Community Support**
 - Expand women's (cis and trans) peer navigation and support groups.
 - Partner with community and faith-based organizations to reduce stigma.
 - Support trans-led and peer-led safe spaces.
4. **Improve Comprehensive Sexual and Reproductive Health Access**
 - Provide consistent access to Pap smears, mammograms, STI testing, and contraception.
 - Train providers to ask comprehensive and respectful sexual health questions.
 - Expand free or low-cost sexual health supplies (condoms, Plan B, menstrual products).
5. **Address Stigma Through Education and Outreach**
 - Provide stigma-reduction and cultural humility training for providers, including front-line staff.
 - Develop inclusive HIV and PrEP education campaigns for heterosexual women, Spanish-speaking communities, and transgender women.
 - Use social media and lived-experience storytelling to normalize HIV care.
6. **Increase Accessibility and Wraparound Services**
 - Integrate housing, transportation, childcare, legal aid, and domestic violence support with HIV services, where feasible.
 - Provide reminders to consumers for preventive screenings.
 - Simplify navigation through coordinated case management.
7. **Advance Structural Supports**
 - Address immigration-related fears to ensure all women can access services safely.
8. **Ensure Gender-Affirming and Inclusive Care**
 - Train providers on integrating HIV and gender-affirming care, including front-line staff where appropriate.
 - Hire and support transgender staff and leaders across healthcare and community-based organizations.

Los Angeles County can strengthen outcomes for all women living with HIV by adopting these recommendations across healthcare, community-based, and policy systems. Immediate priorities should include expanding trauma-informed mental health services, creating women-centered and trans-affirming spaces, and integrating wraparound supports that reduce structural barriers. With investment and commitment, the County can ensure women living with HIV are supported, respected, and empowered to thrive.

Planning, Priorities and Allocations Committee Key Annual Activities & Committee Calendar

**** FOR DISCUSSION ****

- **Co-chair nominations and elections** - Each year the committee facilitates an open process to nominate and elect co-chairs who will provide leadership, ensure fair representation of stakeholders, and guide the committee's agenda and decision-making throughout the year.
- **Workplan development and review** - The committee develops an annual workplan aligned with the overall Commission's workplan and strategic goals. The workplan outlines timelines, milestones, and deliverables, and is reviewed periodically to monitor progress and make adjustments.
- **Annual directives updates*** - Directives provide guidance to the recipient on service delivery expectations and how best to meet the needs of consumers. Annual progress/updates to ensure alignment with community needs, emerging public health trends, and funding requirements.
- **Quarterly Expenditure Reports*** - Quarterly expenditure reports to monitor how allocated funds are being spent. This oversight ensures fiscal accountability, helps identify under- or over-spending, and informs potential reallocations.
- **Utilization Reports*** - Service utilization reports are examined to evaluate service usage across funded programs. These reports highlight increases or decreases in service utilization by service type, cost per service, gaps in service use, potential barriers to care, and opportunities for improving service delivery.
- **HIV/STD Surveillance Data*** - Surveillance data is reviewed to track trends in HIV and STD incidence, prevalence, and disparities. This information informs priority-setting, prevention strategies, and resource allocation.
- **Unmet Needs Reports*** - Help the committee identify services that clients require but are not currently receiving. Use findings to help inform needs assessments and funding priorities.
- **Resource Inventory*** - Review of funding and services offered via Part B funds, EHE, Prevention, and other resources. This allows the committee to determine what care/support services to fund (and at what allocation amounts) that will compliment these services.
- **2027-2031 Integrated Plan Updates and Review*** - Provide updates to the committee on the progress of the Integrated Plan progress/development and provide the committee an opportunity to provide feedback on the plan.

- **Needs Assessment Planning** - Planning for needs assessments is a critical responsibility. The committee determines target populations, defines the scope, methodology, and timeline to ensure that assessments capture the experiences and priorities of people living with and affected by HIV. May lean on specific caucuses or workgroups to assist with needs assessment planning and execution including data collection tools, outreach strategies, and final analysis.
- **Needs Assessment Data Review** – Review finds from needs assessment data to identify service gaps, barriers to access, and emerging trends. This data directly informs decision-making around funding priorities and allocations.
- **Review PSRA Framework** - Review the Priority Setting and Resource Allocation (PSRA) process for effectiveness and equity. Update criteria and scoring systems as needed. Ensures knowledge of and understanding that decision-making processes before priority setting and resource allocation.
- **Review Priorities** – Revisit annual service priorities (from 3 yr projections) to determine whether adjustments are necessary based on updated data, funding changes, or shifts in the epidemic.
- **Annual Allocations*** - Revisit annual service allocations (from 3 yr projections) to determine funding levels for each service category for the upcoming fiscal year. Compare against multi-year projections and adjust based on current data. Ensure allocations align with priorities and available resources.
 - **Contingency Planning* (as needed)** - Contingency scenarios are developed to address potential funding increases or decreases. Identify critical services that require protection during budget cuts. These plans ensure that DHSP can respond quickly while minimizing disruption to critical services.
- **Reallocations*** - Review needs assessment data, expenditures, and utilization data to identify areas for reallocation. Shift funds between service categories to optimize impact. Document and communicate reallocation decisions to DHSP and federal partners.
- **Prevention Planning** – Review prevention HIV/STI data and collaborate with prevention stakeholders to align care and prevention strategies, ensuring an integrated response that addresses both treatment and prevention priorities across the HIV continuum.

Option 1 – Monthly Meeting Calendar (March 2026 – February 2027)

Month	Key Activities
March 2026	• Co-chair nominations and elections • Review and adopt annual workplan and meeting calendar • HIV/STD Surveillance Data report*
April 2026	• Needs Assessment Planning • Resource Inventory Review • Prevention and Testing Data Report*
May 2026	• Expenditure Report* • Needs Assessment Data Review (prior year findings) • Integrated Plan Update*
June 2026	• Unmet Needs Report* • Review PSRA Framework
July 2026	• Utilization Reports*
August 2026	• Expenditure Report* • Review All Data – summaries with key info • Final Reallocations for PY36*
September 2026	• Review PY37 Priority Rankings and Allocations, revise as needed • Contingency Planning, as needed
October 2026	
November 2026	• Contingency Planning, as needed • Prevention Planning • Expenditure Report*
December 2026

Option 2 – Bi-Monthly Meeting Calendar (March 2026 – February 2027)

Month	Key Activities
March 2026	• Co-chair nominations and elections • Review and adopt annual workplan and meeting calendar • HIV/STD Surveillance Data report
May 2026	• Needs Assessment Planning • Review PSRA Framework • Integrated Plan Update* • Expenditure Report*
June 2026 (meet 2-3x)	• Resource Inventory Review • Prevention and Testing Data Report* • Unmet Needs Report*
July 2026 (meet 2-3x)	• Utilization Reports* • Needs Assessment Data Review (prior year findings) • Expenditure Report* • Review All Data – summaries with key info • Final Reallocations for PY36*
August 2026	• Review PY37 Priority Rankings and Allocations, revise as needed • Contingency Planning, as needed
November 2026	• Expenditure Report* • Prevention Planning
January 2027	• Directive Development (not this year but in future years) • Expenditure Report* • Directives Updates*

Option 3 – Bi-Monthly Meeting Calendar with Data Summit (March 2026 – February 2027)

Month	Key Activities
March 2026	• Co-chair nominations and elections • Review and adopt annual workplan and meeting calendar • Needs Assessment Planning
May 2026	• Needs Assessment Planning • Review PSRA Framework • Integrated Plan Update (Status of Submittal)
Virtual Data Summit (tentative for the month of June over the course of 2-4 days)	• Prevention and Testing Data Report* • HIV/STD Surveillance Data Report* • Unmet Needs Report* • Utilization Reports* • Needs Assessment Data Review (prior year findings)
July 2026	• Resource Inventory Review • Expenditure Report* • Review All Data – summaries with key info • Final Reallocations for PY36*
September 2026	• Review PY37 Priority Rankings and Allocations, revise as needed • Contingency Planning, as needed
November 2026	• Expenditure Report* • Prevention Planning • Directive Development (not this year but in future years)
January 2027	• Directive Development (not this year but in future years) • Expenditure Report* • Directives Updates*

EXHIBIT G

Practice Guidelines for the Care of Persons Living with HIV/AIDS

Ryan White HIV Treatment Extension Act of 2009

San Diego County

In conjunction with United States (U.S.) Public Health Service (PHS) guidelines and accepted community practices, the San Diego County HIV Planning Group's Medical Standards and Evaluation Group recommends the following practice guidelines for the management of human immunodeficiency virus (HIV) infection in patients enrolled in the Ryan White Primary Care Program of San Diego County.

Antiretroviral therapy (ART) and opportunistic infection (OI) prophylaxis (primary and secondary) are recommended in accordance with the most recent PHS guidelines. Guidelines may have been updated since the versions listed below; current versions are available at <https://clinicalinfo.hiv.gov/en/guidelines>.

For San Diego County Ryan White Clinics, chart reviews and performance assessments conducted on behalf of the County of San Diego Health and Human Services Agency (HHS) – Division of Public Health Services – HIV, STD, and Hepatitis Branch (HSHB) will be based upon these guidelines.

A. Guidelines for Staging and Baseline Evaluation (recommended to be completed within the first two visits)

- 1) Complete history, to include at least the following:
 - a. *General background:*
 - Race/ethnicity
 - Current gender identity
 - Sex assigned at birth
 - Housing status
 - Family history
 - Social history
 - Travel history
 - Country of birth
 - b. *Current/lifetime sexual history: (See Appendix A for example)*
 - Sexually transmitted infection/disease (STI/STD) history during lifetime and/or last 5 years
 - Relationship status
 - Detailed sexual history
 - Partner(s), including HIV status and history of pre-exposure prophylaxis (PrEP) use
 - Exposure sites – anorectal, genital, oropharyngeal
 - Use of condoms
 - c. *Current/lifetime substance use history:*
 - Injection drug use (IDU), during lifetime and/or last 5 years
 - Non-injection drug use, during lifetime and/or last 5 years
 - Alcohol and/or drug treatment history
 - Sexual activity under the influence of substances
 - Tobacco use, during lifetime and/or last 5 years
 - d. *HIV care history:*
 - HIV status, including recent/historical CD4+ T-cell count/HIV-1 viral load
 - Prior and current antiretroviral regimens
 - Resistance test results (if available)
 - Current prophylaxis
 - Prior HIV-related complications
 - e. *General medical history:*
 - Immunizations

- Hepatitis history
 - Tuberculosis (TB) risk
http://www.sandiegocounty.gov/content/dam/sdc/hhsa/programs/phs/tuberculosis_control_program/SanDiegoRiskAssessment-Adults.pdf
 - Reproductive history (persons assigned female at birth), including parity, last menstrual period (LMP), and method of birth control
 - Current allergies
 - Other current medications
 - Significant childhood illnesses
 - Surgical history
 - Mental health history, past/current mental health conditions, symptoms of depression, and psychiatric medications
 - Other medical history
- 2) Review of symptoms and general physical exam, including height, weight, temperature, blood pressure, pulse, respiratory rate, general appearance, skin, head, eyes, ears, nose and throat (HEENT), ophthalmoscopy, chest, heart, lungs, abdomen, rectum, anoscopy (if anorectal symptoms), pelvic (persons assigned female at birth), breasts, genitalia, extremities, lymph nodes, mental status, nervous system including reflexes
- 3) Laboratory tests
- a. For the current list of recommended labs and periodicity, please refer to [PHS Guidelines for Laboratory Testing for Initial Assessment and Monitoring of Patients with HIV Receiving Antiretroviral Therapy](#).
 - b. STI Testing
 - Should be performed at baseline and at least annually thereafter for sexually active clients, more frequently (i.e., every three to six months) if indicated based upon the client's sexual practices.
 - Syphilis serology
 - Gonorrhea/Chlamydia – Perform three-site testing (i.e., urogenital, throat, rectum) using nucleic acid amplification testing (NAAT). If antibiotic-resistant *Neisseria gonorrhoeae* is suspected, obtain *N. gonorrhoeae* culture from all exposure sites.
 - Trichomoniasis – Screening with NAAT should be performed annually for persons having vaginal sex.
 - Anal Pap test (optional) – See **Section G – Anal Cancer Screening**.
 - Resources:
 - [Centers for Disease Control and Prevention \(CDC\) Recommendations for Providing Quality STD Clinical Services, 2020](#)
 - [CDC Interim Guidance for STD Care and Treatment During Disruption of Clinical Services](#)
 - [CDC STD Treatment Guidelines, 2015](#)
 - [Updated CDC Gonorrhea Treatment Recommendations, 2020](#)
 - [CDC Recommendations for the Laboratory-Based Detection of *Chlamydia trachomatis* and *Neisseria gonorrhoeae*, 2014](#)
 - c. TB Testing
 - Annual screening in the form of Annual Risk Assessment:
http://www.sandiegocounty.gov/content/dam/sdc/hhsa/programs/phs/tuberculosis_control_program/SanDiegoRiskAssessment-Adults.pdf
 - Annual screening using purified protein derivative (PPD) or interferon-gamma release assay
 - If screening test is positive, the patient should have a chest x-ray.
 - Chest x-ray: At least one should be documented in the medical record if the individual has a history of TB or a positive screening test.
 - d. Viral Hepatitis Testing
 - Hepatitis B screening should be performed by testing for hepatitis B surface antibody (HBsAb), surface antigen (HBsAg), and antibody to core antigen (anti-HBc or HBcAb). Those who are susceptible to infection should be vaccinated against Hepatitis B Virus (HBV) (see **Section C – Guidelines for Immunization**). Patients who are negative for HBsAg and

HBsAb but positive for anti-HBc should be screened for chronic HBV infection by determination of HBV deoxyribonucleic acid (DNA). Those without evidence of chronic infection should consider vaccination.

<https://clinicalinfo.hiv.gov/en/guidelines/adult-and-adolescent-opportunistic-infection/hepatitis-b-virus-infection?view=full>

- Hepatitis C screening with Hepatitis C Virus (HCV) antibody or, if recent (i.e., within last six months) infection is suspected, the patient has advanced immunodeficiency (CD4 count <100 cells/mm³), or the patient has a history of successfully treated or spontaneously cleared HCV infection, ribonucleic acid (RNA) testing should be performed at baseline and at least annually for persons with ongoing risk factors (e.g., IDU) and sexually active men who have sex with men (MSM). HCV RNA should be ordered for all patients with a positive HCV antibody test to assess for active HCV disease.

<https://clinicalinfo.hiv.gov/en/guidelines/adult-and-adolescent-opportunistic-infection/hepatitis-c-virus-infection?view=full>

e. Other Testing:

- Measles antibody titer – All persons with HIV born in 1957 or after should be tested for immunity to measles by measuring antibody titers. The measles, mumps, and rubella (MMR) vaccine should be given to persons with CD4 ≥200 cells/mm³ born in or after 1957 who have not received the vaccine or do not have immunity based on laboratory testing (see **Section C – Guidelines for Immunization**).

4) Appropriate referrals, including but not limited to:

- Treatment adherence counseling
- Ryan White dental program (recommended annually)
- Ophthalmologist if CD4 <50 cells/mm³ (recommended)
- Case management (if eligible)
- Medical nutrition therapy
- Clinical trials
- Mental health
- Substance use treatment
- Partner services/PrEP if client has not achieved sustained viral suppression

For a list of currently funded Ryan White Service Providers, please visit:

[HIV/AIDS Care and Services Resources \(sandiegocounty.gov\)](https://www.sandiegocounty.gov/hiv/aids/care-and-services/resources)

B. Guidelines for Plasma HIV RNA (i.e., Viral Load) Measurements and CD4 Counts

<https://clinicalinfo.hiv.gov/en/guidelines/adult-and-adolescent-arv/plasma-hiv-1-rna-viral-load-and-cd4-count-monitoring?view=full>

- 1) HIV-1 RNA (i.e., Viral Load) – should be performed upon entry to care, before initiation of ART (if initiation of ART is deferred after entry to care), and within 2-4 weeks but no later than 8 weeks after ART initiation. After initiation or modification of ART, repeat at 4-8-week intervals until undetectable. Continue to monitor every 3-4 months during the first 2 years of ART, and then frequency can be decreased to every 6 months if the viral load is consistently undetectable for two years and the CD4 is >500 cells/mm³.
- 2) CD4+ T-cell Count (i.e., CD4 Count) – should be performed upon entry to care and three months after initiation of ART (every 3-6 months in patients who defer ART). After initiation or modification of ART, repeat every 3-6 months during the first 2 years or if the CD4 count is <300 cells/mm³ or if there is any viremia while on ART. May monitor every 12 months if the patient has consistently been on ART with a suppressed viral load and CD4 count 300-500 cells/mm³. Optional once CD4 is consistently >500 cells/mm³ and viral load has been undetectable for >2 years.

C. Guidelines for Immunization

[Adult Immunization Schedule by Vaccine and Age Group | CDC](https://www.cdc.gov/vaccines/imz/adult/schedule)

[Vaccines Indicated for Adults Based on Medical Indications | CDC](https://www.cdc.gov/vaccines/imz/adult/indications)

- 1) Should be offered as soon as possible after initial evaluation at recommended doses.
- 2) Viral loads should not be measured within three weeks of an immunization.
- 3) Pneumococcus (both types), influenza, tetanus, Hepatitis B (if not immune), Hepatitis A (if not immune), human papillomavirus (HPV), meningococcal

- 4) Influenza vaccine: recommended yearly with trivalent inactivated vaccine (live attenuated vaccine is contraindicated in persons living with HIV or PLWH).
- 5) HPV: Recommended for all PLWH through age 26 years as a three-dose series, regardless of the age at initial vaccination. Vaccination may be considered, based on shared clinical decision-making, for persons aged 27-45 years.
<https://www.cdc.gov/mmwr/volumes/68/wr/mm6832a3.htm>
- 6) Varicella zoster: Two doses of the Shingrix vaccines should be given to patients over the age of 50 years with CD4 count >200 cells/mm³.
- 7) Hepatitis Vaccines:
 - a. Hepatitis B: Recommended in persons with negative serology or isolated positive core antibody (i.e., negative surface antigen and antibody). Double dosing (i.e., 40 μ g) of single-antigen three-dose vaccines is recommended to increase seroconversion rates. For those patients who do not seroconvert after the first series, a second series is recommended. If these persons do not seroconvert, they are unlikely to respond to a third series. The safety and efficacy of the two-dose vaccine has not been evaluated in PLWH but is an option if a two-dose regimen is preferred. <https://clinicalinfo.hiv.gov/en/guidelines/adult-and-adolescent-opportunistic-infection/hepatitis-b-virus-infection?view=full>
 - b. Hepatitis A: Seroconversion rates are likely related to CD4 counts. The vaccine may be given in persons who are seronegative. However, if there is no response and the CD4 counts are less than 500 cells/mm³, persons can receive a repeat series when CD4 counts are higher.
- 8) Pneumococcal: Both the 13-valent pneumococcal conjugate vaccine (PCV13) and the 23-valent pneumococcal polysaccharide vaccine (PPV23) are recommended, with the final dose of PPV23 given at ≥ 65 years of age and ≥ 5 years after previous PPV23 doses given before age 65 years. For specific recommendations regarding timing of PCV13 and PPV23 doses, see <https://clinicalinfo.hiv.gov/en/guidelines/adult-and-adolescent-opportunistic-infection/community-acquired-pneumonia-cap?view=full>.
- 9) Meningococcal: Vaccination against serogroups A, C, W, and Y is recommended for all persons living with HIV aged ≥ 2 years. <https://www.cdc.gov/mmwr/volumes/65/wr/mm6543a3.htm>. Vaccination against serogroup B is recommended for persons aged ≥ 10 years who are at increased risk for serogroup B meningococcal disease due to certain underlying conditions or a serogroup B outbreak. HIV disease is not one of the underlying conditions for which serogroup B vaccination is recommended. Serogroup B vaccination may be considered for adolescents and young adults aged 16-23 years on the basis of shared decision-making.
<https://www.cdc.gov/mmwr/volumes/69/rr/rr6909a1.htm>
- 10) Tetanus vaccines: Recommended every 10 years. Recommend that the next booster contain pertussis booster (Tdap) (make sure the patient has had the pertussis vaccine)
- 11) Live Vaccines (Live attenuated influenza vaccine, Varicella or Zoster vaccine, Vaccinia (small pox), Yellow Fever, Live Oral Polio, Measles*, Typhoid) are contraindicated in persons with severe immunosuppression based on the person's age (per Advisory Committee on Immunization Practices or ACIP): CD4 <750 for those younger than 12 months, <500 for those aged 1-5 years, and <200 for those >6 years old.
*The MMR vaccine should be given to persons with CD4 ≥ 200 cells/mm³ born in or after 1957 who have not received the vaccine or do not have immunity based on laboratory testing.
- 12) Booster doses as recommended by CDC guidelines.

D. Treatment:

- 1) All PLWH should receive ART, regardless of CD4 count, to reduce morbidity and mortality, improve health outcomes, and prevent transmission of HIV to others.
- 2) Whenever possible, treatment should be initiated immediately (or as soon as possible) after diagnosis.
 - a. Same-day treatment should be offered if there are no medical indications to defer therapy (e.g., signs/symptoms of intracranial OI).
 - b. If treatment is offered before the results of treatment-naïve genotype are available, an integrase inhibitor-based regimen is recommended.

- 3) All PLWH should be informed that maintaining a plasma HIV RNA (viral load) of <200 copies/mL, including any measurable value below this threshold value, with ART prevents sexual transmission of HIV to their partners. Patients may recognize this concept as Undetectable = Untransmittable or U=U.
- 4) Guidelines on antiretroviral treatment regimens can be found at <https://aidsinfo.nih.gov/guidelines>.
- 5) At the time of revision, an extended-release, injectable drug regimen (coformulation of cabotegravir and rilpivirine) was approved by the Food and Drug Administration (FDA) to replace the current antiretroviral regimen for patients with viral suppression on a stable ART regimen without history of treatment failure and with no known or suspected resistance to either agent. Long-acting injectable ART may be considered for eligible patients and should be administered according to Department of Health and Human Services guidelines: <https://clinicalinfo.hiv.gov/en/guidelines/adult-and-adolescent-arv/hhs-adults-and-adolescents-antiretroviral-guidelines-panel>.
- 6) For patients with HBV coinfection, as determined by a positive HBsAg or HBV DNA test result, tenofovir disoproxil fumarate or tenofovir alafenamide, plus either emtricitabine or lamivudine, should be used as part of the ART regimen to treat both HBV and HIV.
- 7) Patients with HCV coinfection should be managed based on the most up-to-date recommendations (<http://www.hcvguidelines.org>). In general, the goals of therapy, treatment regimen, and monitoring parameters for HIV/HCV-coinfected patients are similar to those recommended for HCV-monoinfected patients.

E. Metabolic and Other Noncommunicable Comorbidities Associated with HIV, ART, and Aging

- 1) The availability of highly effective HIV treatment has resulted in longer life expectancy for PLWH and a larger proportion of PLWH who are aged 50 years or older.
- 2) For all PLWH aged 50 years or older, providers should closely monitor for and promptly evaluate signs or symptoms of the following conditions that are associated with advanced age, long-term HIV infection, ART, or a combination of these:
 - a. Cardiovascular disease and associated risk factors (e.g., hyperlipidemia, glucose intolerance or diabetes mellitus, hypertension, smoking)
 - b. Osteoporosis and bone mineral density loss
 - c. Hypogonadism
 - d. Neurocognitive decline
 - e. Mental health conditions, such as depression
 - f. Polypharmacy
 - g. Kidney disease
 - h. Certain non-acquired immune deficiency syndrome (AIDS)-related cancers
- 3) Specific recommendations regarding metabolic and noncommunicable comorbidities include:
 - a. Check lipid levels prior to and within 1-3 months after starting ART. Patients with abnormal lipid levels should be managed according to national guidelines.
 - b. Random or fasting blood glucose and hemoglobin A1c (HbA1c) should be obtained prior to starting ART. If random glucose is abnormal, fasting glucose should be obtained. After ART initiation, only plasma glucose criteria should be used to diagnose diabetes. Patients with diabetes mellitus should have an HbA1c level monitored every 6 months with an HbA1c goal of <7%.
 - c. Baseline bone densitometry (DXA) screening for osteoporosis in post-menopausal women and men aged ≥50 years. Screening for transgender persons should follow national recommendations based on sex assigned at birth and individualized risk of osteoporosis.
 - d. Testosterone replacement therapy for cisgender men should be prescribed with caution and only in those with symptomatic hypogonadism diagnosed based on the presence of symptoms plus low serum testosterone documented on two separate morning lab tests.

Primary Care Guidance for Persons with Human Immunodeficiency Virus: 2020 Update by the HIV Medicine Association of the Infectious Diseases Society of America:

<https://academic.oup.com/cid/advance-article/doi/10.1093/cid/ciaa1391/5956736>

F. Additional Guidelines for Care of Persons Assigned Female at Birth

- 1) Guidelines for Cervical Neoplasia (modified Algorithm 6 of AHCPR 94-0573):

<https://hab.hrsa.gov/sites/default/files/hab/About/clinical-quality-management/adolescentadultmeasures.pdf>

- a. Age <21 years: Pap test within one year of sexual activity and no later than age 21
 - b. Age 21-29 years: Pap test at time of HIV diagnosis. Repeat yearly for three years. If all tests are normal, repeat Pap test every three years thereafter.
 - c. Age <30 years: No HPV testing should be performed unless abnormalities are found on Pap test.
 - d. Age ≥30 years: Pap only (same as for 21-29 years) or Pap with HPV testing. If both tests are negative, repeat Pap with HPV test every three years thereafter.
 - e. If three consecutive Pap tests are normal, then a follow-up test should be done every three years.
 - f. Patients with abnormal Pap smears or a history of an untreated abnormal Pap smear should be referred for colposcopy and should receive same management and follow-up as the general population.
Refer to American College of Obstetrics and Gynecology (ACOG) guidelines for management of abnormal cervical cancer screening results:
<https://www.acog.org/clinical/clinical-guidance/practice-advisory/articles/2020/10/updated-guidelines-for-management-of-cervical-cancer-screening-abnormalities>
 - f. Cervical cancer screening should continue throughout the patient's lifetime and not, as in the general population, end at 65 years of age.
- 2) Annual mammograms initiated at age 50 or earlier depending on history
 - 3) Treatment for pregnant persons living with HIV – recommend referral to specialist (i.e., UCSD Maternal, Child & Adolescent Program)

G. Anal Cancer Screening:

- 1) Persons with a history of receptive anal intercourse or abnormal cervical Pap tests and all persons with genital warts should have an anal Pap test if access to appropriate referral for follow-up, including high-resolution anoscopy, is available.
- 2) Digital anorectal exam should be performed at least annually for asymptomatic persons.

H. PrEP and Partner Prevention Services – Assess HIV status of partner(s) and evaluate for PrEP referral for all patients living with HIV who have not achieved sustained viral suppression. Please note that Ryan White does not provide reimbursement for PrEP services for HIV-negative partners.

- 1) For guidelines regarding evaluation for and provision of PrEP, please refer to the U.S. PHS Preexposure Prophylaxis for the Prevention of HIV Infection in the United States – 2017 Update. Please note that parts of these guidelines may be outdated, as a second agent (coformulation of emtricitabine and tenofovir alafenamide) received FDA approval for use as PrEP for persons assigned male at birth and may be preferred for certain patients at higher risk of renal and/or bone toxicity.
<https://www.cdc.gov/hiv/pdf/risk/prep/cdc-hiv-prep-guidelines-2017.pdf>
- 2) For guidelines regarding partner services for PLWH, please refer to the Recommendations for Partner Services Programs for HIV Infection, Syphilis, Gonorrhea, and Chlamydial Infection.
<https://www.cdc.gov/mmwr/preview/mmwrhtml/rr5709a1.htm>

I. HIV Management Guidelines for Transgender Individuals – Primary care of transgender PLWH should address the specific needs of this population and include careful attention to potential interactions between gender-affirming therapy and ART and/or OI prophylaxis medications. Guidelines for the Primary and Gender-Affirming Care of Transgender and Gender Nonbinary People, from the Center of Excellence for Transgender Health at the University of California, San Francisco, include recommendations for transgender individuals living with HIV and can be accessed at <https://transcare.ucsf.edu/guidelines>.

J. Interim Guidance for COVID-19 and PLWH – At the time of revision, the County of San Diego was in a state of emergency due to the rapidly evolving Coronavirus Disease 2019 (COVID-19) pandemic caused by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2).

While the limited data currently do not indicate that the course of COVID-19 in PLWH differs from that in persons without HIV, caution is warranted. Some people with HIV may have comorbidities (e.g., cardiovascular disease, lung disease, chronic smoking) that increase risk of more severe disease.

- 1) All patients should maintain on-hand at least a 30-day (and ideally a 90-day) supply of ART.
- 2) Influenza and pneumococcal vaccinations should be kept up to date.
- 3) COVID-19 vaccination should be administered based on CDC and Advisory Committee on Immunization Practices (ACIP) guidance.
<http://www.cdc.gov/vaccines/covid-19/info-by-product/clinical-considerations.html>.
- 4) All patients should receive COVID-19 vaccination when eligible based on California state guidelines.
- 5) Telephone and virtual visits for routine non-urgent care should be considered as an option to encourage retention in care.
- 6) For further guidance, please refer to the U.S. PHS Interim Guidance for COVID-19 and Persons with HIV, available at <https://clinicalinfo.hiv.gov/en/guidelines/covid-19-and-persons-hiv-interim-guidance/interim-guidance-covid-19-and-persons-hiv>.

APPENDIX A

SAMPLE Sexual Health Risk Assessment Form

Sexually transmitted diseases (STDs) raise the amount of HIV in the body and can make HIV easier to pass to another person. Alcohol and drugs can harm your immune system, stop HIV medication from working properly and increase side effects. To help your doctor help you stay healthy and lower your risk of passing HIV and STDs to others, please answer the following questions honestly. Your answers are entirely confidential.

1. Have you had sex (oral, vaginal, anal) within the **last 3 months**? ☐ Yes / ☐ No / ☐ Decline
(If you answered No please skip to #6)
2. In the **last 3 months**, how many sexual partners did you have? # _____ Male / # _____ Female / # _____ Transgender
3. How often did you use condoms?
☐ Always (100%) / ☐ Most of the Time (75% or more) / ☐ Sometimes (50%) / ☐ Seldom (25%) / ☐ Never (0%)
4. In the **last 3 months** how many times have you had sex without using a condom?
_____ Oral / # _____ Vaginal / # _____ Anal; check one: ☐ Insertive (top) / ☐ Receptive (bottom) / ☐ Both
5. In the **last 3 months** what was the HIV status of your sex partner(s)? (Check all that apply)
☐ Positive / ☐ Negative / ☐ Unsure
6. Have you had any of the following symptoms in the **last 3 months**? **Yes** **No**

Discharge from penis/vagina	☐ ☐
Burning feeling with urination	☐ ☐
Sores on your genitals	☐ ☐
Anal discharge or pain	☐ ☐
Mucous or blood in your stool	☐ ☐
Throat sores or pain	☐ ☐
Skin rash	☐ ☐
7. Have you been diagnosed with a sexually transmitted disease (STD, such as Syphilis, Chlamydia, Gonorrhea, NGU, Genital Warts, and Genital Herpes) in the **last 3 months**? (Check one): ☐ Yes / ☐ No / ☐ Don't know
If you answered yes, did you complete treatment? (Check one): ☐ Yes / ☐ No / ☐ Don't know
8. In the **last 3 months** have you used **non-injection** street drugs 9i.e. marijuana, meth, crystal, speed, glass, crack, ecstasy. cocaine)? ☐ Yes / ☐ No
9. Have you **ever injected** steroids, hormones, vitamins or street drugs? ☐ Yes / ☐ No
a. If you answered yes, when was the last time you injected? _____
b. Did you ever share needles? ☐ Yes / ☐ No
10. In the **last 3 months** do you feel that your alcohol or drug use caused you to engage in risky activities (i.e. unprotected sex, needle sharing), even once? ☐ Yes / ☐ No
11. Would you be interested in help to inform your sex and/ or needle sharing partner(s) of possible HIV exposure? ☐ Yes / ☐ No / ☐ Maybe

If you answered Yes or Maybe and would like to speak to a Counselor, please tell us the best way to contact you:

Phone: _____ Can we leave a confidential message? ☐ Yes / ☐ No

Text: _____ Email: _____

Provider/Staff Signature: _____

Change History:

Originally adopted by the HIV Health Services Planning Council in July 2000
Proposed changes adopted by the HIV Health Services Planning Council in May 2003
Proposed changes adopted by the HIV Health Services Planning Council in June 2004
Proposed changes adopted by the HIV Health Services Planning Council in September 2007
Incorporated references updated as necessary
Proposed changes adopted by the HIV Planning Group on August 9, 2017
Proposed changes adopted by the HIV Planning Group on September 22, 2021

Medical Standards and Evaluation Group participants who contributed to the revised document include:

Jeannette Aldous, MD San Ysidro Health Center
Joe Burke, South Bay Alliance

1 Executive Summary and Statewide Coordinated Statement of Need (SCSN)

The United States (U.S.) has taken on a bold plan to end the HIV epidemic by the year 2030. In order to reach national goals of reducing new HIV infections by 75% by 2025 and by 90% by 2030, the country must take aggressive actions by scaling up key HIV prevention and treatment strategies. The presentation of **Florida’s HIV Integrated Prevention and Care (IPC) Plan, 2022–2026** is the culmination of several local (rapid HIV antiretroviral start programs), state (Data to Care programs), and federal initiatives including:

- *National HIV/AIDS Strategy, 2022–2025 (NHAS)*
- *Ending the HIV Epidemic (EHE) in the United States (2019)*
- *National Strategic Plan: A Roadmap to End the Epidemic for the United States, 2021–2025*

These plans work in unison to achieve national goals. This plan builds upon the previous work in Florida’s Statewide Integrated HIV Prevention and Care Plan, 2017–2021 and Florida’s Unified Ending the HIV Epidemic (EHE) Plan, 2020.

The impact of Human Immunodeficiency Virus/Acquired Immune Deficiency Syndrome (HIV/AIDS) in Florida is far reaching with 120,502 persons with HIV (PWH) living in the state as of 2021, which represents only 86% of PWH—the remainder of whom are unaware of their status (approximately 14%). We believe people in Florida have the right to:

- Know their HIV status.
- Access Pre-Exposure Prophylaxis (PrEP) if they are negative but at risk for developing the disease.
- Receive services needed to achieve or maintain a high quality of life if they have tested positive.
- Obtain health care, free of stigma.
- Be a voice in their local communities to effect positive change.

According to the Centers for Disease Control and Prevention (CDC), in 2020 (the most recent data available), Florida was ranked third highest (15.7 per 100,000 population) for new HIV diagnosis rates in the United States (including the District of Columbia). In 2021, 4,708 persons received an HIV diagnosis in Florida, a 37% increase from the 3,441 HIV diagnoses in 2020. In 2021, 83% of those newly diagnosed were linked to HIV-related care within 30 days of diagnosis. The number of AIDS cases diagnosed in 2012 in Florida was 2,846, and in 2021 case numbers dropped to 1,860. The current estimate of 14% of PWH in Florida not knowing their status, along with the substantial decrease in AIDS cases over a 10-year period, together underscore the importance of HIV prevention and care service delivery in Florida.

The seven Florida EHE counties make up approximately 11% of the total national HIV burden as outlined in the EHE plan and represent 72% of the total persons with an HIV diagnosis in Florida. Five of the EHE

counties, Pinellas (77%), Hillsborough (71%), Orange (72%), Broward (70%), and Duval (69%) had a viral suppression rate equivalent to or greater than the state rate of 69%, while Palm Beach (65%) and Miami-Dade (63%) had lower viral suppression rates than the state at the end of 2021.

Florida is a large and diverse state. It has both rural and metropolitan areas, an extensive mix of cultures, and an oscillating population due to seasonal residents, tourists, and itinerant workers. These factors can challenge the planning processes of disease control. The IPC Plan is designed to demonstrate coordinated HIV prevention and care activities by assessing resources and service delivery needs across HIV prevention and care systems to ensure the allocation of resources based on data.

Florida receives funding for and implements a wide range of programs and services for persons with and those at increased risk for HIV, including: the AIDS Drug Assistance Program (ADAP), Ryan White HIV/AIDS Program (RWHAP) patient care programs, prevention (HIV testing, PrEP, linkage), housing, substance use disorder and mental health, and other programs.

Core medical and support services are provided by the federal RWHAP to low-income Floridians living with HIV or AIDS who have inadequate or no health insurance and are ineligible for Medicaid, Medicare, or any other public insurance programs through different entities. Services such as medical care, pharmaceuticals, dental services, payment of health insurance premiums, laboratory services, counseling and treatment for substance use disorder, and medical case management are provided through the various parts of the RWHAP. Each part has separate eligibility criteria that clients must meet.

Ending HIV requires partnership and collaboration. This IPC Plan was developed through collaborative efforts that span the continuum of HIV prevention and care, and with representatives from the Florida Comprehensive Planning Network (FCPN) and associated advisory groups, local HIV planning bodies, Department of Health staff, and communities living with and affected by HIV/AIDS. The IPC Plan also aligns with the previously submitted Florida EHE Plan (2020), Florida's 4 Key Component Plan (2016), and the NHAS goals and strategies.

Florida's IPC Plan encompasses the state's entire system of HIV prevention and care. The IPC Plan was reviewed with members of Florida's integrated HIV prevention and care planning body, FCPN, during the Fall 2022 meeting held in Lutz, Florida, October 18–19, 2022. During the two-day meeting, FCPN members and other stakeholders in attendance had an opportunity to provide feedback and suggestions on the draft plan. Concurrence for the plan was gained on October 19, 2022, through a vote of FCPN members. The Department of Health (Department) is pleased to present Florida's IPC Plan, which is intended to re-energize and strengthen a whole-of-society response to the epidemic while supporting PWH in Florida and reducing HIV-associated morbidity and mortality.

1.1 Approach and Partnerships

Critical information about the IPC Plan has been organized in the following sections:

- Community Engagement and Jurisdictional Planning Process (Section 2)
- Contributing Data Sets and Assessments (Section 3)
- Situational Analysis (Section 4)
- Calendar Year (CY) 2022–2026 Goals and Objectives (Section 5), organized by the goals of the National HIV/AIDS Strategy and inclusive of the four pillars of the EHE initiative: Diagnose, Treat, Prevent, and Respond.
- 2022–2026 Integrated Planning Implementation, Monitoring and Jurisdictional Follow Up (Section 6)

Plan development was facilitated by The AIDS Institute through multiple meetings with the FCPN. The FCPN became an integrated HIV prevention and care planning body in 2017 and is made up of representatives from HIV prevention, care, all parts of the RWHAP, federally qualified health centers (FQHC), state and local government, academia, service providers, consumers, and advocates as seen in the figure below. The FCPN is made up of three representatives per each of Florida's 14 HIV partnership areas—a prevention representative, patient care representative, and a Department representative (42 seats). In addition, there are five at-large representative seats—proposed and voted upon by FCPN—which represent specific populations and/or areas of practice (e.g., behavioral science). Each of Florida's six RWHAP Part A jurisdictions also have a representative at the FCPN table (six seats).

FIGURE 1: FCPN MEMBERSHIP DIAGRAM

The FCPN typically meets twice per year, in-person (with virtual meeting options for those unable to attend in person) and the FCPN committees (i.e., Membership, Nominations, and Bylaws Committee;

Medication Access Committee; Coordination of Efforts Committee; Needs Assessment Committee; and Executive Co-Chairs Committee) and associated advisory groups (Florida Gay Men’s HIV Workgroup, Community HIV Advisory Group) meet monthly via videoconference.

In 2021, in preparation for developing the IPC Plan, the Department, in collaboration with the FCPN and RWHAP Part A partners, hosted a series of virtual webinars delivered statewide to share information from the Integrated HIV Prevention and Care Plan Guidance, including the Statewide Coordinated Statement of Need, CY 2022–2026, released by CDC and Health Resources and Services Administration (HRSA) in June 2021. The figure below summarizes the key meetings held. Detailed descriptions of each meeting are bulleted after the figure.

FIGURE 2: PLAN DEVELOPMENT MEETINGS

- In January 2022, an integrated HIV planning kick-off meeting was held with Florida’s State Surgeon General, the FCPN Executive Co-Chairs’ Committee, representatives from Florida’s six RWHAP Part A areas (Fort Lauderdale, Miami, Tampa/St. Petersburg, Orlando, West Palm Beach, Jacksonville), The AIDS Institute, and the Department’s Division of Disease Control and Health Protection leadership, and HIV, sexually transmitted disease (STD), and viral hepatitis staff to discuss Florida’s approach to developing the statewide HIV IPC Plan for 2022–2026. There were 31 participants (29 in-person and 2 virtual).
- The first full-body FCPN meeting was held in April 2022 and was an in-person meeting with virtual attendance options. This meeting was used to develop goals, objectives, and strategies that were taken back to local planning bodies for discussion and feedback. There were 150 meeting participants (68 in-person and 82 virtual), representing all 14 HIV partnership areas.
- In August 2022, the FCPN met again as a full body to develop activities for the strategies that aligned with NHAS. This meeting included small-group exercises to ensure everyone around the table and attending virtually could provide input and actively participate in the activity development process. All proposed activities were collected, and a survey was distributed after the meeting to allow all attendees to vote on prioritized activities for inclusion in the IPC Plan.

Additionally, acquired consulting services from ISF, Inc. to assist in stakeholder coordination, research, reporting and writing for the 2022–2026 IPC Plan. ISF performed key stakeholder group interviews in each of Florida’s 14 HIV partnership areas and each group included lead representatives for the Department, RWHAP Part A, Part B, and local community planning group members. There were 165 meeting participants (52 in-person and 113 virtual), representing all 14 HIV partnership areas.

- The FCPN fall 2022 meeting was held in October and used to review the first draft of the IPC Plan, solicit public comment, and input, and conduct a concurrence vote with the full membership of FCPN. There were 149 meeting participants (53 in-person and 96 virtual), representing all 14 HIV partnership areas.

Letters of concurrence were drafted in November 2022 and subsequently signed by the community co-chairs of the FCPN for inclusion into the IPC Plan. The Department also worked to finalize and ultimately submit the IPC Plan in January 2023.

The Department prioritizes a collaborative approach and works directly with the six RWHAP Part A areas. Ongoing coordination efforts include monthly calls with RWHAP Part A and B programs which split responsibilities of running calls (each call hosted by one of Florida’s Ryan White Part A areas); the monthly calls are used to discuss major issues including the IPC Plan.

A data-informed approach was used to develop the IPC Plan, taking into account data and activities from Florida’s approach to HIV prevention and care, including routine HIV screening, rapid access to treatment and care (Test & Treat), epidemiologic data, HIV Care Continuum outcomes, and other data which help identify priority populations and HIV health disparities. The Department’s High-Impact Prevention (HIP) funding opportunity was developed with the HIV status-neutral approach at the forefront, and funds 44 community and faith-based organizations statewide to provide HIV testing and linkage to care, prevention, and essential support services. Florida also maintains more than 1,600 registered HIV test sites statewide. The HIV status-neutral approach to reducing new HIV diagnoses involves initial HIV testing services as the entry point to HIV prevention and/or care services irrespective of a positive or negative test result. The Department has also engaged in HIV stigma reduction efforts, participating in the University of Florida (UF) stigma workgroup, and contracting with UF for the provision of evaluation and planning activities that will be used to develop program interventions addressing the stigmas related to HIV. Information from Florida’s EHE plan was also used to develop content for the updated IPC Plan.

Florida’s RWHAP Part A areas have developed their own local integrated HIV prevention and care plans which, like the state’s plan, align with the NHAS goals and objectives, but contain locally developed activities tailored to each geographic region. Florida’s statewide IPC Plan and the RWHAP Part A IPC Plans will work in concert to advance the goals and objectives of the NHAS and build a pathway to end the HIV epidemic. Links to each of the RWHAP Part A IPC Plans are provided in Table 1.

HIV service regions are broken down into 14 partnership areas, each with an HIV/AIDS Program Coordinator (HAPC) to oversee prevention and care program operations in the area and assure that program activities are planned in an inclusive and collaborative manner to ensure the other local resources and specific client needs are considered and addressed. They work closely with RWHAP recipients, health district resources, other county programs, and academic and university resources as available.

The HIV/AIDS Section also works closely with many organizations to ensure coordination of effort because of the co-morbidities often associated with HIV/AIDS and their impacts on public health. These organizations include STD, TB, and Viral Hepatitis and Outbreak Response Sections; Children’s Medical Services; local community-based organizations (CBOs) and county health departments (CHD); universities; the Florida Department of Corrections; the Department’s state laboratories in Jacksonville and Miami; and the Department’s central pharmacy.

The six RWHAP Part A Eligible Metropolitan Areas (EMAs) and Transitional Grant Areas (TGAs), and the RWHAP Part C, D, and F programs collectively bring more than \$94.6 million annually to Florida and are key resources in meeting the service needs of PWH in their service area. The RWHAP Part C program directly funds local projects to support service capacity building as well as early intervention services; there are 20 RWHAP Part C programs in Florida. The RWHAP Part D program directly funds a local Tampa project that provides clinical services to women, infants, children and youth (WICY); there are six RWHAP Part D programs in Florida.

The Department HIV Surveillance Program works closely with each local area to provide customized data reports that reflect key information about the epidemic in each area. These data reports are provided to the local CHDs, planning bodies, and each of the RWHAP Part A areas to assist them in preparing grant applications and other reports. Local planning bodies use epidemiologic data, demographic, and service

data, focus groups, resource inventories, and client and provider satisfaction surveys to gauge areas of program strengths and weaknesses.

The Department's HIV Prevention Program collaborates with the Patient Care, ADAP, Medical, and Surveillance programs to deliver comprehensive HIP strategies and services with overarching goals of reducing the number of new HIV transmissions, increasing the proportion of persons living with HIV who know their status, linking PWH to care and support services, and reducing risk behaviors that may lead to HIV and STD diagnoses. Florida's HIP program is multi-faceted and includes HIV testing, linkage to care, peer navigation programs, comprehensive prevention interventions for PWH, partner services, PrEP and post-exposure prophylaxis (PEP), perinatal HIV prevention, corrections initiatives, condom distribution, community outreach (traditional and Internet-based) and engagement, and other services. The Prevention Program also collaborates with the RWHAP Part A programs, FQHCs, CBOs, academia, PWH, and other stakeholders to implement many HIP interventions and strategies. These essential partnerships help to ensure individuals are receiving comprehensive HIV prevention services along the HIV care continuum, leading to improved health outcomes for those living with HIV/AIDS.

Stakeholder engagement occurs on a regular basis through the FCPN and assists the Department in planning patient care and prevention activities. The FCPN is composed of representatives from the Department, all parts of the RWHAP, FQHCs, academia, service providers, CBOs, PWHs, and advocates. The FCPN reviews and gives feedback on projects the HIV/AIDS Section develops, such as the Needs Assessment, the SCSN and statewide IPC Plan, other programs funded with state general revenue, as well as various program standards, and guidelines.

The HIV/AIDS Section routinely communicates with the RWHAP Part A administrators to ensure that they are informed of program activities and have an opportunity to comment and contribute to various projects. Areas of collaboration have been on the transition of RWHAP clients to the Affordable Care Act (ACA) Marketplace® (Marketplace®), work on the Statewide IPC Plan, and development of the ADAP HCV treatment pilot project.

Over the past two years, there have been multiple meetings to plan for a uniform methodology to select insurance plans and move clients to the Marketplace®. Determining eligibility criteria for insurance coverage, planning for the provision of wrap around services, and the potential local coverage of additional clients were main topics of discussion. This project has been very successful; clients, regardless of whether they receive services from RWHAP Part A or Part B ADAP, or are mutual clients, have the same options for insurance selection criteria and process to enroll in the Marketplace® for insurance coverage.

Collaborations, partnerships, and stakeholder engagement exist in many forms throughout Florida; however, opportunities exist to expand partnerships further and engage new and non-traditional partners in more regular communication (for example, Department of Veterans' Affairs and Indian Health Service) to further the objectives and support the strategies of Florida's statewide IPC Plan.

1.2 Documents Submitted to Meet Requirements

In order to meet the submission requirements of the IPC Plan, as outlined in the CDC and HRSA Integrated HIV Prevention and Care Planning Guidance (2021), Table 2 provides descriptions for each document referenced in the IPC Plan. Documents have also been flagged where new material was created specifically for the IPC Plan or where existing material was used. These documents have also been linked in the Appendix, Section 9.5.

TABLE 2: SUPPORTING DOCUMENTATION

Document	Description	Developed for this plan?
CDC and HRSA Integrated HIV Prevention and Care Planning Guidance, 2022–2026	Developed to support the submission of the IPC Plan for each state for the 2022–2026 cycle.	No (Existing)
Florida’s Unified EHE Plan, 2020	Unified plan representing the state and the seven counties identified as Phase 1 EHE jurisdictions: Broward, Duval, Hillsborough, Miami-Dade, Orange, Palm Beach, and Pinellas.	No (Existing)
State of Florida IPC Plan, 2017–2021	Developed collaboratively across Florida stakeholders to eliminate HIV transmission and reduce HIV related deaths for the 2017–2022 cycle.	No (Existing)
Meeting Notes from the August and October FCPN Meetings	The August FCPN meeting was used to identify Florida specific activities to address the Goals, Objectives and Strategies identified by the CDC. The October FCPN meeting was used to review the IPC Plan DRAFT with stakeholders, receive their feedback, and incorporate that feedback into the FINAL version of the IPC Plan.	Yes (New)
Local Area Resource Inventories	Includes recipients’ and community resources for prevention and patient care across 14 partnership areas in the state of Florida.	No (Existing)
Local Area Interview Questionnaires	Interviews were held with all 14 partnership areas and questions were raised to gather feedback in supporting multiple areas of the IPC Plan.	Yes (New)
Local Area Engagement Activities	Provided meeting summaries and feedback from a variety of engagement activities such as local area town halls.	No (Existing)
Documentation of Community Engagement	Describes Florida’s partners and the voices engaged along with engagement efforts at the statewide level and seven major metropolitan areas. Interviews were held with all HIV partnership areas to identify community groups active on local planning councils.	No (Existing)
Florida HIV Continuum of Care Dashboards	Consolidates “Resource Inventories” across the state.	No (Existing)

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Document	Description	Developed for this plan?
Florida’s Ryan White (RW) HIV Care Needs Assessment: Key Findings 2019	Survey to determine met and unmet service needs for PWH in Florida.	No (Existing)
RWHAP Part A Plans	Represents the latest collaborative effort for each Part A partnership area in developing their unique IPC Plan	No (Existing)
PS19-1906 EHE Plan Executive Summary Florida	Key points, including strategic partnerships and planning support, from Florida’s EHE Plan	No (Existing)

2 Community Engagement and Jurisdictional Planning Process

Community engagement is an overarching element of Florida’s 4 Key Component Plan which intersects with the four pillars of the EHE initiative and the NHAS. Community members were engaged in all phases of the planning process and will continue with the implementation of strategies and activities to build a pathway to eliminate HIV transmission in Florida.

During 2021 and 2022, varying degrees of community engagement took place at state and local levels in preparation for developing the IPC Plan. In addition to community engagement activities performed October 2019 through October 2020 for EHE planning and implementation, additional community engagement activities were conducted in each HIV partnership area to ensure stakeholders were included in the integrated HIV planning process.

The HIV Planning Process

Florida’s HIV planning process operates with the principle that determining the best way to support HIV prevention and care needs is through coordinated decision making with local entities, which collectively informs the overall statewide IPC Plan. As such, the Department engaged stakeholders and community members to create an IPC Plan for HIV efforts across the state. The remainder of this section outlines the planning process, inputs into the IPC Plan, analysis performed, priority goals and objectives, and a detailed plan to support successful implementation.

The Department arranges the state into 14 HIV partnership areas (shown in Figure 3), each with an HAPC to oversee prevention and care program operations in each HIV partnership area. HAPCs ensure that program activities are planned in an inclusive and collaborative manner to ensure other local resources and specific client needs are considered and addressed.

FIGURE 3: FLORIDA HIV PARTNERSHIP AREAS

Consortia are community-based regional planning entities established by RWHAP Part B recipients. The consortia plan and prioritize RWHAP Part B funds allocated to their area, promote coordination of services, and serve as a community forum. Representatives of local public and non-profit health and support service providers serve as consortium members. Lead agencies are member agencies in the consortium designated to perform contract administration as a fiscal agent.

Local jurisdictions around the state drive community engagement with the goal to educate and raise awareness about HIV and ensure programs and services are culturally and linguistically appropriate and developed with input from the populations intended to be reached. The local jurisdictions host focus groups, town halls, events for HIV/AIDS observance days, multiple outreach events, media interviews; teach public health classes at local universities; and use their social media presence.

Table 3 provides an example of different groups that participate in the community engagement and planning processes.

TABLE 3: HIV PREVENTION AND CARE PLANNING PARTICIPANTS

Local Jurisdiction Partnership Groups
• Existing community advisory boards • Community members resulting from new outreach efforts • Community members that represent the demographics of the local epidemic (e.g., race, ethnicity, gender, age, and others.) • Community members unaligned or unaffiliated with agencies currently funded through HRSA and CDC • STD clinics and programs • City, county, tribal, and other state public health department partners • Local, regional clinics, and school-based health care facilities; clinicians; and other medical providers • Behavioral health care agencies • Federally qualified health centers and community health centers • Medicaid/Medicare partners and private payors • Strategic planning and quality management collaboratives • Correctional facilities, juvenile services, local law enforcement and related service providers • Community- and faith-based organizations, including civic and social groups • Professional associations • Local businesses • Local opioid advisory groups • Local academic institutions • Commercial and retail pharmacies • Pharmaceutical and biomedical industry partners • Diagnostic industry partners • Digital media service providers • Adult entertainment industry partners

For a full list of specific community resources by partnership area, please refer to Appendix Section 9.3: Partnership Area Resource Inventories.

Florida's new IPC Plan for 2022–2026 was built upon the foundational goals, strategies and activities from the Florida Statewide Integrated HIV Prevention and Care Plan, 2017–2021; Florida's Unified Ending the HIV Epidemic Plan, 2020; the National HIV/AIDS Strategy; and input from local planning bodies and community members. Figure 4 shows the different inputs used to develop the 2022–2026 IPC Plan.

FIGURE 4: INPUTS TO THE 2022–2026 INTEGRATED HIV PREVENTION AND CARE PLAN

The Department's HIV/AIDS Section works in partnership with Florida's statewide integrated HIV planning body, FCPN. Members of FCPN include PWH and representatives across the state representing patient care and prevention groups, local planning bodies, state and local advisory groups, CBOs, academic institutions, local and regional clinics, city, and county governments, RWHAP programs and recipients, advocacy groups, substance use, mental health and social service providers and behavioral science groups. Figure 5 shows a representation of the community engagement and planning groups involved across the state.

FIGURE 5: COMMUNITY ENGAGEMENT AND PLANNING

In describing how the jurisdiction approached the planning process, the subsequent sections address steps used in the planning process, the groups involved, and representation from the priority populations:

- Entities Involved in the Process (Section 2.1)
- Role of Planning Bodies and Other Advisory Groups (Section 2.2)
- Engagement of People with HIV (Section 2.3)
- Social Determinants of Health (Section 2.4)
- Priorities (Section 2.5)
- Updates to Other Strategic Plans Used to Meet Requirements (Section 2.6)

2.1 Entities Involved in the Process

Florida has a long history of both engaging PWH and the broader community in developing plans for prevention and care services. This has been accomplished primarily through what is now known as the FCPN, which has been in existence since 1993. The available seats for FCPN are made up of three representatives from each of Florida's 14 HIV partnership areas—one representative each for prevention, patient care, and the Department of Health (total of 42 seats). Additionally, there are five at-large representative seats—proposed and voted upon by FCPN—which represent specific populations and/or areas of practice (e.g., behavioral science, substance use). Each of Florida's six RWHAP Part A jurisdictions also has a representative at the FCPN table (6 seats). There is a combined total of 53 representative, at-large, and RWHAP Part A seats available on the FCPN. Currently, 41 of the 53 FCPN representative seats are filled. Members of FCPN include PWH and other individuals across the state representing local partnerships. FCPN members are recruited statewide to represent local or at-large positions from patient care and prevention groups, local planning bodies, community and faith-based organizations, academic institutions, recipients of HIV prevention and care services, local and regional clinics, city, and county governments, RWHAP recipients, advocacy groups, substance use disorder and social service providers and behavioral science groups. The Department, in collaboration with the FCPN Membership, Nominations and Bylaws Committee will develop a plan of action to recruit for the remaining vacant seats.

Of the current FCPN member base—10 members disclosed living with HIV, 28 members disclosed they were not living with HIV, and 3 chose not to disclose their HIV status altogether. Nearly 60% of the current FCPN members are from the ages of 50 to 60+ years of age; followed by 30 to 39 years of age (20%); 40 to 49 years of age (15%); and 20 to 29 years of age (7%). Of the 41 current members, 49% are male, 46% female, and 5% are transgender. Approximately 54% of members reported their sexual orientation as heterosexual; 41% reported as gay, bisexual, and/or lesbian; and 5% chose not to disclose their sexual orientation. Race/ethnicity for members is as follows: White (52%), Black (18%), Hispanic/Latino (20%), Asian/Pacific Islander (6%), multi-racial/other (2%), and American Indian/Alaskan Native (2%).

Prior to 2017, the FCPN was made up of two planning bodies: the Patient Care Planning Group and the Prevention Planning Group. In 2017, the FCPN became fully integrated—merging prevention and care

planning bodies. Membership of the integrated planning body is made up of persons with and those affected by HIV; Department staff; representatives from mental health and substance use organizations; psychologists; social workers; case managers; AIDS service organizations; CBOs; RWHAP Part A, B, C, and D providers; RWHAP Part B lead agencies; advisory groups; and FQHCs. The FCPN maintains a biannual, integrated meeting structure and members are responsible for disseminating information from the meetings back to their respective areas of representation, as well as bringing concerns from those same areas to such meetings, ensuring that the voice of PWH in Florida are part of the integrated planning process. The HIV/AIDS Section oversees the composition of these groups, ensuring that they are representative of Florida's HIV epidemic in the various geographic regions, using the principle of Parity, Inclusion and Representation.

The Department routinely communicates and coordinates with other state partners such as The AIDS Institute; health planning councils; Medicaid/Medicare; Agency for Health Care Administration; Department of Corrections (FDC); Department of Children and Families (DCF); Department programs such as the STD, Viral Hepatitis, and TB programs and other state partners; and the Florida HIV/AIDS Advocacy Network (FHAAN). The AIDS Institute is a national nonprofit organization that promotes a full spectrum of HIV activities including prevention, care, and treatment, through public policy, research, advocacy, and education. Medicaid, FDC, DCF, and the STD, Viral Hepatitis, and TB programs are all state programs that impact and serve PWH. Medicaid is the single largest funder of HIV care in Florida. The HIV/AIDS Section contracts with FDC for pre-release planning services that link discharged inmates with HIV services upon release. DCF oversees mental health services and several housing and homeless programs. The STD Section is a key partner to the HIV Prevention Program, with Disease Intervention Specialists (DIS) providing partner services and following up with newly diagnosed individuals. FHAAN is a statewide effort comprising of PWHs, community advocates, HIV/AIDS and industry professionals, and anyone wanting to be involved to coordinate HIV advocacy efforts.

Collaborations, partnerships, and stakeholder engagement exist in many forms throughout Florida; however, opportunities exist to expand partnerships further and engage new and non-traditional partners in more regular communication (for example, federal Department of Veterans' Affairs and Indian Health Service) to further the objectives and support the strategies of Florida's statewide IPC Plan.

2.2 Role of Planning Bodies and Other Advisory Groups

The Department's HIV/AIDS Section receives advisement on HIV programs and services from various community partners and workgroups, some of which report out directly to the FCPN. These various groups consist of both members of the community, as well as PWH. These groups consist of the Florida Gay Men's HIV Workgroup, the HIV Section Medication Formulary Workgroup, and the Community HIV Advisory Group. Other groups operating in the state but not directly under the FCPN include the Florida Harm Reduction Collective, the Florida Black Leaders Group, and the Florida HIV Justice Coalition. The Department will develop a plan to ensure these groups have a representative at the FCPN table.

For the workgroups that report directly to the FCPN—the Florida Gay Men’s HIV Workgroup, the HIV Section Medication Formulary Workgroup, and the Community HIV Advisory Group—each group consists of PWH who use HIV services and community members selected through an application process and reflective of the profile of the HIV/AIDS epidemic in Florida. Members are appointed for a period of two years and may reapply for subsequent terms. These groups exist to provide a mechanism in which PWH and the community have meaningful input into the development of policies and programs to address their needs with and under the auspices of the Department and the HIV/AIDS Section.

Local Area Interview Results

To better understand the process of community engagement at the local level, interviews were held with each HIV partnership area, with a total of 72 participants. Participants included local Department staff, RWHAP Part A and B representatives, lead agencies, and other community planning body members. During each interview, participants were asked to report on membership, community engagement, outreach activities and keys to success.

Membership: Membership in area partnerships is consistent with all 14 partnership areas having county health departments and CBOs serving populations affected by HIV, as well as HIV service providers. Thirteen out of 14 areas include populations at risk for or with HIV representing priority populations, STD clinics and programs, and HIV clinical care providers and clinicians as part of their voting membership. Only 3 out of 14 partnership areas have epidemiologists and only 4 have representatives from state or local law enforcement or correctional facilities among voting members.

When asked about entities or organizations they would like to have in their planning body, but have not yet been able to secure, areas reported: pharmacists, a school system representative, local school-based clinics, elected officials, representatives from youth organizations, colleges and universities, health promotion groups, an epidemiologist, transportation agencies; faith-based organizations, the Association of Free and Charitable Clinics, and more staff to coordinate the planning body.

Community Engagement: All partnership areas report robust, comprehensive community engagement in each of their counties. All but one area reports challenges with maintaining representation from PWH receiving HIV care services (e.g., RWHAP Part A or B services). Most local areas report having PWH represent approximately 33% of their voting membership; however, these individuals may be staff at local community- and faith-based organizations or on local boards and not necessarily receiving HIV care services through the RWHAP. Several strategies have been used to try and encourage “everyday PWH” to become part of the local planning bodies. Many areas offer incentives and others send out mailers to PWH emphasizing the opportunity to have their voice heard and help the greater good. Other members that areas have difficulty recruiting and keeping are elected officials, faith-based leaders, hospital and health care planning agencies, and law enforcement.

One area restructured planning body meetings from formal events to more informal meetings using lay language and fewer acronyms. They reported that building planning activities around less structure

creates more freedom to speak. Additionally, the planning body keeps meetings to no longer than two hours, food is provided, and agenda items are suggested by members, so they drive future meetings.

To incorporate the perspective of PWH, almost every area sends surveys to clients about services they received and how satisfied they were with those services. This information is used to determine whether some services need to be enhanced, reworked, or streamlined. It is also used for gap analysis purposes and to determine future funding.

About half of the areas report a working relationship with local prisons and jails but felt more could be done to increase testing and treatment efforts. Areas overwhelmingly found value in monthly calls hosted by the Department's HIV/AIDS Section and saw them as a chance to exchange best practices.

Outreach Activities: Partnership areas report hosting focus groups and town hall meetings. Twelve areas held topic-focused community discussions and collaboration building meetings with new partners. Areas also rely on social media to reach PWH engaged in services; however, three areas report that different local restrictions present challenges. Some examples of outreach activities include harm-reduction events, annual surveys to RWHAP recipients, surveys to funded providers, local street fairs and block parties, and events planned around World AIDS Day and other key HIV observance days.

Keys to Success: Partnership areas identified several different ways they have built successful programs:

- Ability to work together to make service delivery appear seamless to clients, regardless of what organization was providing the service.
- Longevity in leadership positions and the sharing of funds between services.
- Consulting with adjacent partnership areas and assisting when possible.
- Having a continuous calendar of events and meetings.
- Participation in statewide calls.
- Collaboration and cohesiveness among partners.
- Cultivating a culture of trust and transparency.

Department Collaboration with RWHAP Parts

RWHAP Parts A, B, C, and D and ADAP programs are key local partners and are at the table as planning activities are performed since no single RWHAP part can meet the needs for all services. The RWHAP Part F program collectively funds Special Projects of National Significance (SPNS), as well as the AIDS Education and Training Centers (AETC) that provides support and training to the medical community in treating patients, and dental programs for PWH.

The planning process is guided by local resource inventories, demographics, satisfaction surveys and service needs expressed locally by PWH who use services. Given the multitude of RWHAP parts, as well as programs funded by other federal, state, and local sources, funding allocation necessitates collaboration and coordination at the local planning body level. Therefore, consortia and planning councils require coordination in RWHAP planning, which involves consideration of other programs in

such areas as assessment of needs, priority setting and resource allocation. Planning bodies must analyze existing resources, regardless of funding stream, to identify areas of unmet need. Likewise, in setting priorities, other resources must be considered in terms of how they help meet service demands so that RWHAP resources can be used to fill gaps.

The Department's HIV/AIDS Section routinely communicates with the RWHAP Part A administrators to ensure they are informed of program activities and have an opportunity to comment and contribute to various projects. Regular monthly calls are used to communicate program updates and policy changes, opportunities for collaboration, and solicitation of feedback. The hosting of the calls rotates, with one of the six RWHAP Part A areas leading the call each month. Examples of collaboration include the transition of RWHAP clients to the Marketplace®, work on the statewide IPC Plan, developing the ADAP HCV treatment project, developing reciprocal eligibility and Notice of Eligibility, data sharing, coordination with ADAP related to the changes in the pharmacy benefits manager, and ADAP formulary updates.

The Department's HIV/AIDS Section allocates RWHAP Part B funding for administration, planning and evaluation, clinical quality management and core medical and support services to 14 lead agencies annually to perform planning activities in their respective areas. Upon receiving RWHAP Part B funds from the Department, each lead agency is required to provide administrative assistance to the planning body (consortium) in the program area. The planning bodies serve as the entities that meet the RWHAP planning requirements for the program area and advise the lead agencies during the priority setting and resource allocation process. Lead agencies facilitate a provider selection process (internal services, external vendors, or competitive procurement process) through a network of local partners (CBOs, CHDs, consumers, planning bodies, and others).

There has also been collaboration with RWHAP Part A partners through EHE initiatives, as RWHAP Part A partners receive EHE funding directly from HRSA to address pillars 2 and 4 (Treat and Respond). The Department receives EHE funding directly from CDC and distributes the funds to the seven EHE counties (county health departments and community and faith-based organizations). Throughout the EHE planning and implementation process (2019 to present), it has been imperative that the Department and RWHAP partners coordinate to maximize efforts, promote information sharing, and ensure resources are used efficiently.

As the recipient of RWHAP Part B funds, the Department is required to develop and maintain a clinical quality management (CQM) program to ensure quality health care services are provided to persons living with HIV. The purpose of the HIV/AIDS Patient Care CQM Program is to provide a systematic approach for planning, measuring, implementing, evaluating, and improving the quality of RWHAP-funded care services delivered to PWH in Florida. Routine review of established performance measures leads to the identification of specific CQM goals for each quality improvement project. Stakeholders who are internal and external to the CQM committee review measures through formally established mechanisms using evidence-based quality improvement methods. This CQM requirement is also mandated by HRSA for each sub-recipient, at the local level. This includes having a formal quality committee and a local CQM plan. For 2019–2022, the following CQM goals were identified:

- **Percentage of Patients on ART (Antiretroviral Therapy)**—Ensure equitable access to RWHAP-funded HIV services in the state for PWH and ensure equitable results in HIV health outcomes; patients receiving ambulatory outpatient care are also on ART.
- **Improving Viral Suppression for PWH**—Drive maximum viral suppression for PWH in the state, with 90% of PWH achieving viral suppression by 2022.
- **Eligibility**—Ensure PWH in the state have complete eligibility documentation for all services received. Complete eligibility documentation prevents gaps in care and can help identify additional services for which the client has need. The goal is 90% of all clients having accurately completed eligibility documentation by 2022.

2.3 Engagement of People with HIV

Florida strives to actively involve key partners, stakeholders, and PWH and, in doing so, incorporates feedback received, for the IPC Plan, on an ongoing basis. The jurisdiction understands that to best serve those most marginalized, their voices must be involved in all aspects of the process. “Nothing about us, without us” is a call to action that informs the need for cultural shifts in programming, provisions of services, and community engagement. Changes have already been made to the planning process with a greater focus placed on creating an environment that is more welcoming to prospective members who represent communities most affected by HIV.

PWH were influential in the development of the statewide IPC Plan. PWH contributed by participating in the Statewide Needs Assessment and serving on local RWHAP Part B consortia, local prevention planning bodies, RWHAP Part A planning councils as well as RWHAP Parts C and D consumer advisory boards. There are also many robust peer-driven navigation and prevention programs that contribute greatly to PWH involvement on many different levels. They have helped identify what is working well (or not), barriers to care, and in accessing prevention and patient care services, and helping to develop the state’s unmet need matrix.

Further, PWH have participated widely in providing feedback to the Department by attending various town hall meetings that have helped develop goals and improve service delivery around eligibility, medical case management guidelines, HIP, PrEP, post-exposure prophylaxis (PEP), ADAP and many of the other programs overseen by the state. They have also played a key role in the success of the medical monitoring project (MMP) in Florida by willingly volunteering their time to be interviewed for this significant program. Florida has a very active Community HIV Advisory Group (CHAG) which also serves as the MMP’s Community Advisory Board. Proposed changes in policy are reviewed and feedback is provided by this group of dedicated individuals. Table 4 shows some of the community engagement and planning efforts across the state.

TABLE 4: COMMUNITY ENGAGEMENT EFFORTS

Location	Involvement
Statewide	Community engagement activities including: five ad-hoc consultations with representatives from priority populations (30+ participants per session) and launched Florida’s Undetectable=Untransmittable (U=U) campaign. The Department’s HIV/AIDS Section hosted virtual meetings (180+ reached) for FCPN and community guests to refine the elements of the unified EHE plan from a statewide perspective.
Area 1 Counties: Escambia, Santa Rosa, Okaloosa, Walton	Community engagement activities were conducted, including the implementation of a U=U campaign, launched with a press conference inviting local civic leaders and community partners. A meeting was also held with the superintendent of schools and a school board member to provide information on local HIV data.
Area 2A Counties: Bay, Calhoun, Gulf, Holmes, Jackson, Washington	Partnered with BASIC NWFL for HIV and HCV testing and condom distribution. PanCare of Florida (FQHC) conducted mobile HIV testing.
Area 2B Counties: Franklin, Gadsden, Jefferson, Leon, Liberty Madison, Taylor, Wakulla	Partnered with 4 community resources for the provision of ART, 3 community resources for HIV testing and diagnosis, 1 partner for HIV education/community outreach, town hall meeting (10 clients attended), and mailed 14 surveys
Area 3/13 Counties: Alachua, Citrus, Lake, Marion, Putnam, Hamilton, Suwannee, Columbia, Lafayette, Gilchrist, Dixie, Levy, Bradford, Sumter	Conducted a town hall meeting in Area 3/13 and results were shared at the April 2022 FCPN meeting. Draft goals and objectives were sent out to the local consortium via email for review and then discussed at the June 2022 consortia meeting.
Area 4 Counties: Nassau, Baker Duval, Clay, St Johns	Community engagement activities such as: 2 provider meetings and town halls, the creation of a local EHE committee, provider survey (68 reached), community-wide listening sessions (115+ reached), faith-based workshops to address stigma and the social justice aspect of the HIV epidemic, and exclusive focus groups (50+ reached) with priority populations.
Area 5/6/14 Counties: Hernando, Pasco, Pinellas, Hillsborough, Manatee, Polk, Hardee, Highlands	Community engagement activities such as: an online community survey (72 reached), focus groups (8 reached) with youth, community members, and private sector leaders; individual phone interviews (39 reached); virtual town hall meetings per pillar (34 across all meetings); and an HIV care needs survey (600+ reached). Additional activities included: focus groups facilitated by representatives of key priority populations (55 reached across all sessions); a virtual interview with local radio station to engage the community (1,000+ reached); virtual EHE Advisory Council meetings to engage new and existing stakeholders; Teen Talk Thursdays, monthly webinars facilitated by representatives revered by youth (50+ reached per meeting) and listening sessions with HIV service providers (45 reached).

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Area 7 Counties: Seminole, Orange, Osceola, Brevard	Community engagement activities such as: conducted 3 town hall meetings; key informant interviews (27 reached); EHE and HIV stigma conversations on Facebook Live with iHeart Media; 8 virtual town hall meetings with key priority populations (98 individuals participated across all town halls, viewed by 3,356 individuals on Facebook Live); quarterly provider meetings to discuss EHE plans and implementation; 8 pop-up HIV testing events; listening sessions with HIV service providers; and community-wide surveys (300+ reached)—one tailored to the community members and the other tailored to providers.
Area 8 Counties: Sarasota, Desoto, Charlotte, Glades, Lee, Hendry, Collier	Community engagement activities were conducted throughout the area, including health education and outreach, community forums and meetings, and testing events.
Area 9 County: Palm Beach	Community engagement activities such as: service provider interviews (19 reached); focus groups with PWH (10 reached); and Palm Beach resident phone interviews in English, Haitian-Creole, and Spanish (253 reached).
Area 10 County: Broward	Community engagement activities such as: 28 community presentations; community-wide listening session; listening session with youth (9 reached); outreach sessions with college students (40+ reached); 5 focus groups with providers, transgender individuals, men who have sex with men (MSM), Black heterosexual women, and Latino individuals; student survey (130 reached); 40 key informant interviews with community members and service providers; and needs-based surveys for providers (430 reached) and community members (1,780 reached) in multiple languages.
Area 11A County: Miami-Dade	Community engagement activities including: several listening sessions at different venues; met with workgroups; and focus groups outside the RWHAP or the Miami-Dade CHD. Additional activities included: key informant interviews with local CBOs and local government (23 reached); 2 needs-based surveys tailored to HIV service providers (37 reached) and community members (1,158 reached) in multiple languages; online community forums and focus groups representing priority populations (250+ reached); 11 community listening sessions with community mobilization groups that primarily serve Black and Latino populations. Mobilization also occurred among transgender individuals.
Area 11B County: Monroe	Engagement activities including quality management patient surveys in ADAP, customer satisfaction surveys in RWHAP Part B, focus group activities in the Client Advisory Board, multiple discussions in the Florida Keys Community Planning Partnership, and monthly Teams meetings, in which all prevention providers meet to discuss awareness day activities, nationally recognized testing day activities and ongoing local prevention activities (e.g.,

	testing sites, outreach activities and involvement and partnership with the Gay Men's Health Summit and Miami-Dade County).
Area 12 Counties: Volusia, Flagler	Various community engagement activities were conducted throughout the area and included numerous health fairs and HIV observance day events (e.g., health fairs at Bethune Cookman University, Stetson University and Daytona Beach College; HIV Testing Day; World AIDS Day; New Smyrna Beach Senior Summit; One Voice Volusia Health Summit; and HOPE Fest Community Outreach with Hope Church).
Area 15 Counties: Indian River, Okeechobee, St. Lucie, Martin	Conducted focus groups with PWH (25 reached); facilitated HIV needs assessment survey (175 reached); partnered with United Against Poverty St. Lucie County for HIV and sexually transmitted infection (STI) screenings and condom distribution (20+ reached); facilitated an HIV/AIDS symposium where attendees were community members, PWH, and service providers (100 reached); participated in Annual Showcase of Services community event and provided resource information to local social service agencies and community members (70 reached); conducted HIV and STI screening at local substance use disorder treatment centers (20 reached); participated in community health resource fair and provided HIV and STI screenings as well as condom distribution (100+ reached); hosted National Latino AIDS Awareness Day testing event (6 reached); and facilitated weekly HIV and STI testing and awareness events in 4 area counties (number reached varied), where all events were conducted in multiple languages.

2.4 Social Determinants of Health

To reduce new HIV diagnoses in Florida, it is critical to ensure that everyone with HIV is aware of their status, is linked to and retained in HIV medical care, and maintains viral suppression. Collaborative efforts from prevention and patient care programs at the state and local levels, including by CHDs, RWHAP partners, CBOs, and health care providers are an integral part of ending the HIV epidemic in Florida. There must also be a focus on the social determinants of health that preclude people from engaging in prevention activities, seeking treatment, and acquiring an adequate level of health literacy. Lower health literacy has been tied to poorer health outcomes in PWH; therefore, ensuring basic levels of health literacy is essential to ensure medication and treatment adherence and ultimately, viral suppression. Social determinants of health (as shown in Figure 6) include food and housing insecurity, geographic location, educational status, poverty, racism, violence, and stigma.

FIGURE 6: DEMOGRAPHIC HIV STATISTICS

In the past decade, Florida has seen a general decline in HIV diagnoses in Florida; however, Black and Hispanic/Latino populations are disproportionately impacted with higher rates of new diagnoses compared to the White population. Additionally, late-stage HIV or AIDS is also higher in the Black population. For males diagnosed with HIV in 2021, Black males were 6 times more likely to be diagnosed with HIV compared to the White males; additionally, Hispanic/Latino males were 4 times more likely to be diagnosed with HIV compared to White males. Similar trends are observed for females, where Black and Hispanic females were 12 and 3 times, respectively, more likely to be diagnosed with HIV compared to White females.

With respect to mode of transmission, in 2021, the majority (61%) of new HIV diagnoses were a result of male-to-male sexual contact (MMSC), followed by 31% who were persons who had heterosexual contact, and 4% who were persons who inject drugs (PWID). Through the identification of priority populations disproportionately impacted by HIV, Florida will continue to engage with and seek input from members of those communities to address health disparities and social determinants of health.

Florida's incorporation of the status-neutral approach and Undetectable=Untransmittable (U=U) into HIV prevention and care service delivery is a key component in addressing social determinants of health and stigma that may prevent individuals from engaging in HIV care services. In June 2020, the Department announced its endorsement of the Prevention Access Campaign's U=U. In becoming a U=U partner, the Department joined nearly 1,000 organizations around the world supporting the science-backed message that PWH who use antiretroviral therapy and have an undetectable viral load in their blood have effectively no risk of sexually transmitting HIV.

Florida will work to ensure programs and services for PWH and those at increased risk for acquiring HIV align with the National Culturally and Linguistically Appropriate Services (CLAS) Standards

(<https://thinkculturalhealth.hhs.gov/Assets/Pdfs/EnhancedNationalCLASStandards.Pdf>), which provide a structure to implement culturally and linguistically appropriate services, and increase the ability of the state to address health care disparities.

2.5 Priorities

The IPC Plan priorities are based on the four goals of the NHAS, 2022–2025:

1. Prevent new HIV infections.
2. Improve HIV-related health outcomes for people with HIV.
3. Reduce HIV-related disparities and promote diverse community wellness.
4. Achieve integrated, coordinated efforts that address the HIV epidemic among all partners and stakeholders.

For the complete list of unique activities to support each strategy, please refer to Appendix Section 9.1 Strategy and Activity Table.

Additionally, the RWHAP Part A's local priorities align with the NHAS, and the four pillars outlined in the EHE: diagnose, treat, prevent, and respond. All goals and objectives include various local initiatives with some overlap between several CDC and HRSA grants.

Based on the most recent HIV data trends for the state (2017–2021) and feedback from community engagement activities conducted in preparation for the IPC development, Florida's integrated HIV prevention and care planning body (FCPN), along with the RWHAP Part A partners, has determined to focus on PWH, Black and Latino populations, LGBTQ communities, PWID, and youth populations.

The planned outcomes of the IPC include reducing HIV-related disparities and promoting diverse community wellness by expanding targeted efforts to prevent HIV transmission using innovative and evidence-based approaches, decreasing the annual HIV diagnosis rate, ensuring early linkage to care, and increasing the number of PWH who are retained in care and virally suppressed. Progress on these outcomes will be ongoing throughout the project period and will benefit the overall community by improving population-level health and reducing the incidence of HIV/AIDS.

While setting goals and priorities, *Demanding Better: An HIV Federal Policy Agenda by People Living with HIV* (<https://www.pwn-usa.org/wp-content/uploads/2021/07/Networks-Policy-Agenda-FINAL.pdf>) was referenced to ensure the Meaningful Involvement of People with HIV/AIDS (MIPA) in decision-making, at every level of the response. In *Demanding Better*, the U.S. People Living with HIV Caucus outlines five recommendations which must be included in every aspect of the federal HIV response:

1. Concretely elevating the meaningful involvement of people living with HIV and disproportionately impacted communities in the HIV response.
2. Proactively creating an affirming human rights environment for people living with HIV.

3. Addressing inequities in the federal response by attending to racial and gender disparities.
4. Adding sex workers and immigrants living with HIV as priority populations.
5. Affirmatively committing to improving quality of life for people living with HIV.

MIPA requires dedication, planning and assessment, organizational buy-in, and a champion to help usher its development and continued assessment. Although the U.S. Department of Health and Human Services (HHS) *National Strategic Plan: A Roadmap to End the Epidemic for the United States, 2021–2025* (<https://files.hiv.gov/s3fs-public/HIV-National-Strategic-Plan-2021-2025.pdf>) largely did not address these recommendations in the final version, Florida’s statewide IPC Plan will do so to the greatest extent possible, as they were created by and for people living with HIV.

2.6 Updates to Other Strategic Plans Used to Meet Requirements

Local jurisdictions perform an annual needs assessment, based on core questions developed through the FCPN Needs Assessment Committee. The needs assessments are created using multiple sources of information from PWH and other stakeholders. Interviews are conducted with PWH and stakeholders to incorporate their feedback and needs. Additionally, surveys are sent out to clients and focus groups are held with the community to understand any changing of needs and priorities. Ongoing feedback of PWH and stakeholders is accomplished by broadly advertising public meetings, allowing public access to all draft, and completed reference documents through online postings, and encouraging participation by members and guests at all meetings. Following completion, the IPC Plan will be presented to the groups who contributed to ensure ongoing community engagement. With greater representation comes additional perspectives that are pivotal to evaluating and improving all planning processes, including the IPC Plan.

Florida’s new IPC Plan for 2022–2026 was built upon the foundational goals, strategies, and activities from the Florida Statewide Integrated HIV Prevention and Care Plan, 2017–2021, Florida’s Unified Ending the HIV Epidemic Plan, 2020, the National HIV/AIDS Strategy, and input from local planning bodies and community members.

3 Contributing Data Sets and Assessments

In analyzing contributing data sets and assessments used to describe how HIV impacts the jurisdiction, the subsequent sections will detail HIV prevention services, barriers to accessing those services, and gaps in the service delivery system:

- Epidemiological Snapshot (Section 3.1)
- Data Sharing and Use (Section 3.2)
- HIV Prevention, Care and Treatment Resource Inventory (Section 3.3)
- Gaps, Needs and Barriers (Section 3.4)
- Needs Assessment including Methodology, Approach, Priorities, and Actions Taken (Section 3.5)

3.1 Epidemiologic Snapshot

The full Epidemiological Profile of HIV in Florida, 2017-2021 will be provided separately. Below is a brief snapshot of the key points.

According to the CDC, in 2020,⁴² Florida had the third highest number of HIV diagnoses and was the third highest for new HIV diagnosis rates per 100,000 population in the U.S., including the District of Columbia. In 2021, 4,708 persons received an HIV diagnosis in Florida, a 37% increase from the 3,441 HIV diagnoses in 2020; however, these data should be interpreted with caution due to impacts from the COVID-19 pandemic which impacted testing, access to care and surveillance activities. In 2021, 83% of those newly diagnosed were linked to HIV-related care in 30 days of diagnosis. There were 120,502 PWH, regardless of AIDS status, living in Florida through 2021 which represents only 86% of all the PWH in Florida. The remainder of whom are living with the disease but are unaware of their HIV status. Among the PWH, 73% were retained in care and 69% had a suppressed viral load at the end of the year. Twenty percent (20%) of PWH had no care in 2021.

Geographical Region and Socio-Demographic Characteristics of Florida

Florida is a southern state that spans a geographic region of 53,624 square miles, comprises 67 counties and 283 cities, and has a mix of urban, suburban, and rural areas. The 2021 population in Florida was 22.0 million residents, with an average of 410 residents per square mile. Approximately 20% of the population is under the age of 18 and 21% is over the age of 65. According to the U.S. Census Bureau, in 2020, 12.4% of Floridians were living in poverty and 16% of Floridians under the age of 65 were without health insurance. The population of Florida is very diverse, with approximately 20.8% of persons residing in the state being foreign born (born outside the continental U.S.). Although most new HIV diagnoses in 2021 were among those born in the U.S. (58.1%), 41.9% of people newly diagnosed with HIV in Florida were born outside the U.S. mainland.

The racial distribution among the adult population (age 13 and above) in Florida in 2021, was 55% White, 15% Black, 26% Hispanic/Latino, and 5% other races including American Indian, Asian, or

multiracial. There were 4,708 HIV diagnoses among adults in 2021. The greatest burden was among the Black population, which received 38% of the new HIV diagnoses in 2021 despite only representing 15% of the adult population in Florida. Hispanic/Latino people were also disproportionately represented for new HIV diagnoses, with 40% of the new HIV diagnoses, compared to 21% among White people as shown in Figure 7.

FIGURE 7: ADULT (AGE 13+) HIV AND AIDS DIAGNOSES AND POPULATION BY RACE/ETHNICITY, 2021, FLORIDA

In 2021, Florida continued to see disparities in HIV diagnoses among adults, despite an annual decrease in the HIV diagnosis rate among Black persons in the past five years. The HIV diagnosis rate per 100,000 population among Black males (93.0) was nearly six times higher than for White males (16.3) and the rate for Hispanic/Latino males (69.3) was more than four times higher than for White males. The HIV diagnosis rate among Black females (36.0) was 12 times higher than for White females (3.0); the rate for Hispanic/Latina females (7.8) was more than two times higher than for White females (see Figure 8). Black persons had a lower statewide viral suppression (<200 copies/mL) rate of 64% compared to 77% for White persons and 71% for Hispanic/Latino persons.

FIGURE 8: ADULT (AGE 13+) HIV DIAGNOSIS RATES BY SEX AND RACE/ETHNICITY, 2021, FLORIDA

In 2021, there was at least one HIV diagnosis in all but 7 counties in Florida and the state HIV diagnosis rate was 21.4 per 100,000 population (see Figure 9). Miami-Dade (42.1), Broward (33.5), Orange (30.3), Duval (30.2), and Palm Beach (21.7) counties had rates higher than that for the state in 2021. The greatest numbers of HIV diagnoses were from the seven counties identified in the national EHE initiative: Miami-Dade (N=1,204), Broward (N=652), Orange (N=439), Hillsborough (N=323), Duval (N=300), Palm Beach (N=322) and Pinellas (N=130). These seven counties diagnosed a combined total of 3,370 cases in 2021, or 72% of the statewide total.

FIGURE 9: HIV DIAGNOSIS RATE BY COUNTY IN 2021, FLORIDA

Trends in HIV Diagnosis

Data for 2020 and 2021 should be interpreted with caution due to the impact of COVID-19 on HIV testing, care-related services, and case surveillance activities in state and local jurisdictions. Figure 10 shows that over the past 10 years (2012–2021), the rates of diagnosed HIV and AIDS in Florida have decreased 9% and 43%, respectively.

FIGURE 10: TEN-YEAR TREND (2012–2021) OF HIV AND AIDS RATES PER 100,000 POPULATION IN FLORIDA

The number of HIV diagnoses decreased by 4% from 2018 to 2019 and increased by 3% from 4,556 (2019) to 4,708 (2021). Additionally, the number of new HIV diagnoses increased by 6% among adult men and decreased by 6% among adult women from 2019 to 2021. The number of new HIV diagnoses over the past 5 years (2017–2021) decreased among all but two age groups: persons aged 30 to 39 (15% increase) and persons aged 40 to 49 (2% increase). The number of new HIV diagnoses over the past five years decreased among all race/ethnicity groups except Hispanic/Latino persons, where a 25% increase was observed.

With respect to mode of exposure, male-to-male sexual contact continues to be the primary mode of exposure for HIV among males (77% in 2021), followed by heterosexual contact (18%) and injection drug use (IDU) (3%). Over the past five years (2017–2021), transmissions among males that observed an increase in HIV diagnoses were MMSC (1%) and IDU (28%), whereas transmissions that decreased were MMSC/IDU (12%) and heterosexual contact (1%).

Among females, heterosexual contact is the primary mode of exposure for HIV (92% in 2021), followed by IDU (8%). Over the past five years (2017–2021), decreases in HIV diagnoses among females were observed among both transmissions: heterosexual contact (11%) and IDU (13%).

Thirty-eight out of the 67 counties (57%) saw a decrease in new diagnoses of HIV from 2018 to 2019. Twenty-eight out of the 67 counties (42%) saw a decrease in new diagnoses of HIV from 2019 to 2021. All but two of the seven EHE counties in Florida saw a decrease in HIV diagnoses from 2019 to 2021 (Pinellas [32%], and Orange [5%]). Palm Beach County saw a 31% increase from 2019 (N=245) to 2021 (N=322), and Hillsborough County saw a 12% increase from 2019 (N=288) to 2021 (N=323). The three remaining EHE counties (Duval, Miami-Dade, and Broward) all saw a 3% increase from 2019 to 2021. Challenges exist with many new HIV diagnoses being among people who may be new to the county, state, or country and who may not have benefited from the robust prevention activities available throughout Florida; yet the new (or re-diagnoses) count toward new HIV diagnoses for local jurisdictions and the state.

Perinatal HIV Transmission

A strategic long-term goal in Florida is to reduce or eliminate the annual number of babies born in Florida with perinatally acquired HIV. Since the introduction of azidothymidine (AZT) in 1994, perinatally acquired HIV diagnoses have drastically declined (see Figure 11). Over the past three years (2019 to 2021), there were eight perinatally acquired HIV diagnoses with an average transmission rate of 0.006. For the first time in the history of the HIV epidemic, there were no perinatally acquired HIV diagnoses born in Florida in 2019. There were four in 2020, and four in 2021.

FIGURE 11: PERINATALLY ACQUIRED HIV DIAGNOSES, 1979–2021, BABIES BORN IN FLORIDA

Prevalence of PWH in Florida

The rate of PWH in Florida in 2021 was 547.6 per 100,000 population, with the majority of PWH living in the large metropolitan areas and the seven counties outlined in the EHE plan. However, there is also a high rate of PWH living in smaller, more rural counties, such as those in northern Florida (see Figure 12). There were 120,502 PWH living in Florida in 2021. Among the adult PWH (N=120,379), 44% were Black, 28% were White, 26% were Hispanic/Latino, and 2% were American Indian, Asian, or multiracial. More than one-half (57%) were over the age of 50. MMSC was the mode of exposure for 71% of males. Heterosexual contact was the mode of exposure for 86% of females. Ten percent (10%) of PWH had a history of IDU. Among the PWH in 2021, 503 (0.4%) were transgender individuals and the primary mode of transmission was sexual contact (90%).

FIGURE 12: PWH, LIVING IN FLORIDA, BY COUNTY OF RESIDENCE, YEAR-END 2021

Late HIV Diagnosis and Resident Deaths Due to HIV/AIDS

HIV/AIDS-related deaths in Florida decreased markedly (30%) from 1995 (N=4,004) to 1996 (N=2,796) after the advent of highly active antiretroviral therapy (HAART) in 1996. Furthermore, HIV-related deaths in Florida from 2012 to 2021 decreased 34% over the past 10 years, 16% over the past five years, and 7% in the past year from 659 in 2020 to 612 in 2021. The Black community has been disproportionately affected by HIV in Florida since the epidemic began in 1981 and despite a large decrease in the rate of HIV-related deaths among Black persons (43% since 2012), HIV disparities still exist among Florida's Black population. In 2021, rates of HIV-related deaths were five times higher for Black males (11.9 per 100,000 population) compared to White males (2.6 per 100,000 population) and nearly 11 times higher for Black females (7.5 per 100,000 population) compared to White females (0.7 per 100,000 population) with HIV.

Of the 4,708 HIV diagnoses in 2021, 19% (N=895) were late diagnoses, which are defined as persons receiving an AIDS diagnosis within 90 days of their confirmed HIV diagnosis. By race/ethnicity, 20% of Black persons, 21% of White persons, and 16% of Hispanic/Latino persons were late diagnoses. Among adults (age 13+), the two groups with the highest proportion of late diagnoses by age and mode of exposure were persons aged 50 and over (29%) and males with a history of IDU (29%), respectively.

HIV Care Continuum

The HIV Care Continuum is a diagnosis-based model that reflects the series of stages from initial diagnosis to being retained in care and achieving viral suppression. The HIV Care Continuum has four main stages: HIV diagnosis, linkage to care, retention in care, and viral suppression. It demonstrates the proportion of individuals diagnosed and living with HIV who are engaged at each stage. This model is used by federal, state, and local agencies to identify issues and opportunities related to improving the delivery of services to PWH across the entire continuum.

In 2021, despite the COVID-19 pandemic, of the 120,502 PWH in Florida, 80% (N=95,959) were reported to be in care (received at least one documented VL (viral load) or CD4 lab, medical visit, or HIV-related prescription in 2021), 73% (N=88,274) were retained in care (had HIV-related care two or more times at least three months apart), and 69% (N=83,556) were virally suppressed. As Figure 13 shows, of the persons retained in care, 90% had a suppressed viral load (<200 copies/mL). Twenty percent (20%) (N=24,543) did not receive any HIV-related care in 2021.

FIGURE 13: PWH LIVING IN FLORIDA ALONG THE HIV CARE CONTINUUM, YEAR-END 2021

The seven EHE counties make up approximately 11% of the total national HIV burden as outlined in the EHE plan and represent 72% of the total persons living with an HIV diagnosis in Florida.

Five of the EHE counties, Pinellas (77%), Hillsborough (71%), Orange (72%), Broward (70%) and Duval (69%) had a viral suppression rate equivalent to or greater than the state rate of 69%, while Palm Beach (65%) and Miami-Dade (63%) had lower viral suppression rates than the state at the end of 2021. It's important to note that PWH who receive services from the RWHAP and ADAP tend to have better results of viral suppression. For example, although Miami's overall viral suppression rate was 63%, approximately 82% of the 8,418 clients served by Miami's RWHAP Part A and Minority AIDS Initiative (MAI) program in fiscal year 2021 were virally suppressed.

The five populations ranked lowest in the percentage of suppressed VL (<200 copies/ml) in 2021, in descending order, were as follows:

1. Male PWID (58%)
2. Black Males with Heterosexual Contact (59%)
3. Black Males with MMSC (65%)
4. Persons 25–39 years of age (66%)
5. Persons 13–24 years of age (67%)

When compared with the HIV Care Continuum for Florida, the above five populations demonstrated disparities, particularly in the last stage, suppressed VL (<200 copies/ml). In 2021, 69% of PWH in Florida had a suppressed viral load. The five populations of concern in this section show suppressed VL percentages below 69%. This is significant to note in observing the ultimate health outcome of treatment adherence and an individual living with HIV leading a healthier life.

HIV-Related Co-Morbidities

STIs and hepatitis B virus (HBV) and (HCV have been steadily increasing in Florida over the past five years, including a 4% increase in chlamydia, a 40% increase in gonorrhea, and an 88% increase in early syphilis. Co-infection of PWH with STIs also increased during this same time period, with an increase of 67% for HIV/gonorrhea, 72% for HIV/chlamydia, and 76% for HIV/early syphilis. In 2021, there were 302 adults who were also co-infected with HBV, 86% of whom were male; 59% of the males reported MMSC exposure, and 30% of females reported IDU exposure. There were 537 PWH who were coinfecting with HCV in 2021, the majority of whom were males (82%) with MMSC (66%), IDU (13%), or heterosexual (11%) exposure. Forty-eight percent (48%) of female PWH with a co-occurring HCV diagnosis had IDU exposure. An increase in routine screening of all STIs, HIV, and hepatitis is needed to capture and prevent disease burden.

HIV Transmission Clusters and Networks

One aspect of the Florida IPC and the Florida EHE plans is to detect and respond to rapidly growing HIV transmission clusters and networks and prevent future HIV diagnoses using data and laboratory results collected through routine public health surveillance. Transmission cluster network analyses are conducted using data from point-of-care HIV-1 genotypic resistance testing to identify genetic (molecular) links of similar virus strains by comparing those with similar HIV genetic sequences. Those data are then used to identify networks of recent and rapid transmission for prevention and linkage-to-care interventions. The observed HIV transmission rate in molecular clusters identified across the U.S. is, on average, 11 times higher than the transmission rate in the general HIV population, thus indicating the importance of quickly using proven interventions to stop further transmission of HIV. HIV molecular clusters are considered rapidly growing when there have been five or more new HIV diagnoses in the previous 12 months. The Department is actively conducting surveillance and investigation for HIV clusters. The Department routinely conducts monthly analysis to detect rapidly growing molecular clusters and time-space clusters of public health significance. Additionally, a state level HIV cluster review committee is convened monthly to review cluster data, discuss challenges, and brainstorm strategies to improve the statewide response. Since fall 2021, the Department's Bureau of Communicable Diseases has established routine communication with CHDs experiencing clusters to coordinate and guide local responses to investigate and respond to clusters. Florida's updated HIV Cluster Detection and Response plan was submitted to CDC in fall 2021 and will be updated in 2023.

Since the beginning of the Department's HIV transmission cluster detection program in November 2017, the HIV/AIDS Section has identified 64 clusters at a 0.5% genetic distance between strain of HIV demonstrating rapid growth. These molecularly linked transmissions comprise a total of 772 persons receiving an HIV diagnosis in Florida with a much larger, often underdefined transmission and risk network. Though members of molecular clusters live across the state, 554 (72%) have a current residence in one of the seven EHE counties. The state has also taken a collaborative approach to responding to other outbreaks that impact the care and treatment of PWH (e.g., COVID-19, Mpox, hepatitis A, and meningococcal disease), providing trainings, developing messaging, and promoting health resources and services.

3.2 Data Sharing and Use

De-identified HIV, viral hepatitis, STD, and TB data are routinely shared via ad-hoc requests to surveillance programs with outside entities including, but not limited to, academic institutions, community partners, RWHAP parts, internal agency partners and collaborators, and the public. Each of these programs provide annual data which are uploaded into FLHealth CHARTS (Florida Community Health Assessment and Resource Tool Set) (<https://www.flhealthcharts.gov/charts/CommunicableDiseases/default.aspx>). In addition, the Department is updating the FLHealth CHARTS website (a web-based platform that provides easy access to health indicator data at the community and statewide level for the state of Florida from a multitude of sources) with a new dashboard (at the county level) that will incorporate a multitude of HIV/AIDS indicators including but not limited to, demographic and socio-economic indicators, partner services data, testing and treatment facilities, PrEP, and other data not previously included on FL Health CHARTS.

By ensuring all these data and information are made readily accessible and user-friendly, the new dashboard will help local and state planning bodies develop more effective and efficient programs and corresponding activities and monitor progress of IPC strategies and activities. All data are protected securely and confidentially, adhering to the Department's internal policies and strictly adhering to CDC's, *National Centers for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention (NCHHSTP) Data Security and Confidentiality Guidelines*.

Summarized ad-hoc data requests are honored based on the ability of the program to generate the requested data within the time constraints of the request. Data requests for ZIP code data will receive suppressed data (data by ZIP code with three or more cases) based on internal Department ZIP code suppression rules.

Epidemiologic Data

Summarized annual data are uploaded to the Department's HIV/AIDS Section web page (<http://floridaaids.org>) and are also available on a SharePoint site for internal use at the state and CHD level. Annual data releases include a comprehensive epidemiological profile for the state and for each partnership area, a state slide set presented annually to FCPN, and other annual data products. The epidemiological profiles are an expanded Excel workbook with multiple tabs containing 5-year trend analyses of HIV (demographics, diagnosis, AIDS, deaths, and continuum of care), STIs, HBV, HCV, and TB.

Factsheet and Slide Sets to Support Stakeholder Engagement and Planning

Various factsheets are generated to portray epidemiology and disease highlights for a demographic population. These fact sheets address various HIV/AIDS awareness day topics as well as highlight summary data for high-risk population groups. These fact sheets are updated annually, shared with community stakeholders, and uploaded to the Department's external web and internal SharePoint sites. Integrated slide sets and epidemiological profile tables are generated to support stakeholder engagement and planning. The Department's HIV/AIDS Section has generated comprehensive slides sets

and epidemiologic profiles specifically for each of the 14 partnership areas each year since the 1990s. These slide sets and profiles are shared with the RWHAP Part A entities, community stakeholders, field surveillance staff, and others who may request these data. These data are frequently used as tools for program planning and evaluation.

Other Data Sources

Along with HIV data, the Department summarizes data from MMP and CDC's National HIV Behavioral Surveillance (NHBS) surveillance project, along with Department PrEP, Test and Treat, and HIV counseling and testing data. Data from the needs assessments are also shared in reports sent out to FCPN membership. Other data sources include the RWHAP Eligibility Portal, CAREWare, and Provide Enterprise (an online care management system).

Data Sharing Agreements

For persons requesting de-identified data in a database format that can be analyzed for public health research purposes, the researcher must first submit a concept proposal with research aims, benefit to public health, and required data variables and time frame for the requested data. An internal Department research committee reviews the feasibility of the project, including for potential human subjects impacts and ethical considerations. Once approved, the requestor must complete a Data Use Agreement (DUA) and obtain a study approval or study exemption letter from the Department's Institutional Review Board. Once received, the DUA is routed for legal review and signatures. Data are provided via secure FTP format and can only be housed on secure servers as part of the DUA.

Any program outside of the Department that is approved to receive HIV data through a Data Sharing Agreement (DSA) for the purpose of linking or re-engaging HIV clients into care must be in full compliance with the NCHSTP Data Security and Confidentiality Guidelines for HIV, Viral Hepatitis, STD, and TB Programs, Department security and confidentiality policies, Health Insurance Portability and Accountability Act (HIPAA) guidelines and have documented active-client consent to share. Data sharing with programs outside the Department requires approval of the overall responsible party, HIV/AIDS Section administrator and legal counsel. A memorandum of understanding or DSA must be completed between the Department and the program requesting data. The HIV Surveillance Program will provide only the minimum data required to conduct linkage and reengage to HIV care and services.

In partnership with the six RWHAP Part A programs located in the seven EHE counties and through funding received by Georgetown University, the Department has developed and is preparing to implement a data sharing and Data to Care (D2C) effort to improve linkage to HIV care for persons out of care in those jurisdictions.

Some challenges exist with data sharing; for example, the Department's data sharing agreement with the Florida Agency for Health Care Administration (AHCA) for Medicaid does not allow the Department to share data on Medicaid enrollments of the same clients receiving services in and from the RWHAP

Part A jurisdictions. This leads to duplicative and sometimes costly efforts for the RWHAP Part A programs to run Medicaid verification checks on the clients for eligibility assessments.

3.3 HIV Prevention, Care, and Treatment Resource Inventory

To ensure that the state is meeting the goals and objectives set forth to best address the needs of PWHs, Florida must prioritize the financial resources and assess the capacity to provide the services outlined. The following section provides a comprehensive HIV financial resources inventory for Florida. Components include, but are not limited to, statewide public and private funding sources for HIV prevention, care, and treatment services; the dollar amount and the percentage of the total available funds for each funding source; program or service delivery; and what step of Florida's HIV Care Continuum is impacted.

Resource inventories have been provided by all 14 HIV partnership areas in the state of Florida. Each partnership area provided separate inventories for prevention and patient care, which can be found in Appendix Section 9.3 Partnership Area Resource Inventories. Table 5 represents Florida-specific funding from various sources for HIV-related services statewide, where available, for FY 2021.

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

TABLE 5: FUNDING RESOURCE INVENTORY

Funding Source and Area/Jurisdiction	Funding Amount (\$)	Percentage of Total Funding (%)	Services Delivered	HIV Care Continuum Steps Impacted¹
HRSA RWHAP Part A (EMA/TGA)²	\$76,146,512	12.67%		
Fort Lauderdale	\$15,724,848		Medical case management (including treatment adherence), oral health care, EIS, mental health services, substance abuse treatment (outpatient), case management (nonmedical), food bank/home-delivered meals, health education/risk reduction, housing services, legal services, medical transportation services, psychosocial support services	2,3,4,5

¹ HIV Care Continuum: 1 = HIV Testing and Diagnosis: Staff, services and systems that help to identify and test persons who are unaware of their HIV status; 2 = Linkage to Care: Staff, services, and systems that help connect newly diagnosed PWHA to care; 3 = Retention in Care: Staff, services, and systems that help PWH remain engaged in care and treatment services; 4 = Provision of ART: Staff, services, and systems that help PWH access and remain adherent to antiretroviral medication; 5 = Viral Suppression: Staff, services and systems that help PWH achieve and maintain viral suppression.

² RWHAP Part A figures represent FY2021 funding amounts.

³ The State Health Office is the recipient of HRSA RWHAP Part B funds.

⁴ State General Revenue to County Health Departments includes 4B000, 4BNWK, and 4BAPS.

⁵ CDC-PS21-2102: Unable to obtain exact funding amounts. Average funding award for each provider was approx. \$441,625.

⁶ CDC-PS18-1807: Unable to obtain exact funding amounts. Average funding awards approx. \$350,000.

⁷ Unable to obtain Florida-specific funding levels.

⁸ Additional private foundation awards exist; however, recipients and award amounts are unknown.

Other sources of funding include funds from the state of Florida general revenue, Housing Opportunities for Persons with AIDS (HOPWA), U.S. Department of Housing and Urban Development (HUD), RWHAP all parts, CDC Integrated HIV Prevention and Surveillance, CDC MMP, CDC NHBS, CDC and HRSA EHE funds, SAMHSA, tribal organization funding, and private foundation funding, where available. More work is needed to identify Florida-specific funds related to HIV services from the Veteran’s Administration (VA) and Medicaid.

The Florida HIV Care Continuum Dashboard Tool was developed as a mechanism to gather information related to how funds are distributed statewide and RWHAP services are delivered by geographic area. The purpose and goal of the tool was to provide a snapshot of HIV prevention and patient care funding and assess HIV prevention and patient care activities across the care continuum by each of the 14 HIV partnership areas.

The tool provides a listing of resources in CHDs and local communities, as well as illustrating gaps and unmet needs by contrasting regional differences and highlighting areas of need. The information in the Florida HIV Care Continuum Dashboard Combined Tool was self-reported by each local area; therefore, slight differences may appear in terms of funding or data reported. Additionally, specific caveats may apply since they may have alternate funding streams coming into their local areas or enhanced best practices or collaborative efforts which result in increased funding as reported by the state.

The purpose of this inventory is to provide a snapshot of HIV prevention and patient care funding by area. The goal of this inventory is to help assess HIV prevention and patient care activities across the continuum of care by area. The inventory provides a snapshot of resources in CHDs and communities. Individual area resource inventories can be found in Appendix Section 9.3 Partnership Area Resource Inventories.

3.4 Gaps, Needs and Barriers

Through the development of Florida’s Unified EHE Plan and through local community engagement activities, additional gaps, needs, and barriers were identified which span across all pillars as described in Table 6:

TABLE 6: GAPS, NEEDS AND BARRIERS

Summary	Description
Meaningful Community Engagement with Priority Populations	The Department received feedback from community partners on the perceived effectiveness of current public health initiatives. Partners identified across all IPC pillars determined there is a need for increased and meaningful community engagement with all of Florida’s populations that are disproportionately affected by and living with HIV, including Black and Hispanic/Latino populations and the LGBTQ community. The Department recognizes that Florida’s racial/ethnic minority populations continue to increase in size and continues to address gaps in diverse community

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Summary	Description
	wellness throughout the state. Improvements in HIV outcomes over the last decade have had great strides. However, populations of racial and ethnic minorities should continue to be prioritized to improve prevention and care access. For Florida’s racial/ethnic minority populations, HIV outcomes should improve among all populations at the same rate – especially among Florida’s diverse population. While Florida has maintained the Business Responds to AIDS (BRTA) and Faith Responds to AIDS (FRTA) initiatives for over a decade, additional efforts are needed to involve faith-based and business leaders. Faith-based leaders, as trusted members of their communities, are well-poised to educate and mobilize Black and Hispanic populations around HIV/AIDS. Feedback indicates there would be a benefit for leaders of faith-based institutions to engage in HIV education and awareness. Challenges exist around maintaining community engagement with and representation from PWH who receive services directly through the RWHAP, both at state and local levels.
Geography and Transportation	Whereas there are major metropolitan areas in the state, 30 of Florida’s 67 counties (45%) are designated as rural per the 2010 U.S. Census.³⁹ Many Floridians live in areas that have both rural and urban characteristics, which makes addressing the needs of these communities challenging. Transportation is often a barrier for clients attempting to access HIV care services and can lead to missed appointments, decreased medication adherence, and disengagement from care.²⁰ County size and lack of affordable, safe, and timely transportation options are also factors contributing to barriers in accessing care. For example, in Miami-Dade County, some clients who live in far south Dade, and fear stigma of accessing HIV care closer to home, opt to ride hours on public transportation, often in inclement weather, to access services near downtown Miami.
Poverty and Education	In 2020, 13% of people living in Florida reported living below the federal poverty level.²⁰ Counties with the highest poverty rates included DeSoto, Hamilton, Hardee, Hendry, and Madison. In 2016–2020, 88.5% of people aged 25 years and older living in Florida had at least graduated from high school (compared to 89.4% for the U.S.).²⁰ Counties with the fewest individuals with at least a high school diploma included DeSoto, Glades, Hamilton, Hendry, and Lafayette. Counties with the lowest education levels were found in central and northern Florida.
Mental Health and Substance Use Disorders	Persons experiencing mental health and substance use disorders are at increased risk for HIV and frequently lack access to HIV and STI education, prevention, and care services.²² In 2020, nearly 18% (7,842) of the 44,577 reported drug overdose deaths in Florida involved opioids.²³ There was an approximate 28% increase in the number of persons treated for addiction with self-reported IDU between 2014 and 2018.²⁴ There was a 2% increase in HIV diagnoses from 2017–2021 among persons with an IDU-related mode of exposure.⁶ Over that same time period, acute HCV infections

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Summary	Description
	increased by 366% in Florida; injection drug use is the primary mode of exposure among persons diagnosed with acute HCV. Efforts are needed to ensure organizations providing behavioral health and substance use treatment services are providing education around HIV, STIs, and HCV and are knowledgeable about local testing and treatment resources. According to the FDCF, 2020 Florida Youth Substance Abuse Survey (FYSAS) State Report, substance use among students in Florida continues to decline. Among middle and high school students in Florida, between 2010 and 2020, the prevalence of lifetime alcohol use decreased from approximately 52% to 35% and the past-30-day prevalence of alcohol use decreased from 29% to 15%. Regarding marijuana use, the prevalence of lifetime and past 30-day marijuana use among middle and high school students also decreased between 2010 and 2020. According to estimates from the 2022 FYSAS among high schoolers, the lifetime prevalence is 2.8% for opioid misuse, 4.1% for stimulant misuse, and 5.7% for opioid and stimulant misuse.⁴⁵ Methadone- or buprenorphine-assisted maintenance treatment (including psychosocial support as needed and if desired) is the evidence-based standard of care used to treat opioid use disorders. According to an analysis of 25,866 Florida Medicaid enrollees diagnosed with opioid use disorders only about 28% go on to initiate medication-assisted treatment. About 56% of newly diagnosed individuals who began methadone treatment continued for 180 days, compared about 19% of newly diagnosed individuals who began treatment with buprenorphine.⁴⁶
Multicultural and Multilingual Issues	Florida population estimates for 2020 show racial/ethnic distributions as follows: 51.5% White (non-Hispanic), 14.5% Black (non-Hispanic), 3.0% Asian American, and 0.2% Native American. Hispanic/Latino persons make up over a quarter (26.5%) of the population. Florida ranks in the top five states with the highest Hispanic/Latino populations in the U.S. and has one of the largest Black/African American populations in the country. Florida's Asian population is growing, particularly in Gulf Coast locations. The state is home to two federally recognized American Indian tribes (the Seminole and the Miccosukee in South Florida) and many more non-federally recognized tribes, bands, and clans. The Miami metropolitan area (along with New York City) maintains one of the highest populations of Caribbean immigrants, with approximately 63% of Caribbean immigrants in the U.S. living in these two metro areas. Just over 20% of Florida's population is foreign-born and nearly 30% of households in Florida speak a language other than English.⁵ There is a lack of bilingual and multilingual health care providers and media and marketing messages in certain regions of the state.²⁵ Florida works to ensure programs and services for PWH and those at increased risk for acquiring HIV align with the National CLAS Standards and that translation services are made available to all clients receiving services at CHD clinics and through funded HIV prevention and care service providers.

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Summary	Description
Racism, Discrimination, and Medical Mistrust	Persons experiencing racism and discrimination are less likely to remain adherent to care and more likely to have poorer health outcomes.²⁶ Medical mistrust tends to be higher among Black and American Indian populations in Florida. The Tuskegee Study conducted by the U.S. Public Health Service left lasting impacts on the way Black persons view health care, particularly public health.²⁷ Similarly, studies have shown the sterilization of American Indian women by the Indian Health Service in the 1960s and 1970s created a culture of distrust of government-funded health care services.²⁸
In-Migration, Tourism, Seasonal, and Mobile Populations	Florida sees more than one-hundred million tourists each year, many of whom are drawn to popular beach towns and cities like Miami, Fort Lauderdale, and Key West.²⁹ Its many theme park attractions and over 8,400 miles of coastline make Florida a destination for tourists from around the world. According to VISIT FLORIDA's latest estimates, during Quarter 1 of 2022 (January–March), Florida saw a total of 36 million visitors. This represents a 14% increase from Q4 2021, and the third consecutive quarter that overall visitation has surpassed pre-pandemic levels. Approximately 34.1 million domestic visitors traveled to Florida in Q1 2022, and there were approximately 1.3 million travelers from overseas who visited the state during that same time period (represents an increase of nearly 169% from Q1 2021).⁴⁷ The state also has a large population of seasonal residents—students, seasonal workers (in industries such as hospitality, agriculture, and tourism), and persons who reside here part time to avoid harsh winters. In addition, Florida is home to several state and private higher-learning institutions, including Historically Black Colleges and Universities (HBCUs). These colleges and universities are often located in Florida's major metropolitan areas, which have higher than average HIV incidence. If tourists, visitors, and persons migrating into the state receive their original HIV diagnosis in Florida, that case counts toward Florida's overall HIV prevalence. The Department's surveillance unit works with other states and jurisdictions to perform deduplication efforts to ensure that persons initially diagnosed in another state or jurisdiction are not counted toward Florida's overall prevalence.
Immigration and Refugee Services	Over the past few years, foreign-born individuals and individuals born in U.S.-dependent areas immigrating to Florida have accounted for roughly half of the population's growth; more than one in five Florida residents is an immigrant.³⁰ Individuals born outside the continental U.S. comprise roughly 20% of the state's population, and in Miami-Dade County, more than 60% of the population is foreign-born. Among non-U.S. born residents in Florida, persons born in Haiti, Cuba, Venezuela, and Colombia experienced the highest numbers of HIV diagnoses in 2021. This presents a need for increased cultural humility to ensure health education, prevention, and care services are delivered in a culturally and linguistically appropriate manner (i.e., National CLAS Standards).

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Summary	Description
	FDCFs Refugee Services Program is federally funded by the Office of Refugee Resettlement in HHS to assist refugees to achieve economic self-sufficiency and social adjustment in the shortest possible time after their arrival in the United States. While in recent years the number of arrivals has decreased nationwide, the state of Florida's refugee program is the largest in the nation, receiving more than 5,000 refugees, asylees, and Cuban/Haitian entrants each year. Eligibility for programs of Refugee Services is determined by federal law and includes the following: Refugees; Cuban/Haitian Entrants; Asylees; Afghan and Iraqi Special Immigrants; and Certified Victims of Human Trafficking.⁵¹ FDCF Refugee Services currently manages more than a dozen refugee services contracts with state agencies, local governments, and community-based organizations. Through their Refugee Health Program, the Department's CHDs provide health screenings to ensure newly arrived refugee clients do not have communicable diseases and to identify health issues. AHCA provides payment for Refugee Medical Assistance services with federal funding and in accordance with Medicaid rules. Of Florida's 67 counties, approximately 32 counties receive refugees for health services on a regular basis. Geographically, new arrivals tend to resettle more frequently in one of the nine following Florida counties: Miami-Dade, Hillsborough, Duval, Palm Beach, Broward, Orange, Collier, Lee, or Pinellas.⁵² From the latest data available from FDCF, in 2021, 30,092 refugees arrived or became eligible for Refugee Services in Florida. Additionally, over the last five years (2017–2021), 97,492 refugees arrived or became eligible for Refugee Services. Florida received refugees from 47 different countries last year, of which 72% of refugees were Cubans, and 50% of refugees settled in Miami-Dade County. Cuban, Haitian, Afghan, Mexican, and Chilean were the top nationalities of new refugees in 2021.⁵³
Criminal Justice	According to the National Corrections Institute, Florida's incarceration rate (prisons and jails) was 371 per 100,000 population in 2020.⁴⁸ In 2020, the U.S. Bureau of Justice Statistics ranked Florida eleventh among states in terms of incarceration rates.³² Most incarcerated PWH were diagnosed prior to entering the correctional system; however, HIV testing in a correctional setting may be the first time persons who are incarcerated take advantage of testing and prevention education. Although condom provision is one of the simplest harm-reduction interventions to control HIV, STIs, and viral hepatitis, condoms are prohibited in correctional settings. Section 945.355, Florida Statutes (F.S.), requires inmates of FDC to be offered HIV testing prior to release, while jails (which are governed by each county) do not have uniform statewide HIV testing policies. Over time, the Department has built relationships with county jails to establish HIV testing and linkage programs. Increased partnerships with county jails are needed to expand HIV, STI, and HCV testing.

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Summary	Description
HIV Criminalization	Established in 1990, section 384.24, F.S., criminalizes non-disclosure of STI status, and separately HIV status, prior to sex. The offense requires the person to be aware of their STI and HIV status, to be informed of the risks of transmission through sex, and to go on to have sex with another person. At the time the law was established there was a modest understanding of how HIV transmission occurred, and treatment options were limited. After 30 years of research and advancements in HIV treatment, the law does not take into account the latest science and measures to prevent transmission (e.g., viral suppression, U=U). Persons with HIV and other community members have reported that criminalization laws may be discouraging HIV testing and perpetuating stigma against persons with HIV.
Environmental Impacts	Severe weather events can disrupt and interrupt HIV prevention and care delivery systems. Florida is a state particularly vulnerable to frequent hurricanes. When Hurricane Michael hit the Florida Panhandle in October 2018 as a category 5 storm, it caused mass destruction. Thousands of homes were destroyed, and many residents were displaced. PWH in the area had trouble accessing services and medications due to widespread devastation. Many people were forced to find housing elsewhere in Florida or even in other states. Emergency medication fills were available through the Department’s ADAP program; however, increased efforts are needed to identify PWH in need of reengagement in care and ancillary services following a natural disaster. Most recently, on September 28, 2022, Hurricane Ian made landfall on Florida’s southwest coast (Fort Myers area) as a category 4 storm, with Lee and Charlotte counties bearing the greatest impacts. More than 100 people lost their lives in Hurricane Ian, with most deaths being attributed to drowning—the record-breaking storm surge reached as high as 18 feet in some areas. Hurricane Ian is being categorized as the deadliest storm to hit Florida since the 1935 Labor Day Hurricane. The Department used the federal emergency declaration to ensure that ADAP clients had access to medication refills ahead of the storm and worked with ADAP staff statewide to communicate to clients that they had the ability to get prescriptions filled at any pharmacy location in their local areas.
Homelessness and Housing Instability/Insecurity	In 2021, the Florida Housing Coalition reported Florida having the third-highest homeless population of any state in the nation, with 27,640 people living in homeless shelters and on the streets. Before the COVID-19 pandemic, 875,259 very low-income Florida households—including hardworking families, seniors, and people with disabilities—paid more than 50% of their incomes for housing. For PWH, housing is one of the primary predictors of their access and adherence to treatment, other health outcomes, and life expectancy. There are several definitions of homelessness or unstable housing, such as lacking a fixed, regular, or adequate nighttime residence, but also including residing in a motel, doubling up with friends or family, or “couch-surfing.” People fleeing domestic violence are also considered unstably housed if they do not have the resources and support to obtain other

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Summary	Description
	permanent housing. Responses from Florida’s 2019 HIV Care Needs Assessment survey indicated that, of persons who experienced housing-related barriers, the top three barriers were not having money to pay rent, being afraid of others knowing their HIV status, and not having enough food to eat.⁵⁵
Food Insecurity	The latest data from Feeding America show that in 2020, Florida’s overall food insecurity rate was 10.6% (approximately 2.3 million people). Although Florida’s overall food insecurity rate is lower than the U.S. average of 11.8%, 42 out of 67 Florida counties (63%) have food insecurity rates at or above the national average (>11.8%). Florida’s 2019 HIV Care Needs Assessment Survey revealed that for PWH who reported experiencing housing-related barriers, one of the top three issues reported included not having enough food to eat. Many antiretroviral medications used to treat HIV require they be taken with food and ensuring proper nutrition for PWH is paramount to medication adherence and improved health outcomes.⁵⁶
Persons with HIV Aged 50+	Improvements in ART for HIV over the years have led to people with diagnosed HIV living longer and healthier lives, especially when diagnosed early, maintained on ART, and virally suppressed. In 2021, persons with HIV aged 50 and older living in Florida made up nearly 57% of the state’s total population of persons diagnosed and living with HIV. Persons aged 50 and older living with HIV face several health challenges—HIV-related and other comorbidities (e.g., cardiovascular and liver disease, neurocognitive impairment), concurrent use of multiple medications (i.e., polypharmacy), oral health problems (e.g., tooth loss), and mental health and substance use disorders.
Outbreak Response for Syndemics	Over the past several years, the state has taken a collaborative approach, with RWHAP and other community-based partners, to responding to other outbreaks that impact the care and treatment of PWH (e.g., COVID-19, Mpox virus, hepatitis A, and meningococcal disease), providing trainings, developing messaging, and promoting access to available health resources and services (e.g., vaccine promotion events for hepatitis A and meningococcal disease). Greater coordination is needed to ensure these intersecting conditions are addressed holistically (e.g., whole-person care).
HIV Workforce Infrastructure (public and private)	Current challenges exist with the HIV workforce—both public and private. The Department’s Bureau of Communicable Diseases experienced a high degree of turnover in key leadership positions in 2022, beginning in spring and continuing into fall 2022. Key positions such as the Bureau Chief of Communicable Diseases, HIV/AIDS Section Administrator, Statewide HIV Planning/EHE Coordinator, HIV Patient Care unit manager, Communications unit manager, and Clinical Quality Management Liaison all became vacant during that time. Other positions that had

Summary	Description
	been vacant prior to 2022 are still in need of being filled and include the Performance and Quality unit manager and Statewide Minority AIDS Coordinator. High turnover and staff reaching retirement age have led to gaps in historical program knowledge and staff having to assume interim roles or double-up on responsibilities. Staffing shortages and recruiting challenges have also been reported from CBOs and private sector agencies (e.g., difficulties recruiting health care professionals).
Vulnerable Populations—Human Trafficking, Domestic/Intimate Partner Violence	According to the Florida Alliance to End Human Trafficking, Florida ranks third in the nation for the number of human trafficking cases reported and ranks second in the nation for the number of labor trafficking cases reported. The majority (71.4%) of cases are sex trafficking cases, followed by labor trafficking (14.3%), unspecified trafficking (9.0%), and sex/labor trafficking (5.1%). Persons experiencing exploitation are particularly vulnerable to exposure to HIV, STIs and viral hepatitis due, in part, to substance use, lack of access to health care, lack of autonomy, and exposure to violence.⁵⁷ In 2020, 106,515 crimes of domestic violence were reported to Florida law enforcement agencies and during FY 2020–21 and Florida’s certified domestic violence centers provided 412,360 nights of emergency shelter to 10,287 survivors of domestic violence and their children. Many more survivors of domestic violence are not reporting their abusers to the police or accessing services at domestic violence services due to reasons such as shame, fear, or being prevented from doing so by their abusers. For this reason, the number of cases is thought to be underreported. Women in violent relationships are at a four times greater risk for contracting STIs, including HIV, than women in non-violent relationships and women who experience intimate partner violence are more likely to report risk factors for HIV.⁵⁸

3.5 Needs Assessment

The information gained from the 2019 HIV Care Needs Survey represents a statewide comprehensive assessment of the needs of PWH in Florida. Survey questions were designed to better understand the current demographics of PWH in Florida and the HIV medical care, patient care services, jail and prison release services, and housing services that were needed and delivered during the 12 months prior to the time the survey was taken.

To ensure that services provided through the Patient Care Program are appropriate and contribute to improving health outcomes for PWH, the HIV/AIDS Section conducted the 2019 HIV Care Needs Survey throughout the state. The primary focus of the survey was to determine met and unmet service needs for PWH in Florida. Data collected from this survey are intended to help statewide and local planning stakeholders determine the best ways to distribute funds and resources. This survey was launched on

May 28, 2019, and continued to completion on September 6, 2019. The survey was delivered via Survey Gizmo and paper to Floridians living with HIV who sought HIV care services in each of the 14 program areas of the Ryan White Patient Care Program.

Limitations

Using the convenience sampling method to collect input for this type of assessment has its advantages, disadvantages, and limitations. Surveys collected using this method can yield rich qualitative data for review and planning in a comparatively cost-efficient manner. Data are available relatively quickly to match the pace of planning needs and are useful to signal changes or shifts in attitudes, behaviors, and outcomes. Among the disadvantages of collecting assessment data via convenience sampling are the potential for bias in data collection and sampling errors that could introduce inaccuracies. Surveying processes that use the convenience sampling method have limitations. Survey participants were self-selected.

3.5.1 Methodology

Survey questions were grouped into sections that included general demographics, HIV medical care, and patient care, jail and prison release, housing, and prevention services. Questions were related to the past 12 months of service. Distribution of the survey was facilitated by the 14 consortia lead agencies throughout Florida. A sample size for each county was calculated based on the number of PWH. Each county was provided the minimum number of surveys to be sent to reach 25% of total PWH at a 10% response rate. RWHAP Part B lead agencies, in collaboration with RWHAP Part A recipients, worked with local providers, community members, and other stakeholders to obtain the survey responses. The survey was made available in three languages: English, Haitian-Creole, and Spanish. Paper surveys were collected locally and mailed to the HIV/AIDS Section for data entry and analysis.

A total of 4,114 surveys were conducted by the end of the survey period: 3,758 in English, 334 in Spanish, and 22 in Haitian-Creole. Of these, 3,777 were complete, 147 were partial, and 190 were disqualified. Respondents were required to answer the demographic questions about age, gender, race, and county.

This document presents the key findings of the 2019 HIV Care Needs Assessment. Results from this survey will be used to help guide service implementation and resource allocation in Florida's HIV/AIDS Patient Care Program.

Survey respondents' counties of residence were reported for 66 of Florida's 67 counties. Union County was not surveyed because there are no reported PWH in that county. A total of 3,879 respondents answered the question about residence. Table 7 lists the number of respondents from each county.

TABLE 7: FLORIDA COUNTY OF RESIDENCE

County	Count	Percent	County	Count	Percent

			Total	3,879	

A sample size for each county was calculated based on the number of PWH. Each county was provided the minimum number of surveys to be sent to reach 25% of total PWH at a 10% response rate. As shown in the figure below, the three counties with highest unmet quotas were:

- Broward
- Palm Beach
- Orange

FIGURE 14: UNMET SURVEY QUOTAS BY COUNTY

3.5.2 Approach

The FCPN Needs Assessment Committee has worked diligently since 2019 to develop the 2022 HIV Care Needs Survey and Needs Assessment Toolkit; releasing it in October 2022. The purpose of the toolkit is to familiarize areas statewide with the importance, components, and processes of needs assessment. The toolkit provides the information needed for active involvement in the needs assessment process by individuals with little or no prior experience in community planning or community-based assessments. The needs assessment process is designed to gather data to inform patient care services both locally and statewide with meaningful input from people impacted by HIV. The survey remained open through December 31, 2022. Once results are received and analyzed, this information will be used to update the SCSN.

The 2019 survey questions were grouped into sections that included general demographics, HIV medical care, and patient care, jail and prison release, housing, and prevention services. Questions were related to the past 12 months of service. Distribution of the survey was facilitated by the 14 consortia lead agencies throughout Florida. A sample size for each county was calculated based on the number of

PWH. Each county was provided the minimum number of surveys to be sent to reach 25% of total PWH at a 10% response rate. RWHAP Part B lead agencies, in collaboration with RWHAP Part A recipients, worked with local providers, community members, and other stakeholders to obtain the survey responses. The survey was made available in three languages: English, Haitian-Creole, and Spanish. Paper surveys were collected locally and mailed to the HIV/AIDS Section for data entry and analysis.

A total of 4,114 surveys were conducted by the end of the survey period: 3,758 in English, 334 in Spanish, and 22 in Haitian-Creole. Of these, 3,777 were complete, 147 were partial, and 190 were disqualified. Respondents were required to answer the demographic questions about age, gender, race, and county.

3.5.3 Priorities

The needs assessment process identified the following key priority areas: Demographics, HIV Medical Care, Patient Care Services, Jail and Prison Release Services, and Housing.

Demographics Summary

Appropriate sample sizes for each county were calculated based on the number of PWH. Each county was provided the minimum number of surveys to be sent to reach 25% of total PWH at a 10% response rate. The five counties with the most survey respondents were Miami-Dade, Hillsborough, Pinellas, Brevard, and Duval. Most counties met their quotas, but 13 did not. The three counties with highest unmet quotas were Broward, Palm Beach, and Orange.

Overall, most survey respondents fell into two age groups: 55 to 64 years old and 45 to 54 years old. Stratified by race/ethnicity (see Figure 15), this trend held true for those who identified as non-Hispanic White, non-Hispanic Black, and non-Hispanic multiracial/other. However, for those who identified as Hispanic White, Hispanic Black, and Hispanic multiracial/other, the trend showed that most fell into the 35 to 44 years old and 45 to 54 years old categories as seen in Figure 15.

FIGURE 15: HIV CARE NEEDS SURVEY RESPONDENTS (PWH) BY AGE AND RACE/ETHNICITY

Most survey respondents reported working a full-time job for the past 12 months. The second largest group reported not being able to work due to disability. Approximately half of respondents reported that their 2018 household gross income (before taxes) was less than \$15,000 and roughly one-third reported incomes that were between \$15,000 and \$30,000. Stratified by race/ethnicity, most of those categorized as earning less than \$15,000 and those earning between \$15,000 and \$30,000 were non-Hispanic Black. Most of those categorized as earning between \$30,000 and \$50,000, between \$50,000 and \$100,000, and more than \$100,000 were non-Hispanic White.

HIV Medical Care Summary

Most survey respondents reported that they had seen a doctor about their HIV during the past 12 months. When asked about the frequency of HIV-related care, most reported receiving care two or three times during the past 12 months. For respondents who reported that they had not received HIV-related care or had received care fewer than two times in the past year, the most common reasons overall were that they were not in care, were depressed, or missed their appointments, as shown in Figure 16. When stratified by race/ethnicity, the most common reason given by Hispanic White, non-Hispanic White, and non-Hispanic Black persons remained that they were not in care. The second and third most common reasons given by Hispanic White persons were not knowing where to go and missing their appointments, respectively. For non-Hispanic White persons, the second and third most common reasons were that they were depressed and that this was their provider's decision, respectively. For non-Hispanic Black persons, the second and third most common reasons were that they missed their appointments and were depressed, respectively. The total numbers of responses from those who identify as Hispanic Black, Hispanic multiracial/other, and non-Hispanic multiracial/other about reasons for not receiving care were very low (8, 31, and 8, respectively).

FIGURE 16: TOP 5 REASONS RESPONDENTS HAD NOT BEEN IN CARE BY RACE/ETHNICITY

*Hispanic Black, Hispanic Multiracial/Other, and Non-Hispanic Mutliracial/Other not shown due to low number of responses.

The overwhelming majority of survey respondents received HIV-related medical care in the county where they live. For the small number of respondents who received care in a different county from where they live, the most common reasons given were that doctors or services were not available in their county of residence, preference and better doctors in a different county, continuity of care with an established provider, convenience and closer to home, and confidentiality.

Most survey respondents reported that they always take their HIV medications just as their doctor prescribed them. For those who reported that they did not always take their medications as prescribed, the reasons given included that the medication made them feel bad or sick, they could not afford the cost, they were on a medication break as directed by their physician, they did not know where to get medication, and forgetting.

Patient Care Services Summary

Most survey respondents reported that they did get the patient care services they needed during the past 12 months. For those who did not get needed services, the five most common barriers listed were not knowing where to get services, being depressed, not having transportation, not being able to pay for services, and missing appointment(s). When stratified by race/ethnicity, the most common barrier listed for all race/ethnicity categories (except Hispanic Black persons) was not knowing where to get services. The top barrier to care for Hispanic Black persons was depression.

As shown in Figure 17, the top five patient care services deemed by respondents as most important for the state to provide for PWH were (in order of priority):

1. Medications
2. Case management
3. Dental and oral health
4. Health insurance
5. Outpatient medical care

FIGURE 17: TOP FIVE PATIENT CARE SERVICES MOST IMPORTANT TO SURVEY RESPONDENTS

When stratified by race/ethnicity, the top two services reported by respondents as most important remained medications and case management across all race/ethnicity categories, but the priorities for dental and oral health, health insurance, and outpatient medical care were ranked differently (though they remained in the top five).

Jail and Prison Release Services Summary

The overwhelming majority of survey respondents reported that they had not been in jail or prison during the past 12 months as shown in Figure 18. Of the 211 who reported having been incarcerated (5.9% of all respondents), 82.5% reported that the jail or prison staff knew of their HIV status and most (65.9%) reported that they did receive HIV-related medical care. Upon release from jail/prison, 40.3% of respondents reported that they did not receive any HIV-related information or assistance. Of those who did receive care and assistance, 29.4% received a supply of HIV medication to take with them, 24.2% received referral to medical care, 22.3% received referral to case management, and 10.9% received information about finding housing.

FIGURE 18: SURVEY RESPONDENTS IN JAIL AND PRISON DURING THE PAST 12 MONTHS AND WHETHER SERVICES WERE RECEIVED WHILE INCARCERATED

Of the 240 respondents who answered the question about barriers to getting needed HIV services after release from jail or prison, most (59.6%) indicated that this question did not apply to them because they did get needed services. For those who experienced barriers to care, the most frequent barriers reported were:

- No insurance or financial reasons.
- No transportation to services.
- Did not know where to go for services.
- Could not get away from drugs.
- Had trouble finding trustworthy friends.

- Did not want others to know of their HIV status

Housing Summary

Overall, survey responses indicated that most respondents did not experience barriers to HIV-related care due to their current housing situation as shown in Table 8. Of those who did experience housing-related barriers, the top three barriers were not having money to pay rent, being afraid of others knowing their HIV status, and not having enough food to eat. When stratified by race/ethnicity, barriers varied in rank, but the top three barriers from the overall responses consistently remained in the top three across race/ethnicity categories.

TABLE 8: HIV HOUSING SERVICES RESPONDENTS NEEDED OR RECEIVED IN THE PAST 6 MONTHS

	Received Needed Services		Needed Service, But Could Not Get Service		Needed Service, But Did Not Know About Service		Did Not Need Service		Total Responses
	Count	Row %	Count	Row %	Count	Row %	Count	Row %	Count
Help finding an affordable place to live	357	11.26%	345	10.88%	303	9.56%	2,165	68.30%	3,170

Temporary short-term housing	141	4.91%	181	6.30%	152	5.29%	2,397	83.49%	2,871
Housing where my child(ren) can live with me	108	3.80%	69	2.43%	98	3.45%	2,567	90.32%	2,842
Nursing home	81	2.88%	48	1.71%	53	1.88%	2,633	93.53%	2,815
Money to pay utilities	281	9.49%	289	9.76%	319	10.78%	2,071	69.97%	2,960
Money to pay rent/mortgage	304	10.20%	319	10.70%	343	11.51%	2,015	67.59%	2,981
Housing for persons living with HIV	174	5.91%	249	8.46%	237	8.05%	2,285	77.59%	2,945
Assisted living facility	99	3.49%	82	2.89%	91	3.20%	2,568	90.42%	2,840
Column Totals	1,803		1,894		1,862		20,859		26,418

	Received Needed Services	Needed Service, But Could Not Get Service	Needed Service, But Did Not Know About Service	Did Not Need Service	Total Responses
% of Overall Total	6.82%	7.17%	7.05%	78.96%	100.00%

Overall, most survey responses indicated that respondents did not need any of the available housing services offered through Florida's HIV/AIDS Patient Care Program. For those who were in need, the services most frequently reported as being received, needed but unable to get, or needed but unaware of where to get (approximately 30% of all the survey responses given for each of the following services) were:

- Help finding an affordable place to live.
- Money to pay rent or mortgage.
- Money to pay utilities.
- Permanent, independent housing.

Between 65% and 70% of respondents in need of these services either could not get them or did not know about them. When stratified by race/ethnicity, non-Hispanic Black persons represented the largest number of responses across the board for all services respondents needed but could not get. This same trend held true for all services respondents needed but did not know about.

Overall, for those who needed services, most survey responses (approximately 60%) indicated that respondents did not experience barriers to getting needed housing services and were able to get them. But a sizeable proportion of responses (nearly 40%) indicated barriers to getting needed housing services. The top three barriers reported were that the respondent:

1. Did not know where to get services.
2. Did not qualify for services.
3. Was put on a waiting list.

Actions Taken

The following recommendations were developed to identify key activities to address needs and barriers of the key priority areas:

Demographics Recommendations

It is of concern that the three counties with the largest unmet survey quotas are also three of the counties that have high prevalence of PWH. Collectively, those counties were 603 surveys below quota. Given that this represents 20.6% of the total number of surveys needed to meet quota, it may present a significant deficit of information that is important to consider regarding allocation of resources for HIV

care and services. Going forward, planning for increased staffing and concentrated efforts ahead of survey implementation may help mitigate unmet quotas in counties with high prevalence of PWH.

If survey results are representative of PWH in Florida, they indicate that most are non-Hispanic Black males between the ages of 45 and 64 who have fulltime employment but are living below the poverty level. This highlights the continued disparities minorities face and the economic disadvantage of populations most affected by HIV. Giving priority to this priority population for outreach, staffing, and resources may be warranted to promote diverse community wellness.

With the development and release of the 2022 HIV Care Needs Survey and Needs Assessment Toolkit in October, Florida hopes to increase the number of surveys completed by PWH.

HIV Prevention

One of the priorities for the Department's HIV/AIDS Section is the development of a comprehensive HIV prevention needs assessment through surveys administered to and through HIP providers to address services provision (PrEP, HIV testing, Test & Treat, harm-reduction needs) for persons at risk for HIV. Other entities to be included in the needs assessment include CHDs and operational syringe services programs (SSPs). The Department hopes to accomplish this in 2023.

Policy Barriers

Currently, Florida laws do not present barriers to HIV prevention or patient care services. Minor limitations exist in state laws allowing for syringe exchange programs and include prohibitions on using state, county, or municipal funds to support the operation of the program and permitting a one-to-one exchange of syringes. Florida is also a Medicaid non-expansion state and this may have implications for HIV-related service coverage levels for persons who are eligible for Medicaid.

HIV Medical Care Recommendations

The top reasons given for not receiving care or receiving less frequent care were missed appointments and not in care. To ensure that all PWH in Florida receive the appropriate frequency of HIV-related care, it may be necessary to determine why they were not in care and why they missed appointments. Depression was another top reason given for not receiving care. This points to the importance of educating care providers to be aware of potential mental health and HIV comorbidities and the possible need to implement a protocol for mental health screening along with HIV care visits. To best address these needs and allocate resources appropriately, detailed attention to the top reasons for not receiving care in race/ethnicity categories may be helpful.

In counties where providers and services for HIV-related care are not available, the magnitude of those affected should be investigated and solutions to this problem should be explored. The desire for confidentiality was reported as a reason for seeking HIV-related care in a county other than the

respondent's county of residence. More efforts are needed to address HIV stigma and normalize HIV prevention and care seeking behaviors.

Because HIV medications, when taken as prescribed, are highly effective in attaining VLs that are undetectable and therefore not transmittable, it is imperative that all PWH receive appropriate medication and take it as directed by their physician. It is encouraging that most survey respondents reported that they always take their medications just as prescribed. However, even though the number of those who reported noncompliance with taking their medications is low (12.9%), other personal or biological issues may hinder persons from achieving sustained viral suppression. Reasons given by respondents for not taking medications as prescribed should be investigated further, and solutions or services should be found to overcome these barriers.

Patient Care Services Recommendations

Although most respondents received patient care services they needed, a large proportion (43.4%) did not. Barriers to care centered mostly around logistics, depression, and personal finances. To address logistics and personal finance barriers, allocating more resources for outreach and public information campaigns providing awareness of available HIV/AIDS services for those with low or no income may be helpful. Regarding depression, again we stress the importance of educating care providers to be aware of potential mental health and HIV comorbidities and the possible need to implement a protocol for mental health screening along with HIV care visits. Stigma may prevent persons with HIV from seeking mental health services. Additionally, partnering and finding more accessible mental health service providers is key.

As seen in Figure 19, of the four patient care services reported as most important to respondents, (1) dental and oral health, (2) medication, (3) case management, and (4) health insurance was also high on the list of needed services that respondents reported they could not get or did not know about. This is an area of concern; further investigation into this issue is warranted.

FIGURE 19: PATIENT CARE SERVICES

Jail and Prison Release Services Recommendations

Based on survey responses, the HIV status of 17.5% of those respondents who were incarcerated was not known to jail or prison staff. In addition, 34.1% of those incarcerated did not receive HIV-related medical care while in jail or prison, and 40.3% did not receive HIV-related information or assistance upon release. These numbers represent care intervention opportunities lost. Improvement for collaboration with jail and prison systems to improve continuity of HIV care and post-release accessibility is needed.

Housing Recommendations

Overall, survey results show that most respondents did not need housing services. This is likely a limitation of the persons who responded to the needs assessment. An opportunity could be to ensure that there is a separate avenue with HOPWA to address this in the future. Most who did need services did not experience barriers to getting these services, nor did they experience barriers to taking care of their HIV that were related to their current housing situation. But for those who needed housing services, most centered around needing help to find housing and help to pay for housing and utilities. Because needed housing services for a sizeable proportion of survey respondents were unmet, with the race/ethnicity category most represented in this proportion being non-Hispanic Black, further investigation focusing on this disparity is warranted.

Lastly, the most frequently reported barriers to getting needed housing services reveal distinctly different issues. The most common barrier was not knowing where to get services, which may indicate that public awareness campaigns for this may be needed. Florida does have a HOPWA campaign (Housing for Better Health-Assistance for Persons with HIV/AIDS in Florida); however, its effectiveness and reach may need to be evaluated. The second most common barrier was that respondents did not qualify for services. This may indicate a disconnect between actual need and the program criteria currently in place to determine need. The third most common barrier to getting housing services was that the respondent was put on the waiting list. Causes for this may include limited housing availability and resources and a need for more staffing to process housing services.

4 Situational Analysis

Florida is one of the most culturally diverse states in the nation with a vast array of residents from a wide variety of ethnic, racial, national, and religious backgrounds. The state has long attracted immigrants, particularly from Cuba, Haiti, Colombia, Venezuela, and Mexico. In fact, almost 21% of Florida's population are foreign-born persons (US Census Data - Quick Facts - Florida, 2021). With this diversity comes a higher incidence of disease burden from those in the emerging racial/ethnic minority populations from rural, socio-economically disadvantaged, and medically underserved backgrounds.

Florida continues to implement the best strategies to build a path to improve HIV prevention and care access, specifically among racial/ethnic minorities and other underserved groups. Specific demographics of racial and ethnic minorities and communities experience more barriers to accessing prevention and care services. For persons who are already diagnosed and living with HIV in Florida, activities centering around access to HIV care, including ART, retention in HIV care, and viral suppression, should be focused on such priority populations, including: Black heterosexual individuals (with added focus on Black WCBA), gay and bisexual males of all races/ethnicities, and transgender individuals of all races/ethnicities.

To further move the needle in reducing new HIV diagnoses in Florida, the Department's HIV/AIDS Section is proposing several high-impact initiatives based on the status-neutral approach to HIV prevention and care. The HIV status-neutral approach to reducing new HIV diagnoses involves initial HIV testing services as the entry point to HIV prevention and care services irrespective of a positive or negative test result. See Figure 20.

FIGURE 20: STATUS-NEUTRAL APPROACH TO HIV PREVENTION AND CARE

Source: <https://hivgov-prod-v3.s3.amazonaws.com/s3fs-public/NHAS-2022-2025.pdf>

The strategies proposed include:

1. Statewide expansion of routine HIV, HCV and syphilis screening in hospitals, emergency departments and other health care settings.
2. Increasing PrEP and PEP awareness and uptake.
3. Expansion and awareness of rapid antiretroviral therapy (ART) starts, i.e., Test and Treat.
4. Improving stigma, social determinants of health through awareness and education.
5. Improving health outcomes in aging populations with HIV.

To implement HIV prevention and care services based on the status-neutral approach, Florida will employ the initiatives and strategies which align with the EHE pillars below. The information below also highlights the strengths, challenges, and identified needs related to HIV prevention and care in Florida, the subsequent sections describe each of the following areas:

- DIAGNOSE all people with HIV as Early as Possible (Section 4.1)
- TREAT people with HIV rapidly and effectively to reach sustained viral suppression (Section 4.2)
- PREVENT new HIV transmissions by using proven interventions, including PrEP, and SSP (Section 4.3)
- RESPOND quickly to potential HIV outbreaks to get prevention and treatment services to people who need them (Section 4.4)
- Priority populations (Section 4.5)

4.1 DIAGNOSE People with HIV as Early as Possible

Routine HIV, STI, and HCV Testing in Health Care Settings

In July 2015, the Florida Legislature amended Florida’s HIV testing law to remove the need for separate informed consent prior to HIV testing in health care settings. In September 2016, Rule 64D-2.004, Florida Administrative Code (FAC), was adopted to implement the amended HIV testing law. The intent of this amendment was to simplify routine HIV testing in health care settings, improve the identification of new or existing HIV infections, and help to normalize HIV testing as a routine component of primary health care. There was no change in the law regarding non-health care settings. These changes align Florida more closely with the CDC’s HIV Screening Recommendations.⁴⁴

Since 2015, the Department, including CHDs, has developed a collaborative model for routine communicable disease screening with the Gilead Sciences’ Frontlines of Communities in The United States (FOCUS) initiative. The FOCUS program is a public health initiative that enables partners to develop and share best practices in routine blood-borne virus (HIV, HCV, HBV) screening, diagnosis, and linkage to care in accordance with screening guidelines promulgated by CDC, the U.S. Preventive Services Task Force (USPSTF), and state and local public health departments. FOCUS funding supports HIV, HCV, and HBV screening and linkage to the first appointment after diagnosis. FOCUS partners do not use FOCUS awards for activities beyond linkage to the first appointment.

Florida FOCUS partners include FQHCs and large hospital systems. The Department's public-private partnership with Gilead's FOCUS initiative began in 2016 with the establishment of the very first site—Homestead Hospital in Miami-Dade County. A Department DIS or Linkage to Care Coordinator works with each FOCUS emergency department partnership to assist with linkage to care and other services. The partnership with Homestead was expanded to include syphilis screening and the Department supports the cost of these screenings.

Currently, the Florida FOCUS program has 22 partners across the state (see map in Figure 21) and in 2021, institutions that have implemented the FOCUS program conducted 156,288 HIV tests (1.2% positivity), with 86% linked to care. Additionally, 74,910 HCV tests (4.6% HCV Ab positivity) were conducted and 75% linked to care. In 2022, Florida FOCUS projects plan to complete 187,000 HIV tests and 104,500 HCV tests and commits to onboard facilities to also conduct syphilis testing.

There is no monetary relationship between the Department and Gilead Sciences and as the partners age out of their relationship with Gilead, the Department has developed a cost-sharing model to continue to support testing and linkage to care at these sites by assisting with the costs of testing and reagents.

Current efforts to support expansion include the inclusion of this initiative as an objective in the State Health Improvement Plan where, by December 31, 2026, the Department and external partners aim to increase the number of emergency room or acute care hospitals that are conducting opt-out HIV screening, routine HCV screening, and syphilis testing with a smart screen algorithm from 1 (2021) to 15. Figure 21 visualizes 2022 partner reach for the state of Florida.

FIGURE 21: FLORIDA PARTNER REACH IN 2022

Gaps still exist in the implementation of routine HIV, STI, and HCV testing in hospital emergency departments (EDs) and primary health care settings. Accounts of individuals seeking medical care in hospital EDs for symptoms akin to acute HIV infection are frequent, and, oftentimes, persons visit the ED several times before being tested for HIV, diagnosed, and linked to care. Approximately 7 in 10 PWH saw

a health care provider in the 12 months prior to diagnosis and failed to be diagnosed.⁵⁹ Additionally, reimbursement by Medicaid for HIV testing in hospital EDs is a challenge as we move forward with routinizing testing in EDs; in some cases, testing may not be covered unless deemed medically necessary or clinicians may be less likely to bill when they frequently receive rejections.

From June 2019 to April 2020, the University of Miami AIDS Education and Training Center (UM-AETC) performed outreach to health care facilities in the highest HIV incidence areas throughout Miami-Dade and Broward counties to conduct assessments and academic detailing. Facilities included community health centers and primary care and internal medicine clinics. Assessments examined the status of health care facilities in implementing routine HIV testing and PrEP provision in accordance with CDC guidelines and in implementing or extending third-party billing for routine HIV screening. Less than a quarter (20%) of the health care provider practices reported offering routine HIV screening services to all patients ages 13 to 64, regardless of symptoms or demographics. Of the remaining clinics, 28.6% reported that they test patients based on symptoms and demographics and 30% reported testing only those who requested an HIV test. Among barriers to rapid HIV testing, most practices indicated that they never considered rapid HIV testing as a service (30%). Other barriers to providing rapid HIV testing were the perceived need to obtain consent, staff lacking training for administering and billing, the concern that testing would not be reimbursed by payors, and uncertainty about the implementation of in-office rapid testing.

To eliminate these barriers, the Department has done or will do the following:

- Conducted a Routine Screening Expansion Roundtable, which took place May 26, 2022. The purpose of this meeting, hosted by the Lieutenant Governor, was to bring together a wide variety of external stakeholders to discuss how to expand routine opt-out HIV, syphilis, and HCV screenings in EDs and acute care settings and move toward ending these syndemics in Florida.
- Update Chapter 64D-3, FAC, to include the mandatory reporting of all HIV test results. 64D-3 is titled “Control of Communicable Diseases and Conditions which may Significantly Affect Public Health”. Currently, providers and laboratories are required to report only positive HIV test results to the Department.
 1. Improve the reporting and surveillance of stage zero or acute diagnoses to understand the burden of recent transmission for intervention and prevention.
 2. Understand the scope and total HIV testing being conducted in Florida and calculate a state positivity rate that can be used to drive future interventions and prevention efforts.
- Conduct an assessment on current Florida FOCUS partners to understand who is aging out of the program, and when, and use current funding to support testing and linkage to care efforts.
- Work with directly funded RWHAP Part A programs in the six metropolitan areas of the state to collaborate on supporting routine screening efforts in those areas.
- Collaborate with AHCA to develop a Dear Colleague letter from Medicaid to clarify reimbursement support for routine HIV and HCV screening in hospital EDs.

- Explore leveraging Opioid Settlement Funds to help support the expansion of medication-assisted treatment pathways in hospitals.

In addition to the FOCUS program, the HIV/AIDS Section also has a contract funded through federal grants with the University of Central Florida HealthARCH program that aims to assess the readiness of health systems in the seven metropolitan counties of high-HIV burden and onboard them to modify their electronic health records and offer routines screening for HIV.

Rapid HIV Testing through Non-Traditional Settings and Modalities

Considering Florida's percentage of PWH unaware of their status (14%), increased access to rapid HIV testing is required. Feedback received through community engagement indicated a need for expanded use of mobile testing units, HIV self-test kits, social and sexual network screening, and testing at non-traditional settings and hours. The Department currently supports more than 1,600 registered HIV testing sites around the state that conduct targeted HIV testing in non-health care settings in areas and communities with high HIV incidence. The Department supports these sites with rapid HIV test kits at no cost to the site. Sites must register with the Department and submit HIV testing data as criteria to receive rapid HIV test kits. In 2021, the Department conducted 73 rapid test trainings and certified 1,032 individuals to perform rapid HIV testing. The Department will continue to conduct rapid HIV testing trainings to certify individuals to perform rapid HIV testing in non-health care settings.

In June 2019, the Department began an HIV self-test kit distribution program to provide rapid HIV self-test kits to individuals, at no cost, and through an online request form (available at [KnowYourHIVStatus.com](https://www.knowyourhivstatus.com)). This program was particularly important as COVID-19 closures and restrictions fueled increases in the demand for alternative options for HIV testing. As shown in Figure 22, monthly requests for HIV self-test kits rose sharply beginning in April 2020 and continued through July 2020. Monthly requests tapered slightly from September through December 2020. In 2021, monthly requests for HIV self-test kits decreased but are still higher than pre-COVID levels. Since the program's inception, more than 4,600 rapid HIV self-test kits have been distributed. The HIV/AIDS Section continues to look for opportunities to collaborate, especially with internal Department partners such as the Bureau of Tobacco Free Florida to advertise the availability of free, in-home testing kits.

FIGURE 22: HIV SELF-TEST KITS DISTRIBUTED THROUGH KNOWYOURHIVSTATUS.COM, FLORIDA, 2020 vs. 2021

Additional funds will be needed to support and sustain the expansion of the in-home and point-of-care HIV testing program. Concerns around linkage to care for persons using HIV self-test kits exist and mechanisms will need to be developed to ensure appropriate follow up and timely linkage to care.

Partner Notification Services

Per section 384.26, F.S., the Department is the only entity authorized to perform HIV and STI partner services and notification, and these activities are carried out by trained DIS. While Florida maintains a mature and robust HIV/STI partner services program, opportunities to strengthen the DIS workforce and update partner notification mechanisms exist. Extensive training needs, high caseloads, and low staff retention not only contribute to high DIS turnover rates, averaging 40% annually over the past five years, but also impact the effectiveness of partner elicitation. Numbers of claimed partners have decreased as numbers of anonymous partners reported through mobile dating applications has increased, creating challenges for intervention. In 2017, the Department piloted the use of mobile dating applications as an added partner notification tool for persons exposed to HIV/STIs, with marginal success. Additional strategies are being explored to allow for HIV partner notification via text messaging or phone calls. Since summer 2022, the Bureau of Communicable Diseases has been working to secure approval to allow for text messaging by the DIS workforce as a tool to initiate confidential first contact with clients and enable DIS to conduct partner services for STI/HIV partner notification.

Florida is unique in that there are now four qualified staff to teach the week-long Passport to Partner Services training. In 2022, the STD Section will enter a contract with the University of South Florida to establish a learning academy and completely revamp the existing core training curriculum for DIS and STD program supervisors.

Billing and Reimbursement

In April 2013, the USPSTF gave routine HIV screening of all adolescents and adults, ages 15 to 65, an “A” rating, aligning the rating with the CDC’s HIV screening guidelines. The “A” rating has further implications given the ACA, which requires or incentivizes new private health plans, Medicare, and Medicaid to provide preventive services rated “A” or “B” at no cost to patients. Challenges exist with reimbursement by Medicaid for routine HIV screening in hospital EDs and some facilities report only being able to reimburse for those tests deemed medically necessary. As the state moves forward with expanding routine HIV screening in hospital EDs, more work is needed to ensure these facilities have the ability to bill and receive reimbursements from Medicaid for these screenings.

Billing third-party insurance was reported as a barrier to billing and reimbursement by almost one-third of providers assessed by UM-AETC and was the most prominent barrier encountered. Most clinics reported staff lack of knowledge regarding billing and coding and corporate decisions to be the greatest barriers to implementing routine HIV screening. Other notable barriers were lack of time and staffing capacity to perform billing, challenges in contracting with third-party payors, and difficulty managing multiple contracts with third-party payors.

Stigma

Stigma around HIV affects health care-seeking behavior. Stigma related to HIV/STI screening can occasionally lead individuals to state they do not possess insurance coverage for the service. Similar confidentiality concerns exist for young people who receive health insurance coverage through their parent or guardian (i.e., explanation of benefits). Fear of disclosure of confidential health information can deter youths and adults from seeking out HIV/STI screening and PrEP services. HIV testing locations that are associated with HIV/AIDS service organizations are also perceived as more stigmatizing, with clients citing additional disclosure concerns. There is a need for integration of HIV testing locations with other health care services and screenings to minimize stigma.

The MMP surveillance system also conducts a self-reported survey to understand the various types of stigmas PWH have experienced, including anticipated, enacted, and internalized HIV-related stigma using a 10-item scale ranging from 0 (no stigma) to 100 (high stigma) that measures four dimensions of HIV stigma: personalized stigma since HIV diagnosis, current disclosure concerns, current negative self-image, and current perceived public attitudes about people living with HIV. Analysis of the 2015–2020 Florida MMP data found that females (n=44) reported experiencing a higher level of stigma compared to males (n=32). Additionally, thirty-nine (n=39) transgender individuals reported experiencing stigma.

Thirty-seven (n=37) Black persons reported experiencing HIV-related stigma, compared to White (n=32) and/or Latino (n=32) survey respondents.

Thirty-eight (n=38) heterosexual people reported experiencing HIV-related stigma, compared to bisexual survey respondents (n=36).

Lastly, it was found that those ages 18–29 experienced a higher level of stigma (n=43) than ages 40–49 (n=36), and ages 30–39 (n=35). It was also found that ages 50 and higher experienced the lowest level of stigma (n=32).

Findings from a Department project with the University of Florida ⁴³ (a Bayesian spatial-temporal analysis of racial disparities in HIV clinical outcomes and a pilot stigma intervention protocol for people living with HIV in Florida) indicate that disparities in immune restoration and viral suppression vary by county. Identification of counties where these disparities are most severe provides useful information for the Department and other decision makers to reduce racial disparities in HIV clinical outcomes by implementing targeted interventions, with the ultimate objective of achieving HIV elimination goals in Florida. Stigma remains a key barrier to care engagement and ultimately achieving viral suppression and immune restoration. The preliminary work in this project outlines the development and validation of an updated measure of stigma, which could be implemented to better monitor stigma and its impacts, and an intervention to improve patient-provider communication about HIV-related stigma. The intervention was generally well received by participants and several potential routes of dissemination were identified.

4.2 TREAT People with HIV Rapidly and Effectively to Reach Sustained Viral Suppression

Access and adherence to HIV treatment is important to promote optimal health outcomes for PWH and harnessing the benefits of “treatment as prevention”—when someone takes their HIV medications as prescribed and the amount of HIV in the body is kept at such a low level, they reach viral suppression. Those virally suppressed essentially have no risk of sexually transmitting HIV to others. Treating PWH rapidly after diagnosis will help PWH to achieve and maintain viral suppression, which is part of the current HIV treatment guidelines and is a major pillar in EHE. According to the CDC, approximately 80% of new HIV transmissions occurring annually are from persons who are not receiving HIV-related care and medications. One issue is that the availability of treatments is not evenly accessible or distributed, compounding health disparities and the social determinants of health that fuel further transmission of HIV in the community. This represents a need for expanded access points, hours of operation (to include non-traditional hours and locations) and telehealth capabilities to reach persons with transport or other access issues. Other challenges exist around identifying and re-engaging PWH who are not in care to ensure medical adherence and viral suppression. All areas of the state have dedicated the Department’s linkage staff to not only link persons newly diagnosed with HIV but also identify PWH currently not in care and reengage them into HIV care and treatment.

Test and Treat Program and Rapid Access to ART

Since 2016, Florida has had a robust rapid access to ART program called Test and Treat (T&T). This program offers patients newly diagnosed with HIV, as well as those who have been lost to care and are returning to care, an opportunity to obtain expedited practitioner office visits, labs, and ART, combined with a support system of retention-in-care specialists, to reduce barriers to care engagement. In this

expedited “red-carpet” scenario, PWH have immediate access to a medical provider who can start them on ARV (antiretroviral) medications immediately. T&T has assisted in engaging individuals in care at a much faster rate than those not diagnosed through the program. Since the program’s inception, Florida’s T&T program has enrolled more than 7,374 clients statewide (comprising of 3,342 newly diagnosed individuals and 4,032 previously diagnosed individuals returning to care). Compared to persons diagnosed in Florida who are not enrolled in T&T (see Figure 23), it takes on average 38.3 days to initiate treatment compared to 5.6 days for those newly diagnosed through T&T. Furthermore, the average time to achieve viral suppression is much lower for those who initiate treatment rapidly through T&T—92.2 days compared to 146.4 days for those not engaged in T&T. Wider expansion and adoption of this strategy is needed to impact linkage, retention, and VL suppression rates. Almost all of Florida’s 67 counties have a HRSA-designated Health Professional Shortage Area (areas categorized as rural, partially rural, or non-rural), which represents a need to recruit and train more primary health care and dental service providers. Additionally, needs exist for expanded access points, hours of operation (to include non-traditional hours and locations), and expanded telehealth capabilities to reach persons in rural areas. There is also a need for increased access to treatment for persons diagnosed and living with co-occurring HCV/HIV.

FIGURE 23: TIME FROM T&T ENROLLMENT TO CARE INITIATION AND VL SUPPRESSION, MARCH 2016–DECEMBER 2020, FLORIDA

Below are activities that can help overcome the challenges related to T&T:

- Address gaps in the level of knowledge about the RWHAP system of care among non-RWHAP network health care providers. More education and training are needed for providers on the services available to clients (including ADAP), eligibility requirements, and access points in their service regions.

- Address the need for more training and resources for health care providers related to trauma-informed care (TIC) and intersectionality. Past and current traumatic experiences have an impact on whether a person acquires HIV, is diagnosed, is linked to care, is retained, and maintains viral suppression. Because HIV disproportionately impacts marginalized communities, it is important to consider intersectionality in concert with TIC.
- Intersectionality is a framework for conceptualizing a person, group of people, or social issue as affected by several discriminations and disadvantages; it considers people’s overlapping identities and experiences to better understand the complex prejudices they may face. Examples of social categorizations that inform identity include race/ethnicity, class, gender, sexual orientation, poverty and homelessness, and substance use.

Housing

Many Floridians experience homelessness or unstable housing, which presents a barrier to wellness for PWH as well as those at increased risk for HIV acquisition. Stable housing is closely linked with and is often one of the main determinants affecting HIV health outcomes. Florida’s Council on Homelessness annual report showed that prior to the emergence of the COVID-19 pandemic, homelessness in Florida has declined steadily from 57,551 identified as homeless in January 2010 to 28,328 in January 2020—a 50.8% reduction in homelessness over the last 10 years. In 2021, the Florida Housing Coalition reported Florida having the third-highest homeless population of any state in the nation, with 27,640 people living in homeless shelters and on the streets. It is important to consider the spectrum of housing instability for PWH—traditional definitions of homelessness or unstable housing—but also takes into account situations where individuals and families are residing in temporary residences (e.g., motels), staying with friends or family, or “couch-surfing.” While the federal Fair Housing Act makes it illegal to discriminate against PWH in the provision of housing, consumers frequently cite discrimination, fear of disclosure, and stigma as barriers to safe and affordable housing.³⁵

To meet the housing needs of low-income PWH and their families, the Department administers the HOPWA program. The HOPWA program is a federally-funded initiative through HUD that helps people with HIV/AIDS maintain stable housing and have access to treatment and support services—which can all lead to better health. In Florida, through the State HOPWA Program, 11 regional agencies and 6 cities deliver HOPWA-funded housing services. In addition to the state HOPWA Program, there are 6 non-state funded city HOPWA programs administered locally.

The Department oversees the state HOPWA program and contracts with local community organizations and CHDs as project sponsors to provide HOPWA services in 11 Ryan White Part B consortium geographical areas and six cities throughout the state. Six non-state funded cities redesignate their funds to the state for distribution and fund management by the state HOPWA program. However, the re-designated funds are to be spent in the Eligible Metropolitan Statistical Areas (EMSAs) on housing services in those areas, not the state at large. These cities (counties) include City of Palm Bay (Brevard), City of Cape Coral (Lee), City of Lakeland (Polk), City of Sarasota (Sarasota), City of Port Saint Lucie, (Saint Lucie), and City of Deltona (Volusia).

Additionally, six cities or EMSAs receive and retain management of HOPWA funds they receive directly from HUD; the Department does not manage the HOPWA programs for Jacksonville, Tampa, Orlando, West Palm Beach, Fort Lauderdale, and Miami-Dade. The Florida State HOPWA Program serves those areas of the state that do not directly qualify for HOPWA funding. Between 2020 and 2021, over 2,034 individuals received HOPWA services to ensure they could access and maintain a stable living environment for themselves and their immediate families. An assessment of the state's HOPWA program is needed to identify gaps and barriers in order to make changes to the program in 2023.

With EHE funding received directly through HRSA, RWHAP Part A programs are also exploring ways to leverage funds to assist with paying for housing and rental assistance for persons with HIV.

Patient and Peer Navigation

HIV health navigators (both patient and peers) have a positive impact on the health and well-being of people living with HIV. Patient navigation programs for persons newly diagnosed with HIV or those previously diagnosed and returning to care have consistently proven to be efficacious in ensuring individuals get linked to and are retained in treatment. The lived experiences of peers, “near-peers,” and community health workers are drivers for meeting the diverse needs of newly diagnosed individuals who may be overwhelmed by the thought of entering a health care system as complex as the HIV system of care. In addition, peer navigators act as a support line for persons newly entering or re-entering the care system, providing non-judgmental guidance. There is also a need for expanded patient or peer navigation among persons diagnosed with HCV. Expanded patient navigation is also needed for HIV-negative partners of PWH seeking services. Florida plans to establish and disseminate a statewide peer certification training program.

People with Co-Occurring HIV and Hepatitis C

The current opioid and crystal methamphetamine epidemics are fueling the number of co-infections. It is estimated that 60 to 90% of people who contracted HIV from intravenous drug use also have HCV.³⁶ People living with HCV often have difficulty accessing HCV treatment and related health care. In recent years, there have been improved HCV treatments that can cure HCV in as little as 8 to 12 weeks. ADAP clients living with HCV have access to assistance with HCV treatments. The ADAP formulary was updated in 2017 to include HCV treatments without the need for prior authorizations. Between 2020 and 2021, the ADAP assisted over 650 ADAP clients with access to HCV treatment supported by ADAP. There are opportunities for more uninsured HCV patients to be treated at some free clinics, FQHCs, private clinics, and a limited number of CHDs, but many patients are unaware of where to go when they are first diagnosed.

Expanded Pharmacy Benefits Manager (PBM) for Uninsured or Underinsured ADAP Clients

Clients enrolled in ADAP realize important health benefits. ADAP provides access to U.S. Food and Drug Administration (FDA)-approved medications to low-income individuals with HIV who have limited or no coverage from private insurance, Medicaid, Medicare, or the federally facilitated Marketplace®. About

53% of ADAP clients are uninsured or under-insured and receive medication assistance through the ADAP direct-dispense program. These clients receive assistance with approved ADAP formulary medications directly from the program's contracted pharmacy network. The remaining 47% of ADAP clients obtain access to ADAP formulary medications through supported health insurance plans. These clients are enrolled in the ADAP insurance program and receive assistance with insurance premiums as well as prescription co-pays and deductibles associated with ADAP formulary medications. The ADAP aims to achieve at least 95% of clients who achieve viral suppression regardless of their insurance status. For those in the ADAP insurance program, approximately 97% achieved viral suppression in 2021; however, for those enrolled in the ADAP direct-dispense program, there is a clear disparity with only 89% achieving viral suppression in 2021.

In October 2022, ADAP implemented a PBM network of pharmacies to its uninsured direct-dispense client population. With this initiative, ADAP will increase equity among insured and uninsured clients by providing expanded access to medications through a network of independent pharmacies and commercial chains. The PBM will provide the network of 340B pharmacies and manage the claims using a replenishment model in which direct-dispense clients can access ADAP medications statewide with the main goal of increasing access points and convenience for ADAP clients in Florida. The PBM pharmacy network will ensure access to ADAP formulary medications for enrolled clients served in the direct-dispense in 24 hours. ADAP eligibility files are shared with the contracted PBM entity multiple times throughout the day to ensure newly enrolled clients can access ADAP services during the same day they enroll in the program. The PBM entity will assist clients with their prescriptions by reviewing use data, addressing medication adherence issues, and collaborating with prescribers to resolve incorrect regimens and drug interactions. The PBM entity will also develop and provide training to case managers and health care providers, develop educational materials for providers and clients, and maintain a program information website for providers and clients.

Case Management

Case management plays a critical role in the care coordination of PWH as it assists patients in accessing services, identifying needs, and addressing gaps in services. Case managers also perform important functions such as ensuring rapid access to ART; providing medication samples, where appropriate and feasible; and determining eligibility and enrollment into services. Case manager caseloads are high and continue to increase, impacting the ability to effectively manage complex issues, such as providing medication adherence counseling, helping navigate the health care system, and staying informed and educating PWH on available health care coverage plans. There is a need for additional resources and training to support the case management workforce.

Injectable ART

In May 2021, Florida's ADAP added Cabenuva, the first long-acting injectable antiretroviral to the formulary. Uninsured and insured clients are able to access the medication with coordination between their practitioner's office and a specialty pharmacy. The program provided a series of technical

assistance presentations to providers, staff, and case managers to increase awareness and provide best practices for client adherence. Over 500 ADAP clients have accessed Cabenuva since its addition to the formulary in 2021.

Minority AIDS Initiative (MAI)

As shown in Figure 5 (Section 3.1), Florida continues to experience disparities in HIV diagnoses among adults, despite an annual decrease in the HIV diagnosis rate among Black persons in the past five years. MAI seeks to address the gaps in medical care capacity and increase the accessibility and availability of HIV medical care and related HIV services in minority communities through outreach and education. MAI funds are received from HRSA and are designed to improve linkage and reengagement to comprehensive care and ADAP for low-income racial and ethnic minorities who are living with HIV/AIDS. The Department receives the MAI funding allocation through the state's RWHAP Part B grant and these funds support six community-based providers in Florida counties with the highest HIV incidence. In FY 2021, Florida's funded MAI providers enrolled 1,033 clients, of which 64% were Black and 32% were Hispanic/Latino, a 28% increase from the previous fiscal year which saw 806 clients enrolled, of which 62% were Black and 31% were Hispanic/Latino. Many participants are individuals who had a previous HIV diagnosis but have fallen out of care and have not received care for more than six months. The Department's HIV/AIDS Section will continue to look for ways to strengthen the network of MAI providers with the development and release of the next funding solicitation.

Correctional Settings Initiatives

The Department continues to support treatment and prevention services for incarcerated individuals living with HIV. Persons with HIV in prisons and jails are disproportionately represented compared to the general population. The Department addresses this through the following corrections initiatives: the Pre-Release Planning Program (PRPP), the Peer Education Program (Peer-Ed), and Jail Linkage Programs (JLP). The Department maintains two interagency agreements with the Florida Department of Corrections (FDC) to provide PRPP and Peer-Ed.

JLP is concentrated in the higher populated metropolitan areas in Florida. Fourteen CHDs work to provide services to at-risk inmates and PWH inside the county jails. JLP functions include HIV testing and education in the facility, linkage to care following release from jail, linkage to support services, and follow up with individuals for up to three months following release to ensure medication and treatment adherence. In 2021, approximately 1,755 inmates were tested for HIV, of whom 31 had a positive result.

PRPP provides services to inmates with HIV who are preparing to return to their communities. In 2021, the PRPP provided linkage services to 644 inmates, of whom 305 were linked to care and 160 (52%) kept their appointments upon returning to their community. Recidivism, housing, and transportation are recurring barriers to recently released individuals accessing medical care. In addition, FDC conducts peer education train-the-trainer programs for select inmates at FDC's Central Florida Reception Center and Florida Women's Reception Center (the two largest reception centers in the state). In 2021, 53 inmates completed training to become inmate peer educators and conducted 146 peer-led HIV/STD prevention

and risk-reduction sessions to approximately 5,170 inmates. As a result of the peer education training session, 266 inmates requested an HIV test upon completion.

Expansion of Telehealth

The HIV/AIDS Section began offering telehealth (TH) services in January 2018. The TH program provides on-demand and scheduled PrEP, PEP, same-day or rapid ART and HIV and STD primary care evaluation and treatment visits. The HIV TH service is available to all 67 CHDs. As of May 2021, the Department is averaging over 100 services per month and has provided TH services to 1,604 CHD patients. In 2020, the Department launched a TelePrEP program where patients can access PrEP services through the CHD system via a dedicated telehealth practitioner team. Further credentialing of the HIV TH team of three providers in other CHDs is occurring to allow for these services to be provided by the team. Florida plans to expand and promote the use of telehealth and other new technologies to help alleviate barriers and improve access to HIV prevention and care services.

Insurance Coverage and Affordable Health Care

Florida remains a non-Medicaid expansion state and from 2015 to 2020, an average of 12.7% of people in Florida did not have health insurance coverage (compared to 8.7% for the U.S.).³⁸ The ACA has enabled more individuals to enroll in health insurance but some, particularly those who live just above the federal poverty level (i.e., the working poor), are still unable to afford the cost of coverage. Individuals who fall into this category and need health care are often forced to make difficult choices based on competing life priorities.

As a Part B grant recipient through the RWHAP HIV/AIDS Treatment Extension Act of 2009 (Public Law 111-87), the Department administers the ADAP program. Florida ADAP provides FDA-approved medications to low-income PWH between 0 and 100% FPL who have limited or no health coverage from private insurance, Medicaid, or Medicare. ADAP assists with some premiums and with out-of-pocket costs for drugs on the program formulary. Out-of-pocket costs can be deductibles, co-pays, coinsurance, or similar costs for Medicare Part C or D. Health insurance assistance funded through ADAP is part of ADAP, not a separate program. ADAP provides premium assistance for ACA Marketplace® plans for people with HIV whose income is between 75 and 400% of the FPL. The strategy of enrolling these clients in the direct-dispense program is more cost-effective than enrolling them in the insurance program. Clients in the direct-dispense program have access to the RWHAP system of care, which includes access to outpatient ambulatory health services, case management, and other allowable services. ADAP clients enrolled in the direct-dispense program achieved a VL suppression rate of 89%.

In addition, approximately 93% of ADAP clients enrolled in the program for at least six months have undetectable HIV VL, indicating their HIV disease is under control and unlikely to be spread sexually. The ADAP program aims to achieve at least 95% of clients enrolled in the program at least 6 months who achieve viral suppression regardless of their insurance status. For those in the insured program, approximately 98% achieved viral suppression in 2021, however, for those not insured, there is a clear disparity with only 89% achieving viral suppression in 2021. The approach that Florida ADAP takes

constitutes a close working relationship between the ADAP state health office team, Florida’s 67 CHDs, and 3 contracted statewide service providers: CVS Caremark for PBM services for ADAP insured clients, Magellan Rx for PBM services for ADAP uninsured and underinsured clients and Broward Regional Health Planning Council for Insurance Benefits Management (IBM) services for clients seeking enrollment and premium assistance with health insurance coverage. The Department’s ADAP is operationalized at the CHDs, where ADAP staff assist clients with enrollment by ensuring eligibility determinations and re-certifications. ADAP staff at CHDs use the ADAP database, called Provide, to upload client eligibility documentation. Eligibility files are shared with the contracted PBM and IBM providers multiple times throughout the day to ensure newly enrolled clients can access ADAP services during the same day they enroll in the program. Provide also helps ADAP staff keep track of their client caseload; the system helps identify clients who should be enrolled in the direct-dispense or insurance program based on the information presented during their enrollment. CHD ADAP staff also work closely with the provider community and RWHAP case managers to coordinate efforts with clients to promote medication adherence and retention in care.¹⁶

Additional Unmet Needs of Persons with HIV

Further work is needed to address the unmet needs of PWH identified through various mechanisms—including needs assessment surveys and Florida’s MMP project. The MMP is a surveillance system designed to understand the met and unmet needs of PWH. Among those surveyed in Florida from 2015 to 2020, the most common unmet need was access to dental services (24%), followed by shelter or housing services (14%), SNAP or WIC (12%), and meal or food services (9%). Other unmet needs included mental health services (8%) transportation assistance (8%), HIV case management services (8%), HIV peer group support (6%), medicine through ADAP (4%), and patient navigation services (5%).

4.3 PREVENT New HIV Transmissions by Using Proven Interventions, Including PrEP and Syringe Services Programs (SSPs)

Access to PrEP and PEP

The use of ARV medications to prevent HIV transmission in persons at risk for acquiring HIV is an effective prevention tool. Part of CDC’s HIP approach includes PrEP; in 2014, CDC issued clinical PrEP guidelines for health care providers. CDC recommends PrEP as a prevention tool for persons at increased risk for HIV: persons in sero-different relationships, gay and bisexual men who have sexual partners of unknown HIV status, and PWID. As of December 2018, the Department’s CHDs in each of Florida’s 67 counties are providing PrEP services (counseling, medications, follow-up testing) with support from state funding. CHDs provide PrEP primarily through the STI and family planning clinics and medication is provided at no cost to the client (repeatedly) through the state’s supply of medication. Since the launch of the Department’s PrEP drug assistance program in 2018 over 11,319 CHD clients have received PrEP medications. Current challenges to PrEP delivery through the CHDs include clinician

and staffing shortages and limited capacity for clinicians in smaller CHDs (e.g., fewer clinicians performing multiple duties in the clinic).

The Department’s publicly funded PrEP drug assistance program only accounts for a small portion of all PrEP services statewide. Numerous private-sector partners—including private physicians, FQHCs, community health centers, sexual health clinics, community-based organizations, HIP providers—are screening, prescribing, and maintaining people on PrEP throughout Florida. Also, over the past two years, HRSA has funded approximately 22 FQHCs through their EHE Primary Care HIV Prevention funding opportunity for health centers to expand access to medication to prevent HIV (including PrEP and related services), connect people to care, and ensure care services are well coordinated. According to the latest data available on AIDSVu, Florida has seen an increase in the rate of PrEP users per 100,000 population since 2016; as of 2021, the rate was 226 per 100,000. Florida now ranks third among states and jurisdictions with the highest rate of PrEP users, behind Washington D.C. and New York. PrEP data from AIDSVu reflect the number of people prescribed PrEP in a calendar year. AIDSVu uses data from a database that contains anonymized individual-level prescription records collected electronically from U.S. retail pharmacies, traditional pharmacies, specialty mail-order pharmacies, long-term care facilities, and other pharmacies (e.g., in-hospital pharmacies, HMO pharmacies).⁴⁹

Disparities in the uptake of PrEP and PEP still exist among key priority populations (e.g., Black, and Hispanic males and females, and transgender individuals). Taking a sexual history and discussing sexual health with patients should be a routine practice for primary health care providers; however, limited time for office visits and the reluctance of some providers to discuss sex with their patients presents barriers to routinization. There is a need for increased access to PrEP services in non-traditional settings and through innovative practices. PrEP delivery via telehealth (or “TelePrEP”) was recommended by community groups, clients, and providers as a mechanism by which people facing transportation and employment barriers could access PrEP and increase adherence to follow-up testing. Partnerships with retail pharmacies and clinics and through mobile applications may assist in bridging gaps in PrEP and PEP access. In 2020, by leveraging the existing state telehealth practitioner team, the Department launched a TelePrEP program where patients can access PrEP services through the CHD system.

Currently, federal funding requires the implementation of PrEP and PEP services but does not allow states to allocate funding for medications and limitations for covering associated clinical costs exist. While there are patient assistance programs available to offset the cost of medications, medical visits, and lab testing costs still pose a significant barrier to already disproportionately impacted populations. Clients receiving PrEP have reported that returning every three months for follow-up testing is a barrier to remaining adherent; and in rural and semi-rural areas of the state, transportation to follow-up medical appointments can present further challenges. Clients also cited the cost of medical visits and lab tests and not being able to get time off from work for appointments as barriers to PrEP initiation and maintenance. As a result, more clinics and pharmacies have started to offer non-traditional and after-hours services to increase access to PrEP and PEP. In late December 2021, Apretude (cabotegravir extended-release injectable suspension) received FDA approval for HIV PrEP. Injectable PrEP provides a new option to prevent HIV that does not involve taking a daily pill—which for some people presents

challenges. In summer 2022, the Department initiated a pilot project to test the feasibility of delivering Apretude through CHD clinics. Three CHD clinics (Alachua, Hillsborough, and Miami-Dade) were chosen to participate in the pilot project and represent geographic areas with varying HIV incidence.

In 2019, the USPSTF issued a Grade A recommendation for offering PrEP with effective antiretroviral therapy to persons at increased risk of HIV acquisition. Under the ACA, most private insurance plans must cover preventive services with an “A” or “B” recommendation from the USPSTF without copays or deductibles. This means that at least one PrEP option should be available at no cost to qualifying individuals on these plans.

Increased public and private partnerships are needed to fill gaps in access to PEP services. Many CHD clinics have traditional hours, making them ill-suited as delivery points. Access to PEP is needed quickly after exposure to HIV (in 72 hours) to prevent seroconversion. Clients requesting PEP tend to do so more often during evening hours and weekends. Partnerships with retail pharmacies, rape crisis centers, and sexual assault nursing teams in hospital EDs are needed to expand access points to PEP.

Substance Use Disorders, Syringe Service Programs, and Health Care Access

The past-year prevalence of substance use disorders among adults in Florida was 14.8% in 2019–2020, and the prevalence of needing but not receiving treatment for substance use was 7.5%. According to the Florida Association of Managing Entities, 5,117 adults were added to a waitlist for substance use services in FY 2020–2021.⁵⁰

The most recently published prevalence rates for various substances and substance use disorder among young adults (ages 18–25) and adults in Florida are presented in Table 9 below:

TABLE 9: PREVALENCE OF SUBSTANCE USE AND SUBSTANCE USE DISORDER IN THE PAST YEAR, IN FLORIDA BY ADULT AGE GROUP (2019–2020)

	18 and Older	18–25	26 and Older
Marijuana Use	16.6%	32.9%	14.5%
Cocaine Use	1.7%	4.4%	1.4%
Methamphetamine Use	0.6%	0.6%	0.6%
Heroin Use	0.2%	0.1%	0.2%
Prescription Pain Reliever Misuse	3.6%	4.8%	3.4%
Alcohol Use Disorder	9.5%	13.6%	9.0%

According to FDCF, 2020 Florida Youth Substance Abuse Survey State (FYSAS) report, substance use among students in Florida continues to decline. Among middle and high school students in Florida, between 2010 and 2020, the prevalence of lifetime alcohol use decreased from approximately 52% to 35% and the past-30-day prevalence of alcohol use decreased from 29% to 15%. Regarding marijuana use, the prevalence of lifetime and past-30-day marijuana use among middle and high school students also decreased between 2010 and 2020. Lifetime prevalence decreased from approximately 24% to 20% and past 30-day prevalence decreased from 13% to 11%. According to estimates from the 2022 FYSAS, among high schoolers the lifetime prevalence is 2.8% for opioid misuse, 4.1% for stimulant misuse, and 5.7% for opioid and stimulant misuse.⁴⁵

Section 381.0038(4), F.S., or the Infectious Disease Elimination Act (IDEA), was passed by the Florida Legislature in 2016 and in 2019, the Governor signed a bill amending IDEA to allow county commissions to authorize syringe exchange programs in their county by way of county ordinance. The IDEA legislation mandates that SSPs operate a one-to-one exchange; provide or make referrals for HIV and HCV testing; provide access to substance use prevention, education, and treatment; and provide emergency opioid antagonist kits (naloxone kits). A CDC Determination of Need for Florida for SSPs was approved on February 1, 2020. The CDC Determination of Need supports federal funding applications for SSPs and other organizations. In Florida, there are five approved and currently operational SSPs: IDEA Exchange Miami (located in Miami-Dade County) operated by the University of Miami Miller School of Medicine, the SPOT (in Broward County) operated by Care Resource, the Rebel Recovery SSP (in Palm Beach County) implemented by Rebel Recovery FL, IDEA Exchange Tampa (in Hillsborough County) implemented by Tampa General Hospital and the University of South Florida, and IDEA Orlando (in Orange County) implemented by Hope and Help. An SSP in Pinellas County will be opening their doors in 2022.

Apart from federal funds, grants and donations are the only authorized funding sources for SSP operations in Florida. The five currently operating SSPs receive funding for harm-reduction supplies and services from private grants, donations, and foundations. FDCF donates naloxone nasal spray kits to the SSPs. All sites report that the biggest barrier to effective implementation and operation of their program is funding for harm-reduction supplies. Current funding is inadequate to support the foundational operation of the exchanges, with one site reporting continuous supply shortages that have led to the SSP closing on certain days of the week at a time when the program was experiencing rapid growth.

Since the inception of FDCF's Overdose Prevention Program, the five operational SSPs have distributed over 30,000 naloxone kits and reported 5,602 reversals or rescues. About 29% of all reversals reported to FDCF are through the SSPs. Supplying SSPs with naloxone kits therefore remains a top priority. As other harm-reduction organizations, recovery community organizations, and peer networks, expand and evolve in ways that engage and maintain relationships with the hardest to reach, most at risk individuals in their communities, they should also receive priority support for naloxone distribution. Additionally, in March 2022, the Florida Harm Reduction Collective (FLHRC) established a mail-based naloxone distribution program. The FLHRC comprises of recovery community organizations, overdose prevention programs, SSPs, CBOs, and other stakeholders working to decrease the harms of drug use and eliminate

the stigma associated with harm-reduction. Since March 2022, FLHRC has distributed 1,482 naloxone kits and received 104 reports of overdose reversals through their mail-based naloxone distribution efforts.

Florida's overdose epidemic continues to pose a considerable challenge that the Department addresses through surveillance, prevention, education, and policy efforts. The Florida Overdose Data to Action (OD2A) program has a direct connection to the State Health Improvement Plan and the Department's Strategic Plan. The Department also recently launched an initiative to make naloxone kits available at all 67 CHDs. In 2021, as part of the nationwide opioid litigation undertaken by more than a dozen states, Florida was able to secure more than \$1 billion in settlement funds which will be used to support prevention, treatment, and recovery related services.

The Department supports the IDEA Exchange Miami to provide training and technical assistance to new SSPs, as well as education to local communities on the evidence behind SSPs in the prevention of HIV, HCV, and overdose. Another project, supported by the congenital syphilis grant routinely screens women who inject drugs for HIV and syphilis to reduce the likelihood of babies born with congenital syphilis and link women to treatment and care. Lastly, we will create tangible and measurable steps in addressing viral hepatitis statewide by developing a robust hepatitis elimination plan. We will focus on priority populations disproportionately affected by hepatitis A, B, and C through improving access to prevention, diagnosis, and treatment and increasing vaccination among those priority populations. Also, we will increase access to medication-assisted therapies and linkage to HCV treatment among PWID.

During FY 2021–2022, FDCF deployed HIV Early Intervention Services set-aside funding from the SAMHSA Substance Abuse Prevention and Treatment Block Grant to conduct 18,313 HIV tests across 47 treatment provider sites. A total of 163 tests were positive for HIV.

Comprehensive Health Education and Interventions for Youth

In 2020, more than 31,656 persons between 15 and 19 years of age in Florida were diagnosed with a bacterial STI (syphilis, chlamydia, gonorrhea), for a rate of 2,611 per 100,000 population as shown in Figure 24. These numbers are down slightly from previous years due to the lack of testing and access to testing during the COVID-19 crisis. The presence of an STI increases a person's risk of acquiring HIV. The teen birth rate in Florida has decreased by 59.7%, from 37.2 per 1,000 population in 2009 to 15.0 per 1,000 population in 2020. Of the 4,708 HIV diagnoses in Florida in 2021, 13% (634) were among 13 to 24-year-olds, of whom 53% were Black, 33% were Hispanic/Latino, 12% were White, and 2% were multiracial/other. Most youth diagnoses were attributed to sexual contact, with only 2% attributed to other risks. Of the 2,678 young PWH in Florida in 2021, 67% had a suppressed viral load (versus 69% for all PWH in Florida).

FIGURE 24: TEEN STI RATES

Section 1003.42(2)(n), F.S., requires comprehensive health education that incorporates disease prevention and includes language on the benefits of sexual abstinence and the consequences of teenage pregnancy. Additionally, section 1003.46, F.S., allows school boards to include additional instruction regarding HIV/AIDS. Such instruction may include information about “means used to control the spread of [AIDS].” As outlined in section 1003.42, F.S., parents may submit a written request to the school principal to exempt their child from “the teaching of reproductive health or any disease, including HIV/AIDS, its symptoms, development, and treatment.” Specific content in any subject matter is determined by local school district policy, which gives districts the latitude to determine the type of education program that is implemented. Florida plans to look for alternative settings in which to provide HIV education to youth such as recreation centers, after-school programs, faith-based programs, youth coalitions, and juvenile justice facilities.

Perinatal HIV Prevention Efforts

Perinatal transmission of HIV is when HIV is passed from a woman with HIV to her child during pregnancy, childbirth, or breastfeeding. The use of HIV medicines and other strategies have helped to lower the rate of perinatal transmission of HIV to 1% or less in the US and Europe.³⁷ In Florida, the Department is actively managing the following perinatal HIV initiatives:

- Targeted Outreach for Pregnant Women Act (TOPWA)** – Section 381.0045, F.S., also known as the “Targeted Outreach for Pregnant Women Act of 1998” provides a state funding appropriation for programs to provide outreach and linkage services to pregnant women who may not seek proper prenatal care, who suffer from substance-use disorders, or who are living with HIV or are at increased risk for HIV acquisition. TOPWA providers serve pregnant women who are HIV negative and those living with HIV to ensure they are linked to and receive adequate prenatal care and adhere to medical treatment to prevent perinatal transmission. There are seven funded TOPWA programs in Florida and they provided services to 1,772 clients in 2021. Black females represented 45% of enrollees, Hispanic females represented 44%, and White females represented 7%. Females living with HIV made up just under 8% of TOPWA enrollments.

- **Fetal Infant Mortality Review (FIMR)/HIV Prevention Methodology** – The Department is developing a FIMR/HIV Prevention Methodology in conjunction with a Community Action Team. These efforts are part of a larger effort the Department is undertaking to reduce communicable diseases in WCBA to include congenital syphilis, HBV, and HCV.
- **Baby Rxpress** – The Department’s Baby Rxpress program provides a six-week course of ARV medication to newborns with HIV exposure, lowering the risk of mother-to-child HIV transmission to less than 1%. In 2020, Baby Rxpress filled 344 prescriptions for ARV medications for 256 newborns with HIV exposure at a cost of \$13,556.00, or just under \$53 per baby. Baby Rxpress maintains over 85 participating pharmacies across the state. Participating partners include Empath Health Pharmacy, Health Matters Pharmacy, Walgreens Co., Jackson Pharmacy (three specialty locations), Scripts Pharmacy, and Jackson Drugs.

HIV High-Impact Prevention (HIP) Provider Network

In early 2019, the Department made awards for HIP Request for Applications (RFA) 18-001. HIP RFA 18-001 was released in fall 2018 and provided non-profit organizations an opportunity to apply for funding provided by the Department through the state’s integrated HIV prevention and surveillance grant. A total of \$10 million from this grant was allocated and 44 awards were made to organizations throughout the state that serve Florida’s priority populations. Three-year contracts were executed beginning January 1, 2019, and ending on December 31, 2021, with the option for up to three, one-year renewals. These awards have the ability to be continued through December 31, 2024.

Funded HIP providers deliver a wide array of services, depending on the category of funding and includes, but are not limited to, routine and prioritized testing; integrated STI screening, linkage and reengagement to prevention and care services; interventions for PWH and persons at increased risk of acquiring HIV; PrEP and PEP services; condom distribution; outreach, education, and community engagement; social media and marketing; and essential support services.

In 2021, a total of 12,281 PWH received risk-reduction interventions through contracted HIP providers. Of the PWH receiving risk-reduction interventions, 39.5% identified as MSM, 29% identified as heterosexual males, 28.7% identified as heterosexual females, and 2.8% identified as transgender. Interventions for PWH include Partnership for Health, CLEAR, ARTAS, Healthy Relationships, Connect, Peer Support, and personalized risk-reduction counseling.

Forty-one of the 44 funded HIP providers deliver PrEP screening and referrals and 16 of the providers are able to prescribe for PrEP onsite. In 2021, approximately 42,138 clients of HIP providers were found to be eligible for PrEP services, and, of those, 24,562 were referred for PrEP services and 1,211 were prescribed PrEP.

Risk-reduction interventions for HIV-negative persons at increased risk for acquiring HIV are also delivered by contracted HIP providers. In 2021, a total of 16,235 HIV-negative persons received risk reduction interventions through contracted HIP providers and of those, 43% identified as heterosexual

females, 38% identified as heterosexual males, 18% identified as MSM, and 1% identified as transgender. Interventions for persons with a negative or unknown HIV status include VOICES, CLEAR, Social Network Strategy, Mpowerment, Popular Opinion Leader, Personalized Cognitive Counseling, RESPECT, Community PROMISE, HIV and STD educational sessions, and personalized risk reduction counseling services.

HIP providers are also required to screen clients and refer them to essential support services to assist with housing, transportation, mental health, substance use disorder, and other barriers to care. In 2021, HIP providers screened 51,306 clients for essential support services; 21,224 were referred to services and 2,032 were linked to essential support services.

HIV Minority Media Campaign

In 1999, the Department established a statewide minority media campaign for HIV prevention, as required by section 381.046, F.S. This campaign was most recently rebranded in 2017 with the theme “Protect Yourself.” In 2020, the campaign evolved to include the stories and testimonials of real individuals from Florida impacted by HIV. Figure 25 provides an example of how the Protect Yourself campaign images were used.

FIGURE 25: PROTECT YOURSELF CAMPAIGN IMAGE

The Protect Yourself campaign is implemented across all industry standard platforms including broadcast radio and television, digital and mobile advertising, out-of-home advertising (billboards, bus stops), a dedicated website, social media, and public outreach events. The Department works with local areas to supplement media buys as applicable. The Department updates the campaign annually with input from local and statewide advisory and work groups. During COVID-19, the HIV media campaign was instrumental in getting out social media messaging and website content to populations at risk for or living with HIV. More recently, the HIV media campaign was used to quickly disseminate information and messaging for HIV priority populations related to hepatitis A, meningococcal disease, and Mpox virus. Moving forward, the Department plans to broaden the scope of the campaign to address syndemics (STIs, viral hepatitis).

As previously discussed in Section 2.5, the Department announced its endorsement of the Prevention Access Campaign’s U=U in June 2020. In becoming a U=U partner, the Department joined nearly 1,000 organizations around the world supporting the science-backed message that PWH who use antiretroviral

therapy and have an undetectable viral load in their blood have effectively no risk of sexually transmitting HIV.

4.4 RESPOND Quickly to Potential HIV Outbreaks to Get Needed Prevention and Treatment Services to People Who Need Them

Cluster Detection and Response Plan

The Department is actively conducting surveillance and investigation for HIV clusters. The Department routinely conducts monthly analysis to detect rapidly growing molecular clusters and time-space clusters of public health significance. Additionally, a state level cluster review committee is convened monthly to review cluster data, discuss challenges, and brainstorm strategies to improve the statewide response. Since fall 2021, the state health office has established routine communication with CHDs experiencing clusters to coordinate and guide local responses to investigate and respond to clusters. Florida's updated HIV Cluster Detection and Response plans were submitted to CDC in fall of 2021 and will be updated in 2023. The Department's Bureau of Communicable Diseases plans to engage community stakeholders in further development of the cluster detection and response plan and will accomplish this through the FCPN and associated workgroups, RWHAP partners, and other stakeholders.

Increase Receipt of Genotype Test Results

As the number of analyzable HIV-1 genotype sequences reported to the state has decreased and the number of physicians ordering those tests has also decreased, the Department will enhance physician capacity to order genotype testing for those newly diagnosed or those not on ART returning to care. Figure 26 breaks out resistance type with a genotype sequence.

FIGURE 26: HIV-1 ANTIRETROVIRAL DRUG RESISTANCE IN HIV DIAGNOSES WITH A GENOTYPE SEQUENCE 2021, FLORIDA

The Department is engaging laboratories to improve the completeness and timeliness of electronic laboratory reporting of all reportable HIV lab results including genotype consensus sequences used in transmission network analyses. To increase the receipt of genotypes test results, the Department and its partners are:

- Developing a protocol with the Department’s Bureau of Public Health Laboratories to facilitate access to HIV genotype testing.
- Engaging and educating providers on current HRSA recommendations to order baseline genotypes for newly diagnosed and those returning to care and increase understanding of clinical and epidemiological importance of these tests.
- Educating providers and laboratories on statutory reporting requirements for HIV.
- Educating provider population on response and genotype testing.
- Creating a health care provider letter demonstrating the importance of genotype testing.
- Collaborating with the University of Florida to conduct focus groups on molecular surveillance.
- Conducting laboratory survey on current types and volume of HIV testing in Florida.
- Conducting provider survey on current test ordering strategies.
- Creating of a laboratory report card for laboratories and providers to facilitate improvements.

Data to Care (D2C)

HIV is a reportable disease where routinely collected surveillance data are used as a strategic tool to trigger HIP activities. The D2C initiative is a HIP activity that relies on the use of surveillance data to generate lists of persons living with HIV not in care in Florida. Linkage services are offered to those not receiving treatment by connecting them with HIV care. Florida is a high-morbidity state that has implemented a statewide D2C program since 2015, with the goal of reaching individuals who were not linked to HIV care in one month of diagnosis or if not virally suppressed and part of an HIV transmission cluster and network. In partnership with the six RWHAP Part A programs located in the seven EHE counties and through funding received by Georgetown University, the Department is embarking on a data sharing effort to improve linkage to HIV care for persons out of care in those jurisdictions. Enhancing and expanding on the prioritization of D2C activities by focusing on priority populations that need linkage to care, for example, homeless persons, non-White minorities, non-U.S. born, and persons who inject drugs are populations with the highest rate (>21%) of being out of care (no care in the past 12 months) in 2021, compared to the state (20%). Furthermore, males with IDU, Black men, and persons aged 13 to 39 are populations with the lowest percentage of viral suppression rates (<68%) in 2021, compared to the state (69%). The Department is also increasing linkage-to-care staff training to promote diverse community wellness.

Education and Outreach

As part of the ongoing efforts to respond to HIV transmission clusters and outbreaks, the Department collaborates to provide education, outreach, and community engagement with Floridians at risk for HIV or currently living with HIV, informing them of available HIV prevention and treatment options and

other resources in their area. The Department will complete the following activities to improve awareness of HIV-related services and cluster detection and response actions:

- Generate an annual surveillance summary detailing the community-level response to transmission networks in areas of high HIV burden.
- Create and develop education materials to improve awareness and reduce anxiety surrounding HIV transmission network response activities citing standard public health practice.

Additionally, several of the RWHAP Part A jurisdictions receiving EHE funding from HRSA have purchased mobile medical units to improve their ability to take services and education to populations and communities.

HIV Criminalization

While molecular HIV surveillance (MHS) cannot determine the directionality of disease transmission, it remains a public and community concern that MHS data could be used in criminal transmission prosecutions. An often-required aspect of criminal prosecutions is the “intent to transmit” disease, which cannot be presumed through molecular surveillance or epidemiologic data. However, the ability to use these data in a criminal prosecution poses a threat to community buy-in of routine public health surveillance practices and the use of these data for improving HIV detection and prevention efforts.⁵⁴ In October 2022, the President’s Advisory Council on HIV/AIDS convened and developed recommendations related to MHS such as: local adaptations of MHS must be responsive to the needs in a given jurisdiction based on reviews of state and local HIV criminalization laws; establishment of community advisory boards focused on MHS and cluster detection and response; and plain language notifications be available to PWH about the types of surveillance being conducted and safeguards in place to protect access to and usage of those data. Education to the community at-large is needed on the recent advancements in biomedical interventions, since PWH on medication and virally suppressed (i.e., U=U) have effectively no risk of transmitting the virus to others through sex.

4.5 Priority Populations

Priority populations for primary HIV prevention are derived from the average proportion of each of the race and mode of exposure groups diagnosed with HIV in the last three years (2019–2021). This information is used to address those at the highest risk of acquiring HIV and with the greatest need for primary prevention services (i.e., services directed toward people who have a negative or unknown HIV status). As shown in Figure 27, the top five priority populations are Hispanic/Latino MSM (28% of new diagnoses over the past three years), Black heterosexuals (20%), Black MSM (18%), White MSM (15%), and Hispanic/Latino heterosexuals (8%).

FIGURE 27: PRIORITY POPULATIONS FOR PRIMARY HIV PREVENTION, FLORIDA, 2021

Priority populations for secondary prevention for PWH represent the proportion of each of the race and mode of exposure groups to the total PWH. Secondary HIV prevention activities are directed toward people with HIV, with the intention of preventing transmission to those who are HIV negative. This information is used to prevent HIV transmission through services provided to PWH in these affected demographic groups. As shown in Figure 28, for 2021, the top priority groups include Black heterosexuals (25%), White MSM (22%), Hispanic/Latino MSM (18%), Black MSM (15%), and Hispanic/Latino heterosexuals (6%). Efforts to reduce the transmission of HIV include improving viral suppression among Black males and females and among WCBA (aged 15 to 44).

FIGURE 28: PRIORITY POPULATIONS FOR SECONDARY HIV PREVENTION FOR PWH, FLORIDA, 2021

There were 120,502 persons with an HIV diagnosis living in Florida through 2021 which is estimated to represent only 86% of persons with HIV—the remainder of whom are unaware of their status (approximately 14%, based on the current CDC methodology used to calculate percentage unaware). Persons living with HIV but unaware of their status also need to be prioritized and underscore the

importance of implementing a status-neutral approach to HIV prevention and care. Routine screening is needed to diagnose persons with HIV who are unaware of their status and rapidly link them to care and treatment to achieve viral suppression.

The full Epidemiological Profile for HIV in Florida, 2021, will be provided as a separate attachment. It was developed in accordance with the Integrated HIV Prevention and Care Plan Guidance, including the SCSN, CY 2022–2026 issued by the CDC and HRSA in June 2021. This document provides a comprehensive data overview of HIV, STDs, and HCV in Florida. The full Epidemiological Profile for HIV in Florida, 2021, will also be used to address CDC-PS18-1802 grant requirements.

5 2022–2026 Goals and Objectives

In January 2021, HHS released the HIV National Strategic Plan: A Roadmap to End the Epidemic 2021–2025 which creates a collective vision for HIV service delivery across the nation. IPC Plans created for every jurisdiction address four goals:

- Prevent new HIV infections.
- Improve HIV-related health outcomes for people with HIV.
- Reduce HIV-related disparities.
- Achieve integrated, coordinated efforts that address the HIV Epidemic among all partners and stakeholders.

Objectives have been identified for each of the four goals, and the details of such are outlined in the subsequent section.

Table 10 outlines the goals and objectives for how Florida will address the strategies to diagnose, treat, prevent, and respond to HIV; the goals and objectives align with the NHAS. Actionable activities have been identified to address each of the goals and objectives, along with other pertinent information to inform a plan of action. Those additional details are described in Appendix 9.1 Strategy and Activity Table.

TABLE 10: GOALS AND OBJECTIVES

Goal	Objective
Goal 1: Prevent New HIV Infections	Objective 1.1. Increase awareness of HIV.
	Objective 1.2. Increase knowledge of HIV status.
	Objective 1.3: Expand and improve implementation of effective prevention Interventions.
	Objective 1.4 Increase capacity of health care delivery systems, public health, and health workforce to prevent and diagnose HIV.
Goal 2: Improve HIV-Related Health Outcome of PWH	Objective 2.1. Link people to care rapidly after diagnosis and provide low-barrier access to HIV treatment.
	Objective 2.2: Identify, engage, or reengage people with HIV who are not in care or not virally suppressed.
	Objective 2.3: Increase retention and adherence to treatment to achieve and maintain long-term viral suppression.

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Goal	Objective
	Objective 2.4: Increase the capacity of the public health, health care delivery systems, and health care workforce to effectively identify, diagnose, and provide holistic care and treatment for people with HIV.
	Objective 2.5 Expand capacity to provide whole-person care to older adults with HIV and long-term survivors.
	Objective 2.6: Advance the development of next-generation HIV therapies and accelerate research for HIV cure.
Goal 3: Reduce HIV-related Disparities	Objective 3.1. Reduce HIV-related stigma and discrimination.
	Objective 3.2. Reduce disparities in new HIV infections, in knowledge of status, and along the HIV care continuum.
	Objective 3.3. Engage, employ, and provide public leadership opportunities at all levels for people with or who experience risk for HIV.
	Objective 3.4: Address social determinants of health and co-occurring conditions that exacerbate HIV-related disparities.
	Objective 3.5: Train and expand a diverse HIV workforce by further developing and promoting opportunities to support the next generation of HIV providers including health care workers, researchers, and community partners, particularly from underrepresented populations.
	Objective 3.6: Advance HIV-related communications to achieve improved messaging and uptake, as well as to address misinformation and health care mistrust.
Goal 4: Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic Among All Partners and Interested Parties	Objective 4.1. Integrate programs to address the syndemic of HIV, STIs, viral hepatitis, and substance use and mental health disorders in the context of social and institutional factors including stigma, discrimination, and violence.
	Objective 4.2 Increase coordination among and sharing of best practices from HIV programs across all levels of government (federal, state, tribal, local, and territorial) and with public and private health care payers, faith-based and CBOs, the private sector, academic partners, and the community.
	Objective 4.3 Enhance the quality, accessibility, sharing, and uses of data, including HIV prevention and care continua data and social determinants of health data.
	Objective 4.4: Foster private-public-community partnerships to identify and scale up best practices and accelerate HIV advances.

6 2022–2026 Integrated Planning Implementation, Monitoring, and Jurisdictional Follow Up

To break down the approach for Integrated Planning Implementation, Monitoring and Jurisdictional follow up, the subsequent sections will detail how best to ensure the success of IPC Plan goals and objectives through the following five key phases:

- Implementation (Section 6.1)
- Monitoring (Section 6.2)
- Evaluation (Section 6.3)
- Improvement (Section 6.4)
- Reporting and Dissemination (Section 6.5)

6.1 Implementation

The Department will continue to coordinate and collaborate with internal and external partners and stakeholders to meet the objectives of the IPC Plan. The Department's RWHAP Part B; RWHAP Part A, C, D, and F programs; PWH; and other members of the FCPN-associated committees, workgroups, and advisory groups (e.g., FL Gay Men's HIV Workgroup, Community HIV Advisory Group, Florida Black Leaders Group, CQM Committee); EHE-funded jurisdictions and directly-funded providers; HIV prevention and care providers; state and local agency administrators; and persons at increased risk for HIV will be included in each step of the IPC Plan implementation, monitoring and evaluation. Through this coordinated implementation approach, the Department and partners can explore opportunities to better leverage funding streams supporting Florida's HIV prevention, care, and treatment services (e.g., CDC and HRSA funding to state and local entities). Implementation progress of the IPC Plan will also be used to identify where more resources (e.g., funding, staffing) may be needed to ensure IPC Plan objectives are met.

6.2 Monitoring

The goal of the monitoring and evaluation plan is to assess successful implementation of the unified IPC Plan as measured by:

- Completion of stated strategies and activities.
- Annual progress toward the target measurements of stated goals, objectives, and benchmarks.

Data are used to direct efforts to ensure the program achieves the intended results and to help identify additional operational and process improvement opportunities.

Through biannual meetings and monthly committee calls, the Department's HIV/AIDS Section and the FCPN will actively participate in regular monitoring of strategies and activities set forth in the unified IPC

Plan. The Department, in collaboration with the FCPN Coordination of Efforts Committee, will establish mechanisms and time frames the state will use to monitor, evaluate, and update the IPC Plan, as necessary. This committee leads efforts to ensure data indicators for plan activities are being tracked and that progress is communicated with appropriate programs and partners to meet plan objectives. Data on performance indicators will be collected and disseminated through a status report to statewide partners. Local planning body feedback will also be collected and shared by FCPN representatives for each respective area. The Department currently uses an electronic dashboard tool to collect EHE-related activity information and consideration is being given to using this tool to collect activity-related information for the IPC Plan. Regular FCPN meetings are the principal mechanism for updating planning bodies and stakeholders on the progress of plan implementation as well as soliciting and using feedback from stakeholders for ongoing plan improvements. A standing agenda item to review IPC activity progress will be added to the state's FCPN meetings. After each FCPN meeting, a summary report is provided to all attendees and shared with community partners; this mechanism will be used to share information on the IPC Plan's progress toward completing activities and achieving objectives.

The IPC Plan will receive a detailed annual review by the Department HIV/AIDS Section leadership. As part of the annual review, the section will use surveillance and program data to assess health outcomes along the HIV Care Continuum that impact the quality of the HIV service delivery system. This will allow for adjustments to be made in response to changing conditions, and information from the review will be provided to FCPN for feedback.

The Department's HIV/AIDS Section, with the engagement of stakeholders, will review the strategic plan using identified measures and indicators to analyze, assess, and evaluate outcomes and determine whether modifications to the IPC Plan are necessary. The diverse range of perspectives—knowledge, values, needs, and abilities—of stakeholders will be applied through a participatory planning and evaluation process. The collaborative approach, structured and arranged to interweave state and local community partnerships with shared discretion and responsibilities, will help to achieve the IPC Plan objectives more effectively than each program could on its own. This approach will align with, support, and advance the goals of the IPC initiative, the NHAS, and the Department, as well as meet CDC and HRSA requirements. As the state of Florida moves forward in ending the epidemic, regularly scheduled events to inform all stakeholders and researchers of relevant data and evidence for improving or, more precisely, monitoring and evaluating the implementation and impact of the IPC Plan is essential. These opportunities will ensure that plan implementers are working with the best available evidence to work toward ending the epidemic.

6.3 Evaluation

Meaningful measures and indicators will be used to monitor both operational performance and progress on objectives, strategies, and activities in the strategic plan. Data are used to make program decisions and direct efforts to ensure the state achieves the intended results and also to help identify additional operational and process improvement opportunities.

The IPC Plan will receive a detailed annual review by HIV/AIDS Section leadership subsequent to Florida's legislative session and the Department's budget planning process. As part of the annual review, the section will use surveillance and program data to assess health outcomes along the HIV Care Continuum which impact the quality of the HIV service delivery system. This will allow for adjustments to be made in response to changing conditions and information from the review will be provided for input and feedback to the FCPN.

Strategic planning, the process generating the statewide IPC Plan, helps focus resources on vital objectives chosen to move the Patient Care and Prevention programs toward fulfillment of the NHAS goals. The IPC Plan identifies key objectives that Florida will pursue in the next five years, along with strategies and activities that will guide and facilitate the necessary actions required to achieve the desired outcomes. Plan objectives each have a corresponding measure for ongoing monitoring. Using meaningful measures and data indicators will ensure Department HIV/AIDS Section leadership, RWHAP Part A partners and the FCPN planning body members are able to manage and track efforts toward the intended results, while identifying improvement opportunities over the course of the five-year period.

Evaluation ensures the strategies and activities are making changes that positively affect outcomes of the IPC Plan objectives. Evaluation that focuses on project outputs, provides accountability for public resources relating to specific actions. It establishes the empirical basis needed for the ongoing cycle of collaborative planning and the actions that need to be accomplished. The evaluation component is an extension of the integrated Plan, Do, Study, Act cycle which is a continuous process. The IPC Plan must be flexible to allow for adjustments as there are changes to external or internal conditions; yet a meaningful evaluation must be integrated in the planning process and include a review and analysis of the intended outcome. The HIV/AIDS Section, with the engagement of stakeholders, will review the strategic plan using meaningful performance measures and indicators to analyze, assess and evaluate outcomes and determine whether modifications to the IPC Plan are necessary. Through participatory evaluation and diverse range of perspectives, knowledge, values, needs, and abilities of stakeholders will be applied to the planning and evaluation process.

6.4 Improvement

Through routine (biannual) monitoring and communication of progress in achieving the goals and objectives outlined in the IPC Plan, the state will identify areas in need of improvement and make necessary adjustments to the IPC Plan. Revisions will be made on an annual basis and items for proposed revision will be reviewed with RWHAP Part A jurisdictions, members of the FCPN and associated workgroups and advisory bodies, and other key stakeholders, voted on, and implemented. The collaborative approach—structured and arranged to interweave state and community partnerships with shared discretion and responsibilities—will help to achieve the IPC Plan objectives more effectively than each program could on its own. This approach will align, support, and advance the goals of the NHAS, the Department, as well as meet CDC and HRSA requirements, to ensure improvement in the access to and quality of HIV prevention and care services throughout Florida.

6.5 Reporting and Dissemination

Summarized annual data are uploaded to the Department's HIV/AIDS Section web page (<http://floridaaids.org/>) and are also available on an internal SharePoint site for internal use at the state and CHD level. Annual data releases include a comprehensive epidemiological profile for the state and for each partnership area, a state slide set presented annually to FCPN and RWHAP partners, and other annual data products. The epidemiological (epi) profiles are an expanded Excel workbook with multiple tabs containing 5-year trend analyses of HIV (demographics, diagnosis, AIDS, deaths, and continuum of care), STIs, HBV, HCV, and TB.

Various factsheets are generated to portray epidemiology and disease highlights for a demographic population. These fact sheets highlight summary data for priority population groups and are updated annually, shared with community stakeholders, and uploaded to the Department's external web and internal SharePoint sites. Integrated slide sets and epidemiological profile tables are generated to support stakeholder engagement and planning. The Department's HIV/AIDS Section has generated compressive slides sets and epi profiles specifically for each of the 14 partnership areas each year since the 1990s. These slide sets and epi profiles are shared with the RWHAP Part A entities, community stakeholders, field surveillance staff, and others who may request these data. These data are frequently used as tools for program planning and evaluation.

Data Sharing and Use

De-identified HIV, viral hepatitis, STD, and TB data are routinely shared via ad-hoc requests to surveillance programs with outside entities including, but not limited to, academic institutions, community partners, RWHAP Parts, internal agency partners and collaborators, and the public.

Each of these programs provide annual data which are uploaded into FLHealth CHARTS (<https://www.flhealthcharts.gov/charts/CommunicableDiseases/default.aspx>). In addition, FL Health CHARTS is updating the FLHealth CHARTS website (a web-based platform that provides easy access to health indicator data at the community and statewide level for the state of Florida from a multitude of sources) with a new dashboard (at the county level) that will incorporate a multitude of HIV/AIDS indicators including, but not limited to, demographic and socio-economic indicators, partner services data, testing and treatment facilities, PrEP, and other data not previously included on FL Health CHARTS. By ensuring all these data and information are made readily accessible and user friendly, the new dashboard will help local and state planning bodies develop more effective and efficient programs and corresponding activities and monitor progress of IPC strategies and activities.

Along with HIV data, the Department also summarizes data from MMP and NHBS surveillance along with the Department's PrEP, Test and Treat, and HIV counseling and testing data. Data from the needs assessments are also shared in reports sent out to FCPN membership.

7 Letter of Concurrence

For the purpose of this plan, the FCPN membership served as the designated entity to certify concurrence with the content, strategies and activities included in the IPC Plan. The FCPN membership held the concurrence session on October 19, 2022, to officially adopt Florida’s Statewide Integrated HIV Prevention and Care Plan, 2022–2026. Moving forward, all updates to concurrence will be completed through the state’s integrated HIV planning process and with the FCPN.

The concurrence process included:

- Several virtual IPC Planning sessions that reflected the progression of the statewide IPC Plan to ensure that members of the planning body and other community stakeholders had an opportunity to provide input into the development of goals, objectives, strategies, and activities proposed in the IPC Plan.
- Opportunities for FCPN members and community stakeholders to submit their feedback to the state health office representatives with a response to their inquiries and recommendations.
- An opportunity for the FCPN to vote to accept the IPC Plan for submission to HRSA and CDC.

FIGURE 29: LETTER OF CONCURRENCE

F C P N

Florida Comprehensive Planning Network

Dear Colleague:

The Statewide Florida Comprehensive Planning Network (FCPN) concurs with the following submission by the Florida Department of Health in response to the guidance set forth for health departments and HIV planning groups funded by the CDC's Division of HIV/AIDS Prevention (DHAP) and HRSA's HMAIDS Bureau (HAB) for the development of an Integrated HIV Prevention and Care Plan, including the Statewide Coordinated Statement of Need (SC5N) for calendar year (CY) 2022–2026.

Members of FCPN include PWH and representatives across the state representing patient care and prevention groups, local planning bodies, CEOs, academic institutions, local and regional clinics, city, and county governments, RWHA Program recipients, the transgender community, advocacy groups, substance use and social service providers and behavioral science groups.

After a year of collaboration with our planning body members, federal/state/local partners, and community stakeholders, this plan reflects Florida's commitment to eliminating new HIV transmissions and reducing HIV related deaths in our state. FCPN members and guests helped to develop and prioritize the proposed strategies and activities for inclusion into the plan during the Summer 2022 meeting. FCPN members and guests reviewed and made suggestions to the first draft of the plan during the Fall 2022 in-person/virtual meeting. Comments and suggestions from FCPN members were then incorporated into the final draft of the plan.

The FCPN has reviewed the Integrated HIV Prevention and Care Plan submission to the CDC and HRSA to verify that it describes how programmatic activities and resources are being allocated to the most disproportionately affected populations and geographical areas with high rates of HIV.

The planning body concurs that the Integrated HIV Prevention and Care Plan submission fulfills the requirements put forth by the CDC's Notice of Funding Opportunity for Integrated HIV Surveillance and Prevention Programs for Health Departments and the Ryan White HIV/AIDS Program legislation and program guidance.

Astute Co-Chairs of the FCPN, the signatures below confirm the concurrence of the planning body with the Integrated HIV Prevention and Care Plan 2022-2026.

9 Appendix

9.1 Strategy and Activity Table

The table below provides details on the activities suggested to address each strategy. Strategies are categorized by the goal and objective that they fall in.

9.1.1 Goal 1: Prevent New HIV Infections

9.1.1.1 Objective 1.1. Increase awareness of HIV

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

TABLE 11: STRATEGIES AND ACTIVITIES

Strategy 1.1.1		Develop and implement campaigns and resources to provide education about comprehensive sexual health; HIV risks; options for prevention, testing, care, and treatment; and HIV-related stigma reduction.			
Data Indicators		• Number of campaigns developed • Number of publicly funded HIV tests • Number of areas engaging with law enforcement • Stigma measure to be developed • Additional specific, quantifiable measures for each activity (TBD)			
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth			
Timeframe		Critical Partners		Activities	
By 12/31/2026		• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Case managers • Health educators • Peer workers • Community health workers • Linkage Coordinators • Faith-based Organizations		• Develop stigma toolkit and campaign and localized stigma task forces. • Engage with law enforcement around HIV awareness and stigma, and HIV information in their curriculum for youth intervention programs. • Increase culturally competent sexual health education outside of schools. • Increase the use of digital media resources to include messaging on dating apps (e.g., Grindr) and social media apps (e.g., TikTok). • Solicit and execute agreement with new media vendor to deliver HIV media services statewide and to add campaign material to increase awareness of HIV testing, PrEP, treatment, prevention, and stigma awareness among priority groups.	
Planning Areas					
Statewide					

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.1.2		Increase awareness of HIV among people, communities, and the health workforce in geographically disproportionately affected areas.	
Data Indicators		• Number of publicly funded HIV tests • Number of BRTA/FRTA partnerships • Number of outreach and education efforts to specific priority populations • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth; sex workers and human trafficking victims	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Case managers • Health educators • Peer workers	• Increase targeted outreach and education efforts specific to specialized groups, (e.g., FQHCs, local gang taskforces, and other geographically disproportionate communities). • Increase the number of BRTA and FRTA initiatives and partners statewide to increase HIV awareness and reach in communities. • Offer in-person learning opportunities for basic HIV 101 education and increase the number of trained HIV 101 educators (as a result of increased HIV 101 train the trainer opportunities). • Provide HIV education and information to school district stakeholders to encourage buy-in and adoption of culturally competent sexual health education curriculum. • Develop education materials that are both age appropriate and language appropriate.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.1.3	Integrate HIV messaging into existing campaigns and other activities pertaining to other parts of the syndemic, such as STIs, viral hepatitis, and substance use and mental health disorders.	
Data Indicators	• Number of campaigns with integrated messaging addressing syndemics • Number of new or non-traditional partnerships established to deliver education around syndemics • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth; individuals with dual diagnoses	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance use treatment settings • Mobile units • STD clinics • SSPs • Drug treatment programs • Case managers • Health educators • Peer workers • Community health workers	• Collaborate with local partners to educate providers across more platforms on syndemics and work to incorporate HIV messaging in messaging related to other communicable disease areas. • Increase awareness and collaboration with existing SSP to incorporate viral hepatitis, STIs, mental health and substance use disorder messaging in campaigns. • Collaborate with non-traditional and new partners to deliver HIV, STI, viral hepatitis, substance use disorder and mental health messaging across multiple platforms (e.g., radio, print, digital, social media, out-of-home, venue/event-based). Ensure all messaging is culturally and linguistically appropriate. • Identify and engage with other organizations and coalitions that have existing campaigns for STIs, viral hepatitis, substance use, mental health, behavioral health, etc. to encourage these groups to include HIV prevention and care messages in their efforts. • Partner with SAMHSA funding recipients update or create messaging related to the nexus between HIV/STIs and HCV, substance use, and/or mental health. • Collaborate with other local EMAs, RWHAP providers (e.g., Part C clinics), and FQHCs to incorporate additional HIV messaging into existing activities and/or campaigns.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.1.2 Objective 1.2. Increase knowledge of HIV Status

Strategy 1.2.1		Test all people for HIV according to the most current USPSTF recommendations and CDC guidelines.	
Data Indicators		• Number of new HIV diagnoses • Number of publicly funded HIV tests • Number of HIV self-test kits distributed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs	• Develop messaging that normalizes routine HIV testing and reduces stigma surrounding HIV testing. Utilize peers and popular opinion leaders to increase testing in communities. • Ensure providers are kept up to date through education and communication. • Implement routine HIV and STIs screening in health care settings and priority testing in non-health care settings. Expand routine HIV testing to include additional medical settings (e.g., EDs, urgent care facilities, OB/GYN, and primary care providers). • Increase opportunities for HIV testing and address barriers to testing in traditional and non-traditional settings. • Increase testing accessibility through increased partnerships with outside-the-box providers, such as non-traditional medical settings, civic groups, local papers, event planners, FBOs, population-based care providers, and others. Ensure testing is where people are.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.2.2	Develop new and expand implementation of effective, evidence-based or evidence informed models for HIV testing that improve convenience and access.	
Data Indicators	• Number of new HIV diagnoses • Number of publicly funded HIV tests • Number of HIV self-test kits distributed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs	• Assess current HIV testing laws for opportunities to consider increasing testing requirements in additional circumstances. • Decrease barriers to testing by increasing testing beyond traditional venues and work hours and normalizing knowing your status. • Identify barriers to testing and care from people with lived experience and develop improvements to delivery. • Provide easy access to home test kits, including through self-serve vending machines and as add-ons to other self-tests (such as COVID, pregnancy); improve reporting structures to increase self-test linkage. • Routinize HIV testing as part of the standard of care during an annual physical as well as during other health or wellness visit appointments or opportunities.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.2.3		Incorporate a status neutral approach to HIV testing, offering linkage to prevention services for people who test negative and immediate linkage to HIV care and treatment for those who test positive.	
Data Indicators		• Number of new HIV diagnoses • Number of publicly funded HIV tests • Number of HIV self-test kits distributed • Number of people receiving prescriptions for PrEP • Percent of newly diagnosed PWH linked to HIV medical care in 7 days of diagnosis • Percent of newly diagnosed PWH linked to HIV medical care in 30 days of diagnosis • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs	• Develop and provide status-neutral resources around testing, treatment, prevention, and other services. • Educate private providers about status neutral HIV prevention and care services. • Ensure strong linkage to PrEP and PEP infrastructure that exists. • Increase the use of combined testing and vaccination efforts as a means of destigmatizing HIV prevention and testing services. • Support and expand the use of a “no wrong door” approach for HIV prevention and care services in a variety of organizations.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.2.4		Provide partner services to people diagnosed with HIV or other STIs and sexual or needle sharing partners.	
Data Indicators		• Number of people receiving HIV partner services interviews • Number of people receiving prescriptions for PrEP • Percent of newly diagnosed PWH linked to HIV medical care in 7 days of diagnosis • Percent of newly diagnosed PWH linked to HIV medical care in 30 days of diagnosis • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs	• Increase collaboration with needle exchange/harm-reduction programs. • Increase partner services capacity, whether by increasing funding for DIS positions, allowing additional Department staff to provide partner services, or allowing non-Department organizations to provide partner services. • Provide partner services during non-traditional hours and via telehealth to reduce barriers. • Reduce barriers around partner disclosure and referral. • Use partner services to provide negative partners access to PrEP, educational materials, and other preventative resources and services.	
Planning Areas			
Statewide			

9.1.1.3 Objective 1.3: Expand and Improve Implementation of Effective Prevention Interventions

Strategy 1.3.1		Engage people at risk for HIV in traditional public health and health care delivery systems, as well as in nontraditional community settings.	
Data Indicators		• Number of publicly funded HIV tests • Number of HIV self-test kits distributed • Number of people receiving prescriptions for PrEP • Number of primary care visits (AHCA report) • Number of FQHC visits for priority populations • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Correctional health settings • SSPs • AHCA (Medicaid/Medicare)	• Create local Prevention Interventions Taskforces to work collaboratively to raise awareness (e.g., utilizing non-health care events), share resources, and provide referrals. • Incorporate additional public health professionals in care settings • Increase academic detailing in Primary Care, Urgent Care, and Emergency Department settings to raise awareness for prevention interventions. • Increase the number of community mobilization initiatives and partnerships in communities, (e.g., FRTA and BRTA). • Partner with additional social service organizations, (e.g., domestic violence care providers, human trafficking organizations, United Way, YMCA, Boys and Girls club, and others) to expand HIV testing, prevention, and care services.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.3.2	Scale-up treatment as prevention/U=U by diagnosing all people with HIV, as early as possible and engaging them in care and treatment to achieve and maintain viral suppression.	
Data Indicators	• Number of publicly funded HIV tests • Number of people receiving prescriptions for PrEP • Percent of newly diagnosed PWH linked to HIV medical care in 7 days of diagnosis • Percent of PWH retained in care • Percent of PWH who are virally suppressed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Correctional health settings • SSPs	• Use existing planning bodies to work collaboratively to expand and increase rapid ART access programs. • Increase viral suppression rates by increasing the use of peers in programs and using messaging that focuses on living a healthy life. • Review programs with low VL suppression to identify areas for technical assistance and increase the number of trained evidence-based Intervention (EBI) providers in those programs to assist in navigation services and other interventions to reduce community VL. • Scale up of injectable ARV programs (i.e., PrEP and HIV treatment).
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.3.3		Make HIV prevention, including condoms, PrEP, PEP, SSPs easier to access and support continued use.	
Data Indicators		• Number of condoms distributed statewide • Number of people receiving prescriptions for PrEP • Number of people receiving PEP • Number of operational SSPs • Additional specific, quantifiable measures for each activity (TBD)	
		Priority Populations PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Correctional health settings • SSPs	• Use existing planning bodies to work collaboratively to raise awareness and share resources on PrEP, PEP, condoms, and SSP, in order to provide referrals and increase accessibility of services. • Increase the number of PrEP providers through academic detailing and education. • Encourage that SSPs (including clean-needle distribution and exchange) are placed in proximity of known overdose events or deaths. • Increase awareness and promote the use of the Provider PrEP hotline.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.3.4		Implement culturally competent and linguistically appropriate models and other innovative approaches for delivering HIV prevention services.	
Data Indicators		• Number of cultural humility trainings performed • Number of engagement activities with local and state civic, community and spiritual leaders • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Correctional health settings • SSPs	• Embrace the adoption of assessing quality of life instead of limiting approach to focusing on health outcomes only. • Engage with local and state civic, political, community, and spiritual leaders to increase awareness of HIV and populations living with and affected by HIV. • Increase cultural humility trainings and other linguistically appropriate trainings for delivering HIV prevention services. • Partner with the Florida Department of Education (FDOE) to open conversations on how to evaluate outcomes of current health education programs for success. • Provide HIV messaging in English, Spanish, and Haitian-Creole.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.3.5	Support research into the development and evaluation of new HIV prevention modalities and interventions for preventing HIV transmissions in priority populations.	
Data Indicators	• Number of partnerships with HIV-related research entities • Number of HIV research sharing events and opportunities • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Academia • SSPs	• Expand frameworks for evaluation of EBIs through collaborative efforts and partnerships. • Expand the use of economic modeling to optimize public health strategies and interventions (e.g., PrEP 2-1-1) in additional jurisdictions. • Strengthen partnerships with HIV-related research entities (e.g., Florida Consortium for HIV Research [FCHAR]) to increase knowledge sharing and build expertise. Encourage attendance at Florida HIV Community, Providers & Researchers Conference.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.3.6	Expand implementation research to successfully adapt EBIs to local environments to maximize potential for uptake and sustainability.	
Data Indicators	• Number of partnerships with HIV-related research entities • Number of HIV research sharing events/opportunities • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Academia • SSPs	• Adapt interventions frameworks to be more inclusive of all communities. • Conduct listening sessions with those currently implementing interventions and those participating in interventions to uncover best practices and lessons learned. • Increase collaboration with state and national entities, subject matter experts (SMEs) and CBA and TA providers to share information and findings that may lead to innovation and strategies.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.1.4 Objective 1.4 Increase capacity of health care delivery systems, public health, and health workforce to prevent and diagnose HIV

Strategy 1.4.1	Provide resources, incentives, training, and technical assistance to expand workforce and systems capacity to provide or link clients to culturally competent, linguistically appropriate, and accessible HIV testing, prevention, and supportive services especially in areas with shortages that are geographic, population, or facility based.		
Data Indicators	• Number of cultural humility trainings performed • Number of public health workforce trainings on PrEP and PEP, mental health, and substance use and misuse • Number of partnerships with rural health networks • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	Community-based organizations, health care delivery systems, public health, and health workforce		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • STD clinics • Drug treatment programs • Correctional health settings • SSPs • Case managers • Health educators • Peer workers • Linkage coordinators	• Collaborate with local, state, and national training partners to increase and expand training cultural humility trainings. • Collaborate with local, state, and national training partners to provide additional training for the public health workforce and front-line staff on PrEP and PEP prescribing, mental health, and substance use and misuse. • Expand awareness and use of the Collaborative Pharmacy Practice Agreement which gives pharmacists authority to provide specific patient care services, including PrEP. • Expand partnerships with rural health networks. • Explore opportunities to incentivize the expansion of the health care workforce and health care facilities. • Identify language barriers and use stigma-free language for vulnerable populations.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.4.2		Increase the diversity of the workforce of providers who deliver HIV prevention, testing, and supportive services.	
Data Indicators		• Number of cultural humility trainings performed • Number of HIV testing providers in rural areas • Number of partnerships with rural health networks • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		Community-based organizations, health care delivery systems, public health, and health workforce	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • STD clinics • Drug treatment programs • SSPs • Case managers • Health educators • Peer workers • Linkage coordinators	• Determine areas that lack providers and find ways to incentivize organizations to serve as HIV CBOs. • Encourage HIV testing as a workplace activity. • Engage community hubs and community leaders to broaden their social services by provided HIV testing. • Use all available training resources (local and national) to create a diverse testing force across the state in both traditional and non-traditional settings.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.4.3	Increase inclusion of paraprofessionals and SMEs on prevention teams by advancing training, certification, supervision, financing, and team-based care service delivery.	
Data Indicators	• Number of partnerships with private entities • Assessment of ART barriers conducted • Number of peer navigators or near-peers • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Community-based organizations, health care delivery systems, public health, paraprofessional, and health workforce	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Case managers • Health educators • Linkage coordinators • Peer and near-peer workers • CHWs	• Assess barriers to antiretroviral therapy (HIV treatment or PrEP) in communities • Develop a community-based workforce that is able to provide more services in a single visit • Find creative ways to combat critical workforce attrition • Increase the number of peer navigators providing services. • Leverage partnerships with private entities to increase access to prevention services. • Develop pathways which promote career growth for paraprofessionals.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.4.4	Increase the diversity and capacity of health care delivery systems, community health, public health, and the health workforce to prevent and diagnose HIV.	
Data Indicators	• Number of academic institutions receiving education and outreach • Number of local providers, peer navigators and near-peers that reflect priority populations • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Community-based organizations, health care delivery systems, public health, paraprofessional, and health workforce	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Case managers • Health educators • Linkage coordinators • Peer workers, Near Peers • CHWs	• Increase the number of local care providers, peer navigators, and SMEs of color in order to reflect the burden of the epidemic in a county. • Increase the number of inclusive sexual health services being offered by providing training on sexual orientation and gender identity. • Provide education and outreach to academic institutions (e.g., public health programs, nursing, other paramedical programs) to encourage integration of testing and prevention training into curriculum to increase the number of certified testers. • Require HIV education and training of school personnel. • Require HIV education in clinical licensure. • Establish best practices for responsible parties to hire and retain employees that reflect the epidemic.
Planning Areas		
Statewide		

Goal 2: Improve HIV-Related Health Outcomes of Persons with HIV (PWH)

9.1.2.1 Objective 2.1. Link people to care rapidly after diagnosis and provide low-barrier access to HIV treatment

Strategy 2.1.1	Increase linkage to HIV medical care in 30-days of diagnosis, as early as the same day.	
Data Indicators	• Number of new HIV diagnoses • Number of PWH engaged in care through T&T • Number of PWH engaged in care through telehealth • Number of PWH linked to same-day treatment (rapid ART) • Percent of newly diagnosed PWH linked to HIV medical care in 30 days of diagnosis • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Local RWHAP Part A and EHE partners	• Facilitate the ability of peers, medical providers, and eligibility staff to link clients to care and access rapid ART medications. • Collaborate with local partners and providers across multiple platforms to incorporate more T&T facilities that will offer rapid access to ART and PrEP and PEP medications. • Increase awareness with local providers to incorporate messaging on T&T and rapid ART protocols. • Support the use of incentives such as food and transportation vouchers and phones to assist with linkage to care activities.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.1.2	Provide same-day initiation or rapid start (within 7 days) of ART for those who are able to take it.	
Data Indicators	• Number of new HIV diagnoses • Number of PWH engaged in care through T&T • Number of PWH engaged in care through telehealth • Number of PWH linked to same-day treatment (rapid ART) • Percent of newly diagnosed PWH linked to HIV medical care in 7 days of diagnosis • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Local Part A and EHE programs	• Establish youth ambassadors and advocates; collaborate with academic institutions (e.g., Scale It Up Florida). • Expand routine HIV and STI testing to include additional medical settings (e.g., pediatricians, primary care, and student health centers). • Increase targeted outreach and education efforts specific to specialized youth and teen groups. • Increase the number of culturally competent sexual health education in educational, recreational, and faith-based organizations, facilities, and groups.
Planning Areas		
Statewide		

9.1.2.2 Objective 2.2: Identify, engage, or reengage people with HIV who are not in care or not virally suppressed

Strategy 2.2.1	Expand uptake of data-to-care models using data sharing agreements, integration and use of surveillance, clinical services, pharmacy, and social/support services data to identify and engage people not in care or not virally suppressed.	
Data Indicators	• Number of new HIV diagnoses • Number of PWH linked to same-day treatment (rapid ART) • Number of PWH reengaged through D2C • Number of PWH engaged in care through telehealth • Percent of PWH retained in care • Percent of PWH who are virally suppressed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Local RWHAP Part A and EHE partners	• Collaborate with local partners and providers across more platforms to incorporate more T&T facilities that will offer rapid ART and PrEP and PEP medications. • Develop a single-point eligibility data system that will support all RWHAP partners to assist with linkage and retention services. • Execute cooperative agreements and data sharing agreements with local providers, jails, and prisons to link and refer clients to care who are soon to be released from an institution. • Support data sharing efforts and educate peers, DIS, medical providers, pharmacists, and eligibility and outreach staff on how to assist in linking clients to care and accessing rapid ART medications.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.2.2		Identify and address barriers for people who have never engaged in care or who have fallen out of care.	
Data Indicators		• Number of new HIV diagnoses • Number of PWH linked to same-day treatment (rapid ART) • Number of PWH reengaged through D2C • Number of PWH engaged in care through telehealth • Percent of PWH retained in care • Percent of PWH who are virally suppressed • Additional specific, quantifiable measures for each activity (TBD)	
		Persons living with diagnosed HIV	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Local RWHAP Part A and EHE partners		• Expand opportunities to increase awareness and education of local providers on how to incorporate messaging and services for mental health, substance use, homelessness, and other wrap-around services. • Expand routine HIV/STI testing, and substance use counseling to additional settings such as homeless shelters, urgent care centers, substance use treatment centers. • Expand RWHAP drug formularies to include more treatment drugs for comorbidities. • Expand the use of mobile units to assist with linkage and reengagement efforts. • Support the use of peers to assist with linkage, reengagement, and retention efforts.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.2.3 Objective 2.3: Increase retention and adherence to treatment to achieve and maintain long-term viral suppression.

Strategy 2.3.1		Support the transition of health care systems, organizations, and clients to become more health literate in the provision of HIV prevention, care, and treatment services.	
Data Indicators		• Number of in-person and virtual learning opportunities for staff providing prevention, care, and treatment services • Number of plain language processes and materials developed to assist clients who are newly diagnosed or returning to care • Number of peers and near-peers providing linkage, reengagement, or retention efforts • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		Persons living with diagnosed HIV, health care systems, community-based organizations	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Local Part A and EHE programs		• Develop plain language processes and materials to assist clients who are newly diagnosed or returning to care. • Offer in person and virtual learning opportunities for basic HIV 101 education and increase the number of trained HIV 101 educators and clients (as a result of increased HIV 101 train the trainer opportunities). • Support the use of peers and near-peers to assist with linkage, reengagement, and retention efforts.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.3.2		Develop and implement effective, evidence based or evidence-informed interventions and supportive services that improve retention in care.	
Data Indicators		• Number of peers, near-peers, and/or CHWs providing retention support • Number of peer programs implemented • Number of provider educational opportunities around syndemics • PWH reengaged through D2C • Percent of PWH retained in care • Percent of PWH who are virally suppressed • Additional specific, quantifiable measures for each activity (TBD)	
		Persons living with diagnosed HIV	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Peers and near-peers • CHWs • Linkage coordinators • Local RWHAP Part A and EHE partners		• Collaborate with local partners to educate providers across more platforms on syndemics and work to incorporate HIV (including aging HIV population) into primary care practice. • Expand the use of peers, linkage coordinators and CHWs to implement the ARTAS intervention strategies and adherence measures. • Identify and integrate best practices for peer programs from similar states and jurisdictions. • Review EBIs for effectiveness by using validated tools to predict engagement. Ensure EBIs include target audience. Establish rapid response protocols. • Streamline clinical protocols to eliminate client burden by reducing the frequency of CD4/VL labs, providing 3–6 months of medications at one time, and offering telehealth clinical and case management services.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.3.3	Develop and implement effective, evidence-based, or evidence-informed interventions such as HIV telemedicine, accessible pharmacy services, CHWs and peer navigators, and others, that improve convenience and access, facilitate adherence, and increase achievement and maintenance of viral suppression.	
Data Indicators	• Number of PWH linked to same-day treatment (rapid ART) • Number of PWH reengaged through D2C • Number of PWH engaged in care through telehealth • Number of peers, near-peers, and CHWs providing linkage and retention support • PWH reengaged through D2C • Percent of PWH retained in care • Percent of PWH who are virally suppressed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, health care systems, academic institutions, community-based organizations	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Pharmacies • Peers and near-peers • Case managers • CHWs • Linkage coordinators • SSPs • Local RWHAP Part A and EHE partners	• Allow 3–6 months of ART medications to be dispensed at one time. • Create funding opportunities for community-based providers to support recruitment and retention of staff. • Develop a single-point eligibility data system integrated with multi-data systems that will support all RWHAP parts. Implement a centralized eligibility determination system for all RWHAP Parts. • Expand access to health insurance coverage to eligible clients. • Provide training to health workers and peers that will support or increase adherence measures.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.3.4	Support ongoing clinical, behavioral, and other research to support retention in care, medication adherence and durable viral suppression.	
Data Indicators	• Number of collaborations with academic institutions engaged in HIV research • Number of updates to providers on ongoing or recruiting efforts on clinical trials • Number of FQHCs and other community health settings engaged in research • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, health care systems, academic institutions, community-based organizations	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Local RWHAP Part A and EHE partners	• Encourage persons living with HIV to participate in the research by making research findings easier to understand. • Engage and collaborate with local colleges and universities to increase research opportunities at the local level. • Engage local organizations such as FQHCs to assist with research and interventions. • Provide paid incentives to encourage persons living with HIV, students, or researchers to get involved in the research. • Provide updates to providers on ongoing or recruiting efforts on clinical trials.
Planning Areas		
Statewide		

9.1.2.4 Objective 2.4: Increase the capacity of the public health, health care delivery systems, and health care workforce to effectively identify, diagnose, and provide holistic care and treatment for people with HIV

Strategy 2.4.1	Provide resources, value-based and other incentives, training, and technical assistance to expand workforce and systems capacity to provide or link clients to culturally competent and linguistically appropriate care, treatment, and supportive services especially in areas with shortages that are geographic, population, or facility based.		
Data Indicators	• Number of cultural humility trainings performed • Number of public health workforce trainings on PrEP and PEP, mental health, and substance use or misuse • Number of PWH engaged in care through telehealth • Number of peers, near-peers, and CHWs providing linkage and retention support • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	Persons living with diagnosed HIV, community-based organizations, health care delivery systems, public health, and health workforce		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Pharmacies • Peers and near-peers • Case managers • Linkage coordinators • CHWs • SSPs • Local RWHAP Part A and EHE partners	• Collaborate with the AETC to assist with training efforts. • Establish a statewide conference for medical providers. • Expand telehealth to increase capacity for services and use mobile units to increase outreach efforts. • Increase culturally competent HIV trainings to local providers. • Increase targeted outreach and education efforts specific to specialized providers.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.4.2		Increase the diversity of the workforce of providers who deliver HIV and supporting services.	
Data Indicators	Priority Populations	• Number of public health workforce trainings on basic HIV education • Number of peers, near-peers, and/or community health workers providing linkage and retention support • Number of provider educational opportunities around syndemics • Additional specific, quantifiable measures for each activity (TBD)	
		Persons living with diagnosed HIV, community-based organizations, health care delivery systems, public health, and health workforce	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Peers and near-peers • Case managers • CHWs • SSPs • Local RWHAP Part A and EHE partners		• Facilitate the ability of peers, medical providers, and eligibility staff to link clients to care and access rapid ART medications. • Collaborate with local partners to educate providers across more platforms on syndemics and work to incorporate HIV (including aging HIV population) into primary care practice. • Increase providers of color in communities. • Offer in-person and virtual learning opportunities for basic HIV 101 education and increase the number of trained HIV 101 educators (as a result of increased HIV 101 train the trainer opportunities). • Modify contractual language in HIV contracts to encourage staffing reflects the local demographics of the HIV population.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.4.3	Increase inclusion of paraprofessionals on teams by advancing training, certification, supervision, reimbursement, and team functioning to assist with screening/management of HIV, STIs, viral hepatitis, and mental and substance use disorders and other behavioral health conditions.	
Data Indicators	• Number of peer navigators or near-peers • Number of public health workforce trainings on basic HIV education • Number of peers, near-peers, and CHWs providing screening and adherence support • Number of provider educational opportunities around syndemics • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, community-based organizations, health care delivery systems, public health, paraprofessional, and health workforce	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Peers and near-peers • Case managers • CHWs • SSPs • Certified addiction professionals and counselors • Local RWHAP Part A and EHE partners	• Collaborate with social service organizations on screening and management of HIV, STIs, viral hepatitis, and mental and substance use disorders and other behavioral health conditions. • Identify support staff who can be trained to provide support services in a range of industries (i.e., medical COE). • Develop and implement a statewide peer certification program. • Increase training and inclusion opportunities for CHWs. • Collaborate with other social service providers to increase screening and management of HIV, STI, viral hepatitis, and mental and substance abuse. • Expand collaborations with school health services to provide support to the younger population. • Identify and promote trainings for paraprofessionals regarding social determinants of health and the syndemics facing Florida.
Planning Areas		
Statewide		

9.1.2.5 Objective 2.5 Expand capacity to provide whole-person care to older adults with HIV and long-term survivors

Strategy 2.5.1	Identify, implement, and evaluate models of care that meet the needs of people with HIV who are aging and ensure quality of care across services.		
Data Indicators	• Number of partnerships with organizations that serve PWH aged 50+ • Assessment of barriers to care for PWH aged 50+ • Number of educational opportunities for PWH aged 50+ • Number of collaborations with service providers that specialize in services for the aging population • Number of educational opportunities in settings where persons aged 50+ may reside or congregate (senior centers, retirement communities) • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	Persons over the age of 50 living with diagnosed HIV		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Local RWHAP Part A and EHE partners	• Broaden the scope of partnerships to include established entities who serve PWH over the age of 50 providing primary, specialty and pharmacy services. • Utilize statewide advisory groups to identify barriers in models of care for PWH who are aging. • Collaborate with existing service providers (e.g., Eldersource, Department of Elder Affairs, Visiting Angels) that work with the elderly to integrate in HIV prevention, care, and support services. • Increase HIV and aging education in senior centers, assisted living facilities, retirement communities, and others. • Collaborate with geriatric care providers to educate on risk of aging PWH. Also educate them on risk for older patients who may be at risk of acquiring HIV, e.g., how to talk to and engage older adults in sexual health conversations.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.5.2	Identify and implement best practices related to addressing psychosocial and behavioral health needs of older people with HIV and long-term survivors including substance use treatment, mental health treatment, and programs designed to decrease social isolation.		
Data Indicators	• Number of partnerships with organizations which address psychosocial and behavioral health for PWH aged 50+ and long-term survivors. • Number of educational opportunities on substance use and mental health for PWH aged 50+ • Number of educational opportunities in settings where persons aged 50+ may reside or congregate (senior centers, retirement communities) • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	Persons over the age of 50 living with diagnosed HIV		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • FDEA • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Area Agencies on Aging • Local RWHAP Part A and EHE partners	• Collaborate with local partners to educate providers across more platforms on syndemics and work to incorporate HIV (including aging HIV population) and behavioral health into primary care practice. • Increase provider knowledge on the aging HIV population and the effects on dementia. • Expand partner networks to include organizations already addressing psychosocial and behavioral health for persons with HIV aged 50+ and long-term survivors. • Engage national aging institutions to advise on establishing the most effective program design to address psycho-social and behavioral needs of the aging population including substance use and mental health treatment. • Review existing research and evidence-based practices from mainstream non-HIV oriented care providers and integrate into HIV-oriented care. • Establish Long Term Survivor Empowerment Teams which can foster individual virtual or in-person mental health sessions assessing the needs of patients and ensuring their needs are met accordingly. • Reach out to existing elder services providers to learn more about what they offer and what's working and ask how HIV prevention and support could be added into their efforts.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.5.3	Increase HIV awareness, capability, and collaboration of service providers to support older people with HIV, including in settings such as aging services, housing for older adults, substance use treatment, and disability and other medical services.		
Data Indicators	• Number of partnerships with organizations which address psychosocial and behavioral health for PWH aged 50+ and long-term survivors. • Number of educational opportunities on substance use and mental health for PWH aged 50+ • Number of educational opportunities in settings where persons aged 50+ may reside or congregate (senior centers, retirement communities) • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	Persons over the age of 50 living with diagnosed HIV		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • FDEA • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Area Agencies on Aging • Local RWHAP Part A and EHE partners	• Collaborate with local Area Agencies on Aging. • Collaborate with local partners to educate providers across more platforms on syndemics and work to incorporate HIV (including aging HIV population) and behavioral health into primary care practice. • Establish a long-term survivor peer empowerment team (statewide).	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.5.4	Promote research, cross-agency collaborations, and sharing of research discoveries that address specific aging-related conditions in people with HIV, and other comorbidities and coinfections that can impact people with HIV of all ages.	
Data Indicators	• Number of collaborations with service providers that specialize in services for the aging population • Number of educational opportunities on substance use and mental health for PWH aged 50+ • Number of educational opportunities provided by HIV long-term survivor groups • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, academic institutions, community-based organizations, health care delivery systems, and public health systems	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • FDEA • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Academy of HIV Medicine • Area Agencies on Aging • Association of Nurses in AIDS Care • Local RWHAP Part A and EHE partners	• Create housing opportunities for the aging HIV population. • Expand funding to allow medical and support care for comorbidities. • Integrate cross-agency collaborations to include access to all client-level data to all RWHAP parts. • Provide education around HIV and aging to local partners and service organizations • Provide HIV education to the Florida Insurance Commission's office to promote less insurance burdens on HIV care. • Collaborate with HIV long-term survivor's groups to provide education to various stakeholder groups.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.5.5	Develop and optimize collaborative multi-agency and multi-sectoral approaches and strategies to address emergent and evolving challenges facing people living with HIV at various life stages to support healthy aging with HIV.	
Data Indicators	• Number RWHAP programs offering geriatric case management services • Number of collaborations with service providers that specialize in services for the aging population • Number of educational opportunities on substance use and mental health for PWH aged 50+ • Number of educational opportunities provided by HIV long-term survivor groups • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, academic institutions, community-based organizations, health care delivery systems, and public health systems	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • FDEA • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Area Agencies on Aging • Assisted living and skilled nursing facilities • Local RWHAP Part A and EHE partners	• Expand RWHAP services to offer geriatric case management and offer partner prevention services. • Explore opportunities to educate local and state legislators on the important role medical marijuana plays in the management of HIV disease. • Increase awareness with local providers to incorporate messaging on T&T and rapid ART protocols, HIV stigma and care, and aging HIV population. • Increase provider knowledge on aging HIV population, including persons with perinatally-acquired HIV • Revise service delivery models to address healthy aging and address comorbidities.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.2.6 Objective 2.6: Advance the development of next-generation HIV therapies and accelerate research for HIV cure.

Strategy 2.6.1		Promote research and encourage public-private partnerships to accelerate new therapies to achieve sustained viral suppression and to address drug toxicity, viral resistance, adherence, and retention in care and stigma associated with ART use.	
Data Indicators		• Number RWHAP programs offering geriatric case management services • Number of collaborations with service providers that specialize in services for the aging population • Number of collaborations with academic institutions focusing on HIV therapies and HIV cure research • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		Persons living with diagnosed HIV, academic institutions, community-based organizations, health care delivery systems, and public health systems	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Local RWHAP Part A and EHE partners		• Collaborate with academic institutions to explore opportunities for research around HIV therapies and an HIV cure. • Explore ways to leverage RWHAP Part A funding to support services for aging PWH. • Provide HIV education to the Florida Insurance Commission's office to promote less insurance burdens on HIV care.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.6.2	Increase investment in innovative basic and clinical research to inform and accelerate a research agenda to discover how to sustain viral suppression, achieve ARV-free remission, reduce, and eliminate viral reservoirs, and achieve HIV cure.	
Data Indicators	• Percent of ADAP clients using injectable ART • Number of collaborations with academic institutions focusing on HIV therapies and HIV cure research • Number of collaborations with academic institutions engaged in clinical research and ART clinical trials • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, academic institutions, community-based organizations, health care delivery systems, and public health systems	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Local RWHAP Part A and EHE partners	• Engage with medical providers and insurance companies to on ways to reduce the burden of medication interruption. • Collaborate with academic partners and institutions on clinical research and ART clinical trials. • Collaborate with academic partners and institutions to explore opportunities for research around HIV therapies and an HIV cure. • Increase access to ART injection medications through ADAP and other payer sources.
Planning Areas		
Statewide		

**Goal 3: Reduce HIV-related Disparities and Health Inequities****9.1.3.1 Objective 3.1. Reduce HIV-related stigma and discrimination**

Strategy 3.1.1	Strengthen enforcement of civil rights laws (including language access services and disability rights), reform state HIV criminalization laws, and assist states in protecting people with HIV from violence, retaliation, and discrimination associated with HIV status, homophobia, transphobia, xenophobia, racism, and sexism.	
Data Indicators	• Number of educational and skills building opportunities for PWH • Stigma indicator to be developed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Advocates • Local and state law enforcement • First responders • Department of Justice and U.S. Immigration and Customs Enforcement satellite offices • Correctional facilities • HIV Justice Coalitions • RWHAP partners	• Educate local and state law enforcement agencies on culturally competent HIV basics, civil rights, and trauma informed care. • Educate local and state legislators, political and civic. Leaders and organizations, and policy makers on basic HIV transmission, prevention, and care; include HIV data specific to local areas. • Support education and skill building opportunities for PWH to promote understanding of civil rights and engagement in policy making.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.1.2	Ensure that health care professionals and front-line staff complete education and training on stigma, discrimination, and unrecognized bias toward populations with or at risk for HIV.	
Data Indicators	• Number of continuing education opportunities and trainings for health care professionals and front-line staff • Number of HIV stigma materials developed and/or disseminated • Stigma indicator to be developed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • State and local law enforcement • First responders • RWHAP partners	• Develop and/or identify and disseminate HIV stigma materials and resources for health care professionals and front-line staff. • Identify and disseminate continuing education opportunities and training for health care professionals and front-line staff on HIV stigma; include working with the AETC and Area Health Education Centers. • Work with professional organizations to encourage the adoption of HIV stigma training as part of professional standards for health care professionals and front-line staff.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.1.3	Support communities in efforts to address misconceptions and reduce HIV-related stigma and other stigmas that negatively affect HIV outcomes.	
Data Indicators	• Number of outreach and education opportunities to recruit peers • Number of community and faith-based leaders engaged in trainings that address HIV stigma and misconceptions • Stigma indicator to be developed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • RWHAP partners	• Conduct outreach and education campaigns to train and employ peers to provide education, navigation, and support services. • Create opportunities and invite marginalized individuals to speak and join virtually (and anonymously) to present their perspectives, educate, and stay protected. • Engage community- and faith-based leaders at local and state levels to develop and host culturally tailored trainings that address stigma and HIV misconceptions. • Support local areas to develop general education and social media campaigns and materials to de-stigmatize HIV and those living with or affected by HIV.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.1.4	Ensure resources are focused on the communities and populations where the need is greatest, especially Black, Latino, and American Indian/Alaska Native and other people of color, particularly those who are also gay and bisexual men, transgender people, people who use substances, sex workers, and immigrants.	
Data Indicators	• Number of new diagnoses in communities and priority populations at increased risk for HIV • Number of mobile medical units providing services to priority populations • Number of ongoing and new initiatives for priority populations • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • RWHAP partners	• Identify or develop information to educate potential funders and philanthropic organizations to increase awareness of HIV-impacted populations and communities. • Support ongoing and new initiatives and programs specifically focused on priority populations. • Use HIV data to target HIV and STI education and outreach to high-priority populations and ZIP codes which reflect the residents and effectively represent the community. • Use mobile medical units and street outreach to bring services and resources to communities and populations where the need is greatest.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.1.5		Create funding opportunities that specifically address social determinants of health (SDOH) as they relate to Black, Latino, and American Indian/Alaska Native and other people of color.	
Data Indicators	Priority Populations	• Number of funding opportunities which support programs that address SDOH in Black, Hispanic and other racial/ethnic communities • Number of educational opportunities which address SDOH • Additional specific, quantifiable measures for each activity (TBD)	
		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Tribal organizations • RWHAP partners		• Approach private corporations and other entities for sponsorship and educational opportunities to address SDOH. • Develop mini grants and create other opportunities to support programs that address SDOH in Black, Hispanic/Latino, and other racial/ethnic communities. • Explore opportunities to expand the use of MAI funding and assess outcomes.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.3.2 Objective 3.2. Reduce disparities in new HIV diagnoses, in knowledge of status, and along the HIV care continuum

Strategy 3.2.1		Increase awareness of HIV-related disparities through data collection, analysis, and dissemination of findings.	
Data Indicators		• Number of materials developed and disseminated which highlight HIV-related disparities • Number of HIV data dashboards available • Number of educational opportunities and listening sessions for impacted communities • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • RWHAP partners	• Develop and expand the use of easy-to-read materials (e.g., infographics, one pagers) to help audiences of varying types (general public, clients, providers) to highlight HIV-related disparities. • Expand the use of data dashboards and provide education to relevant groups on how to access and use the information to increase awareness of HIV-related disparities. • Focus efforts to educate and gather information from populations and communities impacted by disparities. Include client perspectives and needs in addition to quantitative data.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.2.2	Develop new and scale up effective, evidence-based, or evidence-informed interventions to improve health outcomes among priority populations and other populations or geographic areas experiencing disparities.	
Data Indicators	• Number of collaborations with academic institutions and other partners (outside of HIV) • Number of funding opportunities which focus on improving health outcomes in priority populations • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Community-HIV Advisory Group • RWHAP partners	• Collaborate with academic institutions and other partners (outside of HIV) to develop EBIs focused on priority populations and geographic areas impacted by disparities; other partners include mental health, substance use, SAMHSA providers, local homeless coalitions, and others.). • Develop funding mechanisms to support the development or scale up of interventions to improve health outcomes (e.g., mini-grants, RFAs, purchase orders). • Support opportunities at local and state levels to develop or scale up EBIs, including developing internship programs to engage young professionals. • Use local economic modeling to determine those interventions for scale up (e.g., interventions that have the greatest potential to reduce HIV in communities and populations experiencing disparities).
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.3.3 Objective 3.3. Engage, employ, and provide public leadership opportunities at all levels for people with or who experience risk for HIV

Strategy 3.3.1		Create and promote public leadership opportunities for people with or at risk for HIV.	
Data Indicators		• Number of people with or at risk for HIV on planning bodies and other advisory groups • Establishment of peer navigator certification program • Number of training and mentorship opportunities for PWH to build leadership and advocacy skills • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • Community-HIV Advisory Group • SSPs • Academia • RWHAP partners	• Develop and support opportunities for people living with or affected by HIV to serve in leadership roles at state and local levels (e.g., HIV Speaker's Bureau). • Establish a statewide peer navigator and educator certification program. • Increase and expand education, training, and mentorship opportunities for PWH to build skills for engaging in a variety of leadership and advocacy roles (social, political, civic, spiritual). • Create an inventory of chairs and co-chairs for local area advisory and planning groups	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.3.2	Work with communities to reframe HIV services and HIV-related messaging so they do not stigmatize people or behaviors.	
Data Indicators	• Number of HIV-related materials reviewed by the state’s educational material review panel • Number of engagement activities conducted with priority populations and local leaders to develop HIV-related messaging • Stigma indicator to be developed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Community-HIV Advisory Group • Educational material review panel • RWHAP partners	• Engage with priority populations and local leaders/influencers to develop HIV-related messaging that does not stigmatize. • Ensure the intentional use of people-first and inclusive language in HIV service delivery, educational materials, and informational campaigns (review existing and incorporate into new products). • Expand the use the state’s health education review panel (i.e., Carlos Alvarez Educational Material Review Panel) to ensure HIV-related messaging and materials are culturally and linguistically appropriate and use people-first language.
Planning Areas		
Statewide		

9.1.3.4 Objective 3.4: Address social determinants of health and co-occurring conditions that exacerbate HIV-related disparities

Strategy 3.4.1		Develop whole-person systems of care that address co-occurring conditions for people with HIV or at risk for HIV.	
Data Indicators		• Number of syphilis diagnoses in communities and priority populations at risk for STIs • Number of HCV diagnoses in communities and priority populations at increased risk for HCV, including PWID • STI, HCV, and TB co-infection rates among persons diagnosed with HIV • Number of new diagnoses in communities and priority populations at increased risk for HIV • Viral suppression percentages in communities and priority populations at increased risk for HIV • Additional specific, quantifiable measures for each activity (TBD)	
		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • RWHAP (all parts) and EHE partners		• Expand local partnerships and collaborate with local providers to address and alleviate barriers to accessing care. • Identify opportunities to centralize eligibility, enrollment services, and health care services for PWH (e.g., HOPWA, RW, ADAP). • Incorporate other health screenings and services into HIV care. • Pilot health care models and interventions for people at risk for or living with HIV who have co-occurring conditions e.g., SUD and mental health conditions.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.4.2		Adopt policies that reduce cost, payment, and coverage barriers to improve the delivery and receipt of services for people with or at risk for HIV.	
Data Indicators		• Number of HIV service providers offering after hours and weekend services for HIV clients • Number of training and cross-training opportunities for medical case managers, RWHAP Part B, HOPWA, and CBOs • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • RWHAP Part A and EHE partners • RWHAP Part B • Health care and related policy and advocacy orgs. • Insurance providers • Pharmaceutical industry partners	• Centralize eligibility processes and cross-train medical case managers, RWHAP Part B, HOPWA and CBOs. • Streamline clinical practices, reduce annual number of visits, CDH, PVC tests. Three or 6-month ART prescriptions. • Explore cost-effective programs that reduce cost, payment, and coverage barriers to improve the delivery and receipt of services for people with or at risk for HIV and use their findings for adopting related policies. • Create consistencies in the RWHAP system of care (Part A, Part B) to eliminate barriers to HIV care (e.g., longer time in between recertification, reciprocal eligibility). • Explore the incorporation of afterhours and weekend services for HIV clients to assist with retention in and adherence to care. • Engage in discussions with Florida Office of Insurance Regulation, Medicaid/Medicare (ACHA), and other entities to identify policies that create barriers for delivery of HIV services for people with or at risk for HIV.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.4.3		Improve screening and linkage to services for people with or at risk for HIV who are diagnosed with and/or are receiving services for co-occurring conditions.	
Data Indicators		• Number of educational opportunities for providers specializing in co-occurring conditions • Number of partnerships with agencies implementing routine screening and linkage services • Number of mobile units offering HIV/STI screening, treatment, and prevention services during non-traditional hours • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • STD clinics • Mobile units • Drug treatment programs • SSPs • Academia • RWHAP and EHE partners	• Educate providers specializing in co-occurring conditions. • Expand collaboration with FQHCs (and FQHC look-alikes) at state level to improve screening. • Expand partnerships with agencies to expand routine screening and linkage to care services for persons newly diagnosed with HIV or for persons previously diagnosed who are returning to care. • Address challenges and barriers to screening and linkage to services for people with or at risk for HIV who are diagnosed with and are receiving services for co-occurring conditions. • For those at risk, educate non-HIV providers to conduct sexual health and substance use risk assessments routinely. Work with medical certification boards to ensure ongoing education and compliance. • Increase the use of mobile units offering HIV and STI screening, treatment, and prevention services beyond traditional testing hours. • Explore opportunities to modify electronic medical records to increase routine screening and facilitate information sharing	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.4.4	Develop and implement effective, evidence-based- or evidence-informed interventions that address social determinants of health among people with or at risk for HIV including lack of continuous health care coverage, HIV-related stigma and discrimination in public health and health care systems, medical mistrust, inadequate housing and transportation, food insecurity, unemployment, low health literacy, and involvement with the justice system.	
Data Indicators	• Number of mobile units providing outreach services to priority populations • Number of educational materials identified and disseminated on client rights and health literacy • Stigma indicator to be developed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Peers and near-peers • CHWs • RWHAP (all parts) and EHE partners • Local and state law enforcement • Housing coalitions • Health care and related policy and advocacy orgs. • Transportation agencies	• Expand the use of mobile outreach units and telehealth technology to address SDOH and provide linkage referrals. • Explore opportunities to use peers and CHWs as mentors outside of the health care system. • Identify and disseminate information and trainings for clients on their rights, grievance policies, customer feedback, and health literacy.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.4.5	Develop new and scale up effective, evidence-based/informed interventions to improve health outcomes and QOL for people across lifespan including youth and people over 50 w/ or at risk for HIV, and long-term survivors.	
Data Indicators	• Establishment of telehealth provider network • Number of cultural humility trainings for providers • Number of non-traditional HIV/STI testing and treatment sites • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons aged 50+; youth; long-term survivors	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • FDEA • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Area Agencies on Aging • Elder services agencies	• Develop a telehealth provider network. • Expand access to HIV/STI testing and treatment outside of public health; include public-private partnerships. • Identify and disseminate trainings that include cultural humility trainings for providers. • Identify best practices for consortia to find and identify EBIs. • Promote long-term survivor groups and the Florida Gay Men's HIV Workgroup.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.4.6	Develop new and scale up effective, evidence-based/informed interventions that address intersecting factors of HIV, trauma and violence, and gender especially among cis- and transgender women and gay and bisexual men.	
Data Indicators	• Number of trainings identified and disseminated on TIC • Number of training opportunities for evidence-based interventions addressing mental health • Number of training opportunities to educate the HIV, STD, hepatitis/substance use, and mental health workforce on intersecting issues • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Correctional settings • RWHAP and EHE partners • Correctional settings • Advocacy groups	• Create opportunities to support providers and agencies implementing EBIs that address trauma and violence. • Identify and disseminate provider trainings on trauma informed care (TIC). • Identify and develop training-of-trainers for TIC to ensure all RWHAP are using a TIC approach. • Provide training opportunities for existing EBIs in the mental health practice. • Identify existing effective, EBIs that address intersecting factors of HIV, trauma and violence, and gender. • Recruit staff with lived experience that reflect the PWH they are trying to serve. • Educate the HIV, STD, hepatitis, substance use, and mental health workforce on the intersecting issues. Ensure diverse organizations are involved in the development of new cross-sectional interventions. Seek out or directly provide funds to support collaborative efforts.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

- 9.1.3.5 Objective 3.5: Train and expand a diverse HIV workforce by further developing and promoting opportunities to support the next generation of HIV providers including health care workers, researchers, and community partners, particularly from underrepresented populations.

Strategy 3.5.1		Promote the expansion of existing programs and initiatives designed to increase the numbers of racial/ethnic minority research and health professionals.	
Data Indicators		• Number of trainings for HBCUs around HIV prevention, care, and treatment • Number of partnerships established with HBCUs • Development of inventory of SPNS projects and opportunities for replication • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		Racial/ethnic minority research and health professionals	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • HBCUs • Health care providers • Health care professional organizations		• Create a state-funded program to fill federal gaps. • Cross-train CHWs. • Increase promotion of the HIV field in academic institutions (e.g., MPH programs, Schools of Medicine, Pharmacy, Nursing, and Social Work) through career fairs and supporting certifications and training programs. • Provide training and opportunities for partnership with HBCUs around HIV prevention, care, and treatment. • Develop an inventory of SPNS and support funding opportunities to replicate effective programs.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.5.2	Increase support for the implementation of mentoring programs for individuals from diverse cultural backgrounds to expand the pool of HIV research and health professionals.	
Data Indicators	• Number of organizations identified that have mentorship programs • Number of training opportunities identified for PWH to build leadership and advocacy skills • Number of professional groups and associations engaged • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • HBCUs • Health care providers • Health care professional organizations	• Identify and support the use of mentorship programs for individuals from diverse backgrounds • Elevate voices of people living with HIV through increased advocacy and training. Encourage their participation through support groups. Ensure people who represent the population are in positions to assist with peer support services. • Support implementation of mentoring programs for individuals from diverse cultural backgrounds to expand the pool of HIV research and health professionals. • Identify organizations that have existing mentoring programs and disseminate the information with other agencies to coordinate efforts. • Reach out to professional groups that emphasize memberships of color like the National Association for Black Social Workers, HBCUs, sororities and fraternities, civic organizations, and others.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.5.3		Encourage the implementation of effective recruitment of community partners through community-based participatory research and social networking approaches.	
Data Indicators		• Number of opportunities to collaborate with the Florida Center for HIV/AIDS Research • Number of research study opportunities shared with community partners and planning bodies • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWI and persons who use drugs	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • HBCUs • Health care providers • Health care professional organizations	• Develop professional articles for publication. • Identify opportunities to collaborate with the FCHAR. • Provide information on and encourage community participation in legitimate research studies and grants. • Recruit youth and young adults to participate in local and state HIV planning bodies and advisory workgroups. • Support the use of community opinion leaders and social networking strategies. • Amplify and encourage efforts to share research output with participants.	
Planning Areas			
Statewide			

9.1.3.6 Objective 3.6: Advance HIV-related communications to achieve improved messaging and uptake, as well as to address misinformation and health care mistrust.

Strategy 3.6.1			Develop and test strategies to promote accurate creation, dissemination, and uptake of information and to counter associated misinformation and disinformation.
Data Indicators	• Number of educational and community sharing opportunities to share information and address misinformation • Number of anti-stigma campaigns and materials developed to dispel HIV myths • Assessment of common myths and misconceptions held in and among priority populations • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Peers and near-peers • CHWs • Academia • Media partners • Digital content providers • RWHAP and EHE partners	• Assess common myths and misconceptions in and among priority populations and identify strategies to combat misinformation. • Promote the use of community sharing experiences and educational opportunities (e.g., community forums, celebrations, observance days). • Ensure messaging is succinct, culturally appropriate, consistent with HIV treatment guidelines, and delivered by persons credible to diverse populations across the state. • Develop and disseminate anti-stigma campaigns which focus on dispelling myths and misconceptions about HIV. • Expand the use of community gatekeepers and social network strategies to deliver HIV information through culturally appropriate methods. • Use existing workgroups to assist with developing and testing strategies to promote accurate creation, dissemination, and uptake of information and to counter misinformation.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.6.2		Increase diversity and cultural competence in health communication research, training, and policy.	
Data Indicators		• Number of collaborations with HBCU medical colleges and other schools of health • Number and type of training opportunities for cultural humility in health communication research • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • HBCUs • Professional and policy organizations and associations	• Create opportunities for advancement among diverse candidates. • Identify ways to create more targeted messaging for specific populations of PWH and consistently use language that is both people-first and inclusive. • Work with HBCU medical colleges such as Pharmacy, Social Work, Nursing, Medical Schools, and others. • Provide training opportunities for diversity and cultural competence in health communication research, training, and policy (e.g., conferences, webinars, lunch-and-learns). • Train and hire PWH who are qualified for roles in HIV leadership, research, training, peer support, and others. • Work with statewide advisory groups and SMEs to identify ways in which diversity and cultural humility can be incorporated into health communication trainings.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.6.3		Expand community engagement in health communication initiatives and research.	
Data Indicators	Priority Populations	• Number and type of engagements with CBOs, social service agencies and community resource centers • Assessment of populations that may not be receiving accurate health information • Number of collaborations with academic institutions to solicit feedback on health communication initiatives and research • Additional specific, quantifiable measures for each activity (TBD)	
		HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Community gatekeepers • RWHAP and EHE partners	• Identify ways to engage priority populations and communities in HIV media and messaging initiatives and research. • Increase engagement with CBOs, community resource centers, and social service agencies to help develop new health communication initiatives; activities could include townhall meetings, focus groups, health fairs, community celebrations, cultural events, and others. • Assess populations that may not be receiving accurate health communications, recruit leaders from those populations and train them to disseminate communications (through staffing agreement). • Engage with academic institutions (e.g., HBCUs) to solicit feedback on health communication initiatives and research. • Amplify and encourage efforts to share research output with participants.	
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.6.4	Include critical analysis and health communication skills in HIV programs to provide participants with the tools to seek and identify accurate health information and to advocate for themselves and their communities.	
Data Indicators	• Number and type of needs assessments conducted • Number of educational opportunities for providers, peers, and staff on health literacy identified and disseminated • Number and type of health literacy resources identified and developed for clients • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • AETC • Community gatekeepers • CHWs • Peers and near-peers	• Explore ways in which to incorporate critical analysis and health communication skills into HIV programs and services to increase client skills needed for health literacy and advocacy. • Ensure that needs assessments are conducted regularly, including questions related to provider communication skills and HIV-related messaging, in order to better respond to community needs and identify areas for improvement. • Identify and disseminate educational opportunities for providers, peers, and staff on health literacy, and encourage providers to screen clients for health literacy in order to be able to ensure the successful transfer of health information and health communication. • Identify and develop health literacy resources for clients that are new to care in order to help orient them to ways they can become more knowledgeable about their health and actively participate in their plan of care. • Increase provider and staff knowledge for strategies to identify and address misinformation and for strategies that increase the sharing of accurate health information.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.6.5			Expand effective communication strategies between providers and clients to build trust, optimize collaborative decision-making, and promote success of evidence-based prevention and treatment strategies.
Data Indicators			• Number of local leaders, influencers, and gatekeepers recruited to assist with communication initiatives • Number of CHWs and peers • Number of education and training opportunities on leading with empathy, active listening, patient experience, and on TIC • Additional specific, quantifiable measures for each activity (TBD)
Priority Populations			HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • AETC • Community gatekeepers • CHWs • Peers and near-peers		• Identify best practices for effective communication strategies between providers and clients to address medical mistrust. • Recruit local leaders, influencers, and gatekeepers to assist with communication initiatives designed to build trust. • Use CHWs and peers help to bridge communication gaps between clients and providers. • Offer education and training on leading with empathy, active listening, patient experience, and TIC to promote understanding amongst clients and providers to build trust in the client to provider relationship. • Research best practices in effective communication and explore the creation of a health communication resource compendium. • Increase the reach of messaging and media by engaging with community leaders and expanding partnerships to include organizations and agencies of all size. • Offer third-party encryption messaging to strengthen consumer trust.
Planning Areas Statewide			

Goal 4: Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic Among All Partners and Interested Parties

9.1.4.1 Objective 4.1. Integrate programs to address the syndemic of HIV, STIs, viral hepatitis, and substance use and mental health disorders in the context of social and/or institutional factors including stigma, discrimination, and violence

Strategy 4.1.1	Integrate HIV awareness and services into outreach and services for issues that intersect with HIV such as intimate partner violence, homelessness/housing instability, STIs, viral hepatitis, and substance abuse/mental health disorders.	
Data Indicators	• Development of community of practice to share expertise and collaborate on focus areas • Number of trainings identified and disseminated related to human trafficking, domestic violence, and sexual assault • Number of partnerships with mobile providers • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • PWH engaged in services • Housing coalitions • HOPWA providers • State and local law enforcement	• Develop a Community of Practice program (HUD, Homeless Coalition, FDOE, FDC) to learn, share expertise, and collaborate on focus areas. • Expand marketing and advertising campaigns of internal and external partners to promote and increase awareness of resources and services. • Identify and disseminate trainings and technical assistance on human trafficking, domestic and intimate partner violence and sexual assault for health care staff. • Increase partnerships with mobile service providers. • Leverage social media and outreach to disseminate program results and lesson learned.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.1.2		Implement a no-wrong-door approach to screening and linkage to services for HIV, STIs, viral hepatitis, and substance use and mental health disorders across programs.	
Data Indicators		• Number of reciprocal agreements established with local community partners • Number of HIV service providers using a no-wrong-door approach to screening and linkage services • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Health care providers • RWHAP and EHE partners	• Adopt a no-wrong-door approach focused on streamlining referral processes and linkage to care. A no-wrong-door approach provides individuals with or links them to appropriate services regardless of where they enter the system of care. This principle commits all service agencies to respond to the individual's stated and assessed needs with appropriate treatment or supportive linkage with programs capable of meeting the client's needs. • Establish local referral networking system to increase access to care through assignment of health care navigators. • Establish reciprocal agreements with local community partners.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.1.3	Identify and address funding, policy, data, workforce capacity, and programmatic barriers to effectively address the syndemic.	
Data Indicators	• Number of local information sessions conducted with stakeholders to identify barriers to service delivery • Analysis of data from the state’s HIV/AIDS hotline • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health and human rights advocates • HIV/AIDS policy experts • Health care providers • STD clinics • RWHAP and EHE partners • Local planning bodies	• Analyze and explore ways to use data from the state HIV/AIDS hotline to assess barriers. • Access statewide resources to identify gaps in service and funding opportunities to combat programmatic barriers. • Conduct local information sessions/workshops with stakeholders to analyze data and identify problematic areas as it relates to the delivery of service. • Create incident reporting system to identify individuals in need of assistance (e.g., assault, discrimination, housing). • Engage with local and state legislators to educate and inform on workforce capacity and impacts of staffing shortages.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.1.4		Coordinate and align strategic planning efforts on HIV, STIs, viral hepatitis, substance use disorders, and mental health care across national, state, and local partners.	
Data Indicators	Priority Populations	• Development of collaborative forum to share and learn about OD2A programs • Number of local health care facilities participating in local community health needs assessments • Additional specific, quantifiable measures for each activity (TBD)	
		HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • FDCF • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings and providers • Drug treatment programs • SSPs • Academia • Health care providers • RWHAP and EHE partners • Local planning bodies		• Ensure the Community Health Improvement Plan and Community Health Assessment is inclusive of internal and external partners. • Create a collaborative forum to share and learn about (OD2A programs across multi-agencies (e.g., faith-based organizations, CBOs, providers, the Department, FDCF). • Ensure the State Health Improvement Plan process and planning is inclusive of external groups and partners. • Establish a role or function in existing local planning bodies to conduct research into opioid initiatives and networks. • Invite local health care facilities to participate in local community health needs assessments.
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.1.5	Enhance the ability of the HIV workforce to provide naloxone and educate people on the existence of fentanyl in the drug supply to prevent overdose and deaths and facilitate linkage to substance use disorder treatment and harm reduction programs.	
Data Indicators	• Number of opportunities to education state and local legislators on harm-reduction practices • Number of local planning bodies supporting or participating in opioid initiatives • Number and type of naloxone access points • Number of naloxone training courses identified and disseminated • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • State and local law enforcement • Local planning bodies • RWHAP and EHE partners	• Educate local and state legislators on the use of fentanyl test strips and alignment with harm-reduction practices. • Establish a role or function in existing local planning bodies across multiple agencies (CHD, community, state, FCPN, OD2A project opioid providers) to support and/participate in opioid initiatives or the development of an opioid initiative. • Implement Naloxone Training Course and Training Program (CDC) • Increase the number of access points for naloxone (statewide). • Integrate OD2A into RWHAP service delivery system at local levels.

Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.4.2 Objective 4.2 Increase coordination among and sharing of best practices from HIV programs across all levels of government (federal, state, tribal, local, and territorial) and with public and private health care payers, faith-based and CBOs, the private sector, academic partners, and the community

Strategy 4.2.1		Focus resources including evidence-based and evidence-informed interventions in the geographic areas and priority populations disproportionately affected by HIV.	
Data Indicators		• Development of interactive locator for mobile service providers • Number of public-private partnerships established at local levels • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • RWHP and EHE partners • Digital resource providers (e.g., AIDSVu)		• Develop a mapping tool/interactive map locator/pin map of mobile units. • Develop regular partnership meetings with internal and external service providers at the local level. • Foster strong public-private partnerships to accelerate advances in HIV by inviting stakeholders outside of typical HIV partnerships to attend awareness days and generate new approaches to addressing the HIV epidemic. • Identify best practices and interventions from other jurisdictions that address similar priority populations. • Increase the use of outreach and education to reach priority populations and geographies.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.2.2	Enhance collaboration among local, state, tribal, territorial, national, and federal partners, and the community to address policy barriers that contribute to persistent HIV-related disparities and implement policies that foster improved health outcomes.	
Data Indicators	• Development of centralized information platform to collect integrated HIV planning information • Number of and type of materials developed and disseminated in three languages (i.e., English, Spanish and Haitian-Creole) • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health and human rights advocates • HIV/AIDS policy experts • Health care providers • PWH engaged in services • Tribal organizations • Minority leadership programs • RWHAP and EHE partners	• Appoint community liaisons among local, state, tribal, territorial, national, and federal partners to assess and address barriers and social determinants via policy change and enhanced communication. • Create a centralized information platform to house local, county, state, consortium planning body meeting information, and proposed activities, and projects. • Create opportunities to bring a wide variety of partners and stakeholders together to increase cross-collaboration. • Foster strong public-private partnerships to accelerate advances in HIV by inviting stakeholders outside of typical HIV partnerships to attend awareness days and generate new approaches to addressing the HIV epidemic. • Incorporate three-language formula in marketing and advertising materials to overcome social barriers in disproportionate communities.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.2.3		Coordinate across partners to quickly detect and respond to HIV outbreaks.	
Data Indicators		- Number and geographic location of HIV transmission clusters identified - Number of intersectional teams developed at local levels for outbreak response - Number of mobile units using HIV transmission cluster data to direct positioning - Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities	
By 12/31/2026	- The Department - Community- and faith-based organizations - Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites - Behavioral health care and substance abuse settings - Drug treatment programs - SSPs - Academia - Health care providers - RWHAP and EHE partners	- Create a centralized system for outbreak detection, reporting, and notification (e.g., meningitis, Mpox, HIV, STD, viral hepatitis). - Develop intersectional teams and protocols that include Department DIS, RWHAP programs, funded EHE providers, case managers, local medical and support services providers to share information and rapidly identify and link individuals diagnosed with HIV to care and treatment. - Establish response planning teams across multi-agencies and multi-sectors of the community (e.g., faith-based organizations, CBOs, providers, the Department) to track HIV outbreaks and provide rapid access to HIV treatment and care. - Use HIV transmission cluster data to direct the positioning of mobile units to respond to clusters of active transmission.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.2.4	Support collaborations between CBOs, public health organizations, education agencies and schools, housing providers, and health care delivery systems to provide linkage to and delivery of HIV testing, prevention, care, and treatment services as well as supportive services.	
Data Indicators	• Inventory of multi-agency collaborations at local levels • Number of partnerships with non-traditional sites to provide HIV awareness, prevention, or linkage services • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Educational institutions • Health care providers • Housing providers • RWHAP and EHE partners	• Advocate for the revision of MOAs and contracts to include specific standards, wrap-around services (e.g., housing, mental health services, and participation in planning). • Assess and review state and national collaborative frameworks to identify and adopt approaches that enhance current and future public-private partnerships that help scale up best practices and advances in HIV prevention and treatment. • Educate local and state legislators on the state's priority populations and geographies. • Form partnerships with non-traditional sites (e.g., gas stations, sporting events, public restrooms, rest stops) for the extension of providing HIV prevention and treatment services or awareness. • Identify best practices for increasing collaborations among CBOs, public health organizations, education agencies and schools, housing providers, and health care delivery systems to provide linkage to and delivery of HIV testing, prevention, care, and treatment services as well as supportive services.
Planning Areas		
Statewide		

9.1.4.3 Objective 4.3 Enhance the quality, accessibility, sharing, and uses of data, including HIV prevention and care continua data and social determinants of health data

Strategy 4.3.1 Promote the collection, electronic sharing, and use of HIV risk, prevention, and care and treatment data using interoperable data standards, including data from electronic health records, in accordance with applicable law.		
Data Indicators	• Development of centralized dashboard to share aggregate HIV-related data • Number of data sharing agreements developed with RWHAP partners • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • RWHAP and EHE partners • AHCA • Correctional settings • Community HIV Advisory Group	• Create centralized system or dashboard to share aggregate HIV-related data (e.g., testing, treatment, surveillance) internally and externally that can be readily used to understand local area disease burden, obtain information for grant requirements and using data for action and response. • Design a data system and process for improving data sharing amongst all RWHAP Parts, Florida ADAP, and service providers to improve client-level data sharing and HRSA RSR reporting requirements. • Develop a process to improve and simplify the sharing of HIV-related data both internally and externally to the Department to improve service provision. • Develop a process to increase working with external partners such as VA, private providers, Medicare, and others to improve data sharing at state and local levels. • Ensure that forms and policies around release of information and methods for release (e.g., text, email, phone) are continuously updated and shared with providers.
Planning Areas Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.3.2	Use interoperable health information technology, including application programming interfaces (APIs), clinical decision support tools, electronic health records and health IT products certified by the Office of the National Coordinator’s Health IT Certification Program, and health information exchange networks, to improve HIV prevention efforts and care outcomes.	
Data Indicators	• Evaluation of digital resources and clinical decision support tools • Development of reciprocal client-informed consent and release of information • Number of local areas with electronic referral systems • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • RWHAP and EHE partners • Community HIV Advisory Group • AHCA • Correctional settings	• Assess the ability to create a Health Information Exchange (HIE) and master client index among HIV service providers and link the current Florida HIE to data in the HIV/AIDS Section to improve linkage to care efforts. • Create a reciprocal (e.g., across agencies and all RWHAP parts) client-informed consent and release of information to acknowledge that data may be shared to improve service provision and linkage to care needs. • Develop a process and system to initiate and track electronic referrals to HIV-related prevention, treatment services and other ancillary services. Consult with the AIMS workgroup to review current resources. • Evaluate and promote the use of digital resources and clinical decision support tools. • Identify ways to improve data collection efforts for HIV prevention efforts (e.g., HIV self-test kit information).
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.3.3			Encourage and support patient access to and use of their individual health information, including use of their patient-generated health information and use of consumer health technologies in a secure and privacy supportive manner.
Data Indicators	• Development of client-centered training module around public health data collection and uses of patient information for public health • Development of reciprocal client-informed consent and release of information • Number and type of information shared around use of patient portals to facilitate client access to medical information • Assessment of information sharing methods best suited for rural communities and other areas with limited internet access • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • PWH engaged in services • RWHAP and EHE partners • AHCA • Correctional settings • Community HIV Advisory Group	• Create a client-centered training module around public health data collection and uses of patient information for public health purposes to assist with alleviating fears about misuse and privacy concerns. • Provide guidance and supportive information to encourage the use of patient portals from providers and laboratories to ensure that clients have direct access to their medical information. • Ensure health communication and messaging from provider to client is private, secure, and accessible, and occurs through a HIPAA-compliant platform or channel. • Explore the incorporation of a centralized patient portal or health information application. • Encourage providers currently using patient portals to offer additional client-centered education on patient portal functionality and utilization. • Explore the increase of in-app or in-portal patient health education opportunities. • Assess methods to increase information sharing and patient health education opportunities for people living in rural communities or other areas with limited internet access.	
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.4.4 Objective 4.4: Foster private-public-community partnerships to identify and scale up best practices and accelerate HIV advances.

Strategy 4.4.1	Adopt approaches that incentivize the scale up of effective interventions among academic centers, health departments, CBOs, allied health professionals, people with HIV and their advocates, the private sector, and other partners.	
Data Indicators	• Number and type of public-private partnerships established and maintained • Development of statewide conference on HIV • Number of non-traditional partners participating in local HIV awareness events • Number of HIV prevention and treatment sites using ARV starter packs • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • PWH engaged in services • RWHAP and EHE partners • AHCA • Correctional settings • Community HIV Advisory Group	• Review and assess state and national collaborative frameworks to identify and adopt approaches that enhance current and future public-private partnerships that help scale up best practices and advances in HIV prevention and treatment. • Conduct an annual statewide conference on HIV and invite a wide range of traditional and non-traditional partners to participate and attend and share best practices. • Foster strong public-private partnerships to accelerate advances in HIV by inviting stakeholders outside of typical HIV partnerships to attend awareness days and generate new approaches to addressing the HIV epidemic. • Identify public-private partnership EBIs to scale up the use of ARV starter packs.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.4.2	Expand opportunities and mechanisms for information sharing and peer technical assistance in and across jurisdictions to move effective interventions into practice more swiftly.	
Data Indicators	• Development of centralized information repository on best practices programs and interventions for addressing the HIV epidemic • Number and type of information sharing mechanisms used in local areas • Number of multi-agency collaboratives supporting data and information sharing • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • PWH engaged in services • RWHAP and EHE partners • AHCA • Correctional settings • Community HIV Advisory Group	• Create a centralized information repository to house and disseminate information on best practices, meeting information, and other information that will assist with addressing the HIV epidemic. • Develop local e-newsletters or other mechanisms to disseminate information quarterly on available resources and EBIs being used in the state. • Identify and establish local area collaborative coalitions across multi-agencies and multi-sectors of the community (e.g., faith-based organizations, CBOs, providers, the Department and others) to support data and information sharing and identify best practices that address the HIV epidemic. • Identify state and local subject matter experts and create a state specific technical assistance network.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.4.3			Develop and optimize collaborative multi-agency and multi-sectoral approaches and strategies to address emergent and evolving challenges facing persons of all ages living with HIV.
Data Indicators	• Development of centralized information repository on best practices programs and interventions for addressing the HIV epidemic • Number and type of information sharing mechanisms used in local areas • Number of multi-agency collaboratives supporting data and information sharing • Additional specific, quantifiable measures for each activity (TBD)		
	Priority Populations		
PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers			
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Health care providers • Academia • PWH engaged in services • RWHAP and EHE partners • AHCA • Correctional settings • Community-HIV Advisory Group	• Adopt a collaborative implementation science approach to evaluate, design, and implement strategies that improve health-related outcomes and promote the dissemination and replication of successful interventions and best practices locally. • Create a centralized online platform to collect and respond to complaints, challenges and general inquiries from service providers, clients, stakeholders, and the public. • Foster new and existing community, private, and cross-sector partnerships through strengthened communication and by supporting increased collaborative opportunities or Memorandums of Understanding centered on sharing information, discussing strategies, and providing education. • Increase partnerships and collaboration to provide age-appropriate sexual health resources, education, and support services for young people. • Conduct an annual statewide conference on HIV and invite a wide range of traditional and non-traditional partners to participate and attend and share best practices.

9.3 Partnership Area Resource Inventories

9.4 Epidemiologic Profile

The full Epidemiologic Profile of HIV in Florida, 2017–2021 will be made available separately.

9.5 Other Supporting Documentation

9.6 Glossary

Acquired Immunodeficiency Syndrome (AIDS): A condition that exists when a person has tested positive for HIV and has one or more of 26 listed opportunistic illnesses/infections and/or a T-cell count of 200 or less per micro-liter of blood.

Business Responds to AIDS (BRTA): Modeled after the CDC initiative by the same name, developed initially in 1992, BRTA programs support targeted HIV prevention efforts through partnerships with local businesses. BRTA programs mobilize businesses and labor organizations to respond to HIV/AIDS in the workplace and the community with subtle, noninvasive approaches to raise awareness, promote services, and break down stigma. BRTA activities involve the use of promotional and incentive items that businesses can use to generate conversations around HIV/AIDS with their customers.

Community-Based Organization: A non-profit organization with a 501(c)(3) designation.

Community Engagement: The process of working collaboratively with and through groups of people affiliated by geographic proximity, special interest, or similar situations to address affecting the well-being of those people.

Community Health Worker: Trusted, knowledgeable frontline health personnel who typically come from the communities they serve. CHWs bridge cultural and linguistic barriers, expand access to coverage and care, and improve health outcomes.

Counseling, Testing and Linkage: Provision of counseling, testing and direct assistance in getting a client enrolled into the health and social service system.

Culturally Appropriate: Conforming to a culture's acceptable expressions and standards of behavior and thought. Interventions and educational materials are more likely to be culturally appropriate when representatives of the intended target audience are involved in planning, developing, and pilot testing them.

Epidemic: The occurrence of cases of an illness, specific health-related behavior, or other health-related events in a community or region in excess of normal expectancy.

Ethnicity: The cultural characteristics that connect a particular group or groups of people to each other, such as people of Hispanic or Latino origin.

Faith-Based Organization: A non-governmental agency owned by religiously affiliated entities such as (1) individual churches, mosques, synagogues, temples, or other places of worship or (2) a network or coalition of churches, mosques, synagogues, temples, or other places of worship.

Faith Responds to AIDS (FRTA): Built on the same framework as BRTA, FRTA is a Florida adaptation of the BRTA initiative but for faith-based organizations. FRTA programs are faith-based initiatives that mobilize churches and other faith-based institutions to raise awareness and reduce stigma around HIV/AIDS. FRTA programs are particularly effective at reaching minority communities. FRTA activities involve the use of promotional and incentive items that faith-based organizations can use to generate conversations around HIV/AIDS with their members.

Females: Individuals of the sex that produces large and generally immobile gametes (ova or eggs).

High-Impact Prevention (HIP): Using combinations of scientifically proven, cost-effective and scalable interventions targeted towards the highest risk populations in the right geographic areas to reduce new HIV infections.

HIV Mode of Exposure: Specific behaviors or actions that expose people to HIV and can potentially lead to HIV acquisition. Examples include unprotected anal or vaginal sex with a person living with HIV, injecting drugs with non-sterile, shared drug injection equipment, and male-to-male sexual contact.

Human Immunodeficiency Virus (HIV): The retrovirus virus can lead to AIDS, if not treated. The virus occurs in two types—HIV-1 and HIV-2. Both types are transmitted through direct contact (e.g., through sexual intercourse or sharing injection drug equipment) with HIV-infected body fluids, such as blood, semen, and genital secretions, or from an HIV-positive mother to her child during pregnancy, birth, or breastfeeding.

Incidence: The occurrence of new cases of disease or injury in a population over a specified period of time.

Integrated Prevention and Care Plan: A plan based on the Integrated HIV Prevention and Care Plan Guidance that requires a collaborative process between CDC and HRSA to identify and address: statewide goals for HIV prevention and care; emphasize the populations and communities most affected by the epidemic; highlight areas of need, service gaps, and barriers; identify health disparities and social determinants of HIV-related health; outline activities for implementing goals; and, identify factors for measuring success in achieving goals.

Intervention: A specific activity (or set of related activities) intended to reduce the risk of HIV transmission or acquisition. Interventions may be either biomedical or behavioral and have distinct process and outcome objectives and protocols outlining the steps for implementation.

Linkage: Actively assisting clients with accessing needed services through a time-limited professional relationship. The active assistance typically lasts a few days to a few weeks and includes a follow-up component to assess whether linkage has occurred. Linkage services can include assessment, supportive counseling, education, advocacy, and accompanying clients to initial appointments.

Males: Individuals of the sex that produces small, mobile gametes (sperm).

Men who have Sex with Men (MSM): Men who report sexual contact with other men and men who report sexual contact with both men and women (i.e., bisexual contact), whether or not they identify as gay.

National HIV/AIDS Strategy for the United States: A comprehensive plan focused on reducing HIV incidence, increasing access to care and optimizing health outcomes, and reducing HIV-related health disparities.

Navigation Services: Patient navigation assistance is the process of helping a person obtain timely and appropriate medical or social services, taking into account provider preferences,

insurance status, scheduling issues, and other factors that may complicate access or utilization of services.

Navigator: Patient navigators are peers, volunteers, and/or staff members of clinics, health departments, and community-based organizations. Patient navigators may be lay persons, paraprofessionals, or medical professionals (e.g., RNs, LPNs).

Partner Services: A systematic approach to notifying sex and needle-sharing partners of PWH of their possible exposure to HIV so they can be offered HIV testing and learn their status or, if already diagnosed, prevent transmission to others. Partner Services helps partners gain earlier access to individualized counseling, HIV testing, medical evaluation, treatment, and other prevention services.

Peers (or Near-Peers): Specially trained individuals from the community who may or may not be living with HIV/AIDS, but ultimately have lived experience.

Perinatal: Occurring during the period around birth (5 months before and 1 month after)

Post-Exposure Prophylaxis (PEP): The provision of antiretroviral medications to prevent transmission of HIV following an occupational or non-occupational exposure. Non-occupational post-exposure prophylaxis is referred to as nPEP.

Pre-Exposure Prophylaxis (PrEP): Antiretroviral medication taken to prevention acquiring HIV.

Prevalence: The number of people with a specific disease or condition in a given population at a specific time.

Race: A person's self-reported classification of the biological heritage with which they most closely identify.

Rapid HIV Test: A point-of-care HIV screening test used in both clinical and non-clinical settings, usually with blood from a finger stick or with oral fluid.

Ryan White Treatment Modernization Act: The name given to the Ryan White Comprehensive AIDS Resources Emergency (CARE) Act when it was reauthorized in 2006. This is the primary federal legislation that addresses the needs of persons in the United States living with HIV/AIDS and their families. The original CARE Act was enacted in 1990.

Seroprevalence: The overall occurrence of a disease or condition within a defined population at one time, as measured by blood tests.

Sex: Either of the two main biological categories (male and female) into which humans and most other living things are divided on the basis of their reproductive functions.

Social Determinants: The economic and social conditions that influence the health of persons, communities, and jurisdictions and include conditions for early childhood development; education, employment, and work; food security; health services; housing; income; and social exclusion.

Surveillance: The ongoing and systematic collection, analysis, and interpretation of data about occurrences of a disease or health condition.

Syndemic: The aggregation of two or more concurrent or sequential epidemics or disease clusters in a population with biological interactions, which exacerbate the prognosis and burden of disease.

Transgender: A person who does not identify with their sex at birth and may undergo gender transitionary care including hormone therapy and/or surgical procedures. This is also recognized as gender dysphoria.

Table of Acronyms and Abbreviations

AA	Administrative Agency
Ab	Antibody
ACA	Affordable Care Act
ACIP	Advisory Committee on Immunization Practices
ADA	American Disabilities Act
ADAP	AIDS Drug Assistance Program
AIDS	Acquired Immune Deficiency Syndrome
aPTT	Activated Partial Thromboplastin Time
TCT	Take Charge Texas Database
ART	Antiretroviral Therapy
ASAM	American Society of Addiction Medicine
ASI	Addiction Severity Index
ASL	American Sign Language
BIA	Bethesda Inhibitor Assay
BIA	Bioelectrical Impedance Analysis
BMI	Body Mass Index
BUN	Blood Urea Nitrogen
CARE/HIPP	Health Insurance Premium Payment
CBC	Complete Blood Count
CCR5	C-C chemokine receptor type 5
CD4	Cluster of Differentiation 4
CEU	Continuing Education Unit
CLAS	National Standards for Culturally and Linguistically Appropriate Services
CLIA	Clinical Laboratory Improvement Amendments
CNS	Clinical Nurse Assistant
COBRA	Consolidated Omnibus Budget Reconciliation Act
COVID-19	Coronavirus Disease 2019
CT	Chlamydia
DADS	Texas Department of Aging and Disability Services
DCHHS	Dallas County Health and Human Services
DHHS	Texas Office for Deaf and Hard of Hearing Services
DIS	Disease Intervention Specialist
DO	Doctor of Osteopathic Medicine
DPA	Dallas Planning Area
DSHS	Texas Department of State Health Services
DSW	Doctor of Social Work
EdD	Doctor of Education
EFA	Emergency Financial Assistance
eGFR	Estimated Glomerular Filtration Rate
EHE	Ending the HIV Epidemic
EIA	Enzyme Immunoassay
ePHI	Electronic Personal Health Information
EIS	Early Intervention Services

EMA	Eligible Metropolitan Area
FDA	U.S. Food and Drug Administration
FPL	Federal Poverty Level
GC	Gonorrhea
HAB	HIV/AIDS Bureau
HAV	Hepatitis A Virus
HBsAb	Hepatitis B Surface Antibody
HBV	Hepatitis B Virus
HCO₃	Bicarbonate
HCV	Hepatitis C Virus
HDL	High-density lipoprotein
HHS	U. S. Department of Health and Human Services
HIA	Health Insurance Premium and Cost-Sharing Assistance
HIV	Human Immunodeficiency Virus
HLA-B*5701	Human Leukocyte Antigen major histocompatibility complex, class I, B
HOPWA	Housing Opportunities for Persons with AIDS
HRA	High High-Resolution Anoscopy
HRSA	Health Resources and Services Administration
HSDA	HIV Service Delivery Area
IgG	Immunoglobulin G
IGRA	Interferon Gamma Release Assay
LDL	Low-density lipoprotein
LPAP	Local Pharmaceutical Assistance Program
LTBI	Latent Tuberculosis Infection
LVN	Licensed Vocational Nurse
MA	Master of Art
MA	Medical Assistant
MAC	Mycobacterium avium complex
MCM	Medical Case Manager/ Medical Case Management
MD	Doctor of Medicine
MEd	Master of Education
mL	milliliter
mm³	cubic millimeter
MMR	Measles, Mumps, and Rubella
MMSE	Mini Mini-Mental State Examination
MNT	Medical Nutrition Therapy
MS	Master of Science
MSW	Master of Social Work
NAAT	Nucleic Acid Amplification Test
NMCM	Non-Medical Case Management
NMS	National Monitoring Standards
NP	Nurse Practitioner
nPEP	Non-occupational post-exposure prophylaxis
OAHS	Outpatient/Ambulatory Health Services
OBRA	Omnibus Budget Reconciliation Act
PA	Physician Assistant
Pap	Papanicolaou (test)

Tdap	Tetanus, Diphtheria, and Pertussis
THMP	Texas HIV Medication Program
TMB	Texas Medical Board
TST	Tuberculin Skin Test
USPSTF	United States Preventive Services Task Force
VA	Veteran's Administration Benefits
VTCA	Vernon's Texas Code Annotated
VZV	Varicella-Zoster Virus
WIC	Special Supplemental Nutrition Program for Women, Infants, and Children
μL	microliter

INTRODUCTION

This document provides guidance for care and service delivery, billing, and documentation requirements for organizations receiving Ryan White Parts A, B, State Services, and Ending the HIV Epidemic (EHE) funding in the Dallas Eligible Metropolitan Area (EMA) and the Dallas and Sherman-Denison HIV Service Delivery Areas (HSDA). The guidelines in this document are effective March 1, 2025, through February 29, 2026, and are not to be applied retroactively. Descriptions of the core medical and support services, the [How Best to Meet the Priority](#) document, and the [Service Category Eligibility Based on Federal Poverty Level Guidelines](#) document were developed and approved by the Ryan White Planning Council of the Dallas Area (RWPC) for service delivery in the Dallas EMA and the Dallas and Sherman-Denison HSDAs, known collectively as the Dallas Planning Area (DPA).

DEFINITIONS

Activities May Include:

A list of specific activities that are reimbursable under this service category. This list **is not** comprehensive; it was developed and approved by the RWPC.

Activities Must Include:

A list of specific reimbursable activities that must be included in the delivery of this service category; developed and approved by the RWPC.

Activities May Not Include:

A list of specific activities that are not reimbursable under this service category; developed and approved by the RWPC.

Unallowable Costs Include (per the Health Resources and Services Administration (HRSA)):

- Direct payments to clients
- Clothing
- Employment and employment-readiness services, except in limited, specified instances (e.g., Non-medical case management services or rehabilitation services)
- Funeral and burial expenses
- Property taxes
- Pre-exposure prophylaxis (PrEP)
- Non-occupational post-exposure prophylaxis (nPEP)
- Materials designed to promote or encourage, directly, intravenous drug use or sexual activity, whether homosexual or heterosexual
- International travel
- The purchase or improvement of land
- The purchase, construction, or permanent improvement of any building or other facility

Unit of Service:

The increment of service delivery used for reimbursement requests, documentation, and Take Charge Texas (TCT) entry. It was developed and approved by the Ryan White Grants Management Division of Dallas County Health and Human Services (the Administrative Agency (AA)).

Billing Limitations:

Additional restrictions or limits on the type or amount of service(s) eligible for reimbursement under applicable service categories developed and approved by the RWPC and the Ryan White Grants Management Division of Dallas County Health and Human Services.

How Best to Meet the Priority:

Special instructions developed and approved by the RWPC. These recommendations are ancillary to the services described in this document. They **may not be eligible** for reimbursement through Ryan White, Housing Opportunities for Persons with AIDS (HOPWA), or State Services grants. **Note:** Backup documentation must be submitted for all service units for which reimbursement is requested.

STATE AIDS DRUG ASSISTANCE PROGRAM TREATMENTS

HRSA Description: The AIDS Drug Assistance Program (ADAP) is a state-administered program authorized under Part B of the Ryan White HIV/AIDS Program (RWHAP) to provide U.S. Food and Drug Administration (FDA)-approved medications to low-income clients living with HIV who have limited or no coverage from private insurance for eligible clients and for services that enhance access to, adherence to, and monitoring of antiretroviral therapy (ART). RWHAP ADAP recipients must conduct a cost-effectiveness analysis to ensure that purchasing health insurance is cost-effective compared to the cost of medications in the aggregate. Eligible ADAP clients must be living with HIV and meet the state's income and other eligibility criteria. Please refer to the [Texas HIV Medication Program \(THMP\) webpage for more information](#).

Activities include those determined by the state. ADAP funds may not be used for Local AIDS Pharmaceutical Assistance Program (LPAP) support. LPAP funds are not emergency financial assistance for medications. Allocations for State ADAP are administered through Part B funds and cannot be allocated with Part A or Minority AIDS Initiative (MAI) funds.¹

¹ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. AIDS Drug Assistance Program Treatments. [Page 8](#)

UNIVERSAL STANDARDS OF CARE

The Universal Standards listed below apply to all service categories funded under the RWHAP Part A, B, State Services, and Ending the HIV Epidemic programs for direct care service providers. These standards also apply to services funded in the Dallas EMA/HSDA. These Universal Standards are taken directly from [HRSA's Ryan White HIV/AIDS Program \(RWHAP\) National Monitoring Standards for RWHAP Part A Recipients](#), which includes the Part B HIV/AIDS Bureau (HAB) National Monitoring Standards and expanded to include the Texas Department of State Health Services (DSHS) program requirements for all Ryan White Part B and State Service subrecipients. HRSA/HAB "expects recipients to monitor fiscal and programmatic compliance with all contracts and other agreements for HIV services in the [EMA and] State/Territory" and to report on "ongoing progress" of implementation of the National Monitoring Standards (NMS).

STANDARD OF CARE FOR LICENSURE OR ASSURANCES

- I.** All service providers that receive Dallas County Health and Human Services (DCHHS) pass-through funds from local, state, or federal sources must comply with existing local, state, or federal laws and regulations governing the need for a criminal history check of prospective staff or volunteers. If the provider employs an individual in a staff or volunteer capacity despite discovering a history of prior criminal activity, DCHHS will assume no responsibility for the service provider's decision or any adverse consequences resulting from the employment.
- II.** All service providers shall ensure that each staff member signs a confidentiality agreement annually, affirming individual responsibility for keeping client information and data confidential, and shall maintain original signed confidentiality and Assurances documentation in staff personnel files.
- III.** All service providers shall ensure that each staff member signs Assurances annually, acknowledging that they have reviewed security policies and procedures relevant to their position and shall maintain original signed confidentiality and Assurances documentation in staff personnel files.

STANDARD OF CARE FOR STAFF AND VOLUNTEER TRAINING PROGRAMS

The service provider shall provide to its staff and volunteers the following training programs or opportunities, receipt of which shall be documented in individual staff/volunteer files:

- I.** Initial in-service orientation and training for new staff and volunteers, including agency policies and standard precautions, and periodic development training for all staff and volunteers as required to ensure the continued, safe delivery of high-quality services;

- II. Training on the laws and regulations regarding the privacy and confidentiality of client information;
- III. The opportunity for licensed/credentialed staff to take relevant outside courses to both improve their skills and, if required, earn continuing education units (CEUs) sufficient to maintain licensure and certification;
- IV. Annual cultural sensitivity/competency training complying with the [*National Standards for Culturally and Linguistically Appropriate Services*](#) (CLAS) to serve youth, transgender, African-American, Latinx, undocumented, and underserved populations.
- V. Written procedures on reporting requirements for suspected sexual child abuse reporting, as required by the State if the agency receives funds through grants provided by DSHS.
- VI. All service provider staff requiring access to local, state, or federal client information systems must complete confidentiality and security training annually before being granted access.

STANDARD OF CARE FOR KNOWLEDGE, SKILLS, AND EXPERIENCE

The staff and volunteers:

- I. Shall possess knowledge of HIV/AIDS; the effects of HIV/AIDS-related illnesses and comorbidities on clients; the psychosocial effects of HIV/AIDS on clients and their families/significant others; and current strategies for management of HIV/AIDS;
- II. Those who interact with clients or contacts shall possess the needed communication skills and experience in dealing with a wide variety of people and;
- III. Are culturally sensitive and promote equity in working with persons affected by the HIV epidemic, such as those who are underserved or part of a disproportionately affected population.

STANDARD OF CARE FOR CLIENT RIGHTS AND CONFIDENTIALITY

The service provider:

- I. Shall provide an orientation for clients, during which the clients are made aware of their rights, obligations, services available to them, and realistic expectations of service (exceptions: Health Education/Risk Reduction and Outreach Services categories);
- II. Shall develop the following instruments in both English and Spanish, distributing a copy to each client and posting a copy in a conspicuous place within the facility, as indicated below (exceptions: Health

Education/Risk Reduction and Outreach Services categories):

- a. A client "Bill of Rights" (distributed to each client) which takes into account state and federal laws protecting client rights (including a nondiscrimination statement covering age, gender, race, color, religion (or lack thereof), national origin, sexual orientation, gender identity or expression, disability, political affiliation, and inability to pay), and a written grievance procedure (distributed and posted in a conspicuous place), including Assurances that neither the agency nor any of its staff will retaliate against clients for filing a grievance;
- b. A written policy regarding clients' entitlement to confidentiality (distributed to each client);
- c. An "authorization form to disclose client information." This form must be specific to the individual(s) and service provider(s) to whom the client authorizes the disclosure of information. The form must specify what information will be disclosed, including the expiration date, and is to be signed by the client before disclosing any information. A copy of the signed authorization form shall be retained in each client's record. If a service provider's standards allow for 'verbal approval' (in urgent situations only), verbal approval will be sufficient so long as the individual obtaining the verbal approval signs the authorization form and a witness's signature to attest to the client giving verbal approval. The authorization form with both signatures should be retained in each client's record.
- d. Written policies and procedures are in place to describe how the agency determines, documents, and reports suspected instances of child abuse in accordance with [Chapter 261 of the Texas Family Code](#);
- e. Written policies and procedures are in place to require documented training of all staff regarding every aspect of suspected sexual child abuse screening and reporting;
- f. Written emergency procedures (building evacuation map and emergency procedures to be followed by staff and clients in the event of a fire, bomb threat, severe weather, loss of power, or pandemic) must all be posted; written policy regarding chemical spills or possible biological exposure (i.e., suspected anthrax or smallpox) event need not be posted, but must be in place;
- g. Application and eligibility assessment process, including written, clearly defined eligibility criteria consistent with HRSA written policy (Policy Clarification Notices (PCN) [#13-03](#), [#16-02](#), and [#21-02](#)), ranking criteria for eligible applicants when waiting lists exist, and a written policy regarding the transfer, discharge, or termination of services (distribute); and
- h. Shall maintain client files (written or electronic) in a locked and secured area.
- i. Written policies ensuring respect for client and staff gender identity and expression, which are a person's gender-related identity, appearance, or behavior, whether or not related to what is traditionally associated with the person's physical characteristics or sex assigned at birth. Gender identity may be supported by a medical history of treatment and care related to the identity, consistent

assertion, or any other affirmation that the identity is sincerely held, part of a person's core identity, and not being asserted for an improper purpose.

STANDARD FOR ACCESS, CARE, AND PROVIDER CONTINUITY

The service provider:

- I.** Shall, except where grant funds may be specifically restricted (e.g., MAI funds), provide its services to eligible persons regardless of age, gender, race, color, religion (or lack thereof), national origin, sexual orientation, gender identity or expression, disability, political affiliation, or inability to pay, to the extent resources allow;
- II.** Shall provide culturally sensitive and promote equity services for clients, and shall address linguistic barriers, either directly (by employing bilingual staff, utilizing adaptive equipment for sensory-impaired individuals, etc.) or indirectly through referral (exception: Health Education/Risk Reduction service category);
- III.** Shall provide access to its facility for disabled persons;
- IV.** Shall abide by the general principles for substance abuse/drug screening and disruptive behavior, as approved by the Ryan White Planning Council of the Dallas Area on August 11, 1999 (refer to Appendices [E](#) and [G](#), Texas DSHS HIV/STD Policies [530.002](#) and [530.003](#)).
- V.** Shall provide access to its system of care for persons with HIV/AIDS twenty-four (24) hours/day (i.e., at a minimum, clients who call during non-operating hours will receive guidance via a pre-recorded message) and shall provide information regarding mechanisms to address urgent and emergency needs of the client. Shall have a process in place to respond to clients after hours where phone lines are monitored by staff trained in crisis/escalation, and the client will receive a call back the next business day with a plan to address the urgent need (only applicable to Mental Health Services and Substance Abuse Services categories).
- VI.** Shall develop, maintain, and enforce a security policy regarding how electronic client data are accessed, edited, and deleted, ensuring maximum client security and confidentiality.
- VII.** Shall maintain a safe environment within its facilities to provide services. This includes adopting a written policy to refuse services to anyone who is being verbally abusive of staff or others, is threatening physical abuse to staff or others, is in possession of illegal substances, drug paraphernalia, or weapons on agency property, or is otherwise acting in an unacceptable manner, until, in the judgment of the agency, the individual ceases such behavior. The service provider shall also explore all available alternative options for service provision to such individuals, including referral to a more appropriate service provider.
- VIII.** HRSA RWHAP funds are intended to support only the HIV-related needs of eligible individuals. To be an HRSA RWHAP allowable cost, HRSA RWHAP recipients and subrecipients must be able to make an explicit connection between any service supported with HRSA RWHAP funds and the HIV care and treatment of an incarcerated person and must adhere to established HIV clinical practice standards consistent with U.S.

Department of Health and Human Services Clinical Guidelines for the Treatment of HIV. See HRSA HAB [Policy Clarification Notice #16-02, Ryan White HIV/AIDS Services: Eligible Individuals and Allowable Use of Funds](#).

- IX. Shall provide gender-affirming care and treatment services as described in the [HHS Guidelines for Use of Antiretroviral Agents in Adults and Adolescents Living with HIV](#) refer across HRSA RWHAP core medical and support service categories as outlined in [PCN#16-02 Ryan White HIV/AIDS Program Services: Eligible Individual and Allowable Uses of Funds](#)
- X. Where listed as an allowable activity under these standards, the option to utilize telehealth, telemedicine, or virtual visits instead of in-person services will be the client's decision, rather than the provider's requirement, unless CDC guidelines are issued that require the provider to implement social distancing due to a public health emergency.

PROVIDER RIGHTS FOR SERVICE DELIVERY IN THE DALLAS PLANNING AREA

Service providers reviewing this expectation should be able to identify unacceptable client behavior and respond accordingly with reasonable confidence that the actions taken on their behalf regarding a client were appropriate. Part of the AA's mission is to provide a wide array of services to persons living with HIV (PLWH) and other sexually transmitted diseases (STDs). That mission is achieved through contracts with various service providers who deliver those services.

The AA is responsible for ensuring each service provider understands their rights when addressing client behaviors that may be questionable or disruptive in providing Ryan White programs and services. The service provider will, therefore, be able to ensure that services are offered in a manner free from disruption. In addition, the RWPC of the Dallas Planning Area also has certain expectations of how those services are to be delivered to clients and how client rights are to be respected. On the authority vested by the [Civil Rights Code, Title 42, Chapter 21; Rehabilitation Act of 1973, Sect. 794; Age Discrimination Act of 1975; Public Law 88-352; Title VI](#) and [Part 80 of 45 CFR; 25 TAC §§98.41-98.44](#).

DEFINITIONS AS APPLIED TO THIS EXPECTATION

Contractor: a legal entity under contract with the Administrative Agency to provide goods or services to people living with or affected by HIV, AIDS, or STDs or to implement goals supporting the mission of the RWPC of the Dallas Planning Area.

Service Provider: a person, agency, or facility approved by the Administrative Agency that has entered into a contract with the Administrative Agency or a Texas DSHS contractor to deliver state or federal HIV programs to clients.

Service Program: Health, medical, and social services offered to PLWH by a service provider on behalf of the Administrative Agency.

PLANNING COUNCIL EXPECTATIONS FOR THE SERVICE PROVIDER/CLIENT RELATIONSHIP

The RWPC of the Dallas Planning Area expects service providers to maintain client relations of the highest possible quality by adhering to the following principles:

- I.** Treat each client with respect and consideration while recognizing the client's dignity and individuality.
- II.** Communicate the need for treatment, care, or services to promote equity in a culturally appropriate, culturally sensitive, and equitable manner.
- III.** Allow the client to select comprehensive outpatient health and psychosocial support services or refuse any service without fear of reprisal.
- IV.** Inform the client about treatment or service options, emphasize that it is the client's right to choose an option, and advise the client of several alternatives when multiple service providers are available for the same service.
- V.** Assure that service planning, medical treatment, and counseling plans are determined in cooperation with the client.
- VI.** Maintain a climate free of physical or mental abuse or exploitation in the office or other service delivery settings.
- VII.** Enforce local, state, or federal laws and regulations (such as no smoking or maintaining a drug-free environment) required to conduct business.
- VIII.** Review any decision to modify, suspend, or terminate services.
- IX.** Re-evaluate any modification, suspension, or termination of services to determine if the client's situation has changed (refer to [Texas DSHS HIV/STD Policy 530.003](#)).
- X.** Give clients an avenue to formally complain about treatment or services and inform them of the service provider's decision to deny an application, modify, suspend, or terminate client benefits. Service providers should create a mechanism to receive an appropriate and fair review of the complaint and ensure no reprisal against the client for filing the complaint or grievance.

CONFIDENTIALITY

According to state and federal laws, the service provider must maintain confidentiality regarding all information. The right to confidentiality begins the moment the client applies for services, when the service provider first conducts an evaluation, or when counseling begins.

EQUAL ACCESS TO PROGRAMS AND SERVICES

The service provider must consider client eligibility regardless of age, gender, gender identity, gender expression, sexual orientation, marital status, ethnic origin, race, developmental and physical challenge, or religious practice. Conversely, the client has a right to refuse any recommended services.

IMPARTIAL TREATMENT

Service providers must allow clients to apply for any service or program. Clients must be given fair, impartial treatment in receiving and processing the application and receiving services.

FILING A COMPLAINT OR GRIEVANCE

Contractors must have a written client complaint procedure in place to meet the minimum requirements for managing client complaints. All clients have a right to file a complaint or grievance regarding inappropriate service provider behavior, actions, or perceptions of discrimination. The complaint may be filed per the service provider's grievance procedures. When all other sources with the service provider's grievance process have been exhausted, the client may file the complaint or grievance with the Administrative Agency representative for the DPA by calling 214-819-1849.

In the case of a complaint related to the delivery of clinical services, the client may file a complaint directly to the State of Texas licensing board without filing a complaint locally if the client so chooses.

SERVICE PROVIDER RIGHTS WHEN DEALING WITH A CLIENT

Each service provider must develop written procedures for clients who may be disruptive, uncooperative, or engaging in illegal behavior that is dangerous to themselves or others. The service provider must ensure that staff and clients are consistently informed about the procedures used in every situation. Service providers are expected to use good judgment and attempt to resolve these situations fairly without undue limitation or denial of services to the client.

MODIFYING, SUSPENDING OR TERMINATING CLIENT SERVICES

The service provider is responsible for providing a work environment free from undue disruption, turmoil, or interference. Whenever possible, the service provider should take steps to serve clients to support a healthy work environment. During service provision, clients may behave disruptively, abusively, or threateningly toward staff or other clients. When this type of behavior occurs, the service provider may take the following progressive actions:

- I.** Modify all or part of the services provided to the client.
- II.** Suspend all or part of the services provided to the client.
- III.** Terminate all or part of the services provided to the client.

Depending on the severity of the client's behavior, such as threatening the life of staff or other clients, the service provider may skip one or more of the above steps and take appropriate action. Refer to [Texas DSHS HIV/STD Policy 530.003](#) for information on dealing with clients who threaten to harm themselves or others.

MODIFYING CLIENT SERVICES

The service provider may modify all or part of the services provided to the client when the client is disruptive or uncooperative. Modification may include, but is not limited to:

- I.** Rescheduling the client's appointment for a time later that day or in the near future,
- II.** arranging client services by telephone and
- III.** Mailing food vouchers, bus passes, etc.

SUSPENDING CLIENT SERVICES

Suspension is the temporary withdrawal of a service provided to a client by a service provider. It may be necessary for the service provider to suspend all or part of the services provided to the client for a specific period. This period should be delineated in the service provider's policy and should only be an option when alternative service delivery methods have not produced appropriate client behavior (i.e., the client is repeatedly disruptive or abusive towards staff or other clients). These cases should be directed to the Administrative Agency. Indefinite suspensions are discouraged.

TERMINATING CLIENT SERVICES

The service provider may choose to terminate all or part of the services provided to the client when alternative services delivery methods are not appropriate to the situation (i.e., the client threatens injury or homicide to a staff member or another client, etc.) or when modification or suspension of services has not produced appropriate client behavior. Clinical service providers (e.g., physicians, advanced practitioners, and registered nurses) who terminate services should follow professional practice standards concerning how client services are terminated. Professional organizations and licensing bodies can guide clinical service providers in managing these situations.

DENYING, SUSPENDING, OR TERMINATING A CLIENT'S SERVICE DUE TO SUBSTANCE MISUSE

The service provider may not deny, suspend, or terminate any service funded through HRSA/DSHS if the client is suspected of substance misuse or refuses to accept treatment for substance misuse. Exceptions to this may occur in the course of delivering medical care when a client's active substance misuse contraindicates the prescription of certain medications and treatments. The treating clinician must evaluate these professional decisions on a case-by-case basis.

NOTIFICATION OF THE DECISION TO MODIFY, SUSPEND, OR TERMINATE CLIENT SERVICES

The decision to modify, suspend, or terminate services must promptly and appropriately be communicated to the client. Notice of service termination may be done by any verifiable method, such as in person or by certified letter. When services are to be modified or suspended, staff should establish and communicate the duration of the suspension and inform the client that the resumption of services will depend on the client's willingness and ability to meet certain behavioral expectations. The behavioral expectations should be clearly defined and communicated to the client. The client should also be provided information about alternative methods by which services will be delivered or where such assistance may be obtained. Finally, the service provider should ensure that all actions regarding the modification, suspension, or termination of services are clearly documented in the client's record.

TECHNICAL ASSISTANCE

When desired, the service provider may contact the Administrative Agency to discuss specific situations or to obtain technical assistance. Decisions regarding modifying, suspending, or terminating client services remain with the service provider.

ADMINISTRATIVE AGENCY REVIEW OF DECISIONS TO MODIFY, SUSPEND, OR TERMINATE CLIENT SERVICES

As part of a routine review of the quality of client services or a complaint investigation, AA staff may review the events that led to a modification, suspension, or termination of client services. AA staff will evaluate, at minimum, whether the service provider:

- I.** Followed their internal policies and those of the AA in taking action to resolve the situation;
- II.** respected client rights, and
- III.** Applied the least restrictive limitation on client services necessary to maintain a service delivery setting free of physical and mental abuse or exploitation.

SELF-REFERRALS

Clients can self-refer to core medical and support services and may seek assistance from staff (e.g., a care/case manager) at any time. All agencies are expected to have an intake process and should enroll clients based on service eligibility.

DALLAS ELIGIBLE METROPOLITAN AREA MAP

The Dallas EMA covers eight counties: Collin, Dallas, Denton, Ellis, Henderson, Hunt, Kaufman, and Rockwall.

DALLAS HIV SERVICE DELIVERY AREA MAP

The Dallas HSDA covers eight counties: Collin, Dallas, Denton, Ellis, Hunt, Kaufman, Navarro, and Rockwall.

SHERMAN-DENISON HIV SERVICE DELIVERY AREA MAP

The Sherman-Denison HSDA covers three counties: Cooke, Fannin, and Grayson.

CORE MEDICAL SERVICES

AIDS PHARMACEUTICAL ASSISTANCE

HRSA Description: Local Pharmaceutical Assistance Program (LPAP) is operated by an RWHAP Part A or B recipient or subrecipient as a supplemental means of providing medication assistance when an ADAP has a restricted formulary, waiting list, and/or restricted financial eligibility criteria.²

SERVICES

RWHAP Part A or B recipients using the LPAP service category must establish the following:

- Uniform benefits for all enrolled clients throughout the service area
- Adhere to the DSHS Part B Monitoring Standards
- A recordkeeping system for distributed medications
- Adhere to LPAP advisory board guidance
- Adhere to the drug formulary approved by the LPAP advisory board
- Adhere to the 340B drug distribution system
- Client enrollment and eligibility determination process, including screening for ADAP and LPAP eligibility with rescreening at least every six months.
- Coordination with the state's RWHAP Part B ADAP
 - A statement of need should specify the state ADAP restrictions and the need for LPAP.
- Implementation per requirements of the 340B Drug Pricing Program and the Prime Vendor Program

Activities must include:

Payments to agencies made on behalf of an eligible client for prescribed medications within the locally approved drug formulary to prolong life, improve health, or prevent the deterioration of health. The provider wishing to prescribe medication (including over-the-counter medicines) not on the formulary shall make a request to the LPAP Board for approval.

Activities may not include:

- The LPAP may not duplicate services available through the Texas ADAP program.
- Payment for medications not included in the LPAP formulary.
- Payment for medications dispensed as part of an Emergency Financial Assistance Program (less than 60 days);
- Payment for medications during the application period in the state AIDS Drug Assistance Program;
- Payment for medications that are dispensed or administered during a regular medical visit or are considered part of the services provided during that visit;

² Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. AIDS Pharmaceutical Assistance. [Page 8](#)

- Payment for more than one month of medication at a time and payments for name-brand prescriptions when generic scripts are available.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider:

- 1.1 Shall ensure that medication costs are based on section 340B drug pricing or lower price if available;
- 1.2 Shall develop a memorandum of understanding with one or more pharmacies to ensure continuous availability and best price of medications.
- 1.3 Shall ensure the provision of medication to patients as prescribed by the patient's medical care provider;
- 1.4 Shall maintain appropriate, locked storage of medications and supplies when needed (including refrigeration);
- 1.5 Shall provide and maintain accurate program record keeping, including medication inventory control.

EARLY INTERVENTION SERVICES

HRSA Description: RWHAP Parts A and B Early Intervention Services (EIS) must include the following four components:³

- Targeted HIV testing to help the unaware learn of their HIV status and receive a referral to HIV care and treatment services if found to be living with HIV.
 - Recipients must coordinate these testing services with other HIV prevention and testing programs to avoid duplication of efforts.
 - HIV testing paid for by EIS cannot supplant testing efforts paid for by other sources
- Referral services to improve HIV care and treatment services at key points of entry
- Access and linkage to HIV care and treatment services such as HIV Outpatient/Ambulatory Health Services, Medical Case Management, and Substance Abuse Outpatient Care
- Outreach Services and Health Education/Risk Reduction related to HIV diagnosis

Early Intervention Services are limited to:

- EIS services are limited to counseling and HIV testing, referral to appropriate services based on HIV status, linkage to care, and education and health literacy training for clients to help them navigate the HIV care system. EIS services require coordination with prevention services providers and should be provided at specific entry points.
- Counseling, testing, and referral activities are designed to bring individuals with HIV into Outpatient/Ambulatory Health Services (OAHS). The goal of EIS is to decrease the number of underserved individuals with HIV by increasing access to care. EIS also provides the added benefit of educating and motivating clients on the importance and benefits of getting into care. Individuals found not to have HIV should be referred to appropriate prevention services.

³ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Early Intervention Services. [Page 10](#)

- Telehealth and telemedicine are alternative modalities to provide most Ryan White Part B and State Services-funded services. For the Ryan White Part B/SS-funded providers and Administrative Agencies, telehealth & telemedicine services are to be delivered in real-time via audio and video communication technology and may include videoconferencing software.
- DSHS HIV Care Services requires that for Ryan White Part B or SS-funded services, providers must use features to protect electronic protected health information (ePHI) transmission between clients and providers. RW providers must use a telehealth vendor that provides assurances to safeguard ePHI, including the vendor signing a business associate agreement (BAA). Ryan White Providers using telehealth must also follow DSHS HIV Care Services guidelines for telehealth and telemedicine outlined in DSHS Telemedicine Guidance.

Activities must include:

- Targeted HIV testing to help the unaware learn of their HIV status and receive a referral to HIV care and treatment services if found to be living with HIV;
- Referral services to improve HIV care and treatment services at key points of entry;
- Access and linkage to HIV care and treatment services such as HIV OAHS, Medical Case Management, and Substance Use Care; and
- Outreach Services and Health Education/Risk Reduction related to HIV diagnosis.
- Counseling (pre-test and post-test); and HIV testing to confirm the presence of the disease or diagnose the extent of the deficiency of the immune system;
- Periodic examination and testing to monitor the extent of the deficiency of the immune system until the client can access primary medical care;
- Referrals to primary medical care or biomedical research facilities;
- Providing therapeutic measures for preventing and treating the deterioration of the immune system until the client can access primary medical care;
- Providing continuous follow-up care until there is confirmation the patient has accessed medical services;
- Providing information about other HIV service providers for support services that will increase access to primary care;
- Educating the client on the importance of remaining in primary medical care, including education and counseling in health maintenance and maintenance of the immune system.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall ensure that:

- 1.1** All facilities are appropriately licensed or certified as required by Dallas County for providing early intervention services for HIV, including phlebotomy services.
- 1.2** All staff who provide care and counseling services to clients shall be specifically trained to provide those services for recently diagnosed HIV-positive clients and shall be competently supervised by, at a minimum, a licensed mid-level medical provider.

HEALTH INSURANCE PREMIUM & COST-SHARING ASSISTANCE

HRSA Description: Health Insurance Premium & Cost-Sharing Assistance provides financial assistance for eligible clients living with HIV to maintain continuity of health insurance or to receive medical and pharmacy benefits under a health coverage program. Health care coverage costs that are allowable uses of RWHAP ADAP funds include premiums and medication cost-sharing regardless of the kind of health care coverage (public or private). To use RWHAP funds for health insurance premiums and cost-sharing assistance, a RWHAP Part recipient must implement a methodology that incorporates the following requirements:⁴

- RWHAP Part recipients must ensure that clients buy health coverage that, at a minimum, includes at least one drug in each class of core antiretroviral therapeutics from HHS treatment guidelines, along with appropriate HIV outpatient/ambulatory health services.
- RWHAP Part recipients must assess and compare the aggregate cost of paying for the health coverage option versus the total aggregate cost for medications and other appropriate HIV outpatient/ambulatory health services and allocate funding to Health Insurance Premium and Cost Sharing Assistance only when determined to be cost-effective.

The service provision consists of either or both of the following:

- Paying health insurance premiums to provide comprehensive HIV Outpatient/Ambulatory Health Services and pharmacy benefits that offer a full range of HIV medications for eligible clients.
- Paying cost sharing on behalf of the client.

Activities must include:

- Payment of insurance premiums (premiums will be paid directly to the insurance carrier or its designated agent);
- Payment of related copays and deductibles;
- Copayments for prescriptions included on the formulary approved by the Local Pharmaceutical Assistance Program Board with the exclusions listed in the Local Drug Reimbursement category;
- Payment of three-month prescription copays from mail-order pharmacies where cost-effective or plan-required, with pro-rated monthly costs towards service cap.

Activities may include:

- Copayments, premiums, coinsurance, or deductible costs for individuals enrolled in high-risk pools;
- Supplemental healthcare coverage insurance.

Activities may not include:

- Direct payments to clients;

⁴ Policy Clarification Notice #18-01: Clarifications Regarding the Use of Ryan White HIV/AIDS Program Funds for Health Care Coverage Premium and Cost Sharing Assistance. [Page 2](#)

- Use of RWHAP funds to pay for administrative costs outside the premium payment of health plans or high-risk pool (private health insurance coverage).
- Use of RWHAP funds to pay for premiums or cost-sharing assistance for private health plans that are paid for or reasonably expected to be paid for by Medicaid.

ADDITIONAL PROVISIONS FOR RYAN WHITE PART B

Activities must include:

- Financial assistance, according to the Texas Department of State Health Services policies

Activities may include:

- Copayments, coinsurance, or deductible costs for individuals enrolled in the Texas Risk Pool

Activities may not include:

- Copayments, coinsurance, or deductible costs associated with hospitalization and emergency room care;
- Premium assistance for individuals enrolled in the Texas Risk Pool;
- A limit on the assistance an individual may receive under the Texas Department of State Health Services policies for costs associated with copayments, coinsurance, or deductible payments.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall ensure the following:

- 1.1.** That insurance assistance staff who provide direct services to clients have continuing access to the most up-to-date information available about effective medical care of those with HIV/AIDS and about applicable insurance programs and options;
- 1.2.** that it maintains detailed records in legible form, documenting client eligibility, along with premiums, deductibles, and copays that are paid on behalf of the clients; and
- 1.3.** that client eligibility is re-examined at the birth month and half-birth month intervals to align with eligibility requirements as established by HRSA/DSHS national standards of client eligibility.

RWHAP Parts A, B, C, and D may not pay premiums for Medicare Part D alone; however, RWHAP ADAP funds may be used to pay Medicare Part D premiums and cost-sharing assistance alone when it is cost-effective to do so versus paying for the total cost of medications. RWHAP funds must not be used to pay for premiums or cost-sharing assistance for Medicare Part A, as inpatient care is not a RWHAP allowable cost (see Table 1). Ryan White grant subrecipients must vigorously pursue these other sources of premium and cost-sharing assistance to ensure the RWHAP remains the payer of last resort.

Table 1. Medicare Costs Allowable in the Ryan White HIV/AIDS Program⁵	
Medicare Part	RWHAP Funds
Medicare Part A	• Must not be used by any RWHAP recipient to pay premiums or cost sharing.
Medicare Part B	• May be used by all RWHAP recipients to pay premiums or cost-sharing in conjunction with paying for Medicare Part D premiums or cost-sharing.
Medicare Part C	• May be used by all RWHAP recipients to pay premiums or cost-sharing when the Medicare Part C plan includes prescription drug coverage; or • in conjunction with paying for Medicare Part D premiums and cost-sharing for plans that do not include prescription drug coverage.
Medicare Part D	• May be used by RWHAP Part A, B, C, and D recipients to pay premiums or cost-sharing in conjunction with paying Medicare Part B or Medicare Part C premiums or cost-sharing. • May be used by RWHAP ADAP recipients to pay Medicare Part D premiums and cost-sharing when cost-effective versus paying for the total cost of medications.

HOME AND COMMUNITY-BASED HEALTH SERVICES

HRSA Description: Home and Community-based Health Services are provided to a client living with HIV in an integrated setting appropriate to a client's needs, based on a written plan of care established by a medical care team under the direction of a licensed clinical provider. Includes skilled health services furnished to the individual in the individual's home based on a written plan of care established by a medical case management team that includes appropriate health care professionals.

Services include:

- Durable medical equipment;
- home health aide services and personal care services in the home;
- day treatment or other partial hospitalization services;
- home intravenous and aerosolized drug therapy (including prescription drugs administered as part of such therapy);
- routine diagnostic testing administered in the home;

⁵ Policy Clarification Notice #18-01: Clarifications Regarding the Use of Ryan White HIV/AIDS Program Funds for Health Care Coverage Premium and Cost Sharing Assistance. [Page 5](#)

- assistance with housing-based testing, treatment, and therapies;
- and appropriate mental health, developmental, and rehabilitation services.

This definition also includes non-medical, non-nursing assistance with cooking and cleaning activities to help clients with disabilities remain in their homes.

Activities may not include:

- Inpatient hospital services;
- Nursing home or other long-term care facility services.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall ensure the following:

- 1.1 They are licensed and certified by the State of Texas to provide home health services.
- 1.2 All provider staff, contractors, and consultants who provide direct-care services and require licensure shall be appropriately licensed by the State of Texas.

HOME HEALTH CARE

HRSA Description: Home Health Care is the provision of services in the home that are appropriate to a client's needs and are performed by licensed professionals. Services must relate to the client's HIV disease and may include the following:⁶

- Administration of prescribed therapeutics (e.g., intravenous and aerosolized treatment and parenteral feeding)
- Preventive and specialty care
- Wound care
- Routine diagnostics testing administered in the home
- Other medical therapies, including physical and rehabilitative treatment

The provision of Home Health Care is limited to clients who are homebound. Home settings do not include nursing facilities or inpatient mental health/ residential substance abuse treatment facilities.

Activities may not include:

- Inpatient hospital services;
- Nursing home or other long-term care facility services.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall:

⁶ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Home Health Care. [Page 12](#)

- 1.1 Be licensed and certified by the State of Texas to provide home health care services.
- 1.2 Ensure all provider staff, contractors, and consultants who provide direct-care services and require licensure are appropriately licensed by the State of Texas.
- 1.3 Be available to all individuals eligible to receive Ryan White services, regardless of their religious denominational affiliation.

HOSPICE SERVICES

HRSA Description: Hospice services are end-of-life care services provided to clients in the terminal stage of an HIV-related illness.⁷

Allowable services are:

- Mental health counseling
- Nursing care
- Palliative therapeutics
- Physician services
- Room and board
- Social support;
- Spiritual guidance.

Activities must include:

- Medically ordered care.

Activities may not include:

- Service provision in skilled nursing facilities or nursing homes.
- Provision of nutritional services, durable medical equipment, and medical supplies or case management services.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall:

- 1.1 Be licensed and certified by the State of Texas to provide hospice services.
- 1.2 Ensure all provider staff, contractors, and consultants who provide direct-care services and require licensure are appropriately licensed by the State of Texas.
- 1.3 Ensure that physician certification of life expectancy is specified, as established by terminal illness, and does not exceed six months.
- 1.4 Be available to all individuals eligible to receive Ryan White services, regardless of their religious denominational affiliation.

⁷ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Hospice Services. [Page 13](#)

MEDICAL CASE MANAGEMENT

HRSA Description: Medical Case Management (MCM) is the provision of a range of client-centered activities focused on improving health outcomes in support of the HIV care continuum. Activities may be prescribed by an interdisciplinary team that includes other specialty care providers. Medical Case Management consists of several types of case management encounters (e.g., face-to-face, phone contact, and other communication forms).^{8,9}

Key activities include:

- Initial assessment of service needs
- Development of a comprehensive, individualized care plan
- Timely & coordinated access to medically appropriate levels of health & support services & continuity of care
- Continuous client monitoring to assess the efficacy of the care plan
- Re-evaluation of the care plan at least every six months with adaptations as necessary
- Ongoing assessment of the client's and other key family members' needs and personal support systems
- Treatment adherence counseling to ensure readiness for and adherence to complex HIV treatments
- Client-specific advocacy and review of utilization of services

Activities must include:

- Assessment of client's medical needs and overall acuity;
- Developing and reviewing a care plan (according to the Standards of Care) based on the client's needs and choices, with goals and strategies for completion;
- Medically focused form of case management;
- Linking and coordinating client care to ensure that quality medical care is received, including medical, mental health, vision, and dental care;
- Implementing the care plan through time-lined strategies;
- Coordination with client's medical providers;
- Providing information, referrals, and assistance with linkages to needed medical services;
- Monitoring and following up on the goals of the care plan and revising as necessary;
- Providing education about medical therapies, including the benefits and side effects of medications;
- Providing interventions; treatment adherence counseling to improve adherence to medical therapies; compliance with medical appointments;
- In-patient case management to prevent unnecessary re-hospitalization or to expedite discharge;
- Assessment of the client's need for medical nutrition therapy.

Activities may include:

- Screening for practice that may make an individual susceptible to HIV followed by reduction interventions for persons living with HIV susceptible of transmitting HIV;

⁸ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Medical Case Management. [Page 13](#)

⁹ Texas Department of State Health Services: [Medical Case Management \(including Treatment Adherence Services\) Service Standard](#)

- Implementing interventions or strategies promoting adherence to antiretroviral medications for HIV+ persons with all types of case management, including face-to-face, phone contact, and other forms of communication;
- Benefits Counseling, Enrollment & Outreach Education (e.g., Medicaid, Medicare, Market Place/Exchange, other private insurance, etc.);
- Allow Medical Case Managers to complete intakes, screening for client eligibility, and determine the need for all services;
- Take Charge Texas (TCT) and other types of data entry or documentation directly related to case management performed for/on behalf of a client.
- Virtual Visits
- Telehealth/Telemedicine – addresses virtual visits (per local policy)

Activities may not include:

- Mental health or substance abuse counseling;
- Diagnostic or preventive care;
- Nutrition counseling;
- Complementary or alternative treatments, including chiropractic care, massage therapy, hypnotherapy, herbal therapy other than those prescribed by a physician, and acupuncture;
- Compilation of outcome measures reports;
- Development, distribution, or analysis of client satisfaction surveys;
- Recreational activities

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider must ensure that:

- 1.1. Each staff person who provides medical case management services to patients shall have, at a minimum, a bachelor's degree in social science or behavioral science, nursing, or a related field from an accredited domestic or international college or university. Alternatively, a minimum of one (1) year of employment experience performing medical case management, case management, or client advocacy may substitute for each year of college education.
- 1.2. Each medical case management supervisor shall, at a minimum, be a registered nurse licensed by the State of Texas or a professional with a Master's degree in social science or behavioral science or a related field from an accredited domestic or international college or university.

STANDARD OF CARE 2.0: MEDICAL CASE MANAGEMENT SERVICES CORE COMPONENTS

- 2.1 Coordinating medical care includes scheduling appointments for various treatments and referrals, including lab screenings and medical specialist appointments, as well as mental health, oral health care, and substance abuse treatment.

2.2 Follow-up of medical treatments includes accompanying clients to medical appointments, calling, emailing, texting, or writing letters concerning various treatments to ensure appointments are kept or rescheduled as needed. Additionally, follow-up includes ensuring clients have the appropriate documentation, transportation, and understanding of procedures. MCM staff must also encourage and enable open dialogue with medical healthcare professionals.

2.3 Treatment adherence includes the provision of counseling or special programs to ensure readiness for and adherence to HIV/AIDS treatments.

The HRSA/HAB performance measures for Medical Case Management Services are on the HRSA website at the following link: [Medical Case Management HRSA/HAB Performance Measures](#).

MEDICAL NUTRITION THERAPY

HRSA Description: Medical nutrition therapy must include the following:¹⁰

- Nutrition assessment and screening
- Dietary/nutritional evaluation
- Food and nutritional supplements per a medical provider's recommendation
- Nutrition education and counseling

These services can be provided in individual or group settings, aside from HIV Outpatient/Ambulatory Health Services. All services provided under this category must be according to a medical provider referral and based on a nutritional plan developed by the registered dietitian or other licensed nutrition professional.

Activities may include:

- Referral for BMI (Body Mass Index), Bioelectrical Impedance Analysis (BIA), or other appropriate measures of nutritional status;
- Review of lab results to gauge nutritional/supplement needs;
- Provide counseling in health promotion, disease progression, and disease prevention;
- Food provisions based on the medical care provider's recommendation;
- Provision of nutritional supplements:
 - Nutritional supplements include medical, nutritional formulas, vitamins, and herbs;
 - The provision of food consists of recommending a significant change in daily food intake based on a deficiency, which may directly affect HIV/comorbidities.

Activities may NOT include:

- Provision of food or meals.

¹⁰ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Medical Nutrition Therapy. [Page 14](#)

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

- 1.1 Services must be provided by a licensed, registered dietitian (RD) or other licensed nutrition professional pursuant to a medical provider's written referral.
- 1.2 This level of specialized instruction is above basic nutrition counseling and includes an individualized dietary assessment performed by an RD.

MENTAL HEALTH SERVICES

HRSA Description: Mental health services are the provision of outpatient psychological and psychiatric screening, assessment, diagnosis, treatment, and counseling services offered to clients living with HIV. Services are based on a treatment plan, conducted in an outpatient group or individual session, and provided by a mental health professional licensed or authorized within the state to render such services. Such professionals typically include psychiatrists, psychologists, and licensed clinical social workers.¹¹

Activities must include:

- Outpatient mental health therapy and counseling services provided solely by Mental Health Practitioners licensed in the State of Texas.
- Mental Health Assessment
- Treatment Planning
- Treatment Provision
- Individual psychotherapy
- Conjoint psychotherapy
- Group psychotherapy
- Psychiatric medication assessment, prescription, and monitoring
- Psychotropic medication management
- Drop-In Psychotherapy Groups
- Emergency/Crisis Intervention
- Mental health services can be delivered via telehealth, subject to federal guidelines, Texas State law, and DSHS policy.

Activities may include

- Virtual Visits
- Telehealth/Telemedicine Visit (Address virtual telehealth/telephone visit/consultation)

¹¹ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Mental Health Services. [Page 15](#)

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

Licensure must meet the following criteria:

- 1.1** Level I psychiatric services include individual psychiatric and medication treatment and monitoring of psychiatric disorders provided by a board-certified or board-eligible psychiatrist (D.O. or M.D.) or board-certified mid-level provider licensed and specializing in psychiatry (w/supervision as required by law). Services must be provided in an outpatient clinic setting, OR,
- 1.2** Level II counseling services include intensive mental health therapy and counseling (individual, family, and group) provided solely by a state-licensed mental health professional. Direct service providers must possess postgraduate degrees in psychology, psychiatry, or counseling (Ph.D., Ed.D., DSW, D.O., M.D., M.S., M.A., MSW, M.Ed., or equivalent) and must be licensed by the State of Texas to provide such services; OR,
- 1.3** Level III counseling services include general mental health therapy and counseling (individual, family, and group). Direct service providers must possess a postgraduate degree in the appropriately related field, be in the process of obtaining Level II licensure with the State of Texas, and be properly supervised by a licensed clinical supervisor approved by the state licensing board.

STANDARD OF CARE 2.0

- 2.1** All mental health interventions must be based on proven clinical methods and in accordance with legal and ethical standards.
- 2.2** Confidentiality must be maintained, is critically important, and cannot be overstated unless otherwise indicated based on federal, state, and local laws and guidelines (i.e., abuse, self, or other harm).

SERVICE STANDARDS AND PERFORMANCE MEASURES

The following standards and performance measures are guides to improving healthcare outcomes for PLWH throughout the State of Texas within the Ryan White Part A, Part B, and State Services Program.

Service Standard	Performance Measure
Client Orientation Orientation is provided to all new clients to introduce them to program services, ensure their understanding of the need for continuous care, and empower them to access services. Orientation includes written or verbal information provided to the client on the following: • Services available • Clinic hours and procedures for after-hours emergency and non-life-threatening urgent situations • How to reach staff member(s) as appropriate • Scheduling appointments	• Percentage of new clients with documented evidence of orientation to services available in the client's primary record.

• The client's responsibilities for receiving program services and the agency's responsibilities for delivering them • Patient rights, including the grievance process	
Mental Health Assessment All clients referred to the program will receive a Mental Health Assessment by licensed mental health professionals. A mental health assessment should be completed no later than the third counseling session and should include, at a minimum, the following as guided by licensure requirements: • Presenting problems • Completed mental status evaluation (including appearance and behavior, self-attitude, speech, psychomotor activity, mood, insight, judgment, suicidal ideation, homicidal ideation, perceptual disturbances, obsessions/compulsions, phobias, panic attacks) • Cognitive assessment (level of consciousness, orientation, memory, and language) • Current risk of danger to self and others • Living Situation • Social support and family relationships, including client strengths/weaknesses, coping mechanisms, and self-help strategies • Medical history • Current Medications • Substance use history • Psychosocial history to include: ○ Education and employment history, including military service ○ Sexual and relationship history and status ○ Physical, emotional, and sexual abuse history ○ Domestic violence assessment ○ Trauma assessment ○ Legal history ○ Leisure and recreational activities Clients are assessed for care coordination needs, and referrals are made to case management programs as appropriate. If pressing mental health	• Percentage of clients with documented mental health assessment completed by the third (3rd) counseling session, unless otherwise noted, in the client's primary record.

needs emerge during the mental health assessment requiring immediate attention that results in the assessment not being finalized by the third session, this must be documented in the client's primary record.	
Treatment Plan All eligible client files should have documented evidence of a detailed treatment plan and documentation of services provided within the client's primary record. A treatment plan shall be completed within 30 days of the Mental Health Assessment. The treatment plan should include: • Diagnosed mental health issue • Goals and objectives • Treatment type (individual, group) • Start date for mental health services • Recommended number of sessions • Date for reassessment • Projected treatment end date (estimated) • Any recommendations for follow up Treatment, as clinically appropriate, should include counseling regarding: • Risk reduction and health promotion • Substance use disorder • Treatment adherence • Development of social support systems • Community resources • Maximizing social and adaptive functioning • The role of spirituality and religion in a client's life, disability, death and dying, and exploration of future goals The treatment plan must be signed by the mental health professional rendering service and developed in conjunction with the client. Treatment plans are reviewed and modified at a minimum, midway through the number of determined sessions agreed upon for frequency of modality or more frequently as clinically indicated.	• Percentage of clients with documented detailed treatment plan and documentation of services provided within the client's primary record. • Percentage of clients with treatment plans completed and signed by the licensed mental health professional rendering services in the client's primary record. • Percentage of clients with documented evidence of treatment plans reviewed/modified at a minimum midway through the number of determined sessions agreed upon for frequency of modality in the client's primary record.
Psychiatric Referral Clients are evaluated for psychiatric intervention, and appropriate referrals are initiated as documented in the client's primary record.	• Percentage of clients with a documented need for psychiatric intervention are referred to services as evidenced in the client's primary record.
Psychotropic Medication Management	• Percentage of clients accessing medication management services with documented evidence in the client's

Psychotropic medication management services are available for all clients directly or through referrals. PharmDs can provide psychotropic medication management services. The mental health professional will discuss with the client concerns about prescribed medications (side effects, dosage, interactions with HIV medications, etc.). The mental health professional will encourage the client to discuss concerns about prescribed medications with their HIV-prescribing clinician (if the mental health professional is not the prescribing clinician) to manage medications effectively. Prescribing providers will follow all regulations required for prescribing psychoactive medications as outlined by the <u>Texas Administrative Code, Title 25, Part 1, Chapter 415, Subchapter A, Rule 415.10.</u>	primary record of education regarding medications. Percentage of clients with changes to psychotropic/psychoactive medications with documented evidence of this change shared with the HIV-prescribing provider, as permitted by the client's signed consent to share information, in the client's primary record.
Provision of Services Services will be provided according to the individual's treatment plan and documented in the client's primary record. Progress notes are completed according to the service provider's standardized format for each session and will include the following: - Client name - Session date - Focus of session - Interventions - Progress on treatment goals - Newly identified issues/goals - Counselor signature and authentication (credentials). In urgent, non-life-threatening circumstances, an appointment will be made within one (1) business day. If an agency cannot provide the needed services, the agency will offer to refer the client to another organization that can provide the services. The referral must be made within one (1) business day for urgent, non-life-threatening situation(s).	Percentage of clients with documented evidence of progress notes completed and signed in accordance with the individual's treatment plan in the client's primary record.
Coordination of Care Care will be coordinated across the mental health care coordination team members. The client is involved in the decision to initiate or defer treatments. The mental health professional will involve the entire care team in educating the	Percentage of agencies who have documented evidence in the client's primary record or care coordination, as permissible, of shared mental health treatment adherence with the client's prescribing provider.

client, providing support, and monitoring mental health treatment adherence. Problem-solving strategies or referrals are in place for clients who need to improve adherence (e.g., behavioral contracts). There is evidence of consultation with medical care/psychiatric/pharmacist as appropriate regarding medication management, interactions, and treatment adherence.	
Referrals As needed, mental health providers will refer clients to a full range of medical/mental health services, including: • Psychiatric evaluation • Pharmacist for psychotropic medication management • Neuropsychological testing • Day treatment programs • In-patient hospitalization • Family/Couples therapy for relationship issues unrelated to the client's HIV diagnosis	• Percentage of clients with documented referrals, as applicable, for other medical/mental health services in the client's primary record.
Discharge Planning Discharge planning will be done with each client when treatment goals are met or when a client has discontinued therapy, as evidenced by non-attendance of scheduled appointments, as applicable. Documentation for discharge planning will include, as applicable: • Circumstances of discharge • Summary of needs at admission • Summary of services provided • Goals and objectives completed during counseling • Discharge plan • Counselor authentication, in accordance with current licensure requirements	• Percentage of clients with documentation of discharge planning when treatment goals are being met as evidenced in the client's primary record. • Percentage of clients with documentation of case closure per agency non-attendance policy as evidenced in the client's primary record.

ORAL HEALTH CARE

HRSA Definition: Oral health care services provide outpatient diagnostic, preventive, and therapeutic services by dental health care professionals, including general dental practitioners, dental specialists, dental hygienists, and licensed dental assistants.¹²

Activities must include:

- Diagnosis and treatment of existing dental disorders and services aimed at preventing similar disorders in the future.¹³

Activities may include:

- Preventive Services: dental cleanings, examinations, x-rays, adjustments to removable appliances, and one surface restorations;
- Routine Services: initial examinations, emergency appointments, deep cleanings with anesthesia, simple extractions, multiple surface restorations, biopsies, and localized chemotherapy;
- Specialty Service: surgical extractions, extensive restorations, periodontal surgeries, restorations requiring sedation, root canals, occlusal guards, and prosthodontics (partials and dentures).
- Oral health services visits may be delivered via telehealth and are subject to federal guidelines, the Texas Dental Board, DSHS policy, and guidelines established by the Administrative Agency.
- Virtual Visits
- Telehealth/Medicine Visit (Addresses virtual telehealth/telephone visit/consultation)

Activities may not include:

- Cosmetic dentistry for cosmetic purposes only is prohibited.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

- 1.1. All service provider staff, contractors, and consultants who provide direct-care services and require licensure shall be appropriately licensed by the Texas State Board of Dental Examiners.
- 1.2. Dental students and dental hygiene students who provide direct-care services may only do so under the direction and supervision of a licensed dentist.

SERVICE STANDARDS AND PERFORMANCE MEASURES

The following standards and performance measures are guides to improving healthcare outcomes for PLWH throughout the State of Texas within the Ryan White Part A, Part B, and State Services Program.

¹² Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Oral Health Care Program. [Page 15](#)

¹³ American Dental Association Parameters. <https://ebd.ada.org/en/evidence/guidelines>

Service Standard	Performance Measure
Dental and Medical History To develop an appropriate treatment plan, the oral health care provider shall obtain complete information about the patient's health and medication status. This information shall include, but not be limited to, the following: • The client's HIV-prescribing primary medical care provider's name and phone number; • Pregnancy status as applicable; • A baseline current CBC laboratory test; • Current CD4 and Viral Load laboratory test results; • Coagulants (PT/INR, aPTT, and if hemophiliac baseline deficient factor level [e.g., Factor VIII activity]) and inhibitor titer (e.g., BIA); • Tuberculosis screening result; • Patient's chief complaint; • Current Medications, including any osteoporotic medications; • Sexually transmitted infections; • HIV-associated illnesses; • Allergies and drug sensitivities; • Alcohol use; • Recreational drug use; • Tobacco use; • Neurological diseases; • Hepatitis A, B, C status; • Usual oral hygiene; • Date of last dental examination; and • Any predisposing conditions that may affect the prognosis, progression, and management of oral health conditions. All lab results documented in the medical and dental history must align with current treatment guidelines.	• Percentage of oral health patients who had a dental and medical health history (initial or updated) at least once in the measurement year (HRSA/HAB Performance Measure).
Limited Physical Examination The oral health provider is responsible for completing an initial limited physical examination in accordance with the Texas Board of Dental Examiners that shall include, but not be limited to: • Blood Pressure; • Pulse/Heart Rate; and	• Percentage of oral health patients with a documented limited physical examination completed in the primary client oral health record.

• Basic vital signs. The dental practitioner shall also record blood pressure and pulse heart rate as indicated for invasive procedures involving sedation and anesthesia. If the dental practitioner is unable to obtain a patient's vital signs, the dental practitioner must document in the patient's oral health care record why the attempt to obtain vital signs was unsuccessful.	
Oral Examination Clinical oral evaluations include evaluation, diagnosis, and treatment planning. A patient must have either an initial comprehensive oral exam or a periodic recall oral evaluation once per year, such as: • Comprehensive oral evaluation, to include bitewing x-rays, new or established patients; • Periodic Oral Evaluation to include bitewing x-rays established patient; • Detailed and Extensive Oral Evaluation, problem-focused by report; • Re-evaluation, limited, problem-focused (established patient; not post-operative visit), or • Comprehensive Periodontal Evaluation, new or established patient.	• Percentage of oral health patients with a documented oral examination completed within the measurement year in the client's primary oral health record.
Periodontal Screening or Examination A periodontal screen shall include the assessment of medical and dental histories, the quantity and quality of attached gingival, bleeding, tooth mobility, and a radiological review of the status of the periodontium and dental implants. A comprehensive periodontal examination includes: • Evaluation of periodontal conditions; • Evaluation and recording of dental caries; • Evaluation and recording of missing or unerupted teeth; • Evaluation and recording of restorations; • Evaluation and recording of occlusal relationships; • Evaluation of oral cancer; • Probing and charting;	• Percentage of oral health patients who had a periodontal screen or examination at least once in the measurement year (HRSA/HAB Performance Measure).

• Evaluation and recording of the patient's dental and medical history; and • General health assessment. Some forms of periodontal disease may be more severe in individuals with immune system disorders. Patients with HIV may have especially severe forms of periodontal disease. The incidence of necrotizing periodontal diseases may increase in patients with acquired immune deficiency syndrome (AIDS).	
Dental Treatment Plan A dental treatment plan that includes preventive care, maintenance, and elimination of oral pathology shall be developed and discussed with the patient. Various treatment options shall be discussed and developed in collaboration with the patient. A treatment plan appropriate for the patient's health status, financial status, and individual preference must include as clinically indicated: • Provision for the relief of pain; • Elimination of infection; • Preventive plan component; • Periodontal treatment plan if necessary; • Elimination of caries; • Replacement or maintenance of tooth space or function; • Consultation or referral for conditions where treatment is beyond the scope of services offered; • Determination of adequate recall interval; • Invasive Procedure Risk Assessment (before oral surgery, extraction, or other invasive procedure); • The dental treatment plan will be signed by the oral care health professional providing the services. (Electronic signatures are acceptable)	• Percentage of oral health patients who had a dental treatment plan developed or updated at least once in the measurement year (HRSA/HAB Performance Measure).
Phase 1 Treatment Plan Phase 1 treatment includes prevention, maintenance, and elimination of oral pathology that results from dental caries or periodontal disease. This includes: • Restorative treatment; • Basic periodontal therapy (nonsurgical);	• Percentage of oral health patients with a Phase 1 treatment plan completed within 12 months (HRSA/HAB Performance Measure).

• Basic oral surgery that includes extractions and biopsy; • Non-surgical endodontic therapy and • Space maintenance and tooth eruption guidance for transitional dentition. A Phase 1 treatment plan will be established and updated annually to include diagnostic, preventive, and therapeutic services that will be provided. The Phase 1 treatment plan, if the care was completed on schedule, is completed within 12 months of initiating treatment.	
Oral Health Education Oral health education must be provided and can be documented by either a licensed dentist, dental hygienist, dental assistant, or dental case manager and shall include: • Oral hygiene instruction • Daily brushing and flossing (or other interproximal cleanings) and prosthetic care to remove plaque; • Daily use of over-the-counter fluorides to prevent or reduce cavities when appropriate and applicable to the patient. If deemed appropriate, the reason is stated in the patient's oral health record; and • Smoking/tobacco cessation counseling as indicated. Additional areas for instruction may include Nutrition. For pediatric patients, oral health education shall be provided to parents and caregivers and be age-appropriate.	• Percentage of oral health patients who received oral health education at least once in the measurement year (HRSA/HAB Performance Measure).
Referrals Referrals for other services must be documented in the patient's oral health care chart. Any referrals provided by the oral health provider must have documented evidence of outcomes of the referral and/or follow-up documentation regarding the referral.	• Percentage of oral health patients with documented referrals provided have outcomes and/or follow-up documentation in the primary oral health care record.

OUTPATIENT/AMBULATORY HEALTH SERVICES

HRSA Definition: Outpatient/Ambulatory Health Services (OAHS) are diagnostic and therapeutic services provided directly to a client by a licensed healthcare provider in an outpatient medical setting. Outpatient medical settings include clinics, medical offices, and mobile vans where clients do not stay overnight. Emergency room or urgent care services are not considered outpatient settings.¹⁴

Allowable activities include:

- Medical history taking
- Physical examination
- Diagnostic testing, including laboratory testing
- Treatment and management of physical and behavioral health conditions, including minor surgeries, care of minor injuries, and continuing care and management of chronic conditions.
- Behavioral risk assessment, subsequent counseling, and referral, including early intervention and risk assessment;
- Preventive care and screening
- Pediatric developmental assessment
- Prescription and management of medication therapy, including antiretroviral medications and prophylaxis and treatment of opportunistic infections;
- Treatment adherence
- Education and counseling on health, prevention, and nutritional issues
- Referral to and provision of specialty care related to HIV diagnosis
- Vision Screening/Eye exam as primary medical care visit
- Telemedicine is an acceptable means of providing OAHS but must conform to the Texas Medical Board (TMB) guidelines for providing telemedicine, [*Texas Administrative Code, Texas Medical Board, Rules, Title 22, Part 9, Chapter 174, RULE §174.1 to §174.12*](#) and the [*February 2020 Texas Medicaid Provider Telecommunication Services Handbook, Volume 2*](#).

Activities must include:

- Provision of care that is consistent with Public Health Service guidelines.

Activities may not include:

- Complementary or alternative treatments, including chiropractic care, massage therapy, hypnotherapy, and acupuncture;
- Inpatient medical services;
- Emergency room, urgent care, hospital, or any inpatient treatment center services;
- Pharmacist consultations.

¹⁴ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Outpatient/Ambulatory Health Services. [Page 15](#)

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

- 1.1. the service provider's facilities shall be appropriately licensed, as required by the State of Texas, for the provision of medical care services.
- 1.2. All service provider staff, contractors, and consultants who provide direct-care services and who require licensure shall be properly licensed by the State of Texas or documented to be pursuing Texas licensure while performing tasks that are legal within the provisions of the Texas Medical Practice Act (or in the case of a nurse, the Nursing Practice Act), including satisfactory arrangements for malpractice insurance.

STANDARD OF CARE 2.0: DIAGNOSTIC LABORATORY TESTING

- 2.1. Diagnostic Laboratory Testing includes all indicated medical diagnostic testing, including all tests considered integral to treating HIV and related complications (e.g., viral load, CD4 (cluster of differentiation 4) counts, and genotype assays). Funded tests must meet the following conditions:
 - a. Tests must be consistent with medical and laboratory standards as established by scientific evidence and supported by professional panels, associations, or organizations;
 - b. Tests must be (1) approved by the FDA when required under the FDA Medical Devices Act; and (2) performed in an approved Clinical Laboratory Improvement Amendments of 1988 (CLIA)-certified laboratory or State-exempt laboratory; and
 - c. Tests must be (1) ordered by a registered, certified, or licensed medical provider and (2) necessary and appropriate based on established clinical practice standards and professional clinical judgment.

SERVICE STANDARDS AND PERFORMANCE MEASURES

The following standards and performance measures are guides to improving clinical care throughout the State of Texas within the Ryan White Program. The most current [Guide for HIV/AIDS Clinical Care](#) is cited throughout the standards for additional reference materials for direct care service providers.

Service Standard	Performance Measure
Medical Evaluation/Assessment All HIV patients receiving medical care shall have a completed initial comprehensive medical evaluation/assessment and physical examination that adheres to the current U. S. Department of Health and Human Services (HHS) guidelines within one (1) month of HIV diagnosis¹⁵ or within 15	- Percentage of patients who attended a routine HIV medical care visit within one (1) month of HIV diagnosis (HRSA/HAB Measure – Linkage to Care). - Percentage of existing patients (returning to care and those in current medical care for more than one year) with a documented comprehensive assessment/evaluation completed by a doctor of medicine (MD), nurse

¹⁵ U.S. Department of Health and Human Services, Health Resources and Services Administration, Guide for HIV/AIDS Clinical Care – 2014 Edition. [Page 61](#)

business days of initial contact with a patient who has been in care. Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines.	practitioner (NP), clinical nurse specialist (CNS), or physician assistant (PA) within 15 business days of initial contact with a patient in accordance with professional and established HIV practice guidelines.
Comprehensive HIV-related History Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines. History shall consist of, at a minimum, general medical history, comprehensive HIV-related history, and psychosocial history to include: - Documented past medical and surgical history with regard to chronic diseases such as diabetes, high blood pressure, heart disease, cholesterol, asthma or emphysema, sickle cell disease, etc., per HHS guidelines. - Psychosocial history includes socio-cultural assessment, occupational history, hobbies (as applicable), travel history, mental health, and housing status. - Lifestyle includes tobacco use, alcohol use, illicit substance use, exercise, and travel history. - Sexual Health includes partners, practices, past sexually transmitted infections (STIs), and contraception use (past and present). - HIV-related health history, including most recent CD4 and Viral Load results, current antiretroviral therapy (if applicable), previous adverse ART drug reactions, history of HIV-related illness and infections, HIV treatment history, and staging. The physical examination will include documentation from the complete review of systems, as indicated in the comprehensive medical history.¹⁶ This can be completed during the initial visit or divided over the course of two or three early visits.	- Percentage of new patients with a documented comprehensive HIV-related history that is inclusive of all components listed in the OAHS Standard as referenced in the HHS guidelines. - Percentage of existing patients with a documented comprehensive HIV-related history that is inclusive of all components listed in the OAHS Standard as referenced in the HHS guidelines.
Physical Examination	Percentage of new patients with a documented annual physical examination.

¹⁶ U.S. Department of Health and Human Services, Health Resources and Services Administration, Guide for HIV/AIDS Clinical Care – 2014 Edition. [Pages 61-70](#)

Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines.¹⁷ Providers should perform a baseline and annual comprehensive physical examination, with particular attention to areas potentially affected by HIV. Examination of the oral cavity should be included in the initial and interim physical examinations of all HIV patients.	• Percentage of new patients living with HIV who received an oral cavity exam during the physical exam as documented in the patient's primary record. • Percentage of existing patients with a documented annual physical examination. • Percentage of existing persons living with HIV who received an oral cavity exam during the physical exam as documented in the patient's primary record
Initial laboratory tests, as clinically indicated by licensed provider:¹⁸ Tests will include as clinically indicated: • HIV Antibody, if not documented previously; • CD4 Count and/or CD4 Percentage • Quantitative Plasma HIV RNA (HIV Viral Load) • Standard genotypic drug-resistance testing (refer to Table 3 in the <i>"Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents Living with HIV"</i> for guidance on other scenarios where genotype testing is recommended) • Co-receptor Tropism Test (if considering the use of a CCR5 co-receptor antagonist or for patients who exhibit virologic failure on a CCR5 antagonist) • HLA-B*5701 testing (only before initiating abacavir-containing regimen per guidelines) • Complete Blood Count (CBC) with Differential and Platelets • Chemistry Profile: Electrolytes, Creatinine, Blood Urea Nitrogen (BUN) • Liver Transaminases, Bilirubin (Total and Direct) • Urinalysis with Urine Protein and Creatinine • Quantitative HCV RNA viral load testing (for Hepatitis C (HCV)- positive patients who are candidates for treatment)	• Percentage of new patients with documented initial laboratory tests completed according to the OAHS Standard and HHS treatment guidelines. • Percentage of new patients with documented CD4 count (absolute). • Percentage of new patients with documented HIV-RNA viral load (HRSA/HAB Measure). • Percentage of new patients with documented drug resistance testing, as applicable. • Percentage of new patients living with HIV susceptible to STIs who had a test for chlamydia within the measurement year (HRSA/HAB Measure). • Percentage of new patients living with HIV susceptible to STIs who had a test for gonorrhea within the measurement year (HRSA/HAB Performance Measure). • Percentage of new adult patients who had a test for syphilis performed within the measurement year (HRSA/HAB Performance Measure). • Hepatitis B screening was performed at least once since the diagnosis of HIV or for whom there is documented infection or immunity (HRSA/HAB Performance Measure). • Percentage of new patients for whom HCV screening was performed at least once since the diagnosis of HIV (HRSA/HAB Performance Measure).

¹⁷ U.S. Department of Health and Human Services, Health Resources and Services Administration, Guide for HIV/AIDS Clinical Care – 2014 Edition. [Pages 73-77](#)

¹⁸ Panel on Antiretroviral Guidelines for Adults and Adolescents. Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents with HIV. Department of Health and Human Services. Initial Laboratory Tests. [Page C-1](#).

• Hepatitis A (HAV) antibody, Hepatitis B (HBV) surface antigen, core Ab (core antibody), and surface antibody & Hepatitis C antibody screens at initial intake (providers should screen all patients diagnosed for anti-HCV antibodies at baseline) • Lipid Profile (Total Cholesterol, low-density lipoprotein (LDL), high-density lipoprotein (HDL), Triglycerides); fasting • Glucose (preferably fasting) or hemoglobin A1C • Pregnancy Test (for clients with cervix of childbearing potential) • RPR or treponemal antibody (Syphilis Screening) • Extra-genital gonorrhea (GC) and Chlamydia (CT) Testing • <i>Toxoplasma gondii</i> immunoglobulin G (IgG) • Trichomoniasis testing Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines.¹⁹	
Other Diagnostic Testing Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines. A chest x-ray will be completed if pulmonary symptoms are present; if positive latent tuberculosis infection (LTBI) test (either tuberculin skin test (TST) or Interferon Gamma Release Assay (IGRA)); or if prior evidence of LTBI or pulmonary tuberculosis (TB) (perform annually).²⁰	• Percentage of new or existing patients with documented chest x-rays completed if pulmonary symptoms were present, after an initial positive QuantiFERON TB Test (QTF), after initial positive TST, or annually if prior evidence of LTBI or pulmonary TB.
Initial Screenings/Assessments Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines. Patients should receive screening for opportunistic infections and assessment of	• Percentage of new patients with documented initial medical screenings and assessments as indicated in the OAHS Standard and in accordance with HHS guidelines. • Percentage of new clients with a cervix living with HIV who were screened for

¹⁹ U.S. Department of Health and Human Services, Health Resources and Services Administration, Guide for HIV/AIDS Clinical Care – 2014 Edition. [Pages 79-89](#)

²⁰ U.S. Department of Health and Human Services, Health Resources and Services Administration, Guide for HIV/AIDS Clinical Care – 2014 Edition. [Page 85](#)

psychosocial needs initially and annually according to the most current HHS guidelines.

Screening should include, at a minimum:

- Mental health assessment that includes screening for clinical depression patient health questionnaire (PHQ-2) at a minimum)
- Psychosocial assessment, including domestic violence and housing status²¹
- Substance use and abuse screening
- Tobacco use screening
- Pediatric patients (14 years and younger) will be screened for child abuse as defined in [Chapter 261 of the Texas Family Code](#) and DSHS policy. Consider screening youth 14-17 for child abuse.
- Oral health exam and assessment
- TB Screening
- Cervical Cancer Screen (following the most current clinical recommendations)²²
- **Women Aged <30 Years with HIV:**
 - If younger than age 21, known to have HIV or newly diagnosed with HIV, and sexually active, a Pap test should be performed within one (1) year of onset of sexual activity regardless of the mode of HIV transmission.
- **Women Aged >30 Years with HIV**
 - Papanicolaou (Pap) Testing Only:
 - Pap test should be done at baseline and every 12 months
 - If the results of three (3) consecutive Pap tests are normal, follow-up Pap tests can be performed every three (3) years

Additional screenings as medically indicated include:

cervical cancer in the last three years
(HRSA/HAB Performance Measure).

- Percentage of new patients aged 12 years and older screened for clinical depression on the date of the encounter using an age-appropriate standardized depression screening tool, AND if positive, a follow-up plan is documented on the date of the positive screen **(HRSA/HAB Performance Measure).**
- Percentage of new patients with documented initial psychosocial assessment to include domestic violence and housing status.
- Percentage of new patients living with HIV who have been screened for substance use (alcohol & drugs) in the measurement year **(HRSA/HAB Performance Measure).**
- Percentage of new patients aged 18 years and older screened for tobacco use one or more times within 24 months AND received cessation-counseling intervention if identified as a tobacco user **(HRSA/HAB Performance Measure).**
- Percentage of new patients, if applicable, with completed child abuse assessment (completed if patient aged 14 years and younger).
- Percentage of new patients aged three months and older living with HIV for whom there was documentation that a TB screening test was performed and results interpreted (for TB skin tests) at least once since the diagnosis of HIV **(HRSA/HAB Performance Measure).**

²²Panel on Opportunistic Infections in Adults and Adolescents with HIV. Guidelines for the prevention and treatment of opportunistic infections in adults and adolescents with HIV: recommendations from the Centers for Disease Control and Prevention, the National Institutes of Health, and the HIV Medicine Association of the Infectious Diseases Society of America. [Cervical Cancer Screen Guidelines for <30 and over 3 years of age](#)

• Dilated eye exam every 6 to 12 months if the CD4<50 by an ophthalmologist Anal Cancer (Dysplasia) Screening The Anal Cancer (Dysplasia) Screening Guidelines recommend, at a minimum, an annual digital examination to detect masses on palpation that could be anal cancer. However, performing the digital exam alone as a screening procedure for anal dysplasia or cancer will miss many lesions. Anal cancer screening using a Pap test can improve sensitivity for detecting anal dysplasia or cancer.²³ Cytology combined with high-resolution anoscopy (HRA) is considered the best strategy for the screening of precancerous lesions. If anal pap is performed, clinicians should refer patients with abnormal anal cytology for HRA. In communities where HRA is unavailable, clinicians should consider referring patients with abnormal anal cytology to a surgeon for evaluation.	
Immunizations Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines. Immunizations/vaccinations will be given according to the most current HHS guidelines and the Centers for Disease Control and Prevention's (CDC) "2019 Recommended Adult Vaccination Schedule." Providers will initiate prophylaxis for specific opportunistic infections. Patients will be offered vaccinations for the following: • Tetanus, Diphtheria, and Pertussis (Tdap) per recommended treatment guidelines for immunizations²⁴ • Measles, Mumps, Rubella (MMR) per recommended treatment guidelines for immunizations.²⁵ Adults and adolescents	• Percentage of patients with Tetanus, Diphtheria, and Pertussis current within ten (10) years, tetanus and diphtheria (TD) booster doses every ten (10) years thereafter, or documentation of refusal. • Percentage of patients aged six months and older seen for a visit between October 1 and March 31 who received an influenza immunization OR who reported previous receipt of an influenza immunization (HRSA/HAB Performance Measure). • Percentage of patients living with HIV who completed the vaccination series for Hepatitis B (HRSA/HAB Performance Measure). • Percentage of patients living with HIV who ever received a pneumococcal

is recommended for HIV-positive males and females aged 13 through 26”. For providers who need a vaccine to provide their patients at no cost to the provider, please reference the Adult Safety Net Program. For providers who want to refer their patients for vaccines offered at no cost or reduced cost, please review the Eligibility and Benefits for the Adult Safety Net Program.	
Antibiotic Treatment (Recommend Prophylactic Antibiotic Treatment) Antibiotic prophylaxis for opportunistic infections will be initiated if an active infection has been ruled out and the following conditions are met: <i>Mycobacterium avium</i> complex (MAC): if CD4 < 50 - Toxoplasmosis: if CD4 < 100 and toxoplasma IgG is positive - Pneumocystis pneumonia (PCP) prophylaxis will be completed adhering to the current HHS Guidelines. Preventing 1st Episode of PCP (Primary Prophylaxis) Indications for Initiating Primary Prophylaxis: - CD4 count < 200 cells/mm³ or - CD4% < 14% of total lymphocyte count or CD4 count > 200 but < 250 cells/mm³ if ART cannot be initiated and if CD4 cell count monitoring (e.g., every three (3) months) is not possible²⁹	- Percentage of patients, regardless of age, offered MAC Prophylaxis as medically indicated. - Patients aged six weeks or older diagnosed with HIV, with CD4 counts of less than 200 cells/μL or a CD4 percentage below 15%, will be prescribed PCP prophylaxis (HRSA/HAB Performance Measure).
Antiretroviral Therapy Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines. ART will be prescribed in accordance with the HHS-established guidelines.	Percentage of patients, regardless of age, living with HIV, are prescribed ART for the treatment of HIV during the measurement year (HRSA/HAB Performance Measure).

²⁹ Panel on Opportunistic Infections in Adults and Adolescents with HIV. [Guidelines for the prevention and treatment of opportunistic infections in adults and adolescents with HIV](#): recommendations from the Centers for Disease Control and Prevention, the National Institutes of Health, and the HIV Medicine Association of the Infectious Diseases Society of America.

Patients who meet current guidelines for ART are offered and/or prescribed ART.³⁰	
Drug Resistance Testing Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines. "HIV drug-resistance testing is recommended for persons diagnosed with HIV at entry into care. Genotypic testing is recommended as the preferred resistance testing to guide therapy in ARV-naïve patients."^{31,32} Drug resistance testing must follow the most recent, established guidelines on resistance testing, including genotypic testing on all ARV-naïve patients. The patient's medical practitioner, a registered nurse, or other appropriately licensed healthcare providers (if designated by the practitioner) must provide counseling and education about drug resistance testing.³³ Drug Resistance Assay Not Usually Recommended After therapy is discontinued: Drug-resistance testing is not usually recommended more than four (4) weeks after ARV drugs are discontinued. In patients with low HIV RNA levels, Drug-resistance testing is not usually recommended in patients with a plasma viral load of <500 copies/mL.	Percentage of patients, regardless of age, living with HIV who had an HIV drug resistance test performed before initiation of HIV ART if therapy started during the measurement year (HRSA/HAB Performance Measure).
Health Education/Risk Reduction Health education will adhere to the most current HHS guidelines.	- Percentage of patients living with HIV who received HIV counseling in the measurement year (HRSA/HAB Performance Measure). - Percentage of patients aged 18 years and older screened for tobacco use one or

Providers will provide routine HIV-reduction counseling and behavioral health counseling for HIV-infected patients. Since patients' behaviors change over time as the course of disease changes and their social situations vary, health education providers will tailor routine risk-reduction counseling and behavioral health counseling not only to the individual patient but also to the particular point in time in the patient's life. The following will be conducted initially and as needed: • Providers should discuss safer sexual practices to decrease the probability of transmitting HIV. • Providers should counsel persons living with HIV about the possibility of acquiring syphilis and other STIs from unprotected sexual contact, including all sites of possible transmission, such as the anus, cervix, vagina, urethra, and oropharynx.³⁴ • Providers should discuss family planning with patients • Contraception counseling/hormonal contraception • Drug interaction counseling Providers should counsel patients on tobacco cessation annually for those patients that were screened and positive for smoking (or documented decline of tobacco use)³⁵ • When current alcohol or other substance use is identified, providers should discuss the possible effects of such use on the patient's general health and HIV medications, as well as options for treatment if indicated. • Providers should routinely discuss with patients the importance of disclosure to partners. Patients should be educated about the options for voluntary partner notification. • When HIV patients are diagnosed with early syphilis (primary, secondary, or early	more times within 24 months AND received cessation-counseling intervention if identified as a tobacco user (HRSA/HAB Performance Measure). • Percentage of patients with documented counseling about family planning method appropriate to patient's status, as applicable. • Percentage of patients with documented instruction regarding new medications, as appropriate. • Percentage of patients with documented counseling regarding the importance of disclosure to partners.

latent), providers should intensify reduction counseling, including discussing the importance of condom use. • Nutritional Counseling regarding:³⁶ ○ Quality and quantity of daily food and liquid intake ○ Exercise (as medically indicated)	
Treatment Adherence Assessment of treatment adherence and counseling will be provided that adheres to current HHS guidelines.³⁷ Patients are assessed for treatment adherence and counseling at a minimum of twice a year. Those prescribed ongoing ART regimen must receive adherence assessment and counseling on every HIV-related clinical encounter. If an adherence issue is identified by another member of the healthcare team (Medical Case Manager (MCM), medical assistant (MA), licensed vocational nurse (LVN), or registered nurse (RN)), there should be documented evidence of adherence counseling and follow-up action. This adherence counseling documentation must be evident in the patient's medical record and indicate that the prescribing provider was aware of the adherence issue.	• Percentage of patients with documented assessment for treatment adherence two or more times within the measurement year if the patient is on ART. • Percentage of patients with documented adherence issues who received counseling for treatment adherence two or more times within the measurement year.
Referrals Providers will refer to specialty care or other systems as appropriate in accordance with current HHS guidelines. At a minimum, patients should receive referrals to specialized health care/providers/services as needed or medically indicated to augment medical care:³⁸ • If the CD4 count is below 50, the patient should be referred for examination by an ophthalmologist. • AIDS Drug Assistance Program (ADAP) • Medication Assistance Programs	Percentage of patients, as medically indicated, who had documentation of referrals for: • Mental Health and/or Substance Use • Oral Health • Ophthalmological services • Child abuse (if abuse is suspected) • Disease intervention specialist • Other specialty services. • Percentage of patients with a documented referral in the measurement year has a progress note in the patient's chart regarding attendance and outcomes of the referral.

• Medical care coordination • Medical Specialties • Mental health and substance use services • Treatment education services • Partner counseling and referral • Annual oral hygiene and intraoral examinations, including dental caries and soft-tissue examinations. • Medical Nutrition Therapy (MNT) • Health maintenance, as medically indicated, such as: ○ Cervical Cancer Screening ○ Family Planning ○ Colorectal cancer screening ○ Breast cancer screening • Specialty medical care for any preexisting chronic diseases • Case Management Services or a Disease Intervention Specialist (DIS) for follow-up if a client misses appointments. Service providers/staff are expected to follow up on each referral to assess attendance and outcomes. Refer to the United States Preventive Services Task Force (USPSTF) for details on specific screening modalities and timeframes.	
Follow-up Visits Outpatient Medical Care will adhere to the current HHS guidelines for ongoing health care. Reassessment/reevaluation of health history, comprehensive physical examination, and annual laboratory testing should be documented in the patient's medical record. All HIV patients should have the following lab tests documented annually: urinalysis, with urine protein and creatinine; fasting lipid profile; syphilis screening; and gonorrhea and chlamydia testing (screen all sites of possible exposure). These tests may need to be performed more frequently if clinically indicated. Every 3-6 months:³⁹	• Percentage of existing patients with documented initial medical screenings and assessments as indicated in the OAHS Standard and in accordance with HHS guidelines. • Percentage of patients, regardless of age, living with HIV who had at least one medical visit in each 6-month period of the 24-month measurement period with a minimum of 60 days between medical visits (HRSA/HAB Performance Measure). • Percentage of patients, regardless of age, living with HIV who did not have a medical visit in the last six (6) months of the measurement year (HRSA/HAB Performance Measure). • Percentage of patients, regardless of age, living with HIV with an HIV viral load less

³⁹ Panel on Antiretroviral Guidelines for Adults and Adolescents. Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents with HIV. Department of Health and Human Services. [Table 3](#)

• HIV-RNA viral load; CBC with differential; chemistry profile (to include electrolytes, BUN, creatinine, bicarbonate (HCO₃), estimated glomerular filtration rate (eGFR)); • liver function tests (to include transaminases, total and direct bilirubin); • and glucose⁴⁰ (preferably fasting) or hemoglobin A1c. These tests may need to be performed more frequently if clinically indicated. Providers will continually evaluate patients for adverse outcomes and document the actions taken, outcomes, and follow-up.⁴¹	than 200 copies/mL at the last HIV viral load test during the measurement year (HRSA/HAB Performance Measure). • Percentage of existing clients with cervix living with HIV who were screened for cervical cancer in the last three years (HRSA/HAB Performance Measure). • Percentage of existing patients living with HIV susceptible to STIs who had a test for chlamydia within the measurement year (HRSA/HAB Performance Measure). • Percentage of existing patients living with HIV susceptible to STIs who had a test for gonorrhea within the measurement year (HRSA/HAB Performance Measure). • Percentage of existing adult patients living with HIV who had a test for syphilis performed within the measurement year (HRSA/HAB Performance Measure). • Percentage of existing patients aged 12 years and older screened for clinical depression (annually) on the date of the encounter using an age-appropriate standardized depression screening tool, AND if positive, a follow-up plan is documented on the date of the positive screen (HRSA/HAB Performance Measure). • Percentage of existing patients with documented annual psychosocial assessment to include domestic violence and housing status. • Percentage of existing patients living with HIV who have been screened for substance use (alcohol & drugs) in the measurement year (HRSA/HAB Performance Measure). • Percentage of existing patients aged 18 years and older who were screened for tobacco use one or more times within 24 months AND who received cessation counseling intervention if identified as a tobacco user (HRSA/HAB Performance Measure).

⁴⁰ Panel on Antiretroviral Guidelines for Adults and Adolescents. Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents with HIV. Department of Health and Human Services. [Table 3](#)

⁴¹ U.S. Department of Health and Human Services, Health Resources and Services Administration, Guide for HIV/AIDS Clinical Care – 2014 Edition. Adverse Reactions to HIV Medications. [Page 527](#)

	• Percentage of existing patients, if applicable, with completed child abuse assessment (completed if patient aged 14 years and younger). • Percentage of existing patients aged three (3) months and older living with HIV for whom there was documentation that a TB screening test was performed and results interpreted (for TB skin tests) at least once since the diagnosis of HIV (HRSA/HAB Performance Measure). • Percentage of existing patients, regardless of age, for whom Hepatitis B screening was performed at least once since the diagnosis of HIV or for whom there is documented infection or immunity (HRSA/HAB Performance Measure). • Percentage of existing patients for whom HCV screening was performed at least once since the diagnosis of HIV (HRSA/HAB Performance Measure). • Percentage of patients, regardless of age, living with HIV who were prescribed HIV ART and who had a fasting lipid panel during the measurement year (HRSA/HAB Performance Measure).
Documentation in Patient's Medical Chart Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines. Clinicians will develop/update the plan of care at each visit. If a patient refuses a treatment, such as vaccinations, documentation of denial will be written in the patient's medical chart. The provider developing the plan will sign each entry.	• Percentage of patient medical records with signed clinician entries. • Percentage of flow sheets present and updated in the patient medical records. • Percentage of problem lists present and updated in the patient medical records. • Percentage of medication lists present and updated in the patient medical records.
Documentation of Missed Patient Appointments and Efforts to Bring the Patient into Care.	• Percentage of patient medical records with documentation of specific barriers and efforts to address missed appointments.

The service provider or staff will conduct the following:⁴²

- Contact patients who have missed three (3) consecutive appointments, using at least three (3) different forms of contact (email, phone, mail, emergency contact, phone call, referral to a DIS for home visit) prior to determining they are lost to follow-up;
- Address any specific barriers to accessing services;

Document the number of missed patient appointments and efforts to bring the patient into care

SUBSTANCE ABUSE OUTPATIENT CARE

HRSA Description: Substance abuse outpatient care is the provision of outpatient services for treating drug or alcohol use disorders.⁴³

Services include:

- Screening
- Assessment
- Diagnosis and
- Treatment of substance use disorder, including:
 - Pretreatment/recovery readiness programs
 - Harm reduction
 - Behavioral health counseling associated with substance use disorder
 - Outpatient drug-free treatment and counseling
 - Medication-assisted therapy
 - Neuropsychiatric pharmaceuticals
 - Relapse prevention

Services are limited to the services below, as stated in the HRSA National Monitoring Standards. RWHAP funds shall not be used to establish or operate any programs for distributing sterile needles or syringes for the hypodermic injection of any illegal drugs. Please reference the [*Texas Health and Safety Code, Title 6, Subtitle C, Chapter 481, Subchapter A. General Provisions.*](#)

⁴² U.S. Department of Health and Human Services, Health Resources and Services Administration, Guide for HIV/AIDS Clinical Care – 2014 Edition. Supporting Patients in Care. [Page 1](#)

⁴³ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Substance Abuse Outpatient Care. [Page 16](#)

Activities may include:

- Individual and group therapy;
- Skills training;
- Discharge planning;
- Aftercare and follow-up;
- Harm reduction counseling.
- Virtual Visits
- Telehealth/Medicine Visit
- (Address virtual telehealth/telephone visit/consultation

Activities may not include:

- Residential health services.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall:

- 1.1** Be appropriately licensed by DSHS Substance Abuse Outpatient Services.
- 1.2** Satisfy all requirements, as outlined in DSHS Substance Abuse Services Licensure Rules and Counselor Licensure Rules. All service provider staff and contractors who deliver direct client care shall be properly licensed/credentialed.
- 1.3** Provide access to its system of substance abuse treatment for those with HIV/AIDS twenty-four (24) hours/day, and must provide mechanisms for urgent and emergency care; and
- 1.4** provide a means for clients who have discontinued service due to discharge, discontinuation, relapse, etc., to return to services with the service provider or be referred to a more appropriate service provider.
- 1.5** Work with the client to develop and implement goals, objectives, and strategies within an individualized, written treatment plan, which the client shall sign. The plan shall identify services and support needed to address problems and needs identified during a comprehensive psychosocial assessment consistent with DSHS Substance Abuse Services rules and regulations. The agency shall review the plan at least every six months, revise it as necessary,
- 1.6** identify discharge criteria, and include an initial discharge plan. The discharge plan shall address the continuity of services and ongoing needs of the client. The service provider shall document follow-up no sooner than 60 days and no later than 90 days after discharge.

SERVICE STANDARDS AND PERFORMANCE MEASURES

The following standards and performance measures are guides to improving healthcare outcomes for PLWH throughout the State of Texas within the Ryan White Part A, Part B, and State Services Program.

Service Standard	Performance Measure
Initial Appointment/Screening	• Percentage of client charts with documentation of an appointment

Face-to-face client orientation is provided to all new clients to introduce them to program services, ensure their understanding of the need for continuous care, and empower them to access services. In accordance with the Texas Administrative Code (TAC), clients will be informed of opportunities for the family to be involved in the client's treatment. An appointment will be scheduled within a reasonable amount of time, not more than ten (10) business days, from a client's request for substance use services. The agency may provide written orientation materials to the client that support the above information, are culturally sensitive, promote equity, and are linguistically appropriate. In urgent, non-life-threatening emergency circumstances, an appointment will be made as soon as possible but no later than within one (1) business day, subject to licensure requirements. If an agency cannot provide the needed services, the agency will offer to refer the client to another organization that can provide the services. The referral must be made within one (1) business day for urgent, non-life-threatening situation(s). Each client must complete a documented screening based on best practice standards of care using the Texas Department of Insurance criteria per TAC standards. The screening process shall collect the necessary information to determine the services required to meet the client's needs.⁴⁴	scheduled after request (referral) for substance use outpatient services. Percentage of client charts with documentation of completed screening as indicated.
Comprehensive Psychosocial Assessment All clients referred to the program will receive a Comprehensive Psychosocial Assessment (in accordance with TAC Standards) by a licensed substance use counselor. Initial comprehensive psychosocial assessment protocols shall provide for screening individuals to determine the level of need and appropriate treatment plan development. A comprehensive psychosocial assessment will be completed before the third counseling session* and will include the following: Presenting problems resulting in need;	

⁴⁴ [Texas Administrative Code, Title 25, Part 1, Chapter 448, Subchapter H, Rule §448.801, Screening](#)

• Alcohol and other drug use; • Psychiatric and chemical dependency treatment; • Medical history and current health status, to include an assessment of Tuberculosis (TB), HIV, and other sexually transmitted infections (STI) as permitted by law; • Relationships with family, including domestic/intimate partner violence; • History of trauma/related events; • Stigma; • Housing Stability, expelled from home; • Treatment adherence (e.g., HIV meds); • Social and leisure activities; • Education and vocation training; • Employment history; • Legal issues; • Mental/emotional functioning; and • Strengths and weaknesses.⁴⁵ The assessment shall result in a diagnosed substance use issue, as allowed by the counselor's license and scope of practice. *Note: Clients are assessed for care coordination needs, and referrals are made to other case management programs as appropriate. If pressing needs emerge during the assessment requiring immediate attention that results in the assessment not being finalized by the third session, this must be documented in the client's primary record. Specific assessment tools such as the Substance Abuse and Mental Illness Symptoms Screener (SAMISS) and Addiction Severity Index (ASI) may be used for substance use and sexual history, and the Mini-Mental State Examination (MMSE) may be used for cognitive assessment.	
Treatment Modalities Providers must discuss treatment options with substance-using clients and ask which treatment options they prefer. Providers should inquire about the use of multiple substances and consider the full spectrum of the client's drug use when discussing treatment options.	• Percentage of client charts with documentation of discussion of treatment modalities with the client. • Percentage of client charts for clients on medication-assisted therapies, with documentation of contact with the client's medical provider within 72 hours of treatment initiation or the client's refusal to authorize the communication.

⁴⁵ [Texas Administrative Code, Title 25, Part 1, Chapter 448, Subchapter H, Rule §448.801, Screening](#)

Providers must discuss alternative treatment modalities with the client(s) targeted toward the substance(s) that the client is still using. Providers must rely on the ASAM Criteria (formerly known as the ASAM Patient Placement Criteria) of the American Society of Addiction Medicine (ASAM) for guidance on selecting the best treatment alternatives for specific clients. Medical treatment for substance use must adhere to current HIV Clinical Guidelines.	Percentage of clients with acupuncture services rendered with documented evidence of a physician's order.
Treatment Plan A treatment plan shall be completed within 30 calendar days of completing a comprehensive psychosocial assessment specific to individual client needs. The treatment plan shall be prepared and documented for each client. Treatment planning will be a collaborative process through which the provider and client develop desired treatment outcomes and identify the strategies for achieving them. Individual and family case records will include documentation of the following: - Identification of the substance use disorder - Goals and objectives - Treatment modality (group or individual) - Start date for substance use counseling - Recommended number of sessions - Date for reassessment - Projected treatment end date - Any recommendations for follow up Treatment, as appropriate, will include counseling about (at minimum): - Prevention and transmission, including root causes and underlying issues related to increased HIV transmission. - Treatment adherence - Development of social support systems - Community resources - Maximizing social and adaptive functioning - The role of spirituality and religion in a client's life, disability, death and dying, and exploration of future goals The substance use counselor rendering service will sign the treatment plan. In accordance with TAC	- Percentage of client charts that have documentation of treatment plans completed within 30 calendar days of the completed comprehensive assessment. - Percentage of client charts with documented evidence of treatment plans reviewed/modified at a minimum midway through the number of determined sessions agreed upon for frequency of modality in the client's primary record.

on Substance Abuse, the treatment plan shall be reviewed at a minimum midway through the number of determined sessions agreed upon for frequency of modality and must reflect an ongoing reassessment of the client's problems, needs, and response to therapy.	
Progress Notes Services will be provided according to the individual's treatment plan and documented in the client's record. Progress notes are completed for every professional counseling session and include the following: • Client name • Session date • Clinical observations • Focus of session • Interventions • Assessment • Duration of session • Newly identified issues/goals • Client's responses to interventions and referrals • HIV medication adherence • Substance use treatment adherence • Counselor authentication per current TAC Standards of Care for Substance Abuse Services.	• Percentage of client charts with documented progress notes for each counseling session as indicated.
Referrals The service provider will make appropriate referrals when necessary.	• Percentage of client charts, as applicable, with documented referrals made based on need demonstrated in the assessment and progress notes.
Discharge Planning Discharge planning will be done with each client when treatment goals are met and include: • Circumstances of discharge • Summary of needs at admission • Summary of services provided • Goals and objectives completed during counseling • Referral after completing substance use treatment to the case manager and primary care provider, as appropriate • Discharge plan	• Percentage of client charts with documentation, as applicable, of discharge planning with the client prior to case closure.

Counselor authentication, in accordance with TAC Standards and the counselor licensure requirements. In all cases, providers/case managers shall ensure that, to the greatest extent possible, clients who leave care are linked with appropriate services to meet their needs.	
Discharge Services may be discontinued when the client has: - Reached goals and objectives in their treatment plan - Missed three (3) consecutive appointments in six (6) months. - Continued non-adherence to a treatment plan - Chooses to terminate services - Unacceptable client behavior - Deceased Completed discharge summary in accordance with <i>TAC Standards (§448.805)4</i>, as applicable.	- Percentage of client charts with documentation of case closure (discharge), the reason for discharge, or discharge summary if applicable. Proposed System Level Outcome Measure: Percentage of clients who demonstrate improved viral suppression after completing Substance Use Outpatient Treatment Plan objectives.

SUPPORT SERVICES

CHILD CARE SERVICES

HRSA Description: The RWHAP supports intermittent childcare services for the children living in the household of HIV clients to enable clients to attend medical visits, related appointments, and RWHAP-related meetings, groups, or training sessions.⁴⁶

Allowable uses of funds include:

- A licensed or registered childcare provider to deliver intermittent care
- Informal childcare provided by a neighbor, family member, or another person (with the understanding that existing federal restrictions prohibit giving cash to clients or primary caregivers to pay for these services)

Activities must include:

- Continuing or intermittent provision of basic childcare, including child development activities that promote cognitive learning and social skills development;

Activities may not include:

⁴⁶ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Child Care Services. [Page 17](#)

- Off-site recreational or social activities or to pay for a gym membership.
- Daycare while the HIV+ parent, guardian, or caretaker is at work or school.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall:

- 1.1 Ensure that its child care facility is licensed by either the Texas Department of State Health Services as a Special Care Facility, the Texas Department of Family and Protective Services as a Day Care Facility, or the Texas Department of Aging and Disability Services as a Pediatric Extended Care Facility and that its license(s) are current and available;
- 1.2 ensure that staff and volunteers who require licensure or certification are appropriately licensed/certified and consistent with their professional categories;
- 1.3 ensure that its child/adolescent care facility meets health, fire, and safety standards, including adequate ventilation, clean water, and heating and cooling units, as evidenced by passing the most recent inspections by appropriate regulatory bodies;
- 1.4 obtain an initial test for tuberculosis for prospective staff and volunteers, and a repeat test at least annually to protect clients; and
- 1.5 ensure the availability of age-appropriate services.
- 1.6 Except where grant funds may be specifically restricted (e.g., Minority AIDS Initiative funds), provide its services to eligible children and adolescents (birth through age 18) living with or affected by HIV/AIDS, regardless of gender, race, color, religion (or lack thereof), national origin, disability, or inability to pay, to the extent resources allow.

EMERGENCY FINANCIAL ASSISTANCE

HRSA Description: Emergency financial assistance (EFA) provides limited one-time or short-term payments to assist the RWHAP client with an emergent need for paying for essential utilities, housing, food (including groceries and food vouchers), transportation, and medication. **NOTE:** Part A and Part B programs require Emergency funds to be allocated, tracked, and reported by type of assistance.⁴⁷ Emergency financial assistance can be directly paid to an agency or through a voucher program.⁴⁸

Activities may include:

- Payment of short-term payments for antiretroviral medication.
- Dispensing fee for ADAP medications during the ADAP eligibility determination period.
- Provision of short-term payments/vouchers for housing, transportation (bus/gas voucher), food, and medication assistance.

⁴⁷ HIV/AIDS Bureau, Division of Metropolitan HIV/AIDS Programs [National Monitoring Standards for Ryan White Part A Grantees: Program – Part A](#)

⁴⁸ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Emergency Financial Assistance. [Page 17](#)

- Provision of short-term payments for essential utilities, including water, gas, and electric bills, paid directly to the utility provider.

Activities may not include:

- Provision of short-term payments made directly to clients.

EFA is an allowable support service with an \$800/year/client cap.

- The agency must set priorities and delineate and monitor what part of the overall allocation for emergency assistance is obligated for each subcategory. Careful monitoring of expenditures within a subcategory of "emergency assistance" is necessary to ensure that planned amounts for specific services are implemented and determine when reallocations may be required. Policies and procedures should be implemented to avoid duplication of services.
- Limitations on providing emergency assistance to eligible individuals/households should be delineated and consistently applied to all clients. It is expected that all other sources of funding in the community for emergency assistance will be effectively used and that any allocation of EFA funding for these purposes will be the payer-of-last-resort and for limited amounts, limited use, and limited periods.⁴⁹

Initial medications purchased and reimbursed dispensing fees associated with purchased medication are not subject to the \$800/client/fiscal year cap. EFA to individual clients is provided with limited frequency and for a limited period, with specified frequency and duration of assistance. Emergent needs must be documented each time funds are used.

Assistance is provided only for the following essential services/subcategories:

- Utilities such as household utilities, including gas, electricity, propane, water, and all required fees
- Housing such as rent or temporary shelter. EFA can only be used if HOPWA assistance is not available
- Food such as groceries and food vouchers
- Prescription medication assistance such as short-term, one-time assistance for any medication and associated dispensing fee as a result of component of a primary medical visit (not to exceed a 30-day supply)

SERVICE STANDARDS AND PERFORMANCE MEASURES

The following standards and performance measures are guides to improving healthcare outcomes for PLWH throughout the State of Texas within the Ryan White Part A, Part B, and State Services Program.

Service Standard	Performance Measure
Assisting Clients during the ADAP Eligibility Determination Period	• Percentage of clients that have documented evidence in the client primary record of short-term HIV

⁴⁹ Texas Department of State Health Services HIV/STD Program Policies: [DSHS Funds as Payment of Last Resort \(Policy 590.001\)](#).

HIV+ clients with documented evidence of the emergency need for HIV medications can receive short-term medication assistance (30-day supply) with limited use of EFA for no more than 60 days (2 months or less). Assisting Clients with Short-Term Medications HIV+ clients with documented evidence of pending health insurance medication plan approval can receive short-term HIV medication assistance no more than 60 days through EFA.	medication assistance provided during the ADAP application period. Percentage of clients that have documented evidence in the client primary record of short-term HIV medication copay assistance provided during the health insurance application period.
Client Determination for Emergency Financial Assistance Applicants must demonstrate an emergent need resulting in their inability to pay their utility bills or prescriptions without assistance and risk disconnection of service due to one or more of the following: - A significant increase in bills - A recent decrease in income - High unexpected expenses on essential items - They are unable to provide for basic needs and shelter - A failure to provide EFA will result in danger to the physical health of the client or dependent children - Other emergency needs as deemed appropriate by the agency Agency staff will conduct an assessment of the presenting problems/needs of the client with emergency financial issues. A service plan will be developed documenting the client's emergent need resulting in their inability to pay bills/prescriptions without assistance, and other resources pursued noted before using EFA funding for assistance. The client will be assessed for the ongoing status and outcome of the emergency assistance. Referrals for services, as applicable, will be documented in the client file. The resolution of the emergency status will be documented in the client record.	- Percentage of clients with documented evidence of determination of EFA needs noted in the client's primary record. - Percentage of clients with documented service plan for EFA in the client's primary record that indicates an emergent need, other resources pursued, and outcome of EFA provided. - Percentage of clients with documented evidence of resolution of the emergency status and referrals made (as applicable) with outcome results in the client's primary record.

Emergency Financial Assistance Provided Short-term assistance will only be provided for the following: • Prescription medication assistance All completed requests for assistance shall be approved or denied within three (3) business days. Assistance shall be issued in response to an essential need (as identified by the staff person providing EFA) within three (3) business days of approval of the request. Payment for assistance made to service providers will protect client confidentiality. Use checks and envelopes that de-identify the agency as an HIV/AIDS provider to protect client confidentiality.	• Percentage of clients with documented evidence of payments made by the agency for resolution of emergency status (copies of checks/vouchers available).
---	---

FOOD BANK/HOME-DELIVERED MEALS

HRSA Description: Food Bank/Home Delivered Meals refers to the provision of actual food items, hot meals, or a voucher program to purchase food. This also includes the provision of essential non-food items that are limited to the following:⁵⁰

- Personal hygiene products
- Household cleaning supplies
- Water filtration/purification systems in communities where issues of water safety exist

This category includes providing actual food, prepared meals, or food vouchers to purchase prepared meals. Food bank services are the provision of actual food and personal care items in a food bank setting.

Activities may include:

- Providing food including fresh fruit, vegetables, meats, dairy products, staples, etc.;
- Providing personal hygiene products, including toothpaste, feminine hygiene, bathing soap, shampoo, and deodorant;
- Providing cleaning and paper goods such as toilet paper;
- Delivery of food, personal hygiene items, and cleaning goods to a client's home (rural areas only);
- Provision of nutritional supplements for meal replacement;
- Provision of education for safe food preparation practices;

⁵⁰ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Food Bank/ Home Delivered Meals.
[Page 17](#)

- Provision of nutritionally balanced meals, on-site in a congregate housing setting or home-delivered meals to non-ambulatory individuals with a documented medical need for meal assistance.

On-site/Home Delivered Meals are the provision of prepared meals or food vouchers for prepared meals in either a congregate dining setting or delivered to clients who are homebound and cannot shop for or prepare their own food. This service includes the provision of both frozen and hot meals.

Activities may not include:

- The provision of prepared meals if receiving funding for food pantry services*;
- The provision of food pantry services if receiving funding for home-delivered meals*;
- The provision of pet food or products, household appliances;
- Nutrition counseling;
- Cash to purchase food.

* Approval from the AA is required

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The food bank shall:

- 1.1** ensure that its food pantry program meets all requirements of the local health department for food handling and storage;
- 1.2** maintain and show evidence that all required inspections are current and resulted in acceptable findings;
- 1.3** provide adequate space and equipment to store food in a sanitary manner;
- 1.4** if bulk foods are repackaged, all handlers should be licensed food handlers and
- 1.5** have a Food Product Establishment Permit, if required by the local municipality.
- 1.6** Ensure that if they operate within the City of Dallas, at least one person on staff with direct responsibility for the provision of food is certified by the City of Dallas as a Food Service Manager or is certified by the Texas Department of State Health Services Retail Foods Division as having satisfactorily completed a state-accredited food protection management program.

SERVICE STANDARDS AND PERFORMANCE MEASURES

The following standards and performance measures are guides to improving healthcare outcomes for PLWH throughout the State of Texas within the Ryan White Part A, Part B, and State Services Program.

Service Standard	Performance Measure
Provision of Food Distribution Services Clients referred to or otherwise accessing food banks without a referral must be screened for other eligible resources, such as the Supplemental	• Percentage of clients with documentation in the client's primary record of other food resources accessed prior to clients accessing the food bank.

Nutrition Assistance Program (SNAP), as evidenced in their primary record. Clients accessing food banks have documentation in the client's primary record of the reason/need assessed. Assessment of the client's immediate or ongoing need for food bank services is documented in the client's primary record.	Percentage of clients with documentation in the client's primary record of the assessment of the need for food resources.
Dietary Guidance A registered dietician must be consulted to develop a dietary/nutritional policy that lists specific food items offered in the food bank/pantry or prepared for home-delivered meals. There is a plan to address the needs of clients' special diets. As applicable, clients are referred to an RD for specific dietary issues. Clients are offered counseling, if requested, to help with meal planning and food appropriateness. The program must ensure that available foods are selected, considering special nutritional needs (incorporating generally accepted nutritional standards), religious requirements, and ethnic food preferences, as appropriate. Attempts must be made on a regular basis to provide choices on food items that meet the individual dietary needs of clients, including the foods that fall into the recognized food categories for a healthy diet identified in the dietary guidelines issued by the U.S. Department of Agriculture and U.S. Department of Health and Human Services.	- Percentage of clients accessing food banks are referred, as applicable, to an RD for specific dietary issues as documentation in the client's primary record. - Percentage of clients accessing food banks offered counseling for meal planning and food appropriateness.
Home-Cooked/Hot Meals Clients assessed for food security and offered home-cooked meals/hot meal programs have evidence of the need documented in the client's primary record. Clients provided vouchers for hot meal programs have an increase in food security.	- Percentage of clients accessing hot meal programs have documented evidence of assessment of need in the client's primary record. PILOT: Percentage of clients accessing hot meal programs have increased food security as documented in the client's primary record.
Discharge/Termination The service provider will develop discharge/termination for cause criteria and procedures.	Percentage of clients discharged from food bank/home delivered meals have documentation of reason of discharge in the client's primary record.

HEALTH EDUCATION/RISK REDUCTION

HRSA Description: Health Education/Risk Reduction is the provision of education to clients living with HIV about HIV transmission and how to reduce the risk of HIV transmission. It includes sharing information about medical and psychosocial support services and counseling clients to improve their health status. This service may not be funded using Ryan White Part B funds. DSHS must approve the provision of services not found in other service categories. Topics covered may include:⁵¹

- Education on risk reduction strategies to reduce transmission, such as pre-exposure prophylaxis (PrEP) for clients' partners and undetectable equals untransmittable (U=U)
- Education on health care coverage options (e.g., qualified health plans through the Marketplace, Medicaid coverage, Medicare coverage)
- Health literacy
- Treatment adherence education

Activities must include:

- Preparation and dissemination of the informational handbook, including the following information;
- Chart to track labs and medications;
- Efficient and useful comprehensive service agency listings;
- HIV-reduction messages;
- Reasons to enter and remain in primary medical care;
- Information on Ryan White services;
- Information on eligibility for Ryan White services;
- A method to track referrals;
- General information for newly diagnosed;
- Space to write in provider information (physician, case manager, pharmacy, etc.);
- General health information, including space to document and track body weight, blood pressure, nutrition questions, and questions about medications;
- Explanation of HOPWA;
- Phone numbers of other EMAs;
- Comprehensive Care Coordination section;
- Maintaining a distribution list that includes, at a minimum, key points of entry, Part A, MAI, Part B, State Services, and State HOPWA-funded providers.

Activities may not include:

- Provision of professional and volunteer training and education;
- Provision of verbal information and education about reduction and available HIV-related services.
- Services delivered anonymously.

⁵¹ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Health Education/ Risk Reduction.
[Page 18](#)

HOUSING

HRSA Description: Housing provides transitional, short-term, or emergency housing assistance to enable a client or family to gain or maintain outpatient/ambulatory health services and treatment, including temporary assistance necessary to prevent homelessness and to gain or maintain access to medical care. Housing may provide some core medical or support service and be essential for a client or family to gain or maintain access to and compliance with HIV-related outpatient/ambulatory health services and treatment.⁵²

HRSA/RWHAP recipients and subrecipients that use funds to provide Housing must have mechanisms to assess and document new clients' housing status and housing service needs, at least annually for existing clients. HRSA/RWHAP recipients, subrecipients, and local decision-making planning bodies are strongly encouraged to institute duration limits to housing activities.

HRSA/HAB recommends recipients and subrecipients align duration limits with those definitions used by other housing programs, such as those administered by the Department of Housing and Urban Development, which currently uses 24 months for transitional housing. Housing provides transitional, short-term, or emergency housing assistance to enable a client or family to gain or maintain outpatient/ambulatory health services and treatment, including temporary assistance necessary to prevent homelessness and to gain or maintain access to medical care. Housing services include housing referral services and transitional, short-term, or emergency housing assistance.

Activities must include:

- The development of an individualized housing plan, updated quarterly, to guide the client's linkage to permanent housing.
- Documentation of the necessity of housing services for the purposes of medical care.

Activities may include:

- Housing referral services, assessment, search, placement, and housing advocacy services are provided on behalf of the eligible client and fees associated with these activities.
- Housing referral services provided by a housing case manager or other professionals to include assessment, search, placement, and advocacy services, which possess a comprehensive knowledge of local, state, and federal housing programs and how these programs can be accessed.

Activities may not include:

- Direct payments to eligible clients cannot be used for mortgage payments.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall:

⁵² Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Housing. [Page 18](#)

- 1.1** ensure that each of its housing facilities is licensed by DSHS as an assisted living facility or as a special care facility, as appropriate;
- 1.2** keep its license current and available;
- 1.3** Ensure that housing facilities meet health, fire, and safety standards, including adequate ventilation, clean water, and heating and cooling units, as evidenced by passing the most recent inspections by appropriate regulatory bodies, and comply with applicable local government zoning and occupancy codes in its housing facilities.

Service Standard	Performance Measure
Emergency Housing Assistance Agency staff will initiate an intake within three (3) business days' onset of the emergency housing need. Assessment of client housing status and housing service needs must be documented. Reason(s) for emergency assistance may include but are not limited to: • The client is unable to pay rent due to a recent job loss, unpaid medical leave of absence, exhausted all leave balances • The client is unable to work due to recent hospitalization • The client had to recently purchase unexpected costly HIV medications or pay for unexpected HIV-related medical expenses out of pocket. Assessment that the household need is: • Actual costs to avoid eviction • Other resources are not reasonably available to address the unmet housing need. • The client will maintain or have stable housing as a result of housing assistance. Staff will contact the client at the end of the month to determine if the housing emergency has been resolved. If not resolved and the client needs additional assistance, the client may be assessed for short-term housing assistance.	Percentage of client charts with documented evidence of emergency housing needs assessed. Percentage of client charts that have a documented assessment of other resources reviewed and determined not available to assist the client in a housing emergency. Percentage of client charts with documented evidence of follow-up to housing need with a resolution of housing emergency. Percentage of patients with an HIV diagnosis who were homeless or unstably housed in the 12-month measurement period (HRSA/HAB Performance Measure). Percentage of client charts accessing housing assistance, with stabilized housing documented as a result of the assistance provided.
Housing Plan for Transitional (temporary) and Short-Term Housing All clients receiving assistance for transitional or short-term housing must have a Housing	Percentage of client charts with a documented housing plan developed.

Plan documented within the client files that includes: • Housing status; • Reason for housing assistance need; • Other resources screened for housing assistance. Plans must detail the ongoing housing stability goal, focusing on access to medical treatment and supportive services. The plan must include: • Sustainable short-term and long-term goals for alleviating susceptibility to homelessness, establishing affordable permanent housing stability, and improving access to health care and supportive services. • Identification of barriers to sustainable housing; • Steps to address housing needs; • Referral(s) to available housing support services; and • Budget and money management skills building, if indicated. Documentation in the client's primary record/progress notes that the housing plan is reviewed monthly.	Percentage of client charts with documented evidence of monthly updated housing plans with progress toward goals identified.
Housing Referral Services Housing-related referrals provided by housing assistance/referral providers include housing assessment, search, placement, and advocacy services to seek housing (application to funding sources, visits to court systems). Staff will document all activities in the client's primary record to assist the client in securing housing and the outcome of the assistance.	Percentage of client charts with documented evidence of housing referral services provided, as applicable, including all elements as indicated. Percentage of clients who received housing referral services that obtained secure, stable housing as a result of the assistance

LINGUISTIC SERVICES

HRSA Description: Linguistic services provide interpretation and translation services, both oral and written, to eligible clients. Qualified linguistic services providers must provide these services as a component of HIV service

delivery between the healthcare provider and the client. These services are to be provided when necessary to facilitate communication between the provider and client or support the delivery of RWHAP-eligible services.⁵³

Activities may include:

- Verbal interpretation between a client or caregiver and other service providers to facilitate the delivery of services;
- Written translation of documents into another language, or Braille, for other Dallas County pass-through grant-funded agencies to facilitate the delivery of services to a client or clients;
- Sign language interpretation between a client or caregiver and other service providers to facilitate the delivery of services.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall ensure the following:

- 1.1 That services be provided by a qualified linguist service, both oral and written, including a language line.
- 1.2 The services must comply with the [National Standards for Culturally and Linguistically Appropriate Services](#).
- 1.3 That its interpretation/translation/sign language program staff who provide direct services to clients shall have had at least one year of college and a minimum of six (6) months of experience providing services in this or a related field. One year of stable and relevant employment in the areas of outreach work, community service, supportive work with families and individuals, supportive work with youth, corrections, public relations, or customer service can substitute for the education requirement;
- 1.4 that, if its contract with Dallas County Health and Human Services allows for services for the visually impaired, it makes written materials available in large print;
- 1.5 that staff and volunteers who provide sign language services hold at least Level I American Sign Language (ASL) certification from the [Texas Office for Deaf and Hard of Hearing Services](#) (DHHS);
- 1.6 that it does not utilize Ryan White Part A or Part B funds to provide interpretation/translation services for ineligible individuals or agencies; and
- 1.7 that it maintains detailed records in legible form, documenting all clients, the number of interpretation/translation/sign language units, phone contacts with clients, contacts with service providers on behalf of clients, and contacts with service providers requesting interpretation/translation/sign language services.

MEDICAL TRANSPORTATION

HRSA Description: Medical transportation provides non-emergency transportation services that enable an eligible client to access or be retained in core medical and support services.⁵⁴

⁵³ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Linguistic Services. [Page 19](#)

⁵⁴ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Medical Transportation. [Page 19](#)

Activities must include:

- Transporting an eligible client to an HIV-related medical or support service appointment, HRSA RWHAP-related local planning council/committee meetings, or training sessions.
- Delivering HIV-related medications to an eligible client or in bulk quantity to community-based agencies;
- Distributing bus passes, taxi/ride-sharing vouchers, or gas vouchers to provide access to HIV-related appointments.

Activities may not include:

- Direct maintenance expenses (tires, repairs, etc.) of a privately-owned vehicle
- Any other costs associated with a privately owned vehicle, such as lease, loan payments, insurance, license, or registration fees.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall ensure the following:⁵⁵

- 1.1** through a contractual arrangement, lease agreement, or ownership, that its vehicle service fleet is operated, maintained, and insured exclusively by the service provider;
- 1.2** that it maintains vehicle liability insurance coverage on each vehicle, or as a fleet, with a minimum acceptable limit of \$300,000 combined single limit coverage per vehicle, and that each vehicle used by the provider maintains a current Texas State Inspection, registration, and license plates;
- 1.3** that each driver maintains a current, valid Texas Driver's License, and it shall keep a copy on file;
- 1.4** that it maintains detailed records in legible form of mileage driven, name of individuals provided with transportation, and origin and destination for all trips;
- 1.5** that it has in place a means to communicate with the transport vehicle (a radio, cell phone, or other devices, preferably hands-free);
- 1.6** that it does not utilize Ryan White Part A or Part B funds to transport clients to off-premise social or recreational activities and
- 1.7** It has a written policy defining an "acceptable driving record" and that each driver meets the policy's requirements.

NON-MEDICAL CASE MANAGEMENT SERVICES

HRSA Description: Non-Medical Case Management Services (NMCM) provide guidance and assistance in accessing medical, social, community, legal, financial, and other needed services. Non-medical case management services may also include assisting eligible clients in obtaining access to other public and private programs for which they may be eligible, such as Medicaid, Medicare Part D, State Pharmacy Assistance Programs, Pharmaceutical

⁵⁵ [State of Texas Transportation Code Title 7, Subtitle C, Chapter 545. Operation and movement of Vehicles.](#)

Manufacturer's Patient Assistance Programs, other state or local health care and supportive services, or health insurance Marketplace plans.⁵⁶

This service category includes several methods of communication, including face-to-face, phone contact, and any other forms deemed appropriate by the RWHAP recipient.

Key activities include:

- Initial assessment of service needs
- Development of a comprehensive, individualized care plan
- Continuous client monitoring to assess the efficacy of the care plan
- Re-evaluation of the care plan at least every six (6) months with adaptations as necessary
- Ongoing assessment of the client's and other key family members' needs and personal support systems

Activities must include:

- Completing intakes, screening for client eligibility, and determining the need for all services;
- Assessing and reassessing (according to current Standards of Care) a client's bio-psychosocial history, including the needs of the client and support system;
- Developing and reviewing a care plan based on the client's needs and choices with goals and strategies for completion every six (6) months;
- Implementing the care plan through time-lined strategies;
- Providing information, referrals, and assistance with linkages to needed services;
- Monitoring and following up on the goals of the care plan;
- Advocating on behalf of a client to remove barriers to service;
- Collaborating with other service providers to coordinate client care;
- Providing appropriate crisis intervention as needed.

Activities may include:

- Case management to prevent unnecessary hospitalization or to expedite discharge;
- Screening followed by reduction interventions for HIV-positive persons susceptible of transmitting HIV;
- Benefits Counseling, Enrollment & Outreach Education (e.g., Medicaid, Medicare, Market Place/Exchange, other private insurance, etc.).
- Take-Charge-Texas (TCT) and other types of data entry or documentation directly related to case management performed for/on behalf of a client.

Activities may not include:

- Coordination and follow-up of medical treatments;
- Compilation of outcome measures reports;
- Development, distribution, or analysis of client satisfaction surveys;

⁵⁶ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Non-Medical Case Management Services. [Page 20](#)

- Recreational activities.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall ensure that:

- 1.1 Each staff person who provides case management services to clients shall have, at a minimum, a bachelor's degree in social science or behavioral science, nursing, or a related field from an accredited domestic or international college or university. As an alternative, a minimum of one (1) year of employment experience performing medical case management, case management, or client advocacy may substitute for each year of college education;
- 1.2 each case management supervisor shall have, at a minimum, a bachelor's degree in social science or behavioral science, nursing, or a related field from an accredited domestic or international college or university. As an alternative, a minimum of one (1) year of employment experience performing medical case management, case management, or client advocacy may substitute for each year of college education.
- 1.3 Its case management staff, who provide direct services to clients, have continuing access to the most up-to-date information available about effective medical care for those with HIV/AIDS and
- 1.4 case management supervisors and case managers shall each hold a valid driver's license in accordance with Texas law if needed to carry out work responsibilities.
- 1.5 Case managers complete the [HIV Case Management training series](#) for case management annually.

NON-MEDICAL CASE MANAGEMENT SERVICES - HOUSING-BASED CASE MANAGEMENT

Housing-based case management is non-medical case management in a congregate housing setting. This category is a local exception for the Dallas EMA/HSDA but must comply with the requirements outlined in Non-Medical Case Management.

OTHER PROFESSIONAL SERVICES (LEGAL SERVICES)

HRSA Description: Other Professional Services allow for the provision of professional and consultant services rendered by members of particular professions licensed or qualified to offer such services by local governing authorities.⁵⁷

Such services may include:

⁵⁷ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Other Professional Services. [Page 21](#)

- Legal services provided to or on behalf of the individual living with HIV and involving legal matters related to or arising from their HIV disease, including:
- Assistance with public benefits such as Social Security Disability Insurance (SSDI)
- Interventions necessary to ensure access to eligible benefits, including discrimination or breach of confidentiality litigation as it relates to services eligible for funding under the RWHAP

Preparation of:

- A healthcare power of attorney
- Durable powers of attorney
- Living wills
- Permanency planning to help clients/families make decisions about the placement and care of minor children after their parents/caregivers are deceased or are no longer able to care for them, including:
 - Social service counseling or legal counsel regarding the drafting of wills or delegating powers of attorney
 - Preparation for custody options for legal dependents, including standby guardianship, joint custody, or adoption

Activities may include:

- The preparation of powers of attorney, do not resuscitate orders;
- Interventions necessary to ensure access to eligible services, including discrimination or breach of confidentiality litigation related to services eligible for funding under the Ryan White HIV/AIDS Treatment Modernization Act.

Activities may not include:

- Legal services related to criminal defense, class action suits, or any legal matters unrelated to CARE Act service access;
- Legal services that arrange for guardianship or adoption of children after the death of their normal caregiver;
- Wills, trusts, and bankruptcy proceedings.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall ensure that:

- 1.1 All attorneys, both staff and volunteer, meet the requirements for licensure and are in good standing with the State Bar of Texas; law students, law school graduates, and other legal professionals will be supervised by a qualified licensed attorney.
- 1.2 all staff and volunteer paraprofessionals and notaries possess and maintain proper licenses and certifications as required in the State of Texas;
- 1.3 legal services provided are related to clients' HIV status.
- 1.4 Staff will attend and have continued access to training activities:
 - Agency-paid legal staff and contractors must complete two (2) hours of HIV-specific training annually.

- The new agency-paid legal staff and contractors must complete two (2) hours of HIV-specific training within 90 days of the start date.
- Volunteer legal staff are encouraged to complete HIV-specific legal training.
- Documentation of training on current applicable laws related to HIV is located in the personnel file.
- The agency maintains a system for disseminating HIV/AIDS information relevant to the legal assistance needs of PLWH to staff and volunteers.
- The agency will document the provision of in-service education to staff regarding current treatment methodologies and promising practices.

OUTREACH SERVICES

HRSA Description: Outreach services include the provision of the following three activities:⁵⁸

- Identification of people who do not know their HIV status and linkage to Outpatient/Ambulatory Health Services
- Provision of additional information and education on healthcare coverage options
- Reengagement of people who know their status in Outpatient/Ambulatory Health Services

Activities must include:

- Identifying HIV-positive individuals who know their HIV status and are not receiving care;
- Providing targeted verbal and written information with explicit and clear links to health care services; Directing individuals to early intervention services (EIS) or primary care (HIV counseling and testing, diagnostic, and clinical ongoing prevention counseling services with appropriate providers of health and support services);
- Educating the client on the importance of remaining in primary medical care;
- Completing follow-up by tracking linkages to primary medical care and services that will retain them in primary medical care and treatment;
- Outreach services conducted in conjunction with a primary medical care program.

Activities may include:

- Providing referrals to case management;
- Condom distribution;
- Individual prevention education, which includes screening of practices that may make an individual susceptible to acquiring HIV, followed by reduction interventions for persons living with HIV who may be susceptible to transmission.

Activities may not include:

⁵⁸ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Outreach Services. [Page 22](#)

- HIV counseling/testing;
- Needle distribution;
- Broad scope awareness activities that address the general public;
- Marketing efforts for specific agencies that do not include information about services available in the continuum;
- Outreach conducted in group settings.

OUTREACH (STREET)

HRSA Description: Outreach services are programs that have as their principal purpose the identification of people with unknown HIV disease or those who know their status so that they may become aware of and may be enrolled in care and treatment services (i.e., case finding), not HIV counseling and testing or HIV prevention education. These services may target high-risk communities or individuals. Outreach programs must be planned and delivered in coordination with local HIV prevention outreach programs to avoid duplication of effort; be targeted to populations known through local epidemiologic data to be at disproportionate risk for HIV; be conducted at times and in places where there is a high probability that individuals with HIV will be reached, and be designed with quantified program reporting that will accommodate local effectiveness evaluation.⁵⁹

Activities must include:

- Providing referrals to case management;
- Providing targeted verbal and written information;
- Directing individuals to early intervention services (EIS) or primary care (HIV counseling and testing, diagnostic, and clinical ongoing prevention counseling services with appropriate providers of health and support services;
- Educating the client on the importance of remaining in primary medical care;
- Completing follow-up by tracking linkages to early intervention services, primary medical care, and services that will retain them in primary medical care and treatment;
- Targeting populations identified in local needs assessment, epidemiological data, and service utilization data as being susceptible to HIV disease.

Activities may include:

- Condom distribution;
- Prevention education, which includes screening of practice followed by reduction interventions to reduce acquisition/transmission of HIV; HIV counseling/testing.

Activities may not include:

- HIV counseling/testing;
- Needle distribution;
- Marketing efforts for specific agencies that do not include information about services available in the continuum;

⁵⁹ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Outreach Services. [Page 22](#)

- Outreach conducted in group settings of more than ten (10) individuals.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall ensure the following:

- 1.1** That its outreach workers know about and have experience working with underserved populations;
- 1.2** That its supervisor(s) of outreach workers has, at a minimum, at least two years of experience conducting HIV-related outreach activities with potential clients. In the absence of a supervisor, such as may be the case in a small agency, the agency shall have in place a collaborative agreement with another agency to provide access/outreach training and supervision;
- 1.3** that each outreach supervisor and worker holds a valid driver's license in accordance with Texas law if needed to carry out work responsibilities and
- 1.4** that it has ongoing access to names and last-known locating information for individuals known to be HIV+ and to have become lost to follow-up.

STANDARD OF CARE 2.0: CLIENT RIGHTS AND CONFIDENTIALITY

The service provider shall:

- 2.1** Provide information to potential clients regarding how to access services that may be available to them and their rights and obligations should they become agency clients.

STANDARD OF CARE 3.0: ACCESS, CARE, AND PROVIDER CONTINUITY

The service provider shall:

- 3.1** Provide access for staff, outreach contacts, and clients to current resource information relevant to the population of the EMA/HSDA;
- 3.2** address an outreach contact's specific barriers to accessing services to be able to make appropriate referrals and
- 3.3** establish and maintain an association with prisons, homeless shelters, substance abuse treatment centers, and other entities that have ongoing contact with persons known to be disproportionately impacted by HIV and subject to access barriers.

REFERRAL FOR HEALTHCARE AND SUPPORT SERVICES

HRSA Description: Referral for Health Care and Support Services directs a client to needed core medical or support services in person or through telephone, written, or other types of communication. Activities provided under this

service category may include referrals to assist HRSA/RWHAP-eligible clients in obtaining access to other public and private programs for which they may be eligible (e.g., Medicaid, Medicare Part D, State Pharmacy Assistance Programs, Pharmaceutical Manufacturer's Patient Assistance Programs, and other state or local health care and supportive services, or health insurance Marketplace plans).⁶⁰

ADAP Eligibility Worker

The ADAP eligibility worker assists with an ADAP application, including documentation and follow-up needed to ensure the ADAP eligibility process is accomplished per DSHS Standards of Care.

Program Guidance

Referrals for Health Care and Support Services provided by outpatient/ambulatory healthcare providers should be reported under the Outpatient/Ambulatory Health Services category.

Referrals for health care and support services provided by case managers (medical and non-medical) should be reported in the appropriate case management service category (i.e., Medical Case Management or Non-Medical Case Management).

Activities must include:

- Referral Worker: A documented encounter wherein the Referral Worker directs a client to a service in person or through telephone, written, or other types of communication, including management of such services where they are not provided as part of Outpatient Ambulatory Health or Case Management Services.
- ADAP Eligibility Worker: A completed ADAP application **accepted by** the Texas HIV Medication Program (THMP).

Activities may include:

- Efforts related to ensuring clients can access other public and private programs for which they are eligible.

Activities may not include:

Case Management services.

SERVICE STANDARDS AND PERFORMANCE MEASURES ⁶¹

The following standards and performance measures are guides to improving healthcare outcomes for PLWH throughout the State of Texas within the Ryan White Part B and State Services Program.

Service Standard	Performance Measures
Benefits Counseling	• Percentage of clients with documented evidence of education provided on other public and

⁶⁰ Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Referral Services. [Page 24](#)

⁶¹ Referral for Health Care and Support Services: [Service Standard](#)

Activities should be client-centered, facilitating access to and maintaining health and disability benefits and services. It is the primary responsibility of staff to ensure clients are receiving all needed public and private benefits and resources for which they are eligible. Staff will educate clients about available benefit programs, assess eligibility, assist with applications, provide advocacy with appeals and denials, assist with re-certifications, and advocate for other areas relevant to maintaining benefits/resources. Staff will explore the following as possible options for clients, as appropriate: • AIDS Drug Assistance Program (ADAP) • Health Insurance Plans/Payment Options (CARE/HIPP (Health Insurance Premium Payment), Consolidated Omnibus Budget Reconciliation Act (COBRA), Omnibus Budget Reconciliation Act (OBRA), Health Insurance Assistance (HIA), Medicaid, Medicare, Private, Affordable Care Act (ACA)/Marketplace) • SNAP • Pharmaceutical Patient Assistance Programs (PAPS) • Social Security Programs (Supplemental Security Income (SSI), SSDI, State Disability Insurance (SDI)) • Temporary Aid to Needy Families (TANF) • Veteran's Administration Benefits (VA) • Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) • Other public/private benefits programs • Other professional services Staff will assist eligible clients with completing benefits application(s) as appropriate within 14 business days of the eligibility determination date. Conduct a follow-up within 90 days of the completed application to determine if additional and ongoing needs are present.	private benefits programs in the primary client record. • Percentage of clients with documented evidence of other public and private benefit applications completed as appropriate within 14 business days of the eligibility determination date in the primary client record. • Percentage of eligible clients with documented evidence of the follow-up and result(s) to a completed benefit application in the primary client record.
Health Care Services Clients should be assisted in accessing health insurance, or Marketplace plans to assist with	• Percentage of clients with documented evidence of assistance to access health insurance or Marketplace plans in the primary client record.

engagement in the health care system and HIV Continuum of Care, including medication payment plans or programs. Eligible clients are referred to Health Insurance Premium and Cost-Sharing Assistance to assist clients in accessing health insurance, or Marketplace plans within one (1) week of the referral for health care and support services intake. Eligible clients are referred to other core services (outside of a medical, MCM, or NMCM appointment) as applicable to the client's needs, with education provided to the client on how to access these services. Eligible clients are referred to additional support services (outside of a medical, MCM, or NMCM appointment) as applicable to the client's needs, with education provided to the client on how to access these services. Staff will follow up within ten (10) business days of a referral to HIA to determine if the client accessed HIA services. Staff will follow up within ten (10) business days of a referral to any core services to ensure the client accessed the service. Staff will follow up within ten (10) business days of a referral to support services to ensure the client accessed the service.	• Percentage of clients who received a referral for other core services who have documented evidence of the education provided to the client on accessing these services in the primary client record. • Percentage of clients who received a referral for other support services who have documented evidence of the education provided to the client on accessing these services in the primary client record. • Percentage of clients with documented evidence of referrals provided for HIA assistance that had follow-up documentation within ten business days of the referral in the primary client record. • Percentage of clients with documented evidence of referrals provided to any core services that had follow-up documentation within ten (10) business days of the referral in the primary client record. • Percentage of clients with documented evidence of referrals provided to support services that had follow-up documentation within ten (10) business days of the referral in the primary client record.
--	---

RESPITE CARE FOR ADULTS

HRSA Description: Respite care is the provision of community or home-based, non-medical assistance designed to relieve the primary caregiver responsible for providing day-to-day care of a client with HIV/AIDS.⁶²

Activities must include:

- Structured home or center-based activities that promote skills-building and social interaction that contribute to the maintenance and improvement of the client's support system;
- Periodic and time-limited respite for the caregiver(s) of the infected individual.

Activities may not include:

- Care of a child/youth.

STANDARD OF CARE 1.0: LICENSURE OR ASSURANCES

The service provider shall:

- 1.1** Ensure that center-based facilities meet health, fire, and safety standards and,
- 1.2** Make available daily, structured program activities in each client's care, for clients, and promote the importance of client socialization; and
- 1.3** provide required, non-medical support services to all clients as needed.
- 1.4** Obtain an initial test for tuberculosis for prospective staff and volunteers and a repeat test at least annually to protect clients; and
- 1.5** ensure the availability of age-appropriate services.

SERVICE STANDARDS AND PERFORMANCE MEASURES

The following standards and performance measures are guides to improving healthcare outcomes for PLWH throughout the State of Texas within the Ryan White Part A, Part B, and State Services Program.

Service Standard	Performance Measure
Initial Brief Assessment Service provider staff will initiate an intake within five (5) business days of the referral to include: • Client's support system • Needs of the client	• Percentage of clients with documented evidence of a brief initial assessment completed within five (5) business days of the referral in the client's primary record.

⁶² Policy Clarification Notice #16-02: Eligible Individuals and Allowable Uses of Funds. Respite Care. [Page 24](#)

Supporting documentation of the need for respite care will be included in the assessment. If informal respite care is to be used, the assessment must include the qualifications of the client's personal support network provider.	
Plan of Care In collaboration with the client and the client's family, a plan of care will be developed within ten (10) business days of the brief initial assessment. The plan of care should be signed and dated by both the client and the client's family or legal guardian and located in the client's primary record. A copy of the plan will be offered and documented in the client's record. The plan of care should include: • the objective of respite care • estimate of the number of respite care visits anticipated and services to be provided • type of setting in which respite services will be provided for the client Documentation that the plan of care is being followed may include, at a minimum: • Sign-in sheet documenting attendance in a facility or documentation of informal personal support network provider attendance in the home. • The objective should be listed at the top of the sign-in sheet or documentation for reimbursement by the informal personal support network provider. The plan of care should be reviewed at least every six (6) months to see if progress is being made towards meeting the objective of the respite care with documentation present in the client's primary record.	• Percentage of clients with a documented plan of care developed within ten (10) business days of the initial assessment in the client's primary record. • Percentage of clients with updated and reviewed plans of care every six (6) months documented in the client's primary record.
Referrals If the client's needs are beyond the scope of the services provided by the service provider or the	• Percentage of clients with documented referrals for services beyond the scope of respite care provider in the client's primary client record.

client's informal support network, an appropriate referral to another level of care is made. Documentation of referral and outcome of the referral is present in the client's primary record.	Percentage of clients referred to another level of care have documentation of referral outcome in the client's primary record.
Discharge Once objectives have been met, the agency and client will collaborate on a discharge plan. Reasons for discharge may include: - Services are no longer needed. - Services needed are outside the scope of respite care - Client is deceased - The client has moved out of the area - Unacceptable client behaviors - The client has not attended or received respite care per agency policy and procedure.	Percentage of clients with documented evidence of the reason for discharge in the client's primary record.

RESPITE CARE FOR CHILDREN/YOUTH/ADOLESCENTS

HRSA Description: Respite care is the provision of community or home-based, non-medical assistance designed to relieve the primary caregiver responsible for providing day-to-day care of a client with HIV/AIDS.

Activities may include:

- Provision of basic childcare, including child development activities that promote cognitive learning and social skills development for a child/youth with HIV;
- Periodic and time-limited respite for the caregiver of a child/youth with HIV.

Activities may not include:

- Off-site recreational or social activities
- Care of an adult.

APPENDICES

APPENDIX A: HOW BEST TO MEET THE PRIORITY

Fiscal Year 2023 Ranking	Service Category	Special Instructions
2	AIDS Pharmaceutical Assistance	• Provide information on drug reimbursement programs to formerly incarcerated individuals who are recently released. • Provide information to populations in the Stemmons Corridor area (see the zip code table attached). • Provide information to consumers on copayment assistance available through Ryan White and alternative insurance funding.
7	Health Insurance Premium & Cost Sharing Assistance	• Educate consumers about the various types of insurance, program requirements, and necessary documentation in medical clinics.
3	Medical Case Management	• Educate consumers about the differences between medical and social case management and the appropriate usage of each. • Provide information about the importance of remaining in primary care and maintaining dental hygiene.

		• Collaborate with and refer clients to prevention case managers or reduction specialists to encourage the reduction of practices that may make an individual susceptible to HIV. • Inform newly diagnosed individuals about the importance of entering and remaining in primary medical care. • Provide information in English and Spanish about the availability of local drug reimbursement programs. • Increase the number of bilingual medical case managers as funding allows. • Provide information and referrals to gender-segregated programs (if any) appropriate to the client's self-affirmed gender identity and sense of safety. • Educate and collaborate with alternatively funded substance abuse programs on the treatment of PLWH.
5	Mental Health Services	• Provide information about the importance of remaining in primary care while retaining mental health counseling and information on available primary medical care services. • Collaborate with Early Intervention Services to support newly diagnosed clients and consumers reentering HIV medical care.

		Educate and collaborate with alternatively funded substance abuse programs on the treatment of PLWH.
6	Oral Health Care	- Inform medical and non-medical case managers about dental care options and providers to make appropriate referrals. - Stagger appointments, so the waiting room is not full (no more than two (2) people in the waiting room). - Longer wait times could be due to the provider relocating to a new site - Sites providing services adhere to safety recommendations from the CDC.
1	Outpatient Ambulatory/Health Services	- When and where applicable, provide for the rapid start of medication for newly diagnosed within 48-72 hours; 2 weeks for those returning to care; 6 months for viral suppression once the medication is accessed. - Provide information about Ryan White programs to reduce financial concerns about seeking care. - Ensure providers are knowledgeable regarding managing patients co-infected with HIV and HCV. - Provide information about the importance of remaining in primary care and maintaining dental hygiene. - Provide information in English and Spanish about the availability of local drug reimbursement programs. - Incorporate prevention messages into the medical care of PLWH.

		• Educate and collaborate with alternatively funded substance abuse programs on treatment for PLWH. • Educate and collaborate with alternatively funded mental health programs on treatment for PLWH. • Telehealth and telemedicine should be allowed wherever and whenever possible, i.e., case management, eligibility, • Provider feedback - good responses to telehealth • Receiving services by telephone/ virtual • Meal programs are to-go, and bus passes are distributed using minimal contact. • Business agreements with virtual platforms • Flexibility needs to be maintained when accessing this service • In-person eligibility screening is not required federally • Patient-centered care should be considered • Personal protective equipment (PPE) should be available to clients
9	Substance Abuse Services	• Educate and collaborate with alternatively funded substance abuse programs on treatment for PLWH. • Educate and collaborate with alternatively funded mental health programs on treatment for PLWH. • Placement in/or assignment to gender-segregated programs (if any)

		shall be based on the client's self-affirmed gender identity. A client's sense of where they will be safest and receive the most benefit should be considered. • Personal protective equipment (PPE) should be made available for clients • Virtual group activity to educate and support clients with substance misuse. • COVID-19 education should be provided.
Fiscal Year 2023 Ranking	Service Category	Special Instructions
3	Non-Medical Case Management	• Collaborate with non-Ryan White key points of entry anywhere a client may present for HIV care to provide information on Ryan White Case Management services. • Provide educational materials and activities to promote self-empowerment and reduce fear and denial to facilitate entry into primary medical care. • Provide information about the benefits and security of the Take Charge Texas (TCT) system to promote client sharing. • Collaborate with and refer clients to prevention case managers or reduction specialists to encourage a reduction in practices that may make an individual susceptible to HIV. • Educate clients on the importance of remaining in primary medical care.

		• Provide information in English and Spanish about the availability of local drug reimbursement programs. • Target outreach to African American, Hispanic, and other vulnerable populations to increase utilization of insurance assistance programs. • Increase the number of bilingual non-medical case managers as funding allows. • Educate consumers on their role in the case management process to encourage self-efficacy. • Provide information and referrals to gender-segregated programs (if any) appropriate to the client's self-affirmed gender identity and sense of safety. • Ensure that intake data for transgender clients is sufficient to fully use the transgender-related categories available in Take Charge Texas (TCT). • Incorporate prevention messages into the medical care of PLWH. • PPE should be available for all clients visiting the facility • Ensure there is a workforce that is sensitive to transgender clients • Education about COVID-19 • Offer telehealth and telemedicine whenever possible.
11	Child Care Services	• Evaluate options for providing childcare at medical clinics or other appointments, not including work, to

		encourage clients (especially women) to attend medical appointments. • Offer telehealth and telemedicine whenever possible. • COVID-19 education should be provided. • Personal protective equipment (PPE) should be made available for clients.
2	Housing (Congregate)	• Provide information about the importance of remaining in primary care while addressing housing needs and provide information on available primary medical care services. • Placement in/or assignment to gender-segregated programs (if any) shall be based on the client's self-affirmed gender identity and consider a client's sense of where they will be safest and benefit most. • Care plans and advocacy to remove barriers to service should consider a client's self-affirmed gender identity and sense of safety where appropriate. • COVID-19 education should be provided. • Personal protective equipment (PPE) should be made available for clients • Offer telehealth and telemedicine whenever possible. • Adhere to CDC social distancing guidelines. • Protocol for screening, testing, and quarantining individuals who test positive for COVID-19 and any other

		airborne pathogens as identified by CDC. • Create a wellness station near entrances and lobbies with masks and hand sanitizer.
1	Food Bank	• Provide quality and comprehensive food pantry services in both rural and urban areas. • Provide information about available primary care services. • Provide special non-perishable food items to be taken with medication specifically for the chronically homeless population. • If possible, provide food delivery services. • Create a plan or system to ensure clients at home receive food. • Meet with food banks and service providers and establish an MOU. • Maintain CDC guidelines for social distancing.
3	Case Management (Housing-based)	• Collaborate with non-Ryan White key points of entry anywhere a client may present for HIV care to provide information on Ryan White Case Management services. • Provide referrals to non-Ryan White community resources when appropriate. • Provide educational materials and activities to promote self-empowerment and reduce fear and denial to facilitate entry into primary medical care.

		• Provide information about the benefits and security of the Take Charge Texas (TCT) system to promote client sharing. • Collaborate with and refer clients to prevention case managers or reduction specialists to encourage a reduction in practices that may make an individual susceptible to HIV. • Collaborate with homeless shelters to link out-of-care PLWH to housing services. • Placement in/or assignment to gender-segregated programs (if any) shall be based on the client's self-affirmed gender identity and consider a client's sense of where they will be safest and benefit most. • Care plans and advocacy to remove barriers to service should consider a client's self-affirmed gender identity and sense of safety where appropriate. • COVID-19 education should be provided. • Personal protective equipment (PPE) should be made available for clients • Maintain CDC guidelines for social distancing • Protocol for screening, testing, and quarantining individuals who test positive for COVID-19 and any other airborne pathogens as identified by CDC.
--	--	---

		• Create a wellness station near entrances and lobbies with masks and hand sanitizer.
4	Medical Transportation	• Identify additional options for those living in suburban and rural areas with limited public transportation. • Identify and exhaust all other transportation options, including paratransit. • Personal protective equipment (PPE) should be made available for clients • Maintain CDC guidelines for social distancing
6	Outreach Services	• Track the barriers to care that caused clients to cease accessing medical care and provide an annual report to the Ryan White Planning Council. Each client contacted must be asked why they dropped out of care and whether they reconnected to care. Each answer should be recorded.

No special instructions exist for the following service categories:

- **Core Medical Services**
 - Early Intervention Services
 - Home and Community-based Health Services
 - Home Health Care
 - Hospice Services
 - Medical Nutrition Therapy
 - State AIDS Drug Assistance Program
- **Support Services**
 - Health Education/Risk Reduction

- Home Delivered Meals
- Linguistic Service
- Other Professional Services (Legal Services)
- Outreach – Street
- Referral for Health Care and Support Services
- Respite Care for Adults
- Respite Care for Children/Youth/Adolescents

APPENDIX B: UNITS OF SERVICE AND BILLING LIMITATIONS

Service Category	Units of Service	Billing Limitation
AIDS Pharmaceutical Assistance	One (1) prescription	- Generic medications should be used when available; - Prescriptions issued for cosmetic purposes, non-medically necessary purposes, and over-the-counter medications are not reimbursable; - Only one month of medications may be filled at a time; - Erectile dysfunction and human growth hormone prescriptions are not reimbursable, and - Medications must be on the approved Local Pharmaceutical Assistance Program (LPAP) formulary to be eligible for reimbursement.
Case Management (Non-Medical)	- One (1) fifteen (15) minute face-to-face/other encounter - One (1) virtual visit - One (1) telehealth/telemedicine visit/consultation	- Units billed must be based on documented time spent delivering the service; - Generic newsletters, invitations, etc., sent to clients may not be billed, and - Messages left for clients or on behalf of a client may not be billed.
Case Management (Non-Medical – Housing)	- One (1) fifteen (15) minute face-to-face/other encounter - One (1) virtual visit - One (1) telehealth/telemedicine visit/consultation	- Units billed must be based on documented time spent delivering the service; - Administrative activities may not be billed as units of service;

		- Generic newsletters, invitations, etc., sent to clients may not be billed, and - Messages left for clients or on behalf of a client may not be billed.
Child Care Services	One (1) hour of childcare	None
Early Intervention Services	- One (1) medical visit - One (1) fifteen (15) minute counseling and referral contact	None
Emergency Financial Assistance	One (1) payment or voucher	\$800/year/client cap
Food Bank	One (1) visit for up to a seven (7) day supply of food	None
Health Education/ Risk Reduction	- One (1) fifteen (15) minute individual intervention - One (1) fifteen (15) minute group- level intervention	None
Health Insurance Premium and Cost Sharing Assistance	One (1) monthly payment	Payment(s) for monthly premiums, related copays, and deductibles shall not exceed nine hundred dollars (\$900.00) as established by the Ryan White Planning Council and AA.
Home and Community-based Health Services	- One (1) visit by non-licensed healthcare workers - Durable medical equipment	- Any service provided to an individual eligible for home health coverage under another third-party reimbursement plan may not be billed to DCHHS unless the client has exhausted the benefits available under the plan and, - No units of service will be reimbursed without a physician's order.
Home Health Care	One (1) visit by licensed healthcare workers	Any service provided to an individual eligible for home health coverage under another third-party reimbursement plan may not be billed to DCHHS unless the client has exhausted the benefits available

		under the plan and, No units of service will be reimbursed without a physician's order.
Home Delivered Meals	One (1) on-site meal or nutritional supplement	None
Hospice Services	One (1) day of hospice care	None
Housing	One (1) day of housing, not to exceed the monthly lease rate	- Effective March 27, 2008, there is a 24-month cumulative period of eligibility per household for housing services (<i>HRSA HAB Policy 99-02</i>). - Transitional housing assistance is based on need and available resources and is limited to no more than (6) continuous months of funding within a contract year. Emergency housing assistance is limited to one (1) month of rental/utility assistance within a contract year.
Other Professional Services (Legal Services)	One (1) fifteen (15) minute period of consultation or legal advocacy by an attorney or a paraprofessional	None
Linguistic Services	- One (1) fifteen (15) minute increment of interpretation or sign language - One (1) document	- Units billed must be based on documented time spent delivering the service and, - Interpretation or translation provided for another agency or a group will be reimbursed for the time spent interpreting or translating, not the number of clients receiving the interpretation.
Medical Case Management	- One (1) fifteen (15) minute face-to-face/other encounter - One (1) virtual visit - One (1) telehealth/telemedicine visit/consultation	Units billed must be based on documented time spent delivering the service;

		• Generic newsletters, invitations, etc., sent to clients may not be billed, and • Messages left for clients or on behalf of a client may not be billed.
Medical Nutrition Therapy	• One (1) visit	• No more than one (1) visit per client per day may be reimbursed; • Any service provided to an individual eligible for medical care coverage under another third-party reimbursement plan may not be billed to DCHHS unless the client has exhausted the benefits available under the plan.
Medical Transportation Services	• One (1) van trip per one-way • One (1) bus pass/token • One (1) taxi/ride-share voucher • One (1) gas voucher • One (1) delivery of medications (regardless of the number of medications to be delivered in a single delivery) per one-way	• Pick-up and return van trips during which clients or medications are not being transported may not be billed as units of service, and • Only one (1) unit of medication delivery may be billed regardless of the number of medications to be delivered in a single one-way delivery per client.
Mental Health Services	• One (1) individual Level I psychiatric evaluation visit • One (1) individual Level I medication management visit • One (1) Level II individual forty-five (45) minute session • One (1) Level III individual fort-five (45) minute session • One (1) patient participating in a sixty (60) minute Level II group session • One (1) patient participating in a sixty-(60) minute Level III group session • One (1) virtual visit	• Mental health therapy groups may have no more than twelve (12) participants per group; • Individual sessions should be at least 45 minutes in length and will be reimbursed by the session; • Group sessions should be at least 60 minutes in length and will be reimbursed by the session; • No more than four (4) psychiatric evaluation visits per year per client may be reimbursed; • Fractions of a unit may not be billed;

	One (1) telehealth/telemedicine visit/consultation	- Any service provided to an individual eligible for mental health services covered under another third-party reimbursement plan may not be billed to DCHHS unless the client has exhausted the benefits available under the plan and, - Inpatient psychiatric or psychological services may not be reimbursed.
Oral Health Care	- One (1) dental prophylaxis - One (1) dental routine visit - One (1) dental specialty visit - One (1) prosthetic device - One (1) virtual visit - One (1) telehealth/telemedicine visit/consultation	\$3,000 per year cap unless a waiver is approved - A maximum of two (2) visits per day per client may be reimbursed. A single visit may include multiple services or procedures, and - Any service provided to an individual eligible for dental health services coverage under another third-party reimbursement plan may not be billed to DCHHS unless the client has exhausted the benefits available under the plan.
Outpatient Ambulatory/Health Services	- One (1) visit - One (1) virtual visit - One (1) telehealth/telemedicine visit - One (1) laboratory service - One (1) diagnostic service	- No more than two (2) visits per client per day may be reimbursed; - Outpatient medical services provided over the phone are reimbursable as units of service - Any service provided to an individual eligible for medical care coverage under another third-party reimbursement plan may not be billed to DCHHS unless the client has exhausted the benefits available under the plan.

Outreach Services	One (1) documented encounter	None
Outreach - Street	One (1) documented encounter	None
Referral for Health Care and Supportive Services	- One (1) Referral - One (1) fifteen (15) minute, face-to-face/other encounters with a referral worker to assist a client with access to other services the client may be eligible for - One (1) virtual visit - One (1) telehealth/telemedicine visit/ (Address virtual telehealth/telephone visit/consultation)	None
Respite Care for Adults	One (1) hour of respite care to an HIV+ adult (aged 25+ years)	Units billed must be based on documented time spent delivering the service.
State AIDS Drug Assistance Program	Not Applicable—Not for bid	
Substance Abuse Services	- One (1) individual forty-five (45) minute counseling session - One (1) patient participating in a sixty (60) minute group session (not to exceed ten (10) grant-funded patients per group) - One (1) virtual visit - One (1) telehealth/telemedicine visit (address virtual telehealth/telephone visit/consultation)	- Any service billed to DCHHS must be provided at the facility location licensed by the Department of State Health Services to provide that level of treatment; - Individual sessions should be at least 45 minutes in length and will be reimbursed by the session; - Group sessions should be at least 60 minutes in length and will be reimbursed by the session; - Fractions of a unit may not be billed, and - Any service provided to an individual eligible for substance abuse services coverage under another third-party reimbursement plan may not be billed to DCHHS unless the client has

		exhausted the benefits available under the plan.

Unit(s) of Service vs. Time Billing Table				
Unit(s) of Service	1	2	3	4
Time	1-29 minutes	30-44 minutes	45-59 minutes	60 minutes

APPENDIX C: CLIENT ELIGIBILITY REQUIREMENTS

Services must be available to all eligible clients seeking care in the Dallas EMA/HSDA. All clients will be served regardless of age, sex, race, color, religion, national origin, or sexual orientation, in accordance with the American Disabilities Act (ADA). No eligible client will be refused services.

All clients, both new and already enrolled in care, shall be screened in accordance with [*TDSHS Client Eligibility Policy 220.001*](#). Clients may self-refer to all services supported by funds awarded through the request for proposal (RFP) for Part A, Part B, State Services, and State Rebate of the RWHAP. To the extent feasible, subrecipients will implement consistent, standardized intake and documentation processes that will utilize common forms, minimize the burden on clients, and reduce duplication of data-gathering and reporting on service providers. At a minimum, all subrecipients must comply with the eligibility criteria listed below.

Initial Eligibility and Annual 12-Month Recertification of HIV Status, Texas Residency, and Income

Upon initiation of services, as well as every 12 months, providers must determine whether a respondent meets the following RWHAP Part B/State Services eligibility criteria:

- have a diagnosis of HIV;
- provide documentation of Texas residency and
- provide complete and accurate income documentation.

Recertification of HIV status after initial eligibility determination is not required.

Clients must be screened for program eligibility every six months (no later than the last day of the clients' birth month for the annual 12-month recertification and no later than the last day of the clients' half-birth month for the 6-month self-attestation).

Initial Eligibility Determination Period

A 30-day determination period for all funded services can be accessed by clients who are:

- Newly diagnosed within the previous six months;
- New to the State of Texas/Local EMA/HSDA and in need of medical services;
- Engaging in care for the first time after being diagnosed for longer than six months;
- Returning to medical care after an absence of six months or longer and/or;
- In need of early intervention services.

As applicants are being linked to services, providers should work to complete the eligibility process and collect the required documents. An eligibility determination must be completed within 30 days of program application initiation.

Providers must have an established alternative source of funding should a client be found to be ineligible for Ryan White Part B or state-funded services. This must be documented in agency policy and tracked in

the client file if applicable. The policy must delineate the process for any necessary administrative adjustments if a cost is determined to be unallowable.

Documentation of HIV Status

To be eligible for services paid for by RWHAP and State Services, an individual must have an HIV-positive diagnosis. Affected individuals (people not living with HIV) may be eligible for RWHAP services in limited situations; services for affected individuals must always benefit PLWH. For further clarification on providing services to affected individuals, please refer to [*HRSA Policy Clarification Notice \(PCN\) #16-02, Eligible Individuals and Allowable Uses of Funds*](#). **For EHE services, the only client eligibility requirement is an HIV diagnosis. Services presently funded through EHE include the following:**

- Health Education/ Risk Reduction
- Non-Medical Case Management
- Oral Health
- Outpatient/Ambulatory Health Services
- Outreach Services
- Referral for Healthcare and Support Services

There are many different ways to document HIV infection. Some examples of acceptable forms of documentation are provided below; however, this should not be viewed as a complete list.

Laboratory Documentation

Proof of HIV diagnosis may be found in laboratory test results that bear the client's name. Some examples include:

- A positive result from HIV screening test (HIV 1/2 Combo Ab/Ag enzyme immunoassay [EIA]);
- A positive result from an HIV 1 RNA qualitative virologic test such as an HIV 1 Nucleic Acid Amplification Test (NAAT) or
- Detectable quantity from an HIV 1 RNA quantitative virologic test (e.g., viral load test)

NOTE: HIV testing technology changes rapidly, and standards of HIV confirmation continue to evolve. Providers must stay informed of advances in testing technology as newer tests may also provide proof of HIV diagnosis.

Other Forms of Documentation

Some examples include:

- A signed statement from an entity with prescriptive authority attesting to the HIV-positive status of the person or,
- A complete THMP Medical Certification Form signed by a physician (required by THMP) or,
- A hospital discharge summary documenting the individual is HIV-positive.

NOTE: Exposed infants born to people living with HIV can be served with documentation of the mother's HIV-positive status up to 12 months of age. Children older than 12 months must meet the same criteria for proof of HIV as listed above to continue services.

Facilitating Linkage with an HIV Preliminary Positive Result

A preliminary positive is a positive result from an HIV screening test. Although a preliminary positive is not considered proof of HIV status (because it is not a supplemental test in the current HIV testing algorithm), individuals with such a result are very likely to have HIV infection and would benefit from quick linkage to ongoing medical care. Having only a preliminary positive result from one HIV test should not be a barrier in linkage to medical care.

The ability to rely upon a preliminary positive test result to facilitate linkage to care does not negate the responsibility of the HIV testing site to conduct supplemental testing. The receiving medical provider must be informed of the individual's unconfirmed preliminary positive HIV test result. Once the supplemental results are received from the lab, HIV testing staff must provide these results to the individual and, if a Release of Information is signed, to the HIV care provider. Clinics receiving such individuals may choose to arrange an abbreviated first appointment, during which the individual could receive counseling on HIV infection, orientation to medical care, conduct eligibility screening, and/or begin laboratory work.

NOTE: HIV medical providers may elect to conduct the HIV supplemental test if a memorandum of understanding (MOU) is signed with the HIV testing agency.

Documentation of Texas Residency

To be eligible for services paid for by RWHAP Part B/State Services/THMP, an applicant must reside within the geographic boundaries of Texas and express intent to remain within the state and not claim residency in any other state or country. Texas residency is not a requirement for services exclusively funded by RWHAP Part A. Consult with the DCHHS Ryan White Grants Management Division for more information.

Individuals do not lose their Texas residency status because of a temporary absence from the state. For example, a migrant or seasonal worker may leave the state during certain periods of the year but maintain a home in Texas and return to that home after this temporary absence. This individual will not lose their Texas residency status.

Students

Students from another state living in Texas who are going to attend school may claim Texas residency based on their student status while residing in Texas.

Acceptable proof of residency documents must include the applicant's full legal name and residential address and be unexpired or from the last 30 days.

Documentation of proof of Texas residency can be determined using one of the following:

- valid (unexpired) Texas Driver's License;
- Texas State identification card (including identification from criminal justice systems);

- recent Social Security, Medicaid/Medicare, or Food Stamp/TANF benefit award letters;
- IRS Tax Return Transcript, Verification of Non-Filing, W2, or 1099;
- current employment records (pay stub);
- post office records;
- official state mail;
- current voter registration;
- rent or utility receipts for one month before the month of application in the client's name;
- a mortgage or official rental lease agreement in the client's name;
- valid (unexpired) motor vehicle registration;
- proof of current college enrollment or financial aid;
- property tax receipt;
- a letter of identification and verification of residency from a verifiable homeless shelter or community center serving homeless individuals or,
- a statement/attestation (does not require notarization) with the client's signature declaring that the client has no resources for housing or shelter. For THMP, a letter from an agency worker attesting that the individual has no resources for housing or shelter will be accepted.

If none of the items listed above are available, Texas residency may be verified through:

- Credit card, phone, or cable bill with the client's address clearly indicated on the document; or
- Bank brokerage statement with address clearly indicated on the document; or
- statement from landlord/neighbor/another reliable source; or
- submission of the DSHS-THMP Supporter Statement. This is only accepted when no other proof of residency is available and must be accompanied by a signed statement on agency letterhead from the agency enrollment worker detailing steps that were taken to obtain proof of residency and why they were not successful; or
- observance of personal effects and living arrangement (e.g., visit to the residence). For THMP, a signed statement on agency letterhead detailing this observance and why other forms of proof of residency were not available will be accepted.

There are no further proof of residency requirements (e.g., the requirement for a photo ID or documentation of immigration status) other than those listed above. Subrecipients and providers may not impose more stringent proof of residency requirements regarding eligibility for RWHAP and State HIV-funded services than those listed. Subrecipients must document that all eligibility staff have been made aware of this policy no less frequently than annually. Subrecipients should contact the DCHHS Ryan White Grants Management Division for questions about acceptable documentation of Texas residency.

Documentation of Income

To be eligible for services paid for by RWHAP Part A, MAI, Part B, and State Services, including State Rebate, an applicant must submit proof of income and FPL. Subrecipients must use the DSHS-provided [Income Calculation Worksheet](#) to calculate an applicant's income. Consult the DSHS policy for detailed instructions.

Local Criteria for Eligibility Determination

Dallas RWPC determines the financial eligibility for each prioritized service category. This limit may not exceed 500% of the FPL. Periodically, the Dallas RWPC may alter financial eligibility limits. The financial eligibility for FY 2025-2026 services is listed in Appendix E. Subrecipients should contact the DCHHS Ryan White Grants Management Division for questions regarding financial eligibility limits.

APPENDIX D: DOCUMENTATION REQUIREMENTS

For agencies receiving funding awards, documentation requirements for all service categories must be completed before submission for a reimbursement request. Documentation should occur after each contact, resulting in a reimbursable unit of service. Documentation should include the following elements for all service categories unless noted below:

- I. WHO RECEIVED:** Who received the service? The client's name or identifying number should be on all backup documentation. Not required for Outreach-Street.
- II. WHO PROVIDED:** Who provided the service? For every unit of service for which reimbursement is requested, someone at the agency level had to interface with the client – the backup documentation for every encounter should include their name, signature, and credentials, if appropriate. Not required for Insurance Assistance and Drug Reimbursement.
- III. WHAT:** What service was provided? All documentation should indicate the service provided: medical case management, transportation, food pantry, etc.
- IV. WHEN:** Date and time of service provided; the duration of time on that date or start and stop times.
- V. HOW MUCH:** How many units of the service were provided? Each unit of service billed to DCHHS should match the number of units documented. This documentation of units should follow the guidelines in the Dallas Planning Area Standards of Care and Service Delivery Guidelines for each service category.
- VI. WHERE:** Where was the service provided? Specify the location: clinic, street corner, client's home, van, health fair, etc. This is not required for Health Insurance and Premium Cost Sharing Assistance and Drug Reimbursement.
- VII. WHY:** What was the purpose or intent of the service encounter? Documentation should always reflect the client's needs and address the goals or objectives identified in the care plan. This is not required for Outreach-Street.
- VIII. STATUS:** Progress or lack of progress in achieving goals outlined in the care plan. This is not required for Health Insurance and Premium Cost Sharing Assistance, Drug Reimbursement, Outreach-Street, and Interpretation/ Translation.

To be an allowable cost under the HRSA RWHAP and DSHS, all services must:

- Relate to HIV diagnosis, care, and support,
- Adhere to established HIV clinical practice standards consistent with the U.S. Department of Health and Human Services Clinical Guidelines for the Treatment of HIV and other related or pertinent clinical guidelines, and
- Comply with state and local regulations provided by licensed or authorized providers, as applicable.

Agencies may develop documentation formats to meet their needs while incorporating these required elements. Sample documentation forms for each service category may be obtained from a DCHHS program monitor.

APPENDIX E: FINANCIAL ELIGIBILITY FOR THE DALLAS PLANNING AREA BASED ON FEDERAL POVERTY GUIDELINES

Background: Planning Councils can identify categorically specific activities that address “how best to meet the need.” Specific components or interventions can be modified for and within categories, populations, and geographic focus areas to enhance HIV programming and service delivery within the Dallas EMA.

Rationale: Increase financial eligibility percentages for the FY 2020 Dallas EMA/HSDA for the Outpatient Ambulatory/Health Services, Medical Case Management, AIDS Pharmaceutical Assistance, Health Insurance Premium and Cost Sharing Assistance, and Non-Medical Case Management service categories for Ryan White Part A, B, and State Services based on federal poverty guidelines.

Justification: Due to the increased cost of insurance plans, HIV medications, and outpatient medical care visits, the Planning and Priorities Committee proposes an increase in financial eligibility percentages in core medical & support service categories based on federal poverty guidelines to assess the impact on service utilization, linkage to care, treatment retention, and viral suppression. Additional provisions include an analysis to track/document the number of individuals who qualified or were denied services at 300-400% & 400-500% intervals.

Recommendation: The Planning and Priorities Committee recommends increasing the financial eligibility percentages for FY 2020 Dallas EMA/HSDA for the Outpatient Ambulatory/Health Services, Medical Case Management, AIDS Pharmaceutical Assistance, Health Insurance Premium and Cost Sharing Assistance, and Non-Medical Case Management service categories based on the federal poverty guidelines (subject to HRSA guidance).

Statement of Conflict: All RWPC members employed by RWHAP-funded service providers are conflicted.

Referral for Health Care and Support Services	Part B, State Services				500%	500%

The Ryan White Legislation prohibits imposing the first-party charge on individuals whose income is at or below 100% of the Federal Poverty Level (FPL). Costs to clients with incomes higher than 100% of the FPL are based on a discounted fee schedule and sliding fee scale. **For services rendered using Ending the HIV Epidemic (EHE) funding, the FPL is non-applicable.**

Individual Income	Maximum Charge
At or below 100% of FPL	\$0
101% to 200% of FPL	No more than 5% of gross annual income
201% to 300% of FPL	No more than 7% of gross annual income
Over 300% of FPL	No more than 10% of gross annual income

Ryan White Services should not be denied due to a client's inability to pay.

APPENDIX F: HIV/STD PROGRAM POLICY 530.002: SECTION EXPECTATIONS AND PROVIDER RIGHTS REGARDING THE DELIVERY OF CLIENT SERVICE

1.0 Purpose

This policy clarifies the rights of a Contractor/Subcontractor (Provider) in responding to unacceptable client behavior while providing HIV/STD prevention, treatment, and social services under a contract with the Texas Department of State Health Services (DSHS), TB/HIV/STD Section (Section). Providers reviewing this policy should be able to identify unacceptable client behavior and respond accordingly with reasonable confidence that the actions taken on behalf of the provider agency regarding a client were appropriate. The policy will also outline what the Section expects from the Provider in delivering client services.

2.0 Background

One part of the Section's mission is to provide a wide array of services to persons with HIV. That mission is achieved through contracts with various Providers who deliver those services. The Section is responsible for ensuring that Providers understand their rights when addressing client behaviors that may be questionable or disruptive. The Provider will, therefore, be able to ensure that services are offered in a manner free from disruption. In addition, the Section also has certain expectations of how those services are to be delivered to clients and how client rights are to be respected.

3.0 Authority

Civil Rights Code, Title 42, Chapter 21; Rehabilitation Act of 1973, Sect. 794; Age Discrimination Act of 1974; Public Law 88-352; Title VI, and Part 80 of 45 CFR; 25 TAC §§98.41-98.44.

4.0 Definitions as Applied to this Policy

Contractor - a legal entity under contract with DSHS to provide goods or services to people infected or affected by HIV, AIDS, or STDs or to implement goals supporting the Section's mission.

Provider - a person, agency, or facility approved by the DSHS that has entered into a contract with DSHS or with a DSHS contractor to deliver state or federal HIV/STD programs to clients.

Services - program activities offered by a Provider on behalf of the Section for prevention, health, medical, and social services.

5.0 Section Expectations Regarding the Provider/Client Relationship

The Section expects the Provider to maintain client relations of the highest possible quality.

5.1 General Section Expectations

1. Treat each client with respect, consideration, and recognition of the client's dignity and individuality.
2. Communicate the need for treatment, care, or services in a culturally sensitive and equitable manner.
3. Allow the client to select comprehensive outpatient health and psychosocial support services or to refuse any service without fear of reprisal.
4. Inform the client about treatment or service options, emphasize that it is the client's right to choose, and advise them of alternatives when multiple providers are available for the same service.
5. Assure that service planning, medical treatment, and counseling plans are determined in cooperation with the client.
6. Maintain a climate in the office or other service delivery setting free of physical or mental abuse or exploitation.
7. Enforce local, state, or federal laws or regulations (such as no smoking or maintaining a drug-free environment) required to conduct business.
8. Review any decision to modify, suspend, or terminate services.
9. Re-evaluate any modification, suspension, or termination to determine if the client's situation has changed.
10. Give clients an avenue to formally complain about treatment or services and the Provider's decision to deny an application, modify, suspend, or terminate client benefits, a mechanism to receive an appropriate and fair review of the complaint, and ensure that there is no reprisal of any type against the client for filing the complaint or grievance.

5.2 Confidentiality

The Provider is required to maintain the confidentiality of all information according to state and federal laws. The right to confidentiality begins when the client applies for services, when the Provider first conducts an evaluation, or when counseling begins.

5.3 Equal Access to Programs and Services

The Provider is required to consider client eligibility regardless of age, gender, sexual orientation, gender expression/identity, marital status, ethnic origin, physical challenge, or religious practice. Conversely, the client has a right to refuse any recommended services.

5.4 Impartial Treatment

Providers must allow the client to apply for any service or program. The client must be given fair, impartial treatment in receiving and processing the application and receiving services.

5.5 Filing a Complaint or Grievance

Contractors are required to have a written client complaint procedure in place to meet the minimum requirements for client complaints.

All clients have a right to file a complaint or grievance regarding inappropriate Provider behavior, actions, or perceptions of discrimination. The complaint may be filed in accordance with the grievance procedures of the Provider or with the local organization responsible for monitoring the Provider. When all other sources have been exhausted, the client may file the complaint or grievance with the Section by calling 1-512-533-3000.

In the case of a complaint related to the delivery of clinical services, the client may file a complaint directly to the Section without filing a complaint locally if the client chooses. The Section will investigate all complaints in accordance with HIV/STD Policy 020.050, "Public Complaints and Allegations Related to the Delivery of HIV or STD Programs."

6.0 General Provider Rights When Dealing with a Client

Each Provider should develop written procedures to deal with clients who may be disruptive or uncooperative. The Provider's responsibility is to ensure that staff is well informed about the procedures and use them consistently in every situation. Providers are expected to use good judgment and attempt to resolve these situations fairly without undue limitation or denial of client services.

7.0 Modifying, Suspending, or Terminating Client Services

The Provider is responsible for providing a work environment free from undue disruption, turmoil, or interference. Whenever possible, the Provider should take steps to serve clients and support a healthy work environment.

During the course of serving clients, clients may behave in a disruptive, abusive, or threatening manner toward staff or other clients. When this type of behavior occurs, the Provider may take the following progressive action:

1. Modify all or part of the services provided to the client
2. Suspend all or part of the services provided to the client
3. Terminate all or a portion of the services provided to the client

Depending on the severity of the client's behavior, such as threatening the life of staff or other clients, the Provider may skip one or more of the above steps and take appropriate action. Refer to [HIV/STD Policy No. 530.003](#) for information on dealing with clients who threaten to harm themselves or others.

7.1 Modifying Client Services

The Provider may modify all or part of the services provided to the client when the client is disruptive or uncooperative. Modification may include, but is not limited to:

1. rescheduling the client's appointment for a time later that day or in the near future,

2. arranging client services by telephone and
3. mailing food vouchers, bus passes, etc.

7.2 Suspending Client Services

Suspension is the temporary withdrawal of a service or services provided to a client by a Provider. It may be necessary for the Provider to suspend all or part of the services provided to the client for a specific period when alternative service delivery methods have not produced appropriate client behavior (i.e., the client is repeatedly disruptive or abusive towards staff or other clients).

7.3 Terminating Client Services

The Provider may choose to terminate all or part of the services provided to the client when alternative services delivery methods are not appropriate to the situation (i.e., the client threatens injury or homicide to a staff member or another client, etc.) or when modification or suspension of services has not produced appropriate client behavior.

Clinical service providers (e.g., physicians, advanced practitioners, and registered nurses) who terminate services should follow professional practice standards concerning how client services are terminated. Professional organizations and licensing bodies can guide clinical service providers in managing these situations.

7.4 Denying, Suspending, or Terminating a Client's Service on the Basis of Substance Abuse

The Provider may not deny, suspend, or terminate any service funded through DSHS because the client is **suspected** of substance abuse or refuses to accept treatment for substance abuse.

Exceptions to this may occur in the course of delivering medical care when a client's active substance abuse contraindicates the prescription of certain medications or treatments.

The treating clinician must evaluate these professional decisions on a case-by-case basis.

7.5 Notification of the Decision to Modify, Suspend, or Terminate Client Services

The decision to modify, suspend, or terminate services must be communicated to the client promptly and appropriately. This may be done by any verifiable method, such as in person or certified letter. When services are to be modified or suspended, staff should establish and communicate a specific period for the suspension and inform the client that the resumption of services will depend on the client's willingness and ability to meet certain behavior expectations. The behavior expectations should be clearly outlined and communicated to the client. The client should be given information about alternative methods by which services will be delivered or where such assistance may be obtained.

7.6 Documentation

The Provider should ensure that all modification, suspension, and termination actions are clearly documented in the client's record.

7.7 Technical Assistance

When desired, the Provider may contact the Section to discuss specific situations or to obtain technical assistance. **Decisions regarding modifying, suspending, or terminating client services remain with the Provider.**

7.8 Section Review of Decisions to Modify, Suspend, or Terminate Client Services

As part of a routine review of the quality of client services or a complaint investigation, Section staff may review the events that led to a modification, suspension, or termination of client services. Section staff will evaluate, at minimum, whether the Provider:

1. followed their internal policies and those of the Section in taking action to resolve the situation;
2. respected client rights, and
3. applied the least restrictive limitation on client services necessary to maintain a service delivery setting free of physical and mental abuse or exploitation.

APPENDIX G: HIV/STD PROGRAM POLICY 530.003: HOW TO DEAL WITH CLIENTS WHO THREATEN TO HARM THEMSELVES OR OTHERS

1.0 Purpose

To provide guidance to Contractors/Subcontractors (Providers) in responding to a client's violent or threatening behavior or when a client threatens suicide or exhibits suicidal behavior while providing HIV/STD prevention, clinical treatment, and social services under a contract with the Texas Department of State Health Services (DSHS), TB/HIV/STD Section (Section).

2.0 Authority

Vernon's Texas Code Annotated (VTCA) Health and Safety Code 611.002, Confidentiality of Information and Prohibition Against Disclosure; Health and Safety Code 611.004, Authorized Disclosure of Confidential Information Other than in Judicial or Administrative Proceeding; Health and Safety Code 81.046, Confidentiality; Health and Safety Code 81.103, Confidentiality, Criminal Penalty; Texas Administrative Code, Title 25, 98.44, Denial of Application; Modification, Suspension, or Termination of Client Benefits; Criteria; HIV/STD Policy No. 530.002, Section Expectations and Provider Rights Regarding the Delivery of Client Services.

3.0 Definition as Used in this Policy

Professional - a person licensed or certified by the state or an employee of a facility licensed, certified, or operated by the state.

Provider - a person, agency, or facility approved by the DSHS that has entered into a contract with DSHS or with a DSHS contractor to deliver state or federal HIV/STD programs to clients.

4.0 Provider Rights When Dealing With a Client

Providers should develop written procedures to deal with clients who are violent or exhibit threatening behavior. Providers are expected to use good judgment and attempt to resolve these situations fairly without denying services whenever possible as long as the work environment can remain free from violence or threats (See [HIV/STD Policy No. 530.002](#), Section Expectations and Provider Rights Regarding the Delivery of Client Service).

4.1 Responding to Clients Who Display Violent or Threatening Behavior

When responding to clients who display violent or threatening behavior, staff should take the following actions as appropriate to the situation:

1. Remain calm and speak in a calming voice.

2. If possible, summon a qualified mental health professional for assistance or make a referral.
3. Reschedule the client's appointment for a time later that day or in the near future.
4. When warranted, use alternative service delivery methods, such as telephone for case management, mailing food vouchers, or bus passes.
5. Notify the director of the contracting agency regarding serious client behavior problems for additional appropriate action.
6. Take whatever action is legally available to ensure the work environment is free from violence or threats.
7. Call the proper authorities when a client threatens staff or other clients with a weapon or creates a situation in which other clients and staff fear their safety.
8. Follow-up on any referrals or other actions taken to manage the client.
9. Document any action(s) taken in the client's case file.

4.2 Responding To Clients Who Make Homicidal Threats or Exhibit Homicidal Behavior

A client who makes homicidal threats or exhibits homicidal behavior should be taken seriously. Staff should attempt to take the following actions as appropriate to the situation:

1. Remain calm and leave the area, if possible.
2. Alert another staff member, preferably a supervisor, to the situation (this person should call the police immediately).
3. Try to calm the threatening individual (do not argue or talk back).
4. If possible, summon a qualified mental health professional for assistance or make a referral.
5. Notify the director of the contracting agency regarding serious client behavior problems for additional appropriate action.
6. Call the proper authorities when a client threatens staff or other clients with a weapon or creates a situation in which other clients and staff fear their safety.
7. Follow-up on any referrals or other actions taken to manage the client.
8. Document any action(s) taken in the client's file.

4.3 Responding to Clients Who Threaten Suicide or Exhibit Suicidal Behavior

A client who threatens suicide or exhibits suicidal behavior shall be taken seriously. Staff should carefully question clients to determine the seriousness of the threat before taking any action. Unqualified staff should

not attempt to diagnose clients' mental health status beyond identifying a potential suicidal situation. The following questions may be used to obtain more information from the client:

1. Ask the client what is meant by the threat.
2. Ask the client if they have ever attempted suicide before.
3. Ask the client if there is a history of suicide in the client's family or if someone close to the client has ever committed suicide.
4. Try to find out if the client has a plan and a means to commit suicide.

Any staff member confronted with a suicidal threat should take the following actions as appropriate to the situation:

1. Attempt to detain the client until the extent of the client's need for further help can be determined and the appropriate referral made or action taken.
2. Attempt to persuade the client to talk with a mental health professional or, if they already have one, assist the client in contacting their mental health professional.
3. Contact a family member or friend of the client, if the client is willing, and discuss a protection/safety plan.
4. Complete a "No Harm Agreement" (see attached example) that will cover the period from the current occurrence until the client's next contact with a case manager or mental health provider (the client should keep a copy, and a copy should be placed in the client's chart)
5. If none of the above, the staff member should contact the appropriate mental health center and refer the client (the most likely contact will be the Mental Health and Mental Retardation provider in the local county).
6. Give the client written instructions on contacting their local crisis hotline and hospital emergency room.
7. If unsuccessful with the above, call 911 and request a mental health officer.
8. Notify the director of the contracting agency regarding serious client behavior problems for additional appropriate action.
9. Follow-up on any referrals or other actions taken to manage the client.
10. Document any action taken on behalf of the client in the client's case file.

5.0 Obligation to Report

Communications between a patient and a professional and records of a patient's identity, diagnosis, evaluation, or treatment created or maintained by a professional are confidential (Health and Safety Code §611.002). However, a professional **may** disclose confidential information to medical or law enforcement

personnel if the professional determines that imminent physical injury is probable by the patient, to the patient, or others, or immediate mental or emotional harm is possible to the patient (Health and Safety Code §611.004).

6.0 Where to Go for Help

When desired, the Provider may contact the TB/HIV/STD Section to discuss specific situations or to obtain technical assistance. Decisions regarding whether to continue, modify, suspend, or terminate client services remain with the Provider. (See "[*HIV/STD Policy No. 530.002, Section Expectations and Provider Rights Regarding the Delivery of Client Service*](#)" for more information.)

For an online directory of suicide hotlines, go to www.suicide.org/hotlines/texas-suicide-hotlines.html or call the National Hope Line Network at **1-800-SUICIDE (1-800-784-2433)**.

Introduction

HIV/AIDS clinical care has improved dramatically over the decades, given the availability of new medications and a better understanding of how best to use antiretrovirals and deliver primary care to persons living with HIV/AIDS. Positive change on such a massive scale, however, brings with it new demands on clinicians.

Along with innovations in HIV drug therapies, HIV/AIDS care has become more complex than ever before due to increasing comorbidities that are attributable to HIV treatment and the aging of the HIV-infected population in the United States. Patient needs also have expanded across a broad spectrum of medical, psychological, behavioral, and social issues. Notably, significant numbers of infected individuals are identified and enter care late in the course of their HIV disease, confronting clinicians with complex and immediate care challenges.

Since the early days of the epidemic, clinicians have received training in HIV/AIDS clinical care through the AIDS Education and Training Centers (AETCs) Program – the clinical training arm of the Ryan White HIV/AIDS Program that is administered by the Health Resources and Services Administration (HRSA) and its HIV/AIDS Bureau (HAB). The AETC network conducts more than 14,000 training events each year with approximately 143,000 health care providers in attendance.

The *Guide for HIV/AIDS Clinical Care* is a pillar of the Ryan White HIV/AIDS Program's mission to continuously improve HIV/AIDS clinical care. The *Guide* was first published in 1993 as a collaborative effort of several regional AETCs. It was subsequently updated and expanded in 2006 and 2011. The version before you incorporates many new insights, but the time-tested format has been retained – easy access to crucial facts for a busy clinician.

The developers of the *Guide* strive to be responsive to how HIV/AIDS clinical care is provided today.

- With more routine HIV testing in medical settings, a large number of individuals are entering care via primary care sites that have relatively limited experience managing HIV/AIDS disease.
- A notable proportion of HIV/AIDS primary care in the United States is provided by advanced practice nurses and physician assistants.
- Shortages in the health care work force are worsening. Experienced staff members are aging and retiring, a limited number of new clinicians are entering primary care and specializing in HIV/AIDS care, and fewer clinicians are available in geographic areas with limited resources.

As a result, front line primary care providers may be less familiar with management of HIV/AIDS disease, as outlined in U.S. Department of Health and Human Services treatment guidelines (available at aidsinfo.nih.gov) and clinical practices presented in this *Guide*.

By presenting best practices in the clinical management of HIV/AIDS disease, the *Guide* can help us continue the remarkable advances in HIV/AIDS care that have made the Ryan White HIV/AIDS Program a model for health care delivery for our Nation and for the world.

Abbreviations for Dosing Terminology

BID = twice daily

BIW = twice weekly

IM = intramuscular (injection), intramuscularly

IV = intravenous (injection), intravenously

PO = oral, orally

Q2H, Q4H, etc. = every 2 hours, every 4 hours, etc.

QAM = every morning

QH = every hour

QHS = every night at bedtime

QID = four times daily

QOD = every other day

QPM = every evening

TID = three times daily

TIW = three times weekly

Important Notice

The U.S. Department of Health and Human Services (HHS) HIV/AIDS Bureau is committed to providing accurate information on the care of HIV-infected persons. It is important to be aware that management options and protocols change over time. Forthcoming HHS guidance on certain topics may differ from recommendations contained in this *Guide*. Readers are encouraged to check for updates to treatment guidelines at AIDS Info (aidsinfo.nih.gov) and for updates to drug information at Drugs@FDA (www.accessdata.fda.gov/scripts/cder/drugsatfda).

Supporting Patients in Care

Robin Bidwell, RNC*

* Based on Sheffield and Casale, see "References."

Background

Patients infected with HIV face a complex array of medical, psychological, and social challenges. A strong provider-patient relationship, the assistance of a multidisciplinary care team, and frequent office visits are key aspects of care. Through both the specific services they provide and their overall approach to patients, clinics can have a substantial impact on the quality of care for HIV-infected persons. For example, a patient-centered clinic environment in which education and supportive interventions are emphasized will greatly enhance patients' knowledge about HIV infection. Improving patients' skills in self-management will increase their participation in making health care decisions and provide a stimulus for more active involvement in their own care.

Special Challenges of Caring for HIV-Infected Patients

Providers need to be mindful of several special issues, including the following:

- Many medical, psychological, and social challenges confront persons living with HIV. The delivery of effective care usually requires a strong provider-patient relationship, a multidisciplinary approach, and frequent office visits.
- The stigma associated with HIV places a major psychosocial burden on patients. Stigma and discrimination must be addressed through strong confidentiality protections, emotional support, and cultural sensitivity. It is important to inform all patients of their rights and responsibilities in a language or manner that is respectful and understandable.
- Underserved racial and ethnic groups are overrepresented among people with HIV. Efforts to understand and acknowledge the beliefs of patients from a variety of cultural backgrounds are necessary to establish trust between providers and patients. Cultural competency is imperative in the field of HIV care.
- Providers play a key role in the public health system's HIV prevention strategy. Disease reporting, partner notification, and risk assessment are important aspects of care. Patients may see this as threatening and may need education and emotional support in order to participate in this process. Patients need to be informed of their rights under the Health Insurance Portability and Accountability Act (HIPAA) and understand the public health implications of HIV.
- Many patients have inaccurate information about HIV infection that can heighten their anxiety, sabotage treatment adherence, and interfere with prevention behaviors. Patients need assurance that HIV is a treatable disease and that, with successful treatment, they can experience a normal life expectancy. They also need to hear explicitly that HIV may be transmitted through sexual contact, injection drug use and other blood contact, and perinatal exposure, and that they can take specific measures to prevent transmission to others.
- Many patients need the support that only a peer can provide. Peer educators should be available to help patients navigate difficult health care systems, medication regimens, and lifestyle changes.

2 | Guide for HIV/AIDS Clinical Care

- HIV-infected patients need to have an active voice in their health care. Patient advisory groups can provide valuable program evaluation, which can be used to promote the patient-centered focus of the health care system.

These issues are discussed further in the sections that follow.

Components of HIV Care and Ways to Enhance Care

Important Components of HIV Care

A first step in ensuring that patients are “engaged in care” is the establishment of systems that include mechanisms for coordination and communication of care.

- Clinics must offer a nonjudgmental and supportive environment, because of the sensitive nature of issues that must be discussed.
- A multidisciplinary approach, utilizing the special skills of nurses, pharmacists, nutritionists, social workers, case managers, patient navigators, and others is highly desirable to help address patient needs regarding housing, medical insurance, emotional support, financial benefits, mental health and substance abuse counseling, and legal issues.
- Providers and other clinic staff members should be prepared to conduct appropriate interventions and make timely referrals to community resources and institutions.
- The primary provider should coordinate the various aspects of health care, with close communication among providers across disciplines.
- Individual office visits should be long enough to allow time for thorough evaluation.
- Providers must be able to see patients as frequently as their medical and psychosocial needs require, and clinic scheduling should be flexible so that patients with acute

problems can be seen quickly and new patients can receive and access care in a timely manner.

- A range of medical resources, including providers with subspecialty and laboratory expertise, needs to be established. Co-locating services within testing and counseling sites or within HIV clinics is an excellent way to enhance patient compliance (see chapter *Clinic Management*).
- Patient education is a vital aspect of care that begins during the initial evaluation and continues throughout the course of care (see chapter *Patient Education*).

Taking Steps to Enhance Care

Providing comprehensive care for HIV-infected patients requires a patient-centered focus, a multidisciplinary team, and a willingness to spend time on building relationships with patients. Providers should do the following:

- With the help of case management agencies, counseling and testing centers, and patient-care navigators, provide quick and easy access to care to those newly diagnosed and entering into treatment.
- Front-end staff members need to be knowledgeable, compassionate and efficient with the initial patient contact in order to establish a warm and welcoming environment of care for the new patient.
- Make available self-management education to help patients identify problems, teach decision making techniques, and support patients to take appropriate actions to make necessary changes in their lives.
- Offer care in a patient-centered environment that allows the patient to actively participate in care decisions and provides patient-specific education.
- Encourage patients to learn all they can about their condition.
- Give accurate information regarding prognosis and antiretroviral therapy.

- Foster an atmosphere of nonjudgment, trust, and openness.
 - Anticipate that significant time will be required for patient education.
 - Outline the range of clinic operations and state the expectations for provider-patient communication. Outline how appointments are scheduled and how prescription refill requests are managed.
 - Arrange to see patients with acute problems quickly. Establish a triage system to provide efficient service delivery.
 - Ensure that there are open lines of communication with all patients to receive and answer questions, assess treatment effectiveness, and manage side effects.
 - Provide safe and secure access for patients to communicate with staff. Patient portals can provide quick and direct access to nonemergent information and can provide accurate answers to questions that arise between visits.
- disclose their diagnosis to friends, family, or employers as well as support in dealing with HIV infection. Patients often feel hesitant about seeking emotional and practical support.
- Deliver important information in easily understood terms and in small amounts. Reassess patient understanding of crucial information at subsequent visits, and repeat important information as necessary. Realize that many visits may be required before patients are comfortable with their care and the navigation of the health care system.
 - Screen for anxiety, depression (including suicidal ideation), and substance use.
 - Refer patients to community resources for crisis counseling, support groups, and, if appropriate, psychiatric treatment to help them achieve emotional stability.
 - Assist patients in finding a case manager or patient navigator who can help them learn to navigate the health care system and reduce anxiety about keeping their lives in order.
 - Assist patients in linking to social work services to assist with enrollment into medical insurance and to meet other social service needs, such as housing, food, child care, and substance abuse treatment.

Helping Patients Cope with Emotional Issues

Patients coming to terms with HIV infection often experience a range of emotions, including anger, fear, shock, disbelief, sadness, and depression. Loss is a major issue for patients with HIV because health, employment, income, relationships with friends, lovers, and family, and hope all may be threatened. Many patients feel overwhelmed, and even patients who seem to be adjusting reasonably well can find it difficult to keep all of the many appointments that may be scheduled as they initiate care. Providers need to recognize that patients' emotional states affect their ability to solve problems and attend to important medical or social issues. Providers can do the following:

- Assess each patient's emotional state and the availability of friends and family for emotional support. Some patients will need counseling to help them decide whether to

Helping Patients Develop Self-Management Skills

Self-management support is defined by the Institute of Medicine as the systematic provision of education and supportive interventions by health care staff to increase patients' skills and confidence in managing their health problems, including regular assessment of progress and setbacks, goal setting, and problem solving.

It can be viewed as a portfolio of techniques and tools to help patients choose healthy behaviors, and as a fundamental shift of the provider-patient relationship toward a collaborative partnership.

4 | Guide for HIV/AIDS Clinical Care

After patients have come to terms with their HIV infection, they are ready to embark upon the lifelong process of caring for themselves. Patient self-management involves adopting new health behaviors and requires changes that will occur as a progression of motivational skills. Motivation is defined as the “probability” that a person will enter into, continue, and adhere to a specific change strategy. Patients will feel empowered as they gain the skills and confidence to be active participants in their care.

The following practices should be adopted to foster patient self-management:

- Train staff at all levels on patient self-management concepts and how to incorporate them into care.
- Create an atmosphere conducive to learning these self-management skills, including but not limited to the following areas:
 - Problem solving
 - Medication issues
 - Working with the health care team
 - Planning for the future
 - Goal setting
 - Dealing with difficult emotions
 - Healthy eating
 - Advance directives
 - Sex, intimacy, and disclosure
- Adopt a team approach to health care with the patient as the central team player (patient-centered care).
- Incorporate problem-solving skills into all education efforts.
- Allow the patient time to set small obtainable goals as “first steps” in self-management.
- Realize that many appointments with multiple members of the health care team may be necessary before a patient has all the necessary skills.

Helping Patients Make Positive Changes in Health Care Behaviors

Regardless of whether a patient is new to care or has been in care for many years, the burden of a chronic disease is wearing. Positive change in behavior needs to be an ongoing focus of patient-centered care. After patients have self-management skills, they still need help setting action plans for their health care. The provider needs to help patients adopt realistic action plans by:

- Realizing that new health behaviors require motivation and occur as a progression of learned skills
- Bolstering patients’ self-confidence by adopting action plans that:
 - Are realistic
 - Are something that patients find of value (i.e., something they want to do)
 - Are reasonable (it is better to underestimate and exceed the goal than to overestimate and fail)
 - Are action-specific, with small, obtainable goals

Peer Educators and Patient Advisory Groups

Patients need to be active participants in making decisions regarding their health care. Peer educators and patient advisory groups can help patients become more involved in their care.

In order to best support patients, it is helpful to have peer educators available for them during initial and subsequent visits. This helps to decrease patient anxiety and promotes a patient-centered atmosphere. Providers need to realize that peer educators are HIV-infected individuals who:

- Provide a unique approach to client-centered care
- May attend clinical sessions with patients and provide them with referrals for one-on-one counseling and support

- Are “seasoned clients” who have a desire to help patients in their care
- Work under the same confidentiality guidelines as all other staff members

Another valuable tool for patient-centered care is the use of a patient advisory group (PAG). The PAG is the voice of the people that the clinic serves. The HIV program will listen to this group’s suggestions and use them to improve patient satisfaction and clinic functionality. The PAG’s role could involve identifying clinic problems, recommending changes in the care delivery system, and discussing new treatment approaches. A successful PAG does the following:

- Provides comprehensive, individualized client-based education to all active patients
- Encourages clients to actively participate in treatment decisions and to involve family members and others who comprise their support system
- Designates members who facilitate meetings, promote upcoming meetings, coordinate speakers, and provide feedback to clinic staff and management
- Allows members to serve as cofacilitators, choose topics of discussion, set meeting guidelines, and invite new members
- Fulfills requirements of grants and other funding streams to have enhanced patient involvement

Stigma and Discrimination

Stigma is founded on fear and misinformation. Theodore de Bruyn observed that stigma is associated with HIV because, “It is a life-threatening disease; people are afraid of contracting HIV; it is associated with behaviors that are considered deviant; a belief that HIV has been contracted due to unacceptable lifestyle choices; and, some believe it is the result of a moral fault which deserves punishment.”

Stigma can adversely affect how patients are perceived by others and how they view themselves. The stigma associated with HIV/AIDS is such that individuals known to be or suspected of being infected with HIV may be excluded from community activities and suffer isolation or abandonment. Some patients may feel ambivalent about seeking medical care if, by doing so, they risk disclosing their condition. Others may have learned from experience to expect rejection and therefore may not trust care providers. It is essential for providers to be supportive of patients who are dealing with the burden of stigma.

Stigma of Fear of Contagion

Unfortunately, patients and their families are often unaware that routine household contact with a person with HIV poses no risk of contagion. They should be educated about that, and also taught what to do in situations that do pose risk, such as when bleeding occurs. Clinic staff members must model behavior in this area. For example, gloves should be worn only as appropriate during physical examinations and as consistent with universal precautions. There should not be separate facilities or special procedures for HIV-infected patients.

Stigma Associated with Being Gay, Lesbian, Bisexual, or Transgender

Demonstrating respect and providing excellent care to patients with various cultural backgrounds, beliefs, and sexual orientations are central to medical professionalism. Providers should approach patients in an open and nonjudgmental fashion and be familiar with medical management issues unique to these populations, such as appropriate screening for sexually transmitted diseases for men who have sex with men (MSM) and hormonal treatment for transgender patients. Clinic staff members also must be respectful and supportive; having a staff that is familiar with lesbian, gay, bisexual, and transgender (LGBT) cultures is a natural way to create a welcoming environment. Providers and social workers should be aware of community

agencies with resources available to people who are lesbian, gay, or transgender. In addition, providers and clinic staff members should be aware of special legal issues that affect these populations. For example, designating a durable power of attorney for medical decision making can be particularly important in states that do not recognize same-sex partners or spouses as legal next of kin.

Other Special Cultural Issues

African-Americans, Hispanics, and some immigrant groups are disproportionately affected by HIV, and many people of color with HIV infection have major socioeconomic problems such as poverty, homelessness, lack of medical insurance, lack of acculturation, and undocumented immigration status. Many young people with HIV face similar issues. All these obstacles can make accessing health care difficult and attending to health problems less of a priority for the individual. A patient's cultural background influences health-related beliefs and behaviors, and personal or historical adverse experiences may make some patients distrustful of medical care. In addition, some patients' distrust of medical research can impede their willingness to access new drug therapies. Culturally competent communication between provider and patient may substantially affect adherence with therapies. For all these reasons, providers should do the following:

- Carefully explore what each patient believes about his or her health, what would be appropriate treatment, and who should be involved in medical decision making.
- Use professional interpreters to help overcome language barriers.
- Use case managers and peer educators to help bridge social barriers. The team of peer educators should be culturally diverse in order to be effective with all minority groups.

Confidentiality and Disclosure

Confidentiality of medical information is always mandatory, but the stakes are particularly high for patients infected with HIV, who risk losing medical insurance, employment, and the support of friends or family if their diagnosis is disclosed inappropriately. Although people with HIV infection are protected against discrimination under provisions of the Americans with Disabilities Act, discrimination can be difficult to prove, and there are strict time limits after which charges of discrimination can no longer be made.

Protecting Patient Confidentiality

Adherence to the HIPAA regulations is an important aspect of protecting patient confidentiality. Personnel policies should reinforce measures such as requirements that papers and computer screens containing patient-identifying information not be left unattended and should include provisions for documenting whether phone messages can be left for the patient, and if so, with whom.

Helping Patients Disclose Their HIV Status

Patients who have a support network function better than those who are isolated. However, patients' fears of disclosure are often well founded, and providers must find a balance between accepting patients' unwillingness to disclose their HIV status and the need to develop support networks. Patients may find support groups or individual psychotherapy sessions beneficial in deciding when to disclose, and to whom.

The sex and needle-sharing partners of people with HIV need to be informed about their possible exposure to HIV. Local health departments can either assist patients in making these disclosures or provide anonymous partner notification for them.

A patient-centered clinic staff can help patients with disclosure. For example, staff members

could encourage patients to bring their partners to one of their clinic or counselor appointments in order to disclose their HIV serostatus in the context of the clinic visit. This could allow the health care professional to answer the partners' questions and would provide a neutral environment for the disclosure discussion. Risk of intimate-partner violence should be assessed.

Public Health Role of Providers in the HIV Epidemic

Primary care providers must consider their public health role in curbing the spread of HIV. The incidence of HIV remains unacceptably high, and may be increasing in some populations, especially in communities with relaxed adherence to safer sex recommendations.

All AIDS diagnoses and, in some states, all positive HIV test results must be reported to the state health department. State laws vary in reporting requirements and subsequent notification of potentially exposed individuals (see the National HIV/AIDS Clinicians' Consultation Center *Compendium of State HIV Testing Laws* at www.nccc.ucsf.edu), but the name of the source contact is never divulged to the person being notified. Providers should become familiar with the laws of their jurisdiction by contacting their health department. (The Association of State and Territorial Health Officers provides links to all state health departments at www.astho.org.) Providers are required to do the following:

- Inform patients that their AIDS diagnosis or positive HIV status (depending on individual state requirements) must be reported to the state health department, tell them whether partner notification is required, and explain what they should expect regarding efforts that must be made by the patient, provider, or health department to notify sex partners or individuals who may have been exposed to HIV through

their needle sharing. Assure them that their names are always kept confidential and are never given to potentially exposed individuals by the health department.

- Carefully assess patients' risk-taking behaviors, educate them regarding HIV transmission, and perform screening for sexually transmitted diseases. (See chapters *Preventing HIV Transmission/Prevention with Positives*, *Initial History*, *Initial Physical Examination*, and *Initial and Interim Laboratory and Other Tests*.)
- Provide counseling to encourage safer sexual practices and make referrals to drug rehabilitation or needle exchange centers as indicated. (See chapter *Preventing HIV Transmission/Prevention with Positives*.)
- Provide information about the role of antiretroviral therapy in reducing the risk of HIV transmission.

Clinic Management

Jonathan A. Cohn, MD

Background

HIV outpatient care is unique in that it combines two very different approaches to patient care: long-term health care for individuals with a chronic condition, and the vital public health service of reducing transmission of an infectious disease. Thus, chronic treatment and retention in care are important both for individual patients and for public health.

HIV services often are provided to persons who have challenges in regard to participation in their own health because of discrimination, poverty, active substance use, or mental health disorders. The context of HIV care still is one of persistent stigma regarding HIV infection itself and discrimination against racial, ethnic, and sexual minorities who constitute the groups with the highest HIV prevalence and incidence. At the same time, funding streams from federal, state, and local governments have created opportunities for treatment of uninsured and underinsured individuals and provide resources for creating innovative, effective programs. The Affordable Care Act creates new opportunities to provide care for previously uninsured persons through two insurance mechanisms and other benefits described below. Treatment guidelines, operations research data, and technical support are available to assist in designing, operating, and improving service programs.

Patient Recruitment into Clinic

The persons who were easy to recruit and retain in care are already enrolled; the more challenging patients await recruitment. The U.S. Centers for Disease Control and Prevention (CDC) estimates that up to 25% of HIV-infected persons in the United States are not aware of their HIV infection (Branson, 2006), so there is still much work to be done to diagnose those individuals and link them to care. For newly diagnosed patients, studies show that there often is a substantial delay in attendance at an initial HIV care visit, with only 20–40% of them accessing care within 6 months of diagnosis (Mugavero, 2008). However, for the clinics, the number of newly diagnosed patients who present for care is substantial. A recent survey of 15 HIV programs across the country (median of 1,300 active patients each year) showed that a median of 250 (range 60–730) new patients were enrolled in each clinic each year (Yehia, 2008).

To facilitate linkage to care, every HIV clinic should 1) be linked to agencies that provide HIV testing and services for persons with HIV, and 2) make clinic access easy and comfortable for the clients of those outside services. Many HIV clinics establish referral linkages with community HIV counseling and testing services (CTS), AIDS service organizations (ASOs), sexually transmitted disease (STD) treatment facilities, family planning agencies, drug treatment facilities, local health departments, regional HIV hotlines, and local hospitals and emergency rooms. Many clinics also offer free confidential or anonymous CTS using state or federal funding.

Clinic personnel should build personal relationships with agencies that may provide referrals, invite staff of community agencies to visit the clinic, or hold open houses. Providers from ASOs, such as case managers, can be invited to accompany patients on clinic visits. Referring agencies must know what services the clinic provides and which patients it serves, as well as those it cannot serve.

Various approaches may help facilitate the patient's entry into care. A randomized study showed that using case managers to increase linkage of newly diagnosed persons to care can be effective: 78% of patients who had "strength-based" case management that promoted patient empowerment and self-efficacy kept an appointment within 6 months, whereas only 60% of patients without case management kept an appointment in the time frame (Mugavero, 2008).

Frequently, there is a delay of several weeks for a new appointment with an HIV clinician. Model programs have been established nationwide to improve linkage to HIV care. For example, the HIV clinic at the University of Alabama at Birmingham offers new patients an orientation visit in the HIV program within 5 days of their request for a new patient appointment. In this clinic, an HIV program staff member initiates a welcoming interaction during the patient's first phone call requesting an appointment and invites the patient to an orientation visit. During that visit, a psychosocial assessment is performed, specimens are taken for baseline laboratory tests, any immediate health issues are addressed, and referrals for mental health or substance use disorder care are initiated, if indicated. The orientation visit is used to give patients information on how to use the clinic effectively, provide other on-site nonmedical services, and start processes to access health insurance or AIDS Drug Assistance Program (ADAP) services as needed. The full initial medical visit is scheduled for a later date. In a nonrandomized comparison, the no-show rate at that clinic dropped from 31% to 19% with that approach (Mugavero, 2008).

Success in linking newly diagnosed persons to care may be enhanced through the participation of HIV-infected consumers as peer advocates and peer navigators (see chapter *Supporting Patients in Care*). Either volunteer or paid peer advocates can meet newly

diagnosed patients who have been referred to the clinic, help familiarize them with the clinic services and staff, and help them adjust to both the fact of their HIV infection and their role as a chronic care patient. Groups for newly diagnosed persons co-led by a peer advocate and a professional as well as one-on-one interactions with patients within or outside the clinic (e.g., through a buddy system) can help newly diagnosed persons succeed in the clinic. In clinics that use peers, particular attention must be paid to confidentiality issues. The peers must be trained and supervised (see below), and the patients must agree to participate with peers, either individually or in groups.

Clinics differ in terms of the characteristics of people living in their catchment area and in regard to the levels of expertise of clinic staff members. Some successful clinics target a narrow but underserved population and concentrate on meeting the needs of that population. The environment and services offered by the clinic may be tailored to the patient population. For example, a youth-friendly clinic may differ in these respects from one targeting the working poor.

Retaining Patients in Care

Retaining patients in care is an ongoing challenge (see chapter *Supporting Patients in Care*). Among the 15 surveyed HIV clinics mentioned above, the median no-show rate for appointments was 28% (range 8-40%). For new patients, the range was 5-54% and for returning patients it was 2-40%. Across all the clinics there was a median annual loss-to-follow-up rate of 15% (range 5-25%) (Yehia, 2008). A number of approaches may help patients maintain continuous care in the clinic. An AIDS Education and Training Centers (AETC) working group is creating a toolkit for clinics to assist them in applying evidence-based methods to retention in care; this is available from the National Resource Center (NRC) of the AETC (see resources below).

Respect and cultural competence:

Respecting patients and providing them with effective care builds trust and keeps them coming back. New clinic attendees may have strong feelings related to HIV infection (e.g., fear of death) or how they acquired it (e.g., issues of shame or of secrecy). They may lack trust in medical care (from prior personal experiences or from historic events such as the Tuskegee syphilis experiments) or in current treatments (e.g., “Everyone I knew who took AZT died ...”). Some patients believe that HIV was created in government laboratories to target African-Americans and may or may not believe that the clinic staff is part of the conspiracy. It is important that all staff members be trained to anticipate, recognize, and work with issues such as these.

Patients may experience obstacles to care when there are cultural differences or language barriers between themselves and the staff members. Diversity among health care staff can further improve the experience of racial, ethnic, and sexual minority patients.

Welcoming staff attitude:

Providers must know the target population and build a system that will make patients feel welcome. Patients always should be made to feel that they came to the right place (even in cases in which they must be referred on to another provider or clinic). Patients should receive understanding and support, even if they arrive at the clinic without the required managed care referral form (at least for the first few visits).

Welcoming environment:

Physically comfortable waiting and examination areas, with linguistically and culturally appropriate decoration and reading material, are important for patient retention. A clinic that serves parents or children should make available toys or children’s books.

Orientation to clinic systems and rules:

New patients need a brief description of clinic staff and services, routine and emergency procedures, prescription refill procedures, and after-hours follow-up. They must understand requirements for referrals from managed care providers, and new patients may need help with fulfilling such requirements. Patients also must be oriented to what is expected of them (e.g., arriving on time, calling to cancel or reschedule appointments) and the consequences of not fulfilling their responsibilities (e.g., clinic rules regarding late arrivals). A handout or pamphlet with this information can be very helpful. Patients need to know how to determine the insurance coverage and other benefits for which they may qualify, and how to find out their options if their insurance coverage changes.

Peer support:

Many programs have HIV-infected staff members who provide specific peer-support services. Patients who have had unpleasant experiences seeking medical care in the past, or those who are not used to engaging in medical care, may get better support from another consumer than from a nonpeer staff member. Youth especially may trust information from peers more so than from adult professional staff members.

Peer advocates or peer navigators may work in this role part time or full time, as either volunteers or paid staff. Often they work specifically to make new or recently returned patients comfortable in the clinic. Some programs designate consumers as peer navigators, emphasizing their role in helping new patients, or patients returning after being lost to care, in finding their way through the health care system and support systems. Peer advocates also can help patients ask questions or make their needs known to the clinic staff. Advocates or peer-support persons can be instrumental in helping patients build self-

esteem and acquire new habits that will enable them to use health care services in a proactive manner. Peers are especially helpful when they model good health behaviors, including adherence with appointments and medications and with avoiding unsafe sex or other HIV transmission activities. In some cases, peers have been the basis of a successful program, but in other cases peers model poor health behaviors and themselves become ill. Peers need to adhere to confidentiality rules and good work habits and need to provide accurate information to other clinic staff. Effective selection, training, and supervision of peers are extremely important.

Systems to support attendance:

Clinics should provide feedback and encouragement to patients about the importance of attending scheduled visits. This can be done through written materials such as posters and pamphlets, as well as through comments made by providers during clinic visits. These very inexpensive interventions have been shown to improve clinic attendance (Gardner, 2012).

Patients should receive appointment reminders about 48 hours before each appointment. Reminders typically are given by phone or mail, although text messaging or other forms of electronic communication may be more useful in some settings. It also may be effective to have a staff member contact patients who have missed appointments to find out what prevented them from attending, offer to reschedule, and try to eliminate barriers to clinic attendance.

Factors such as child care needs, work schedules, and transportation problems can be substantial barriers to attending clinic appointments. Addressing these and other challenges may require coordinated efforts by the clinic staff, case manager, and others. In some instances, AIDS service organizations and other community organizations may have funding available to assist with these efforts.

Some programs have a policy detailing their interventions following one or more missed visits: usually one or more phone calls comes first, then a letter to the last known address, and as a last measure, some programs will dispatch personnel to visit the last known address in an attempt to reconnect with a patient who is lost to follow-up. These efforts are more successful when patients are asked for current telephone, address, and other contact information at every clinic visit. Staff members must know to whom a patient has disclosed his or her status; in verbal and written correspondence, staff members must avoid unintended disclosure of the patient's HIV infection.

It is important to document movement of patients to other locations (including correctional facilities) or other care providers whenever the information is known so that these patients are considered transferred rather than lost. Some states provide public lists of incarcerated persons; larger programs may use those lists to find patients who have been missing for some time.

HIV programs can be aggressive in trying to connect with patients who are missing, but also must respect explicit decisions by competent persons to change providers or to forgo medical care.

Outreach encounters to promote participation in care:

A study of seven sites across the United States, funded by the Health Resources and Services Administration (HRSA), found that outreach by health care professionals increased clinic attendance and that frequent outreach by any program staff member increased adherence with antiretroviral therapy (see “References,” below). Outreach by medical professionals included efforts by physicians, nurses, or physician assistants to meet patients outside the HIV clinic setting, often in another part of a medical facility such as an inpatient unit. These encounters were the most expensive type of outreach, but the most effective in engaging new patients in care. Encounters with medical professionals did not increase adherence with medications, however. Other types of outreach, either face-to-face or otherwise (by phone, email, or postal service), by professional, nonprofessional, or paraprofessional staff members, increased adherence with medications, but not with clinic attendance. More frequent encounters of this type were associated with greater improvements in adherence. The results of the study suggest that initial face-to-face contact with medical providers is important for establishing trust that enables new patients to engage in care, and that frequent encounters with other staff members is important for maintaining patients on medications.

Special Population: Women of Color

A 2008 report commissioned by HRSA collected data from the published literature, key informant interviews, and a consultation meeting with Ryan White Care Act (RWCA)-funded providers to provide information on barriers and effective interventions to assist women of color in succeeding with HIV care. Three central themes were extracted from these varied inputs:

1. Development of a responsive care environment that incorporates respect, cultural competency, and flexibility to meet women’s needs;
2. Incorporation of peers into the care system as trained and paid participants in the care teams; and
3. Addressing women’s needs through care coordination, flexibility, health system navigation, and better coordination and communication between medical and social service providers.

HRSA funded a number of clinical sites to test different methodologies applying these principles through the Special Programs of National Significance mechanism; these projects are ongoing and results are not yet available.

Models of Care

Chronic Care Model

Popular in recent years, the chronic care model refers to a mechanism for providing patient-centered care using a variety of staff personnel and interventions to maximize desired health outcomes. This approach has been most highly developed for diabetes care, but it can apply equally well to a wide range of chronic illnesses. In this model, patient training in self-care is key. In contrast to the tradition of teaching patients the pathophysiology of their health condition in lay terms, with this model, training involves focused skills building so that patients can better monitor their health status, use their discretionary medications, and know when and how to contact the professionals for assistance. Frequent contact

between patient and clinical staff, both face-to-face and through other means, both in clinics and in the community, usually are involved. Care is directed toward panels of patients, not just individual patients. Program-wide monitoring of process and outcome variables, such as frequency and results of CD4 cell counts and plasma HIV RNA levels, informs the practice as a whole as well as the quality of care for individuals. These interventions have been shown to improve outcomes, but do not necessarily reduce costs because the staff time required can be substantial.

Patient-Centered Medical Home

The chronic care model concept has been merged with the concept of a home to coordinate care and medical records for children to create the current model of the Patient-Centered Medical Home or PCMH. This concept usually is applied to primary care providers and practices; however, it potentially applies to a specialist who cares for the most prominent or demanding of a patient's health problems as well as other primary care issues. The chronic care model is limited to treatment of one health condition whereas the medical home model supplements such targeted care (e.g., HIV-specific care) with coordination of the other health services the patient may need. HIV programs often act as the primary care provider, especially for patients who do not have insurance and therefore have limited access to other providers, whether the practice is otherwise a primary care or specialty clinic. Many HIV clinics have the capacity to organize and implement a chronic care approach and to coordinate services across other specialties and providers in order to be a true medical home. Several national organizations provide certification of PCMH status to clinicians and practices. One organization is the National Center for Quality Assurance or NCQA (see details on its PCMH certification process on its website (www.ncqa.org). NCQA will certify individual

providers and practices even when they are located within larger institutions. Another organization is the Joint Commission (www.jointcommission.org), which usually certifies PCMH status within an organization that has Joint Commission accreditation for other purposes. General information about the concept and other agencies that provide certification is available online at the National Center for Medical Home Implementation (www.medicalhomeinfo.org). In some states or localities, insurers such as Blue Cross and Aetna have their own certification process. Some health plans provide additional payment to primary care clinicians and practices that are certified as medical home providers, to support the health informatics infrastructure, care coordination, teaching and skill building, and follow-up outside of office visits that are required to manage panels of patients in a proactive manner. The PCMH approach also will provide financial opportunities for practices that become involved in Accountable Care Organizations (ACO), as pay-for-performance models of reimbursement are implemented across the United States. HRSA provides technical assistance to Ryan White grantees interested in being certified as a medical home, and to those interested in learning the lessons of this process even if not seeking certification. Additional information regarding training, resources, and webinars is available on the HRSA Target Center website (careacttarget.org).

PCMH Neighbor

This is a concept for specialty practices who do not wish to or are not able to take up full care coordination for a patient, or who may not be eligible as specialists to become certified as a PCMH (see "References," below). With this concept, a specialist participates in timely and thorough sharing of information and care coordination with a patient's primary care medical home, so that the full array of PCMH services is available without duplication but

with the added expertise of the specialty practice. At this time, there is no additional reimbursement for this status. However, implementing this enhanced level of care coordination with the patient centeredness, proactive approach, and skill building that characterize a PCMH, is expected to improve outcomes and may create opportunities for enhanced reimbursement in the future. This coordination also will be useful for specialist participation in ACOs.

Clinical Services Needed for HIV Care

Optimal array of services provided by an HIV clinic

At a minimum, HIV medical care providers need to offer confirmation of HIV infection, education, recommendations, and management regarding antiretroviral therapy; prevention, diagnosis, and management of HIV-related opportunistic diseases and treatment-related complications; screening and referral for common comorbidities, and linkages to other general health services. Most patients will need additional primary care and specialty health care and support services; it is often more effective and more convenient when these are available on-site rather than by referral. For health interventions to be successful, many patients will need assistance with health behavior change.

The services ideally provided by the HIV clinic include those on the list that follows. Detailed information on most of these topics is available in other chapters in this manual. These standards are derived from the primary care guidelines of the HIV Medicine Association of the Infectious Diseases Society of America (HIVMA/IDSA), the HHS *Guidelines for the Use of Antiretroviral Agents in HIV-1-Infected Adults and Adolescents*, the HHS *Guidelines for the Prevention and Treatment of Opportunistic Infections in HIV-Infected*

Adults and Adolescents, the CDC guidelines on prevention services in HIV care programs, as well as U.S. Public Health Service Prevention Task Force and American Cancer Society recommendations (see “References,” below).

- Age-appropriate immunizations including HIV-specific indications for some, including pneumococcal vaccine, influenza vaccine, hepatitis A and B vaccines, quadrivalent human papillomavirus vaccine in appropriate age groups (see chapter *Immunizations for HIV-Infected Adults and Adolescents*).
- Screening for STDs (syphilis, gonorrhea, chlamydia, trichomonas in women, hepatitis B and C) at enrollment and periodically. After the initial screening, new standards promote periodic screening for acquisition of hepatitis C in persons at risk.
- Assessment of ongoing sexual or drug-use behaviors associated with HIV transmission, and counseling or other interventions to reduce transmission behaviors. Interventions regarding sexual transmission behaviors should be linked with family planning.
- General health screening for hypertension, diabetes, dyslipidemia, and cardiovascular risks, and cervical, breast, and colon cancer. The role of anal cytology in screening for anal cancer remains uncertain because of limited data on effective management of anal dysplasia.
- Care of common general medical illnesses including hypertension, dyslipidemia, uncomplicated diabetes, obesity, asthma, and chronic obstructive pulmonary disease. Care of a wider range of disorders, such as congestive heart failure and chronic kidney disease, will vary by practice.
- Evaluation and care of common comorbidities including hepatitis B and C infection and latent and active tuberculosis (TB). Treatment of active TB, including

directly observed therapy, often is provided by public health agencies; treatment of hepatitis may require referral to a specialist (though increasingly HIV providers are likely to manage treatment of HCV in coinfecting patients as additional direct-acting antivirals for hepatitis C become licensed, with their improved efficacy and lower side-effect profile).

- Provision or linkage to oral health care, nutritional services, and other medical specialties including ophthalmology, dermatology, and oncology.
- Provision or linkage to HIV care for pregnant women, adolescents, and infected or perinatally exposed infants.
- Behavior change for general health issues including smoking cessation and other unhealthy substance use, diet for weight control, and exercise.
- Behavioral health services for adaptation to the illness, mental health disorders, and substance-use disorders including unhealthy alcohol use.
- Provision or linkage to social support services, including community-based case management.
- Additionally, clinics should have a system in place to protect the safety of their employees in regard to occupational HIV exposure (see chapter *Occupational Postexposure Prophylaxis*).

Resources required in providing comprehensive HIV care

Patient access is maximized in clinics that can accept Medicare, Medicaid (including Medicaid managed care), and county insurance programs. Clinics with access to Ryan White Treatment Extension Act funding must accept patients regardless of health insurance status or ability to pay. Federally qualified health centers also can accept uninsured patients and have an important role in expanding access to care. Every state receives Ryan White Part B funds for an ADAP to pay for antiretroviral agents and often other drugs for the uninsured or other eligible persons with HIV. Details vary by state and are available at each state's HIV hotline (for phone numbers, see hab.hrsa.gov/gethelp/statehotlines.htm). Clinics should assist appropriate patients to enroll in the ADAP, and to access the drug coverage or other clinical services that vary by state.

Within designated metropolitan areas, Ryan White HIV/AIDS Program Part A funding may be available. Clinics planning to serve a moderate-to-high volume of HIV patients can apply for a Ryan White Part C planning grant. Clinics serving women, pregnant women, youth, and families are eligible to apply for Ryan White Part D funding. Clinics may collaborate with other agencies in seeking Ryan White funding. Smaller programs may become satellites of larger Ryan White-funded programs. Other individual providers or small clinics may be eligible for Part B reimbursement for medical care of uninsured persons, by working with local case management agencies.

The ACA created online insurance marketplaces or exchanges, at which persons and families with incomes between 100% and 400% of the Federal Poverty Level (FPL) can purchase affordable insurance using tax rebates (for 250-400% of FPL) and other subsidies (for 100-250% of FPL). In addition,

many states are expanding Medicaid eligibility, for example to persons and families with annual incomes up to 138% of FPL. Another benefit of the ACA for persons with HIV is the requirement that core health benefits, including evidence-based preventive services, are provided by all health plans. HIV patients will benefit from the fact that preexisting conditions no longer disqualify persons from obtaining individual health insurance at competitive rates, and that more employers are now expected to provide health insurance for employees. Ryan White Part B Drug Assistance Program (DAP) funds may be used to assist patients with the costs of health plans if doing so is less expensive than providing direct benefits to DAP beneficiaries. Details about the plans available on the exchanges, their costs and benefits, the role of DAP, and Medicaid eligibility vary by state. HIV provider organizations will need to contract with some of the new plans available on their state exchanges, and providers will need to educate themselves on details of their plans. Local organizations have been designated as Certified Application Counselors (CACs), which allows trained staff to assist patients with enrollment on the exchanges and to certify that hardcopy documentation provided by patients, if needed in the course of online enrollment, is accurate. Other help may be provided by ACA navigators, who can assist clients with enrollment decisions but are not able to certify clients' documentation. Specific details and mechanisms for this interaction between ACA insurance benefits and Ryan White benefits are still evolving. Updated information on the benefits of the ACA for persons with HIV is available on the HRSA Target Center website (careacttarget.org).

Personnel:

For patients who are self-sufficient or can access community-based services on their own, a lone provider potentially can deliver comprehensive HIV care. In most circumstances, however, patient care needs are met more effectively when multiple team members are available at the clinical site.

Facilities:

In addition to the usual office layout, other facilities are useful. An examination room suitable for gynecologic examinations is important. An apparatus for pulse oximetry is very useful in assessing patients with respiratory symptoms. Easy access to facilities for collecting venous blood, urine, and stool specimens should be available. On-site access to rapid tests that do not require Clinical Laboratory Improvement Amendments (CLIA) certification may be useful, such as urine pregnancy tests, fingerstick blood glucose tests, and perhaps the rapid HIV antibody screening tests. Laboratory certification to perform urine analysis and microscopic examination of vaginal fluid specimens is very useful. Refrigeration to maintain vaccines and material for tuberculin skin testing is necessary. Refrigeration also enables the clinic to provide patients with on-site injection of medications required once a week or less frequently.

Training and technical assistance:

Patients look to nontechnical staff to corroborate information given by physicians and midlevel providers. Further, patients expect the same accepting attitude from all staff members. Thus, all clinic personnel need training in both technical and cultural matters. One important resource is the AETC NRC (www.aidsetc.org) and the local performance sites of the AETCs funded by HRSA to provide training and technical assistance to clinics. The NRC, local AETCs, and the website of the National HIV/AIDS Clinicians' Consultation Center (www.nccc).

ucsf.edu) provide detailed and patient-specific education to assist clinicians in making treatment decisions. Written educational materials for staff, such as national and regional treatment guidelines, may be obtained free of charge via the Internet and are updated regularly. Many regional and national meetings provide training in both clinical care and prevention. Assistance with enhancing and implementing systems of care, including instituting a quality management program, also is available from the AETCs. See chapter *Web-Based Resources* for other resources for training and information. The National HIV/AIDS Clinicians' Consultation Center's Warmline provides expert clinical advice on HIV/AIDS management for health care providers. This telephone consultation service is available Monday through Friday, 9 a.m. to 8 p.m. eastern time, at 800-933-3413.

Implementing interdisciplinary care in the clinic

It is not enough to have staff members from many disciplines on the payroll; rather, systems that allow staff members to function as a team must be created. Training with follow-up by supervisors is essential. Specific tasks for each staff member need to be assigned (see Table 1). Ideally, members of the staff can meet for a few minutes prior to each clinic session to anticipate special needs and allocate personnel resources. Some clinics place a checklist on each chart at each visit to indicate which team members a patient is meant to see that day and to confirm that all intended interactions have occurred.

The team's potential can be best utilized if there is a regular opportunity to meet and discuss patients outside clinic sessions, in multidisciplinary team meetings. When all members participate, the

discussions can range from the selection of antiretroviral regimens for a patient to addressing the patient's adherence issues or chronic mental illness. Services for infected and affected family members also can be coordinated at these meetings.

Table 1. Clinic Personnel Responsibilities

Tasks prior to a clinic visit

- Remind every patient of appointments via phone call or mail.
- Review charts to list items to address during the visit.

Tasks during a clinic visit

- Verify patient's current contact information and current insurance status.
- Orient new patients.
- Assist with insurance gaps (e.g., teaching about need for referrals, help with insurance application or ADAP).
- Assess other barriers to care and psychosocial needs.
- Assess medication adherence.
- Teach and provide behavior change counseling about medications and self-care.
- Assess ongoing transmission behaviors.
- Teach and provide behavior change counseling about transmission behaviors.
- Educate about clinical trial opportunities (if applicable).
- Make referrals for psychosocial services.
- Make referrals/appointments for medical, dental, mental health care

Tasks following clinic sessions

- Make follow-up calls regarding new medication regimens or referrals.
- Call or mail correspondence to patients who missed their visits.
- Help patients overcome barriers to clinic attendance.
- Extract patient data and enter it into the information system, or upload data from an electronic medical record into reporting or data management software.

Support Services and Linkages Needed for HIV Care

Case management and support services enhance clinical care

Case managers assist patients in accessing the range of services and entitlements that can help them succeed in treatment. This may include helping patients apply for insurance; access support groups; access supplemental food, housing, homemaker, and other concrete services; and access mental health and substance abuse services. Excellent case managers also help motivate patients.

Traditionally, case managers should perform periodic assessments of clients' needs and update their comprehensive care plans at least every 6 months. Home visits can be very useful as part of the assessment. Some case managers or their agencies will provide certain direct services themselves; these may include short-term counseling, transportation for clinic visits, accompanying patients to clinic visits, and providing financial assistance for specific emergencies.

In many localities, HIV case management has been a service provided by community-based agencies. With the evolution of the PCMH concept, and a stronger need to have health care coordination for patients with multiple complex medical conditions, the approach to HIV case management is evolving. A new, and perhaps more useful, model is one in which community-based case managers provide linkage and follow-up for community-based services such as health insurance, transportation, housing, food security, income, and psychosocial support generally. These case managers often have training in a psychosocial discipline. At the same time, medical case managers, usually nurses, provide coordination of medical care services, with support for appointment and medication adherence, side-effect management, self-care, and clinical monitoring between office visits.

Close coordination between clinic staff and case management is important for avoiding duplication of efforts and services. Periodic case conferences between clinic staff and case managers are ideal. Written communication, for example, when sharing case management care plans, can be useful. Case management agencies and clinical sites need to obtain written consent from patients to share the information that allows coordination.

Creating useful linkages with community-based services

Clinics can develop relationships with community-based case managers or directly with providers of specific services, such as mental health, substance abuse, or housing services. Personal contact between staff members of clinics and outside agencies is important for establishing the relationship, and ongoing contacts are necessary for coordination. Community organizations often are pleased to give in-service education to clinic staff personnel in order to streamline the referral process. Clinics should make their expectations clear to community-based agencies. Clinics can function as advocates to ensure that their patients receive the attention and services for which they were referred. Periodic interdisciplinary meetings of clinic staff with representatives of community-based agencies, including case managers, are very useful.

Consumer involvement in HIV clinical care

Many clinics have created patient (consumer) advisory groups to participate in planning and quality management. The role these groups take depends on the specific clinic; some advisory boards educate themselves about clinic issues and provide expert input to clinic processes. Other boards act more as social event or support groups. See chapter *Supporting Patients in Care* for further information.

Enhancements to increase the HIV clinic's effectiveness: information and support

Clinics can enable patients to better care for themselves by providing them with information about HIV and by helping to build a community among them.

Much information is available for patients, including publications on medications, side effects, and adherence. Many clinics display HIV-related education materials, including information on safer sex practices and birth control; many also provide male and female condoms with instructions about their use. In some clinics, a separate area for educational materials may help clients maintain confidentiality. Free educational materials are available from federal and state HIV websites, and the pharmaceutical industry also produces some appropriate materials.

Many ASOs and clinics host support groups for interested patients. Participation must be voluntary, and only patients who are comfortable with revealing their status to other patients will be willing to participate. Some support groups target specific populations. Groups may be more effective if an experienced counselor or mental health provider leads them.

Some clinics hold classes on HIV and adherence. Other clinics provide periodic symposia to keep patients up to date on treatment advances. Clinics serving pregnant women and parents may include classes on birth preparation and parenting. For clinics that have a community advisory board, the board can be the organizing force for these community updates. Both public grants and funds from the pharmaceutical industry may be used to support these events.

Some youth-oriented clinics arrange social events and outings for their patients. Programs for children or mothers may provide support

services for both infected and affected children, ranging from formal psychological care to supportive recreational activities after school or during school breaks.

Medical Information Systems: Tools for Enhancing Care

Medical information systems may include Practice Management Software (PMS), Electronic Health Records (EHRs), and Personal Health Records (PHRs). These three types of software may be available as a suite or as separate products that can be linked, although the linkage of separate products sometimes is challenging. Software products may be designed to run on one desktop computer in a small practice or on a computer server that can be accessed by many users simultaneously, or they may be based on the Internet and managed by the vendor. In all instances, backup of the data and maintenance of confidentiality and compliance with *Health Insurance Portability and Accountability Act* (HIPAA) rules and other laws are necessary.

PMS refers to software used principally for scheduling and billing; it includes information on patient demographics, insurance or payer, attendance with appointments, diagnoses, and sometimes other information. This is very useful in tracking clinic productivity and patient adherence with visits, and in developing an overview of a patient population and understanding the finances of a practice. PMS software can provide data regarding some quality measures, because services such as vaccinations and procedures performed within the practice can be tracked easily.

EHR refers to software used for clinical care, as a substitute for or supplement to a paper medical record. Providers enter their notes into these systems, and clinic staff document procedures and interventions performed in the office. With many systems, prescriptions may be written within the system and sent to pharmacies electronically or by fax,

diagnostic tests may be ordered, and test results may be sent electronically into the EHR for clinician review and action. Paper documents often can be scanned into the system so that hard copies of outside reports can be included in the medical record. EHRs that substitute for paper records can reduce issues of storage, retrieval, and access to paper charts once the transition is complete.

EHR refers to software that the patients can access to see part or all of their medical record. These systems are designed to empower patients as members of their health care team, to provide detailed information to them, and to promote interaction between the consumer and provider.

Potential advantages of EHRs

In an era of transformation of the U.S. health care system, much is said about the potential of these software products to increase efficiency and reduce errors. While this potential is real, substantial effort and investment is required to deploy and maintain systems that are useful to clinicians, administrators, and payers. An EHR for a small office or one that is deployed only in an HIV program can be managed fairly easily, and some products developed specifically for HIV care are available. An EHR for a large organization, such as a multispecialty group, is more complex and requires much more planning, training, maintenance, and sometimes customization to meet the needs of all the users.

Success in EHR implementation is greater when the users are involved in the selection and implementation of the system.

Commercially available systems run on servers for large organizations may provide options for customization; however, customization greatly increases the cost and complexity of installing the software updates that are likely to be required.

EHRs may be text based (such as the system used by the Veterans Health Administration) or data based. Text-based systems are often quicker to learn; however data-based systems may provide more information for quality and program management and reporting needs and may be more useful for billing functions. Some EHR software packages are available at no cost (such as the Veterans Health Administration system and other open-source software) whereas others are available commercially and are maintained by vendors.

Once fully implemented, EHRs are expected to improve quality by improving communication and coordination among clinicians, reminding clinicians about standards of care and the timing of health maintenance or monitoring, avoiding errors associated with handwritten notes or prescriptions, documenting prescriptions, and providing warnings on potential drug interactions or hazards associated with specific diagnoses. EHRs are expected to lower costs by reducing the expense of maintaining paper records and by reducing duplication by sharing prescriptions, test orders, and test results among all users. EHRs can provide both process and outcome data for monitoring and for quality improvement activities (see chapter *Quality Improvement*), and data for Ryan White grantee reports. They also may make it easier for practices to fulfill and document adherence with the standards of payers.

Medicare and other payers are currently offering incentives for specific uses of EHRs, for example when at least 75% of prescriptions are sent electronically (because this is thought to reduce prescription errors) and for other types of “meaningful use” that are thought to improve the organization of care and adherence with clinical care standards.

Cautions

These software packages are complex entities that require substantial staff time and effort, hardware purchase and maintenance, training, and modifications in workflow. EHRs are not simply replacements for paper records; effective use involves changes in the work habits of clinicians. Successful implementation of an EHR system requires working with the end users as the system is developed so that reasonable compromises and accommodations can be made. Choices must be made regarding both the software and the hardware to be used (e.g., a laptop computer used by a single clinician in multiple examination rooms versus a fixed desktop computer in each room). An EHR system that must share data with another system such as a hospital EHR or a laboratory reporting system can be very complex and require substantial investment of time and money, even when the different software systems use compatible data standards. Effective implementation often occurs over the course of years. Implementation of EHR systems is not a panacea and will not solve all health care system problems, but use of EHRs is likely to be a necessity for functioning in the evolving systems of health care finance and reimbursement, as well as an essential tool for monitoring and assuring quality of care for the individual patient and at a population level.

Ensuring that patients receive necessary services at clinics without EHRs

At clinics in which paper charts are in use, forms, checklists, and flow sheets can be designed to remind providers of care standards, simplify data collection, and serve other purposes as well. Sample forms for initial and follow-up visits are posted on the HRSA HIV/AIDS Bureau (HAB) website (www.hab.hrsa.gov). They include reminders regarding clinical standards, reminders of services required for billing levels, checklists built around definitions used by Ryan White

HIV/AIDS Program grantees for reporting to HRSA, and other data for quality management. These instruments often can be used to generate reports to individual providers. Staff members may find it challenging to adjust to using new forms; however, using checklists often saves time by listing required elements of the visit and by reducing the amount of writing. Including representatives from clinical, data, and quality management staffs in the process of designing forms increases the acceptability of new forms or procedures.

Effective Management of HIV Programs

Managing a program with all the components described in this chapter is challenging. For enhancing communication and advancing the clinic's objectives, staff meetings are important. Smaller organizations may include the entire staff at monthly meetings, whereas larger organizations may have staff meetings less often, such as on a quarterly basis. Some larger organizations find it useful to have a monthly interdisciplinary meeting of program leadership, with representation of the different disciplines or program components, such as nursing or clinical care, psychosocial support, data and quality management, behavioral health, research, finance, administration, satellite services, and consumers. These coordinating meetings provide an opportunity for personnel from each discipline to update others on current activities, challenges, successes, and initiatives. They also provide a regular forum for updates on fulfilling grant-related work plan tasks and reviews of financial reports. Minutes of the meetings, which include decisions taken and assignments made, should be prepared and circulated to participants; minutes should be reviewed at the subsequent meeting and reports on assigned tasks should be delivered.

These larger organizations also may have monthly meetings by discipline, for example, comprising the nursing or clinical staff, to transmit information from the larger meeting and to coordinate the discipline-specific activities. In smaller programs, quality management may be part of monthly staff meetings whereas in larger programs it is more practical to have a separate quality management committee (see chapter *Quality Improvement*).

HIV programs often are contained within larger health organizations, and may be outliers with regard to the patients they serve and other features. It is important for program leadership to build and maintain support within the host institution. Where applicable, this may involve reminding the host institution of the grant or other funding the program generates. HIV programs often are on the forefront of innovative health care delivery, for example, in adopting quality management approaches and using other data to assist program management, incorporating EMR and PHR systems, implementing interdisciplinary care that integrates medical care with behavioral health, using a chronic care model or providing a medical home for patients, and linking with community-based programs. An important task for HIV program leadership is making the host institution feel proud and supportive of the HIV program itself.

Quality Improvement

Bruce D. Agins, MD, MPH

Improving Systems of Care:

“Every system is perfectly designed to achieve exactly the results that it achieves.”

Quality improvement (QI) is an important strategy to improve systems and reduce variation in delivery of care and services so that patients receive the right care every time they visit clinic, increasing the likelihood of their achieving the expected benefits and outcomes of care. As we move forward to end AIDS in the United States and meet the goals of the National HIV/AIDS Strategy, QI becomes an even more important methodology to implement in local systems through evidence-based interventions that can improve care, linkage, and retention.

Quality improvement has become a fundamental component of the HIV service delivery system whether care is provided in dedicated or integrated delivery models. Clinical quality management is a legislative requirement for Ryan White-funded programs. Many clinicians have learned the basics of quality management, which are reinforced through Maintenance of Certification programs directed through medical and specialty boards. Many clinicians not only are participating actively in QI activities, but also are leading improvement efforts in their clinics. Moving beyond the basics, however, remains a challenge for clinicians who have limited time to participate in activities not related to direct patient care. Yet, focusing on quality can reveal important phenomena in the operational processes and delivery systems of the clinic of which the leadership is unaware and may reveal factors that explain why intended outcomes are not always being realized. Additionally, the participation of clinicians in clinic-wide QI improvement activities is often a critical ingredient for their success.

Increasingly, QI work in the HIV field is directed toward achieving important health outcomes such as HIV viral load suppression, retention in care, and reductions in readmissions and emergency department utilization. Simple subanalyses of basic performance data also may reveal disparities in how care is being provided to different patient groups in the clinic, for example, according to age, gender, or race/ethnicity. Careful assessment of the social determinants of health also may show which patients need to be targeted in improvement activities. At the same time, advances in health information technology have made it easier to generate data for performance measurement and to produce simple reports that can be used for improvement activities.

This chapter will review the basics of QI; an appendix at the end of the chapter illustrates concepts with examples of more advanced improvement work. The *Health Resources and Services*

“Quality of care is the degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge.”

(Institute of Medicine, 1990)

“All health care organizations, professional groups, and private and public purchasers should pursue six major aims; specifically, health care should be safe, effective, patient-centered, timely, efficient, and equitable.”

(Institute of Medicine, 2001)

“Health care interventions that are known to work and save lives are not being implemented for every patient every time.”

(Salzburg Seminar Statement, 2013)

Administration HIV/AIDS Bureau Performance Measures chapter in this manual presents a national quality initiative developed by the U.S. Health Resources and Services Administration (HRSA) HIV/AIDS Bureau (HAB) for Ryan White HIV/AIDS Program-funded clinics; HRSA's Performance Measures can be incorporated into the quality improvement programs of local clinics.

The fundamental concepts of QI have evolved over the past century to include the following:

- QI provides an opportunity to solve problems that are part of the system and do not depend on one individual.
- Reducing variation in performance will allow consistent delivery of the best possible care.
- Improving processes within the health care delivery system will lead to improvements in outcomes.
- Data are the key to identifying problems and measuring change.
- Focusing on performance measurement and improvement usually stimulates employees to maximize their performance.
- Team-based problem-solving techniques lead to better care and promote a positive working environment.
- Testing changes will identify solutions that work and eliminate putting ineffective solutions into practice.
- Consumers play a pivotal role in providing the “end-user” perception of the quality of the services delivered; their active participation in the quality management program strengthens improvement work and leads to better results.

In addition, documentation of QI activities helps to demonstrate institution-wide compliance with accreditation responsibilities and funding requirements. Data generated from the clinic's QI program showing improvements over time demonstrate to constituents that the program is successful and help to justify its funding. These data also build the evidence base for determining which interventions are successful and can be disseminated to achieve large scale change.

Finally, quality management systems that are dependent on single individuals will not last when these key players leave the clinic or are absent for long periods, whereas a fully functioning QI program that involves staff working in teams with a clearly defined infrastructure will keep going when even the most dynamic individuals depart.

This chapter will articulate the core principles of QI and describe activities that can be easily adapted into the HIV ambulatory care setting to implement a sustainable quality management program.

Introduction to Quality Improvement

QI includes regular measurement of processes and outcomes to analyze the performance of the system of care with the ultimate goal of reducing variation in care delivery. It involves the implementation of solutions to improve

care and the monitoring of their effectiveness in achieving optimal health outcomes for patients. Ongoing cycles of change and remeasurement are implemented to test and try different ideas to determine which practices result in improved care. QI activities in clinics can range from a single team focusing on improving one aspect of care to a

comprehensive QI program with many teams working on a wide variety of improvement projects, with a well-established plan and an oversight committee.

The methods of QI are based on core principles that are readily translated into a practical approach and integrated into the clinical care delivery system (see Table 1). Successful implementation of QI involves actions at two levels: the QI activities and the HIV program processes that provide the structural backbone for them.

Table 1. Core Principles of Quality Improvement
• Emphasis on systems of care: improve processes that link to desired outcomes • Focus on the customer: understanding patients' experience in the clinic will identify areas that are important for improving care • Measurement: collect and use data to improve care • Involvement of participants: encourage direct participation in teams by those individuals who implement the processes being evaluated

Measurement and Management
Are Not Sufficient

Although it is the bedrock for improving care, measurement alone is not sufficient to improve quality. A common pitfall in implementing QI programs is to rely solely upon performance data, the medical or program director's interpretation of it, and one person's decisions about how to make changes. Successful improvements occur most often when staff members from the systems being assessed work together in teams. When they are engaged in the process, staff members are more likely to generate ideas for improvement and to accept changes. Staff review of improvement charts (e.g., see Figure 1, below) generates pride and a sense of accomplishment based on members' participation in the QI work. These charts may be posted on bulletin boards in common areas of clinics so that everyone can view them.

QI Personnel

The size of the clinic will determine who participates in quality-of-care activities. In small HIV clinics with a primary care provider, case manager, nurse, and support staff, most of the staff members are involved in all aspects of QI work. Larger institutions usually establish an HIV Quality Committee that includes senior management of the HIV clinic, designated QI staff members if there are any, and other key players who work in the clinic. A member of this committee represents the group in the agency-wide QI committee. The Quality Committee identifies the priorities for improvement or agrees to pursue the priorities identified by staff members or patients in the clinic. The Quality Committee also charters improvement teams and identifies potential members who are key stakeholders in the process under investigation. In a small clinic that has only a handful of staff members, all clinic personnel may participate in the quality management program and in QI activities, although perhaps in a less formal way than in larger clinics.

Team Membership and
Responsibilities

Teams are formed to address the specific care processes or systems that are targeted for improvement. Team members should be selected to represent the different functions involved in these processes or to represent the components of the system under focus. The size of a team varies according to the size of the clinic and the process under study. In small clinics, the few dedicated HIV program staff members may constitute the project teams, with added representation from different departments as needed (such as from the laboratory, or from other medical disciplines). In larger clinics, teams often include 6-10 members. Membership should include representatives from the different groups in the clinic who are involved in the care process. In

addition to the clinical and case management staff, scheduling clerks and medical records personnel are often important participants, especially when follow-up appointments and documentation are components of the care process or have been identified as areas that need to be improved.

Teams sometimes struggle with engaging physicians in their QI activities. Increasingly, physicians have overcome their reluctance to join process improvement teams, especially since more sophisticated data systems and comparative reports have become available to focus interest on improving care that does not meet standards or falls below mean performance rates. Moreover, physicians are now required to directly engage in practice-based learning and improvement to satisfy requirements for maintenance of professional certification. Studies of physician performance have demonstrated that participation in QI activities enhances job satisfaction and reduces work-life stress.

Involving consumers in QI project teams enhances the work of the team. Consumers who are involved in the clinic's community advisory board often are natural leaders and have a good grasp of clinic processes. Their feedback on the experience of care delivery can reveal areas that need improvement. They know the bottlenecks and can inform the staff how long a clinic visit lasts, whether assessments truly occurred, and whether behavioral interventions are effective. Their ideas about what improves care often diverge significantly from those generated by providers and may not even be recognized unless consumers participate directly in discussions about the system.

Teams are expected to analyze clinical processes, identify areas of change, implement tests of the changes, review data assessing the change, and ultimately make recommendations about which improvements should be adopted in the clinic.

Data Collection

Selecting Measures

Evaluating measurable aspects of care can help in determining the extent to which a facility provides a certain element of care. Quality measures should be based on standards or guidelines, meet the primary goals of QI, and reflect priorities specific to the community and the clinic. In addition, they should represent processes where changes are feasible. For example, in HIV clinics where the population consists of a large number of women, indicators may include rates of routine cervical cancer screening, rates of preconception counseling, or other aspects of care specific to women. In clinics that care for a high volume of patients who have been treated with antiretroviral therapy (ART) for a long time, measures may focus on rates of virologic suppression, screening for adverse effects of antiretroviral medications, and resistance testing. As we focus on our strategies to maximize community viral suppression, measures of linkage to care, engagement, and retention in care become priorities.

Some measures should be selected by soliciting input from patients who attend the clinic (see Table 2). Staff members also often know what aspects of care would benefit from being measured and improved, and they should be consulted to determine priorities. If routine data collection systems already exist in the clinic, data should be reviewed to determine which components of care would be prime candidates for improvement.

On a national level, the HRSA HIV/AIDS Bureau (HAB) has developed HIV/AIDS Performance Measures for monitoring the quality of care provided in Ryan White HIV/AIDS Program-funded clinics. These measures emphasize important areas of HIV care that are linked to the goals of the National HIV/AIDS Strategy and that are also endorsed by the National Quality Forum, which confers eligibility for inclusion in Meaningful Use criteria and other provisions of the Accountable Care Act that are important for both measuring care and are linked to enhanced reimbursement programs. They form a core package of priority indicators that can be enhanced by those that are identified through analysis of local data, or identified by local stakeholders. See chapter *Health Resources and Services Administration HIV/AIDS Bureau Performance Measures* for these.

Ideally, a balanced set of measures should be selected. Different ways to categorize measures might include the following:

- Structure/process/outcome
- Treatment/care (non-ART)/prevention/nonclinical service
- Provider/consumer/funder driven
- Aspects representing overutilization, underutilization, or misutilization of services

Developing and Quantifying Quality Measures

Three major activities constitute the process of developing performance measures:

- Defining the measurement population
- Defining the measures
- Developing the data collection plan

The measurement population is defined by determining factors such as the location of care being studied, whether both men and women are eligible, the applicability of the measure to various age groups, whether any

clinical conditions are necessary to determine the applicability of the measure, the number of clinic visits by the patient, and amount of time the patient has been in care.

After the population is defined, the measure needs to be defined. The measure should be objective and should address specific aspects of quality care. It also should have a straightforward, dichotomous answer. For each measure, specific criteria must be developed to define the “yes” response and the “no” response (see Table 3). This often involves deciding the time period during which an activity has been performed. For example, a measure that evaluates viral load monitoring must include the frequency with which that test should be performed. One simple way to construct this measure would be to ask, “Was viral load measured within the past 6 months?”

Table 3. Examples of Specific Measures with Definitions of Responses

Measure	Definition of Measure	Yes/No Response
HIV Viral Load Monitoring	Was HIV viral load measured in the past 6 months?	Yes: Viral load testing was performed No: Viral load testing was not performed (or the test was done but results were not documented)
HIV Viral Load Suppression	Was the HIV viral load <200 copies/mL at the most recent test during the past year?	Yes: Viral load was <200 copies/mL No: Viral load was >200 copies/mL

Several elements of care should be measured simultaneously, whether abstracted from medical records or analyzed through administrative databases. Measures reflecting aspects of patient management should be selected, as should those involving different populations. Measures also should be selected to evaluate various components of the health care system, such as the components of the chronic disease model.

Clinical measures should include those that affect a large proportion of the patient population, such as whether comprehensive mental health screening has been performed.

The data collection plan includes determining the source of information (e.g., whether medical records or an electronic database will be used), how the data will be recorded, who will record the data, and how a data sample will be selected. A representative sample will allow inferences to be made about the overall clinic population based on observations of the smaller sample. Some form of random sampling should be used, either by using a random numbers table or by selecting every n th record from the list of eligible patients.

If electronic health records (EHRs) are used, sampling will not be necessary.

Careful planning is required, however, to ensure that the measures are included in the electronic system, and that the EHR database is constructed to contain the elements required in the reports generated by the quality evaluation queries.

A common pitfall at this point is to think of the measurement sample as a research project. For the purposes of QI, a sample needs only to be current, representative, and readily obtained (i.e., sample size calculations and the achievement of statistically significant results are not necessary).

Analyzing and Displaying Data

Data should be reviewed and distributed to all members of the team and others involved in the care process under evaluation. When possible, data should be displayed in graphic format. After data from multiple time periods have been collected (e.g., percentage of patients with HIV suppression), a simple line graph (run chart) can be constructed with each point representing a performance rate (percentage) for a given period of time. This usually is the simplest and most effective way to show performance data (see Figure 1).

Identifying Targets and Implementing Improvements

Figure 1. Percentage of Patients with HIV Viral Load Suppression, by Month

Adapted from *Measuring Clinical Performance: A Guide for HIV Health Care Providers*. New York: New York State Department of Health AIDS Institute. April 2002.

After the project team has reviewed the data, it must decide where opportunities for improvement exist. The first step in this process is to investigate the care process in greater detail. Several techniques are used to accomplish this goal. The simplest is brainstorming, in which key stakeholders offer their suggestions as to which processes are the best candidates for change. Another easy method is flowcharting, in which the group breaks down the process into its components to identify how it is coordinated and how its parts fit together. A fishbone diagram, or cause-and-effect diagram, may aid in exploring and displaying the causes of a particular problem (Figures 2 and 3). It often helps for staff members to consider factors potentially influencing a process that are not obvious, and to help sort out those factors that are external to the clinic and those that are internal. A *driver diagram* is a visual tool to help understand and prioritize factors that drive desired outcomes, which are called the “primary outcome.” *Primary drivers* are the factors that drive the primary outcome. *Secondary drivers* are subsets of factors that influence the primary drivers.

Figure 2. Sample Fishbone Diagram

Figure 3. Fishbone Diagram: Low Collection Rates of Race and Ethnicity Patient Data

Used with permission from Kathleen A. Clanon, MD; Low-Income Health Program of Alameda County.

The driver diagram, which can be generated through discussion with stakeholders, is a particularly effective strategy to identify processes that may be key areas to target for improvement goals that will affect the ultimate outcome. For example, if retention in care is the desired outcome, housing status may be a primary driver that, in turn, is affected by access to factors such as entitlements, mental illness, substance use, or health literacy, which then are secondary drivers that, when addressed through QI activities, will affect the primary driver and ultimate outcome. Framing this larger picture of the system that is being improved may be extremely useful for participants at different levels who may be involved in only one aspect of the QI initiative, as well as for those only involved at the macro level who do not recognize the role of the processes being prioritized for ground-level work. An example of a driver diagram focusing on viral load suppression is shown in Figure 4.

Figure 4. Driver Diagram: Viral Load Suppression

Then, the areas that would be most likely to benefit from improvement are selected for change (see Figure 5) and tested in the Plan-Do-Study-Act (PDSA) cycle (see Figure 6). See “Appendix,” below, for examples of QI projects conducted in HIV clinics.

Figure 5. Sample Flow Chart

Figure 6. Plan-Do-Study-Act Cycle

Plan: Plan the change and collect baseline data

Do: Test the change and collect data

Study: Analyze the data

Act: If the change did not improve the process, try another idea. If the change resulted in improvement, adopt the change, monitor the process periodically, and spread the change throughout the clinic

Source: U.S. Department of Health and Human Services, Health Resources and Services Administration, HIV/AIDS Bureau. *A Guide to Primary Care of People with HIV/AIDS*. Bartlett JG, Cheever LW, Johnson MP, Paauw DS, eds. Rockville, MD: U.S. Department of Health and Human Services; 2004:145.

Even if evidence-based criteria on how to improve desired outcomes exist, how they are implemented varies according to the local context. Thinking through the “hows” of an intervention – who will do it, when during the care process it will be done, where it will be done – are important questions to ask as the test of the intervention is planned. After a change has been selected, a test of the change can be quickly implemented and evaluated. A limited implementation of the proposed change can be tested – perhaps with just a few subsequent patients, or those attending on the following day, or those seen by a particular clinician. If the small change does not work, another change can be selected and implemented quickly. If the change is feasible and improvement is noted, it can be adopted more widely, before formal remeasurement occurs, and a regular period of remeasurement can be adopted. If the change was not

successful, then another one can be chosen and tested. Occasionally, multiple changes may be tested simultaneously or on different days of the week.

Many different approaches to QI exist and can be implemented successfully. However, sometimes just stepping back to refocus on the three basic questions of the model for improvement presented by Langley et al. (see “Suggested Resources,” below) can effectively guide QI activities. These are as follows:

- What do we want to accomplish?
- How do we know that a change will result in an improvement – in other words what measure will we use to demonstrate whether our improvements worked?
- What kinds of changes can we test that will result in an improvement?

Establishing Systems to Support QI

The key to sustaining QI in the clinic is development of an infrastructure that supports ongoing QI activities. The central components of this infrastructure include the following:

- A QI plan with goals and a process to prioritize these goals
- A work plan that clearly defines steps, sets timeframes for completion, and identifies responsible parties
- An organizational framework that displays clear lines of accountability for QI in the organization
- Commitment of senior management staff to support the program, allocate resources, and celebrate its successes
- Creation of a culture that supports quality in the program and that values the activities of QI as part of the regular work of the clinic (see Table 4)

Table 4. Tips for Promoting a Culture of Quality Improvement: Integration of Quality into the Regular Work of the Clinic

- Educate staff members about QI and provide them with the skills to participate in QI activities.
- Consistently articulate the values of QI in staff meetings.
- Display QI data and storyboards (simple statements and visual representations that describe a problem, the evaluation process, the proposed changes, and their implementation, and display the results).
- Celebrate successes.
- Provide opportunities for all staff members to participate in QI teams.
- Reward staff members through performance evaluation for their contributions to the QI program.
- Participate in activities with peers to discuss QI activities, share data and learn about successful strategies to improve care.

- Patient participation, to share experiential knowledge and inform QI program development
- Establishment of a formal QI committee to oversee quality activities, monitor the quality plan, and evaluate its effectiveness

The regular, ongoing work of the QI committee, supported by the clinic leadership, constitutes the backbone of the infrastructure that supports ongoing QI activities. The committee oversees the dynamic process of planning, implementation, and evaluation that involves the following:

- Analysis of data from the QI projects
- Solicitation of feedback from participating staff members and from patients
- Decision-making based on the information from its analysis

These contribute to sustaining the QI program and its activities in the clinic.

Sustaining Improvements

Sustainability is probably the biggest challenge that clinics face in the field of QI. All too often, improvements do not last after initial projects are completed, because the structure and culture to support QI are not present or are not supported. The challenge of sustainability therefore is twofold: to maintain the successes of QI work and its clinical outcomes, and to maintain the systems of QI and keep the QI program vital. By asking questions about how care systems can be improved and how QI activities are progressing, clinicians play an important role in both catalyzing and supporting QI activities.

Appendix: Case Examples of Quality Management Initiatives

Using QI to Improve ART Management and Virologic Suppression

In one community health center, nearly 10% of patients on antiretroviral therapy (ART) were not virologically suppressed. The clinic had adopted a strategy of developing a specific ART management plan for each patient being treated. Review of the charts of the 45 patients not suppressed showed that only 40% had a plan in the chart. Only 20% had a plan that was executed. Improvement goals were set for each step, to increase from 40% to 90% for documentation of an ART management plan and from 20% to 75% for execution of the plan. Over the course of a 4-month period, clinicians and support staff were educated about the plan and decision-support tools were created, including an algorithm showing key decision points for plan development and execution with corresponding prompts in the clinic database. Visit forms were revised to incorporate data fields specific to the ART plans. Reminders also were created. All

changes were implemented through small tests of change with formal remeasurement in 6 months; this showed that 100% of patients had a plan in their charts and that 71% of them had it executed. Continued monitoring showed a dip in performance 4 months later to 88% and 60%, respectively, but with gains restored 3 months subsequently to 100% and 65%, respectively. Vigilance and reaffirmation of the main steps have been keys to maintaining performance. The fields are now being added to the new clinic electronic medical record (EMR) system with automatic prompts based on changes in viral load values.

Another clinic focused QI efforts directly on improving rates of virologic suppression. Data on the HIV viral loads of each specific provider were generated to show comparative rates as a stimulus for improved performance on the part of individual providers. ART regimens were reviewed for their appropriateness, and renewed education about antiretroviral drug combinations and resistance monitoring was introduced. The clinicians reviewed their own patient lists each day. Patients who were not virologically controlled were contacted by phone by the clinician or a nurse. Nurses eventually were assigned directly to the primary care team to facilitate communication with patients and ensure that specific issues raised during phone conversations were addressed during clinic visits. Adherence problems were particularly common, and were addressed through these multiple contacts. Reasons for adherence lapses were identified, which allowed for more effective targeting of service interventions with specific patients, including substance use and mental health service referrals, regimen switching, and targeted adherence interventions. The individual providers improved their patients' rates of virologic suppression from 45% to 62%. Review of suppression rates also showed that a subset of patients remained controlled and did not require quarterly monitoring. A decrease in visit frequency was possible for this

group, reducing overutilization of services and unnecessary costs.

Another federally qualified health center with multiple sites struggled with its rates of viral load suppression that ranged from 0% at one small clinic to 47% at another. The medical director was new to the clinic and undertook a thorough investigation of the problem with his team. First, they reviewed the results and matched them with their clinical data and knowledge of the patients. Based on that step, they sent specimens to another lab and found that there had been a major error in the processing of specimens. Once this special cause of their findings was corrected, their rates increased to a range of 50-67%. Then, the team undertook a more thorough investigation of their system and implemented a package of changes based on their analysis and discussions with their patients. Among the improvements the team introduced were the development of a group of adherence educators among their staff, case conferencing *together with the patient* to discuss the results and identify particular issues and concerns that could then be addressed (*managed problem-solving*), biweekly team case conferencing, home visits and phone calls as needed in between visits and preparing provider-specific data results to generate additional incentives for providers to intensify their efforts to work with their patients to decrease viral load. Rates have steadily improved up to the 70-80% range in the short run as the clinic team awaits ongoing measurement results to determine whether it can hold its gains and improve further.

Using QI to Eliminate Disparities

The quality committee in another clinic wanted to determine whether the clinic's performance was consistent across all patient groups and arranged to have the clinic's patient data sorted by race, ethnicity, and primary language spoken. This revealed that data about race, ethnicity, and language spoken were not recorded in a high proportion of

patient records. The team invited patients from their community advisory board to attend a staff meeting where a fishbone diagram was developed to identify potential causes of the poor collection rates of these patient data. Potential reasons were identified in all categories: equipment, patients, procedures, and staff (see Figure 3). A flow chart was developed to identify the sequential steps of data collection. A training program for intake staff was developed, resulting in an improvement in collection of these data to 85%.

Subsequent analysis showed that only 54% of African-American patients and 68% of Latino patients had suppressed HIV RNA whereas white patients had a suppression rate of 75%. A focus group with Spanish-speaking patients revealed that these patients were not getting enough information about medication and its side effects. The QI team decided to aim for an improvement in virologic suppression rates to 75%. A number of changes were implemented and tested throughout the clinic including the addition of peer adherence counseling, using teach-back by nonphysician staff to facilitate adherence problem-solving, along with medication reconciliation. With these new interventions, virologic suppression rates improved to 71% for African-Americans, 80% for Latinos, and 81% for whites. With ongoing QI activities, suppression rates have subsequently increased for all groups and the gaps between groups has narrowed. Ongoing changes aim to narrow these gaps even further.

Finally, in another clinic, analysis showed that major differences in viral load suppression were noted among patients who were stably housed and those who were not. To tackle their low rates, this agency intensified its relationship with their local housing agency and began to investigate other resources in their community to provide transitional housing services.

Health Resources and Services Administration HIV/AIDS Bureau Performance Measures

Overview

The HIV/AIDS Bureau has revised its performance measure portfolio. The updated portfolio is more focused on critical areas of HIV care and treatment, and, as of November 6, 2013, it contains fewer performance measures. The revisions include:

- Identifying core performance measures that are most critical to the care and treatment of people living with HIV
- Combining measures to address people of all ages living with HIV
- Aligning measures with U.S. Department of Health and Human Services (HHS) priorities, guidelines, and initiatives
- Promoting relevant performance measures used in other federal programs
- Archiving performance measures

Unlike the previous version wherein the portfolio included three groups of core measures intended for various levels of programs' ability to implement, the updated portfolio features a set of *Core Clinical Performance Measures* and consolidates several of the previous clinical measures into four categories: *All-Age Clinical Performance Measures*, *Adult and Adolescent Clinical Performance Measures*, *HIV-Exposed Children*, and *HIV-Infected Children*. The Core performance measures emphasize the essential aspects of HIV care and treatment and align with the milestones along the HIV care continuum (hab.hrsa.gov/data/reports/continuumofcare/index.html).

The *Medical Case Management Performance Measures* target all clients, and focus on two key issues: care plans and medical visits. Medical case management programs are encouraged to utilize the Core clinical

performance measures as appropriate.

The *Oral Health Performance Measures* target all clients. The measures are intended for use by programs providing direct oral health services.

The *AIDS Drug Assistance Program (ADAP) Measures* are intended for use by the ADAP. Four measures are included and target all clients, regardless of age.

The *Systems-Level Performance Measures* address aspects of access and entry to care and may be utilized by any system or network.

Two sets of measures not reproduced here (*HIV-Exposed Children* and *HIV-Infected Children*) address a range of clinical, social, and system issues for programs that serve pediatric clients. In addition, the archived performance measures are available for reference on the HRSA HAB website at hab.hrsa.gov/deliverhivaids/habperformmeasures.html.

The HIV/AIDS Bureau encourages all organizations providing HIV services to use the Bureau's revised performance measures, including the Core performance measures, and select the appropriate measures for their own portfolio. Measure selection is based on the services that are provided, prominent clinical issues, and patient demographics. The HIV/AIDS Bureau does not promote using every performance measure available because the activities needed to implement performance measurement (e.g., collecting, analyzing, and

reviewing data) can be costly. Individual programs are recommended to consider having some measures that are collected and analyzed more frequently (e.g., every 2 months or quarterly) and others that are collected and reviewed less frequently (e.g., every 6 months or annually). Grantees are not required to use all performance measures. Given the emphasis on using performance measures to improve patient health, grantees may trend performance measures over time and analyze performance measures for disparities in care.

Core Clinical Performance Measures

Measure	Definition
HIV Viral Load Suppression	Percentage of patients, regardless of age, with a diagnosis of HIV with an HIV viral load of <200 copies/mL at last HIV viral load test during the measurement year
Prescription of HIV Antiretroviral Therapy	Percentage of patients, regardless of age, with a diagnosis of HIV who were prescribed antiretroviral therapy for the treatment of HIV infection during the measurement year
HIV Medical Visit Frequency	Percentage of patients, regardless of age, with a diagnosis of HIV who had at least one medical visit in each 6-month period of the 24-month measurement period with a minimum of 60 days between medical visits
Gap in HIV Medical Visits	Percentage of patients, regardless of age, with a diagnosis of HIV who did not have a medical visit in the last 6 months of the measurement year
<i>Pneumocystis jiroveci</i> Pneumonia (PCP) Prophylaxis	Percentage of patients, aged 6 weeks or older with a diagnosis of HIV/AIDS, who were prescribed <i>Pneumocystis jiroveci</i> pneumonia (PCP) prophylaxis

All-Age Clinical Performance Measures

Measure	Definition
CD4 Cell Count	Percentage of patients, aged 6 months and older with a diagnosis of HIV/AIDS, with at least two CD4 cell counts or percentages performed during the measurement year at least 3 months apart
HIV Drug Resistance Testing Before Initiation of Therapy	Percentage of patients, regardless of age, with a diagnosis of HIV who had an HIV drug resistance test performed before initiation of HIV antiretroviral therapy if therapy started during the measurement year
Influenza Immunization	Percentage of patients, aged 6 months and older seen for a visit between October 1 and March 31, who received an influenza immunization OR who reported previous receipt of an influenza immunization
Lipid Screening	Percentage of patients, regardless of age, with a diagnosis of HIV who were prescribed HIV antiretroviral therapy and who had a fasting lipid panel during the measurement year
Tuberculosis Screening	Percentage of patients aged 3 months and older with a diagnosis of HIV/AIDS, for whom there was documentation that a tuberculosis screening test was performed and results interpreted (for tuberculin skin tests) at least once since the diagnosis of HIV infection
Viral Load Monitoring	Percentage of patients, regardless of age, with a diagnosis of HIV with a viral load test performed at least every 6 months during the measurement year

Adult and Adolescent Clinical Performance Measures

Measure	Definition
Cervical Cancer Screening	Percentage of female patients with a diagnosis of HIV who have a Pap screening in the measurement year
Chlamydia Screening	Percentage of patients with a diagnosis of HIV at risk of sexually transmitted infections who had a test for chlamydia within the measurement year
Gonorrhea Screening	Percentage of patients with a diagnosis of HIV at risk of sexually transmitted infections who had a test for gonorrhea within the measurement year
Hepatitis B Screening	Percentage of patients, regardless of age, for whom hepatitis B screening was performed at least once since the diagnosis of HIV/AIDS or for whom there is documented infection or immunity
Hepatitis B Vaccination	Percentage of patients with a diagnosis of HIV who completed the vaccination series for hepatitis B
Hepatitis C Screening	Percentage of patients for whom hepatitis C screening was performed at least once since the diagnosis of HIV
HIV Risk Counseling	Percentage of patients with a diagnosis of HIV who received HIV risk counseling in the measurement year
Oral Exam	Percentage of patients with a diagnosis of HIV who received an oral exam by a dentist at least once during the measurement year
Pneumococcal Vaccination	Percentage of patients with a diagnosis of HIV who ever received pneumococcal vaccine
Preventive Care and Screening: Screening for Clinical Depression and Follow-Up Plan	Percentage of patients aged 12 years and older screened for clinical depression on the date of the encounter using an age-appropriate standardized depression screening tool AND, if positive, a follow-up plan is documented on the date of the positive screen
Preventive Care and Screening: Tobacco Use – Screening and Cessation Intervention	Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months AND who received cessation counseling intervention if identified as a tobacco user
Substance Abuse Screening	Percentage of new patients with a diagnosis of HIV who have been screened for substance use (alcohol and drugs) in the measurement year
Syphilis Screening	Percentage of adult patients with a diagnosis of HIV who had a test for syphilis performed within the measurement year

Medical Case Management Performance Measures

Measure	Definition
Care Plan	Percentage of medical case management patients, regardless of age, with a diagnosis of HIV who had a medical case management care plan developed and/or updated two or more times in the measurement year
Gap in HIV Medical Visits	Percentage of medical case management patients, regardless of age, with a diagnosis of HIV who did not have a medical visit in the last 6 months of the measurement year (that is documented in the medical case management record)
HIV Medical Visit Frequency	Percentage of medical case management patients, regardless of age, with a diagnosis of HIV who had at least one medical visit in each 6-month period of the 24-month measurement period with a minimum of 60 days between medical visits

Oral Health Services Performance Measures

Measure	Definition
Dental and Medical History	Percentage of HIV-infected oral health patients who had a dental and medical health history (initial or updated) at least once in the measurement year
Dental Treatment Plan	Percentage of HIV-infected oral health patients who had a dental treatment plan developed and/or updated at least once in the measurement year
Oral Health Education	Percentage of HIV-infected oral health patients who received oral health education at least once in the measurement year
Periodontal Screening or Examination	Percentage of HIV-infected oral health patients who had a periodontal screen or examination at least once in the measurement year
Phase 1 Treatment Plan Completion	Percentage of HIV-infected oral health patients with a Phase 1 treatment plan that is completed within 12 months

AIDS Drug Assistance Program Performance Measures

Measure	Definition
Application Determination	Percent of ADAP applications approved or denied for new ADAP enrollment within 14 days (2 weeks) of ADAP receiving a complete application in the measurement year
Eligibility Recertification	Percentage of ADAP enrollees who are reviewed for continued ADAP eligibility two or more times in the measurement year
Formulary	Percentage of new antiretroviral classes that are included in the ADAP formulary within 90 days of the date of inclusion of new antiretroviral classes in the HHS <i>Guidelines for the Use of Antiretroviral Agents in HIV-1-infected Adults and Adolescents</i> during the measurement year
Inappropriate Antiretroviral Regimen Components Resolved by ADAP	Percent of identified inappropriate antiretroviral regimen components prescriptions that are resolved by the ADAP program during the measurement year

Systems-Level Performance Measures

Indicator	Definition
Waiting Time for Initial Access to Outpatient/ Ambulatory Medical Care	Percentage of Ryan White Program-funded outpatient/ambulatory care organizations in the system/network with a waiting time of 15 or fewer business days for a Ryan White Program-eligible patient to receive an appointment to enroll in outpatient/ambulatory medical care
HIV Test Results for PLWHA	Percentage of individuals who test positive for HIV who are given their HIV-antibody test results in the measurement year
HIV Positivity	Percentage of HIV positive tests in the measurement year
Late HIV Diagnosis	Percentage of patients with a diagnosis of Stage 3 HIV (AIDS) within 3 months of diagnosis of HIV
Linkage to HIV Medical Care	Percentage of patients who attended a routine HIV medical care visit within 3 months of HIV diagnosis
Housing Status	Percentage of patients with HIV diagnosis who were homeless or unstably housed in the 12-month measurement period

HIV Care in Correctional Settings

Minda Dwyer, ANP-C; Douglas G. Fish, MD; Abigail V. Gallucci, BS; and Sarah J. Walker, MS

Background

Caring for HIV-infected patients who are incarcerated is a complex and challenging task. For many of these patients, the prison health service provides their first opportunity for access to consistent health care. This chapter will discuss some of the issues relevant to the HIV-infected population in correctional settings.

Jail vs. Prison Settings

It is important to note the distinction between “jail” and “prison” custodial settings. These terms are often used interchangeably, but doing so can create confusion for health care providers, as the services that an inmate receives while incarcerated may differ greatly according to the type of facility (NYSDOH, 2008).

Jails are locally operated, or managed, institutions that detain individuals who typically are serving short sentences of 1 year or less. They also hold individuals who are awaiting arraignment, trial, or sentencing, or those who have violated terms of their parole (Harrison and Beck, 2006). Because inmates who are detained in jail settings have shorter confinement terms, providers often face time constraints in establishing longer-term treatment plans for chronic conditions such as HIV/AIDS, and for substance use and mental health problems. Opportunities for inmate education also may be more limited. In addition, because jail inmates often are released within days, weeks, or months after initial confinement, establishing continuity of health care may be challenging for providers and administrators (Okie, 2007).

Prisons, in contrast, are operated by state governments or the Federal Bureau of Prisons. Prisons generally detain people who have been convicted of state or federal felonies and are sentenced to terms of longer

than 1 year (Harrison and Beck, 2006). The nature of a person’s crime, namely a state or federal offense, will dictate the type of prison in which he or she will be detained. The length of sentences for inmates in state or federal custody is longer than those for persons serving time in jail, and prison inmates typically have a firm release date in advance. As a result, HIV-infected inmates released from prison may be more likely to have treatment and discharge plans in place (NYSDOH, 2008).

Note that these characteristics may differ from prison to prison and jail to jail.

Epidemiology

Inmates continue to be disproportionately affected by the epidemic, with the estimated overall rate of AIDS among prison inmates at more than 2.5 times the rate in the United States general population. In 2006, there were 21,980 HIV-infected inmates in federal or state prisons, according to a report from the Bureau of Justice Statistics, and there are many more in jails. With the advent of effective combination antiretroviral therapy (ART), AIDS-related mortality as a percent of total deaths in state prisons decreased significantly between 1995 and 2006, from 34.2% to 4.6% (Maruschak, 2006).

Inmates who have drug- or sex-related illegal behaviors that lead to incarceration often are at high risk of becoming infected with HIV,

hepatitis C virus (HCV), and other pathogens through these behaviors. Their risk factors may include unsafe substance use behaviors, such as sharing syringes and other injection equipment, and high-risk sexual practices, such as having multiple sex partners or unprotected sex. Many inmates also may have conditions that increase the risk of HIV transmission or acquisition, such as untreated sexually transmitted diseases (STDs).

The prevalences of chronic viral hepatitis and tuberculosis are much higher among incarcerated persons than among the general public. Depending on the prison system, 13% to 54% of inmates are infected with HCV (Cassidy, 2003). The incidence is 10 times higher among inmates than among non-inmates and is 33% higher among women than among men (Nerenberg et al., 2002). The Centers for Disease Control and Prevention (CDC) recommends that all incoming inmates be screened for HCV, and those who are infected should be evaluated for liver damage and the need for treatment (Cassidy, 2003). Chronic hepatitis B virus (HBV) infection and tuberculosis also are substantially more common among the incarcerated population than among the general public. The presence of any of these conditions should prompt HIV testing (Nicodemus and Paris, 2002).

Incarcerated Women

Women account for almost 7% of the prison population in the United States (West and Sobol, 2009). The HIV epidemic in the United States increasingly affects women of color, and this trend is reflected in HIV rates among the incarcerated. In terms of total numbers, there are more males than females with HIV/AIDS in state and federal prisons nationally (19,809 and 2,135, respectively). However, the percentage of female inmates with known HIV infection in these settings is higher than that for incarcerated males (2.4% and 1.6 percent, respectively) (Maruschak, 2006).

In many cases, incarcerated women are low-income and have limited education and sporadic employment histories. Compared with men, they are less likely to be incarcerated for a violent crime, and more likely to be incarcerated for a drug or property offense. Women's property crimes often are the result of poverty and substance-use histories (National Institute of Corrections, 2003). Numerous studies have shown that the behaviors that lead to incarceration also put women at increased risk of HIV infection. Risk factors that are present in abundance among female inmates include the following (Hammett and Drachman-Jones, 2006):

- History of childhood sexual abuse and neglect
- History of sex work, with increased frequency of forced, unprotected sex
- High rates of STDs
- High rates of mental illness
- History of injection drug use (IDU) or sex partners with IDU history
- Poverty

Among all women entering a correctional facility, 10% are pregnant (De Groot and Cu Uvin, 2005). These women should be offered HIV testing, and HIV-infected pregnant women should be offered combination ART immediately to prevent perinatal HIV transmission. Many incarcerated women will receive their first gynecologic care in prison. Because the incidence of cervical cancer is higher among women with HIV, referrals for colposcopy should be made for any HIV-infected woman with an abnormal Papanicolaou test result.

Testing and Prevention

The correctional facility is an ideal location for identifying individuals already infected with HIV, HCV, or HBV, and for education

interventions that are geared to prevent infection among those at highest risk of these acquiring diseases. For many adults, the prison or jail setting is a rare potential point of contact with the health care system, making it an important avenue for HIV testing and linkage to care. It also may be an effective setting in which to initiate and maintain individuals on ART.

Inmates commonly are hesitant to be tested for HIV because they fear a positive diagnosis and because of the potential stigma involved. They often lack accurate information about HIV, including awareness of behaviors that may have put them at risk and knowledge of means for protecting themselves from becoming infected. Health care providers in correctional settings are in a key position to evaluate inmates for HIV risk factors, to offer HIV testing, and to educate and counsel this high-risk group about HIV.

HIV testing policies in correctional facilities vary from state to state and among local, state, and federal penal institutions. Depending on the setting, policies may require testing of inmates upon entry, upon release, or both, but as of 2010 more than 50% of state prison systems did not require HIV testing at any point. Some prisons may do HIV testing based on clinical indication or risk exposure during incarceration, and this may be voluntary or mandatory. Most prison systems do provide HIV testing for inmates who request it. See Table 1 for an overview of the circumstances under which inmates in state prisons were tested for HIV in 2006 (Maruschak, 2006).

In high-risk settings such as correctional facilities, routine, voluntary HIV testing has been shown to be cost-effective and clinically advantageous (Paltiel et al., 2005). The CDC supports universal opt-out HIV screening in prisons and jails and has produced the *HIV Testing Implementation Guidance for Correctional Settings* (www.cdc.gov/correctional_health/default.htm). This

document serves as a guide for individual institutions in determining and establishing the most appropriate testing strategy for their settings, presents the components of such a testing program, and explains obstacles that may be encountered in the implementation process. It also provides information regarding the following:

- Background statistics on HIV in correctional facilities
- Inmate privacy and confidentiality
- Opt-out HIV screening in correctional medical clinics
- HIV testing procedures
- HIV case reporting

Testing inmates for HIV prior to their release is a critical aspect not only of individuals' own health care needs but also of preventing transmission of HIV to others. Knowledge of their HIV status affects people's HIV risk behaviors: Studies have shown that, after learning they are infected with HIV, many persons take measures to reduce the risk of transmitting HIV to others.

Risk-Reduction Education

Given the high HIV seroprevalence among inmates, the reentry of inmates into the community presents a danger of spreading HIV and other infectious diseases, and it is a public health concern. Thus, inmates need adequate HIV prevention counseling before release, both to protect themselves and to decrease the likelihood of infecting others in their communities with HIV (Gaiter and Doll, 1996). The World Health Organization (WHO) has stated: "All inmates and correctional staff and officers should be provided with education concerning transmission, prevention, treatment, and management of HIV infection. For inmates, this information should be provided at intake and updated regularly thereafter."

Risk-reduction counseling addresses specific ways the inmate can reduce the risk of becoming infected with HIV. If an inmate is already HIV infected, the goal of counseling is to reduce the risk of infecting others or becoming infected with a drug-resistant strain of HIV.

Education should include information about the efficacy of ART in decreasing risk of HIV transmission. In addition, it should focus on the use of latex barriers with all sexual activity. Condoms and dental dams are not available in most jails and prisons; nonetheless, the inmate should receive education regarding their proper use. The state prisons systems that provide condoms to inmates are those of Vermont and Mississippi. The larger metropolitan jails in New York City, such as Rikers Island, as well as those in Los Angeles, San Francisco, Philadelphia, and Washington, also provide condoms. Within the systems that allow condoms, inmates' ability to obtain them may be restricted (e.g., limited to one per week or available only via medical prescriptions or dispensing machines) (Sylla, 2007); see chapter *Preventing HIV Transmission/Prevention with Positives*.

No correctional system in the United States provides clean injection needles as a part of a prevention program (Sylla, 2007). However, inmates with a history of IDU should be educated about the risks of sharing needles and injection equipment, specifically the high risk of transmitting or acquiring HIV, HCV, and HBV. Inmates also should be counseled about the risks of sharing needles and other "sharps," such as those used for tattooing or body piercing. Substance abuse treatment should be provided when appropriate. Recovery from addiction often is a chronic process and relapses are common. In addition to substance abuse treatment, risk-reduction strategies should include planning for support after release from the correctional setting. For example, prior to release, inmates should

be provided with information about syringe exchange or clean needle access programs in their communities. These programs have proved to be quite effective in decreasing the rate of parenteral HIV transmission (CDC, 1999).

Furthermore, overdose prevention should be discussed with inmates leaving correctional systems. Using heroin after a period of abstinence, such as during incarceration, hospitalization, or drug treatment, is a major risk factor for overdose. Former inmates are at highest risk of overdose within the first 2 weeks after release (NYSDOH, 2008). Overdose risk is heightened when someone has a significant medical condition, such as HIV infection (Catania, 2007). The literature documents an increased number of correctional systems that consider including naloxone (Narcan) prescriptions in prerelease planning for inmates with a history of opiate addiction (Wakeman et al., 2009). Naloxone is a prescription medicine that reverses an overdose by blocking heroin (or other opioids) in the brain for 30-90 minutes (NYSDOH, 2008).

Antiretroviral Therapy in Correctional Facilities

In correctional facilities, as in any setting, a consideration of HIV treatment must begin with educating the patient about the benefits and risks of treatment and the need to fully adhere to the entire regimen, and with an assessment of the patient's motivation to take ART (see chapter *Antiretroviral Therapy*).

Correctional facilities have two main methodologies for dispensing medications to those who are on ART. Each has advantages and disadvantages that can impact treatment adherence. These are directly observed therapy (DOT) and keep-on-person (KOP).

Directly Observed Therapy

DOT is the system in which the inmate goes to the medical unit or pharmacy for all medication doses; dosing is observed by staff members. This system offers the advantage of more frequent interaction between the patient and the health care team, allowing for earlier identification of side effects and other issues. In general, patients have better medication adherence in this system, resulting in better control of HIV. For some inmates, however, the need for frequent visits to the medical unit or pharmacy may be a barrier to receiving proper treatment, particularly if they are housed at a distance from the medical unit. Another disadvantage of DOT is the potential loss of confidentiality, as many inmates feel that the frequency of dosing and the large number of pills they may take will reveal clues that they are HIV infected. In addition, this system puts inmates in a passive role in terms of medication treatment and does not foster self-sufficiency.

Keep-on-Person

KOP is the system that allows inmates to keep their medications in their cells and take them independently. Monthly supplies are obtained at the medical unit or pharmacy. This system offers greater privacy and confidentiality regarding HIV status. It also allows inmates to develop self-sufficiency in managing medications, which may facilitate improved adherence upon release. However, as the KOP system involves less interaction with medical staff, problems with adherence can be more difficult to identify (Ruby, 2000). Problems with refills also can occur. For example, inmates usually must initiate the process for obtaining a refill. They may be told that a refill request was made too early or too late, which can result in delays in dispensing medications, and ultimately, treatment interruptions. In addition, many facilities do not have on-site pharmacies, but rely on local pharmacies, or a

regional or central pharmacy in the state; this may further delay refills (NYSDOH, 2008).

In a study comparing DOT in HIV-infected inmates with KOP in nonincarcerated HIV-Infected patients receiving ART as part of a clinical trial, a higher percentage of DOT patients achieved undetectable viral loads compared with the KOP patients (85% vs. 50%) over a 48-week period (Fischl, 2001).

Adherence

Adherence is one of the most important factors in determining the success or failure of ART. For the HIV-infected inmate starting ART, a number of issues can affect medication adherence. These include patient-related factors, factors related to systems of care (including the medication dispensing systems described above), and medication-related factors. The following are suggestions for supporting adherence to ART. (Also see chapter *Adherence*.)

Patient-Related Factors

- Correct misconceptions about HIV and ART that are common among inmates and could affect adherence adversely. Inmates should be educated about the disease process and the role of the medications, along with the benefits and risks of taking ART.
- Use teaching tools that are appropriate in terms of language and reading level. Illiteracy and low-level reading ability are common among inmates. Diagrams and videos may be more effective than reading-intensive material in some cases. Basic HIV education prior to initiation of ART should include the following topics:
 - How the medications work
 - Potential benefits in terms of personal health and reducing transmission risk
 - Consequences of nonadherence

- Names and dosages of all medications
- Potential side effects and strategies for managing them
- Encourage participation in peer support groups. These can be effective ways to foster self-esteem, empower inmates to come to terms with a positive diagnosis, allay fears and correct misconceptions about HIV disease, and aid adherence. Upon release, telephone hotlines may be available to provide follow-up support and linkages to community services. To the extent possible, family and friends should be included in the education process.
- Provide alcohol and substance abuse treatment before, or while, initiating ART. Without appropriate treatment during incarceration, linkages to supports, and follow-up treatment upon discharge, inmates are more likely to resume high-risk behaviors that may interfere with adherence to ART. In 2004, nearly one third of inmates in state facilities and one fourth of inmates in the federal system committed their offenses under the influence of drugs (Mumola and Karberg, 2006).
- Use mental health consultation to identify inmates with psychiatric needs. Treatment for underlying mental health disorders should precede or take place concurrently with the initiation of ART to ensure successful adherence. Depression and other psychiatric illnesses are more prevalent among inmates than among the general population (James and Glaze, 2006).

Factors Related to Systems of Care

- Educate the facility's security staff about the importance of timely medication dosing, and communicate with other facilities in advance of a transfer; this can eliminate or reduce the frequency of missed doses.

- Schedule frequent follow-up medical visits in the early weeks after ART is initiated; these can make the difference in whether or not patients "stay the course."
- Consult with an HIV specialist, if possible. If a facility's medical provider lacks experience in treating patients with HIV, the results may be undertreatment of side effects or errors in prescribing medications. Because caring for HIV-infected patients is complicated, HIV specialists can provide assurance that patients are receiving proper care. Of particular concern are patients whose current ART regimens are failing, those who are declining clinically, and those who are coinfecting with other diseases such as tuberculosis, HCV, and HBV.

Medication-Related Factors

- Aggressively monitor and treat side effects. The most common barrier to proper adherence to ART is side effects from the medications. Inmates should be educated in advance about potential adverse events and urged to observe and report them. In the first weeks after starting a new ART regimen, patients should be assessed frequently for side effects. For treating gastrointestinal toxicities, antiemetics and antidiarrheals should be available on an as-needed basis. As with all patients on ART, inmates should have appropriate laboratory monitoring.
- Be aware of food requirements. Various food requirements must be considered carefully when administering ART. That can be especially challenging in the correctional environment, particularly in facilities that do not allow inmates to self-administer medications. Make arrangements with prison authorities to provide food when inmates are taking medications that require administration with food.
- Avoid complex regimens and regimens

with large pill burdens, if possible. Simple regimens with fewer pills appear to help improve adherence.

- Avoid drug-drug interactions. Some antiretroviral medications have clinically significant interactions with other drugs (e.g., methadone, oral contraceptives, cardiac medications, antacids). These interactions may cause failure of either the antiretroviral drug or the other medication, or they may cause additional toxicity. Consult an HIV specialist or pharmacist for information on drug interactions.
- Question patients about medication adherence at each appointment.
- ART regimens need to fit into each patient's schedule and lifestyle. This becomes a bigger issue when an inmate is close to release. Education about HIV management, including ART adherence, should begin well before the inmate is discharged back to the community.

Transition to Community Care

It is estimated that 630,000 individuals are released from jails and prisons in the United States each year (Bonczar, 2003; Travis, 2005), and many of these individuals are HIV infected. Many will have difficulty managing even the most basic elements for successful reintegration into their communities. Inmates living with HIV face many challenges when reentering the community, such as finding stable housing, employment, adequate medication supply, follow-up medical care, and psychiatric and substance use treatment services (Hammett et al., 1997).

Ideally, the discharge process at the correctional facility will maximize the likelihood that the person being released will have continuous medical care. At the time of discharge from the correctional facility, all HIV-infected inmates should have a discharge plan that addresses the following:

- Housing
- Health insurance
- 30-day supply of HIV medications
- Follow-up appointments for medical care and, if necessary, psychiatric and substance abuse care

As discussed, inmates in prisons generally serve longer sentences than do those incarcerated in jails, and they have a release date that is known in advance. Thus, HIV-infected inmates in prisons may be more likely than HIV-infected inmates in jails to have treatment and discharge plans in place before their release. However, because the extent of discharge planning resources varies among correctional systems of care, it is important for care providers to discuss the scope of services their clients received while incarcerated to learn of any service gaps upon reentry to the community (NYSDOH, 2008).

The need to find housing often is the greatest challenge for an HIV-infected inmate leaving a correctional facility. In many correctional systems, inmates must document a physical address at which they intend to reside in order to be released. However, problems with housing availability, stability, and location can create significant stressors for an HIV-infected person being released and can compromise the likelihood that he or she will access HIV health care and adhere to an HIV medication regimen (NYSDOH, 2008).

Medication Continuity Issues

HIV-infected individuals leaving correctional settings have a variety of experiences with ARV medication continuity. A short confinement period, for example, can prevent the development of a solid transition plan. Jail inmates may be released without their medications and have no choice but to call or walk into community health centers or clinics for their medications and ongoing

care. Being released from jail after business hours, such as on a Friday night, can result in treatment interruptions over the weekend (NYSDOH, 2008). Depending on the state system, HIV-infected inmates leaving prison are more likely than jail releasees to have a medication supply in hand when they reenter the community. For example, in the New York State Department of Correctional Services, inmates will leave prison with a 30-day supply of HIV medications as well as a prescription for another 30-day supply (NYSDOH, 2008).

For some individuals, interruptions in treatment occur during their time in jail or prison. For example, many inmates choose not to disclose their HIV infection while they are incarcerated. Particularly if the sentence is short, an inmate may feel it better not to mention HIV status and instead plan to resume taking medications upon release. Such treatment interruptions can result in adverse health outcomes (NYSDOH, 2008).

It is important that clinic staff and community-based organizations develop the capacity to work with clients in real time as they present for care in order to help them maintain continuity with their medications.

Strategies for Supporting Inmates upon Release

- A clear way to support clients is to intervene immediately and directly upon their release, such as by meeting them as they step off a bus or exit a facility.
- Engage clients by:
 - Hearing their stories; listening to concerns, wishes, history, perceptions, feelings, and so forth
 - Asking open-ended questions, affirming strengths, listening reflectively, and summarizing discussions and plans
 - Understanding their backgrounds, goals, and motivations (understand “where they are coming from”)

- Avoiding getting caught up in issues about the crimes they committed
- Identifying perceived needs by asking how services can be beneficial to them
- Acting honestly by providing a full disclosure of one’s role as a provider (e.g., what you can or cannot do)
- Provide material assistance by giving clients something tangible such as a meal ticket, condoms, bleach kit, or hygiene kit.
- Provide information and referrals to short-term and survival services for clients to help improve their immediate situation.
- If possible, accompany clients to support them in obtaining short-term and survival services such as health care, food, shelter, and clothing.
- Respond to emergency situations.
- Support clients in meeting parole or probation requirements to avoid reincarceration. Based on their individual histories, anticipate circumstances that may result in them breaking parole. For example, if a client confides that he or she has anxiety regarding meeting the parole officer, initiate and practice role plays to better prepare the client for this encounter.
- Be culturally competent.
- Link to services (e.g., medical care, mental health, substance use, domestic violence).
- Diversify clinic staffing, and use a multidisciplinary approach, including peer support.
- Think outside the box! (NYSDOH, 2008)

A number of HIV education resources for inmates and correctional health care providers are cited on the Albany Medical College website at www.amc.edu/Patient/services/HIV/index.cfm (go to the section on correctional education).

Table 1. HIV Testing in Prisons: Circumstances Under Which Prison Inmates Were Tested for HIV (by Jurisdiction)

Patient Education

Background

Informed and empowered patients are better able to achieve healthy outcomes as a result of improved communication and development of trust with their care providers. HIV patient education provides patients with knowledge about HIV infection, including prevention, treatment, and other aspects of care, along with tools that enable them to participate more actively in decisions regarding their medical care. Given the complexity and the rapid evolution of HIV information, education and skills-building should be an ongoing activity and a key aspect of the clinical care of HIV patients. This chapter provides a brief review of the areas that should be addressed in patient education and discusses some strategies for integrating patient education into HIV care; additional information on patient education is found in many other chapters, particularly *Supporting Patients in Care*, *Preventing HIV Transmission/Prevention with Positives*, *Smoking Cessation*, and *Adherence*, as well as in the “Patient Education” sections found at the end of most of the clinical chapters.

S: Subjective

A newly diagnosed patient presents to clinic after being referred from a testing center in the community. The patient received the positive HIV test results more than a year ago, but has not been ready to seek care until now. The patient feared hearing that he/she was “going to die.” Now, he/she is ready to consider facing this “terminal” illness. The patient received some information about HIV infection at the testing center, but that was months ago.

O: Objective

See chapters *Initial History*, *Initial Physical Examination*, and *Initial and Interim Laboratory and Other Tests* for information on the initial clinic evaluation.

A/P: Assessment and Plan

The patient will need extensive information and education about HIV infection in general, his/her individual health status and prognosis, and the support and care systems that are available. Below are some suggestions about specific areas to review with a new patient.

Topics for Patient Education

Patient education should cover the following topics:

- What is HIV?
- How is HIV transmitted?
- Progression of HIV; prognosis
- Interpretation of laboratory results
- Treatment information
 - General information regarding the benefits of treatment
 - Indications for treatment, goals of treatment
 - General information regarding potential side effects and risks of treatment
 - Access to medication
 - Insurance information
- Treatment options
- Prevention for positives
- Support services and support groups available to the patient

Patient Educators

In most clinics, a number of different personnel may take on the responsibilities of providing health education to patients. They may include primary care providers, nurses, social workers, case managers, and pharmacists. Some clinics have designated health educators whose role is to provide this type of support for patients. Even when a formal health educator is available, a collaborative, multidisciplinary approach to patient education serves both patients and providers optimally. However, it is important to ensure that patient education messages are coordinated and that patients are receiving consistent information.

Patient education must be provided in a language and at a literacy level appropriate for the patient. Patient education should be conducted in the patient's primary language, if possible; otherwise, skilled medical interpreters should be involved.

Conducting Patient Education

Rarely are patients able to absorb all of the necessary information in a single session. Attention and comprehension levels are optimal during the first 15-20 minutes of a visit, after which an individual's ability to absorb and retain information declines. Therefore, clinics should consider strategies to integrate brief patient education messages throughout the course of patient care and to engage patients in this process. Support groups, case managers, and peer educators can be invaluable in this process of engagement.

It is important to keep the medical information specific to the patient. Although there are some areas of education that should be considered for all patients (see above), patients should not be required to have a high level of understanding in each area. Patients should be given the opportunity to learn as much about an area as they would like, and should be encouraged to gain a working knowledge of the information that is necessary to keep them healthy and safe. Patients vary widely in terms of their interest level in mastering the details of their illness. For example, in the area of "What is HIV?" there may be some patients who want to know details about the basic science and immunologic impact of HIV. With this information, these patients might then want to take the lead in making treatment and care decisions for themselves, in consultation with their care providers. Other patients, however, would feel overwhelmed by this volume of information and involvement and may be best engaged in participating in their care by knowing how HIV is transmitted, how to keep themselves healthy, and how to access more information if they want it. Some patients would prefer for their care providers to "just tell them what to do" rather than take the lead in making their own treatment decisions.

There are a number of websites that provide HIV information for patients (see chapter *Web-Based Resources*). Many patients may prefer this form of self-education. Encourage patients to convey any information they discover to their care providers for further discussion. Reminding patients that they can be teachers as well as students can be a useful strategy for engaging patients in this process. In addition, patients may learn of novel tools and information sources that could be useful to others.

The following are some useful suggestions that providers can convey to their patients:

- Define your goals for each visit; please let your provider know your concerns and what you hope to learn in the course of the visit.
- Write down questions and concerns as they arise, and take that list with you to your appointments.
- Meet all the members of your care team and learn their areas of expertise and what they might be able to offer you.
- Ask about support groups and other peer groups that might be able to provide support/education.
- Review brochures and websites that provide additional information.
- Ask supportive friends or family members to accompany you to clinic visits. They may be able to obtain information that is helpful for their role in supporting your health or reminding you of information discussed at visits.

Initial History

Background

Conducting a thorough initial history and physical examination is important even if previous medical records are available. This is the best opportunity to get a complete picture of the patient’s HIV disease status, comorbid conditions, and his or her physical and emotional condition, as well as to establish the basis for an ongoing relationship with the patient. Many of the conditions that put immunocompromised patients at risk of disease can be detected early, by means of a thorough assessment.

The information gathered through the initial history and physical examination will provide a comprehensive standardized database for the assessment and treatment of HIV-related problems, including acute intervention and ongoing prevention services and supportive care.

This chapter includes essential topics to cover during the clinic intake and examples of questions that can be used to elicit important information (the questions should be tailored to the individual patient). This can be completed during the initial visit or divided over the course of two or three early visits. For essential aspects of the physical examination to cover in an initial clinic intake visit, see chapter *Initial Physical Examination*.

HRSA HAB Performance Measures

Percentage of patients with a diagnosis of HIV who had at least **one medical visit in each 6-month period** of the 24-month measurement period with a minimum of 60 days between medical visits

(Core measure)

Percentage of patients with a diagnosis of HIV who received **HIV risk counseling** in the measurement year

(Adult and Adolescent measure)

Percentage of new patients with a diagnosis of HIV who have been screened for **substance use** (alcohol and drugs) in the measurement year

(Adult and Adolescent measure)

Percentage of patients aged 12 years and older **screened for clinical depression** on the date of the encounter using an age-appropriate standardized depression screening tool AND, if positive, a follow-up plan is documented on the date of the positive screen

(Adult and Adolescent measure)

S: Subjective

Initial History		
Category / Topics to Cover	Sample Questions	
History of Present Illness		
HIV Testing	- What was the date of your first positive HIV test? - Did you have a previous HIV test? If so, when was the last negative result?	
Treatment Status	- Where do you usually receive your health care? - Have you ever received care for HIV? - What was the date of your last HIV care visit? - What is your current CD4 (T-cell) count?	- Do you know what your first CD4 count was? - What was your lowest CD4 count? - What was your highest CD4 count? - Do you know what your first viral load count was? - What is your current viral load count?

Category/Topic to Cover	Sample Questions
History of Present Illness (continued)	
HIV-Related Illnesses	- What opportunistic infection(s) have you had, if any? (PCP, MAC, cryptococcal meningitis, TB, etc.) - What year(s) were you diagnosed with these infections? - Have you had cancer(s)? - What other HIV-related illnesses have you had? Have you had zoster (shingles), oral thrush, pneumonia?
Active TB and TB Testing History	- Have you ever had tuberculosis (TB)? - When was your last TB test? - Was it a TB skin test (TST) or interferon-gamma release assay (IGRA)? - What were the results of this test? - Have you ever had a positive TB result? - What year and what health care setting? - What medications did you take and for how long?
Antiretroviral Therapy (ART) History	- Are you taking HIV medications now? - If so, please name them or describe them, and tell me how many times a day you take them. - How many doses have you missed in the past 3 days? - The past week? - The past month? - What side effects, if any, do you have now? In the past? - What HIV medicines have you taken in the past (names or descriptions)? - When did you start and stop taking them (dates)? - Do you know why you stopped taking these medications? - Do you know what your HIV viral load or your CD4 counts were while you were taking your medications? - Have you ever had a resistance test? - Did you have any side effects to past HIV medications?
Past Medical and Surgical History	
Chronic Diseases	Do you have any chronic conditions, such as the following? - Diabetes - High blood pressure - Heart disease - Cholesterol problems - Asthma or emphysema - Sickle cell disease - Ulcers, acid reflux, or irritable bowel syndrome - Thyroid disorders - Kidney or liver problems - Mental health disorders If so, do you receive medical care for these conditions?
Previous Illnesses	- Have you had any hospitalizations? Where, when, and for what reason? - Have you had any surgeries? When and where? - Have you had any major illnesses, including mental health conditions?
Hepatitis	- Have you ever had hepatitis? What type (A, B, C)? - Do you have chronic hepatitis? - Do you know whether you are immune to hepatitis A or hepatitis B? Have you been vaccinated?

Category/Topic to Cover	Sample Questions		
Past Medical and Surgical History (continued)			
Gynecologic and Women's Health	• When was your last cervical Papanicolaou (Pap) test? • What were the results? • Have you ever had an abnormal Pap test? • When was your last menstrual period? • What is the usual length of your cycle? Is it regular or irregular? • Have you noticed changes in your menstrual cycle? • When was your most recent breast examination? • Have you had a mammogram? When? • Have you ever had an abnormal breast examination or mammogram? • Do you get yeast infections? How often? • Do you get urinary infections? • Have you ever had kidney stones?		
Obstetric	• How many pregnancies have you had? • How many live births? Ages of children now? • How many miscarriages or therapeutic abortions? • Were you tested for HIV during any pregnancy? What year? • Did you deliver an infant while you were HIV infected? • Was HIV medication given during pregnancy and delivery? • Do you have children? What is their HIV status? • Do you intend to become pregnant?		
Anorectal History	• Have you ever had an anal Pap test? • What were the results? • Have you had anal warts? Other abnormalities?		
Urologic History	Have you ever had: • Kidney stones • Urinary tract Infections • Prostate infection or enlargement • Have you had a prostate-specific antigen (PSA) test? (What were the results?)		
Sexually Transmitted Diseases	Have you ever had any of the following infections? If yes, when was last episode? <table border="0"> <tr> <td> • Syphilis (If yes, ask about stage, treatment and date of treatment, titer follow-up, and date and result of last titer.) • Vaginitis • Genital herpes • Nongonococcal urethritis (NGU) </td><td> • Gonorrhea (If yes, ask about sites of infection: oral, anal, urethral, vaginal.) • Chlamydia (If yes, ask about sites of infection: oral, anal, urethral, vaginal.) • Genital warts (HPV) • Proctitis • Pelvic inflammatory disease (PID) • Trichomoniasis </td></tr> </table>	• Syphilis (If yes, ask about stage, treatment and date of treatment, titer follow-up, and date and result of last titer.) • Vaginitis • Genital herpes • Nongonococcal urethritis (NGU)	• Gonorrhea (If yes, ask about sites of infection: oral, anal, urethral, vaginal.) • Chlamydia (If yes, ask about sites of infection: oral, anal, urethral, vaginal.) • Genital warts (HPV) • Proctitis • Pelvic inflammatory disease (PID) • Trichomoniasis
• Syphilis (If yes, ask about stage, treatment and date of treatment, titer follow-up, and date and result of last titer.) • Vaginitis • Genital herpes • Nongonococcal urethritis (NGU)	• Gonorrhea (If yes, ask about sites of infection: oral, anal, urethral, vaginal.) • Chlamydia (If yes, ask about sites of infection: oral, anal, urethral, vaginal.) • Genital warts (HPV) • Proctitis • Pelvic inflammatory disease (PID) • Trichomoniasis		

Category/Topic to Cover	Sample Questions
Past Medical and Surgical History (continued)	
Dental/Oral Care	• When was your last oral health examination? • Do you have all your natural teeth? • Do you have partials or dentures?
Eye Care	• When was your last vision examination? • When was your last dilated retinal examination? • Do you wear glasses or corrective lenses?
Medications	• What (non-ARV) medications do you take? • What herbs, vitamins, nutritional supplements, or over-the-counter (OTC) medications, do you take?
Allergies; Medication Intolerance	• Have you had an allergic reaction to any medications? What type of reaction, how severe? • Have you had allergic reactions to other types of exposures? • Have you had severe side effects from any medications?
Immunizations	When was your last vaccination for the following: • Streptococcal pneumonia (Pneumovax; PPV23, PCV13) • Tetanus/Pertussis (Tdap) • Influenza • Hepatitis A • Hepatitis B Did you have chickenpox as a child, or were you vaccinated against chickenpox? What about measles, mumps, and rubella?
Health-Related Behaviors	Tobacco use: • Do you smoke? How many cigarettes per day? How long have you smoked? How much have you have smoked in the past? • Besides tobacco, what do you smoke? • Do you chew tobacco? Alcohol use: • How often do you have a drink containing alcohol? How many drinks do you have on a typical day? How many per week? • Have you ever had a problem fulfilling work, social, or school obligations because of alcohol use? • Have you ever sought treatment for alcohol-related problems? Drug use: • Do you use any recreational or street drugs we haven't covered in earlier questions? Any prescription drugs or medications that were not prescribed to you? • If so, what drugs and how do you use them (inject, smoke, inhale, etc.)? Drug use (continued): • How often do you use substances? • Have you shared drug-use equipment with another person? • What pain relievers do you use on a regular basis? • Are you interested in treatment for alcohol or drug use? • Have you ever sought treatment? Exercise: • What kind of exercise do you participate in? How frequently? Diet: • What do you eat during a typical day? • Do you consume raw (unpasteurized) milk, raw eggs, raw or rare meat, deli meats, soft cheeses, or raw fish? • How much water do you drink during a typical day? • What is your source of water? • How much caffeine do you drink during a typical day?

Category/Topic to Cover	Sample Questions
Sensitive Sexual and Gender History Questions	
Gender Identity	- Do you consider yourself male or female? - Have you had or considered treatment for sex change? - Are you presently taking hormone therapy? - Have you had hormone therapy in the past? - Have you had any gender confirmation (sex reassignment) surgery?
General Sexual	- Do you have sex with men, women, or both? - In the past, have you had sex with men, women, or both? - In the past 2 months, how many sex partners have you had? - In the past 12 months, how many sex partners have you had?
Sexual Practices	- Do you have anal sex? Vaginal? Oral? - How do you protect yourself from sexually transmitted diseases, or HIV reinfection? - For men who have sex with men: - Are you the receptive or insertive partner, or both? - How often do you use alcohol or drugs before or during sex?
HIV Prevention	- Do you know the HIV status of your partner(s)? - Do you take measures to protect your partners from HIV? What measures? - In what situations do you or your partner use condoms or some other barrier? - Are there situations in which you do not use barrier protection?
Sex Trading	Have you ever exchanged sex for food, shelter, drugs, or money?
Contraception	- What birth control measures do you use, if any? - How often do you use condoms or other latex barriers? - Do you have plans for you or your partner to become pregnant?
Family History	
	Do you have a family history of: - Heart disease? Heart attacks or strokes? - Cholesterol problems? Diabetes? - Cancer? - Mental health conditions (e.g., depression, bipolar disorder, anxiety, phobias)? - Addictions? Which family member(s), and what is their health status currently?
Social History	
Relationship Situation	- What is your relationship status (single, married, partnered, divorced, widowed)? - Do you have children? - Does your partner (and/or children) know about your HIV status?
Living Situation	- Do you live alone or with others? With whom? - How long have you lived in your residence?
Support System	- Who knows about your HIV status? - Which individual has been the most supportive since your HIV diagnosis? - Who has been the least supportive? - Have you used any community services such as support groups?

Category/Topic to Cover	Sample Questions
Social History (continued)	
Employment	• Are you currently employed? • Where do you work? • Describe your job task(s). • What setting do you work in on a daily basis? • Does your employer provide health insurance? • Does your employer know of your HIV status? • If on disability: How long have you been on disability? • What medical condition has made you disabled?
Incarceration History	• Have you ever been incarcerated? When was the last time?
Pets	• What kind of pets do you have, and who cleans up after them?
Travel	• Where have you traveled outside the United States? • When did travel take place?
Mental Health	
Coping	• How do you handle your problems/stresses? • What do you do to relax?
History	• Have ever been diagnosed with depression, anxiety, panic, bipolar disorder, schizophrenia, etc.? • Have you taken or are you taking any medications for these conditions? • Are you seeing a therapist or mental health professional? • Have you had any previous counseling or mental health problems? • Have you ever been hospitalized for a psychiatric condition? • Have you ever thought about hurting yourself? (If yes, probe for previous suicide attempts: Are you feeling that way now?) (See chapter <i>Suicide Risk</i> and prepare for immediate referral if necessary.)
Violence	• Have you ever been sexually abused, assaulted, or raped? • Has an intimate partner ever forced you to do something you did not want to do? • Has a partner, family member, or other person ever physically hurt you? • Have you lived in any situation with physical violence or intimidation? • When has this occurred? • Are you afraid for your safety now? • (If yes) Did you seek legal help, therapy, or other type of assistance?
Childhood Trauma	• Was there any alcoholism or drug abuse in your household when you were a child? • Did you experience or observe violence; physical, sexual, or emotional abuse; or neglect?

Review of Systems

For each positive answer, ask about location, characteristics, duration of symptoms, exacerbating and alleviating factors, previous diagnostic workup, and treatments tried.	
General	Do you ever wake up feeling tired?
Fever	Do you have fevers? How high, and for how long? How often?
Night Sweats	Do you ever sweat so much at night that it soaks your sheets and nightclothes?
Anorexia	How is your appetite?
Weight	- What was your weight 1 year ago? - What is a normal weight for you? - Have you lost or gained weight unintentionally?
Body Changes	- Have you noticed any changes in the shape of your body (describe)? For example, has there been an increase in your waist, collar, or breast size or a decrease in your arm, leg, or buttocks size? - Have you noticed increased visibility of veins in your arms and legs? - Have you noticed thinning of your face, especially around the cheeks?
Head, Ears, Eyes, Nose, and Throat	
Vision	- Have you noticed any changes in your vision, especially blurred vision or vision loss, double vision, new "floaters" or flashes of light? - Have you noticed this problem in one or both eyes? - When did you first notice these changes?
Mouth, Ears, Nose, Throat	- Have you noticed any white spots in your mouth or a white coating on your tongue (thrush, oral hairy leukoplakia)? - Do you ever get sores in your mouth or the back of your throat? Gum problems? - Any nosebleeds? - Do you ever experience hearing loss, ringing in your ears, or ear pain?
Cardiovascular	
Cardiac	- Any chest pain or pressure? Palpitations? - Any shortness of breath during activities or while you are lying down? - How far can you walk or run before you get short of breath? - Any swelling in your feet or legs?
Pulmonary	
Cough	- Do you have a cough? - Can you describe it? Dry or productive, amount, color, odor, presence of blood in sputum? When is it the worst?
Dyspnea	- Do you ever feel short of breath? - Does that happen when you are sitting still, lying down, or moving around? - How severe is your shortness of breath? - What does it prevent you from doing? - Do you ever wheeze??

Gastrointestinal	
Dysphagia	• Do you have any problems with food sticking in your throat or being difficult to swallow? • Do you gag or get nauseated when trying to eat? • Do you notice it is easier to swallow liquids or solids? • Do you have difficulty swallowing pills?
Odynophagia	• Do you have pain in your throat, esophagus, or behind your breastbone when you swallow?
Dyspepsia/Reflux	• Do you ever have heartburn (or a burning feeling rising from the stomach to behind the breastbone)? • When does it happen – after eating, lying down, on an empty stomach? • Do you get the taste of stomach acid in your mouth?
Nausea/Vomiting	• Do you have nausea or vomiting? • When? Are there specific things that cause this?
Diarrhea	• Do you have diarrhea, or more than 3-5 unformed stools a day? • Stool characteristics: bloody, pus, mucus? • Pain or cramping with diarrhea? Tenesmus?
Bowel Habits	• How frequently do you have bowel movements? • Do you have problems with constipation, blood in the stools, or other? • Do you have problems with flatulence or belching after eating?
Genitourinary	
Genital	• Do you have any lesions or sores on your genital area now, or have you in the past? • Have you ever had genital herpes? If yes, how often do you have outbreaks? • When was the most recent outbreak?
Women	• Have you had any lower abdominal pain? • Have you noticed a vaginal discharge or odor? • Do you have any burning or pain on urination? • Frequent urination? • Do you lose control of your urine or have problems getting to the bathroom before you start to urinate?
Men	• Have you noticed any swelling or testicular pain? • Do you have difficulty starting your stream of urine? • Are you getting up at night to urinate? • Have you had burning or pain on urination? • Do you lose control of your urine or have problems getting to the bathroom before you start to urinate? • Do you have any difficulty developing or maintaining an erection? • Any discharge from your penis?

Musculoskeletal	
	• Do you have any muscle aches or pains? Joint pain or swelling? • Back pain? • Have you ever broken any bones? • Do you have chronic pain? • Describe the pain – location, duration, rating (scale of 1-10), alleviating factors.
Skin	
Skin Lesions	• Have you noticed any rash or skin problems? If so, where? • Have you noticed any new moles, bruises, or bumps on your skin? • Do you have any moles that have changed shape, size, or color?
Tinea	• Do you have fungal infections on your skin, especially groin, fingernails, toenails, or feet?
Folliculitis	• Do you have any itchy bumps on your face, back, or chest?
Seborrhea	• Do you have flaking or itching on your skin or scalp?
Neurologic	
Headache	• How often do you get headaches? • Describe the headaches – location, timing, duration, alleviating or aggravating factors. • Do they cause nausea or vomiting? • Does sensitivity to light lead to headaches?
Neuropathy	• Do you have any numbness, tingling, burning, or pain in your hands or feet?
Weakness	• Do you have or have you had any weakness in your arms or legs?
Gait	• Have you noticed any changes in the way you walk?
Memory	• Do you have difficulty with your memory or ability to concentrate? If so, describe.
Seizures	• Have you ever had a seizure or “fit”? • If so, describe the seizure – When? How long did it last? Did you experience loss of consciousness? Did you receive medical care?
Endocrine	
Diabetes	• Have you had any increase in thirst, hunger, or urination?
Thyroid	• Have you noticed changes in your energy level? • Do you have intolerance to heat or cold? • Have you noticed changes in your hair (thinning, coarse texture)?
Sex Steroids	• Have you noticed any changes in your libido? In your energy level, mood?
Hematologic/Lymphatic	
Adenopathy	• Do you have swollen glands? • If so, describe – location, pain, size.
Bruising or Bleeding	• Have you noticed easy bruising or prolonged bleeding after injury? • Nosebleeds or bleeding gums?

Psychiatric	
Mood	• Depression screening: Have you experienced a decrease in your interest or pleasure in your activities? Have you felt depressed, down, or hopeless? • Do you feel more angry, sad, depressed, numb, irritable, or anxious than usual? • Have any major life events have occurred to cause you to feel sad or depressed? • When did these events occur?
Sleep	• How is your sleep? • How many hours do you sleep each night? • What is your sleeping schedule – time to bed and time to rise? • Do you take naps?

HIV Research

Sample Questions	
	• Have you participated in any research protocols? What studies, and when? • Would you be interested in participating in research studies (if available)?

O: Objective

- Conduct a physical examination, focusing on subjective findings elicited in the history. (See chapter *Initial Physical Examination*.)
Note: If significant time has elapsed between the review of symptoms (ROS) and the physical examination, perform another ROS.

A/P: Assessment and Plan

- Arrange for baseline/intake laboratory work. (See chapter *Initial and Interim Laboratory and Other Tests*.)
- Compose a problem list. Initiate a medication list (if appropriate).
- Refer the patient to social services, mental health care, local health department partner services, community and other resources, or other clinic services as needed.

During the current visit or a future visit:

- Perform immunizations for pneumonia (Pneumovax), influenza (as appropriate), and other immunizations as indicated. (See chapter *Immunizations for HIV-Infected Adults and Adolescents*.)
- Provide counseling on prevention of HIV transmission (e.g., safer sex and injection practices), as appropriate. See chapter *Preventing HIV Transmission/Prevention with Positives*.

Patient Education

A very important aspect of caring for HIV-infected individuals is educating patients about HIV infection, including goals of care and ways of achieving those goals.

Review the following with each patient:

HIV disease

- Disease course
- Significance of CD4 cell count and HIV viral load
- Possible treatment approaches, including initial discussion about the importance of ART for the patient's own health and for reducing risk of HIV transmission
- Disclosure (e.g., whom the patient may need to tell about HIV status, relevant legal requirements, approaches to disclosure)

HIV transmission prevention and risk reduction for HIV-infected individuals

(see chapter *Preventing HIV Transmission/Prevention with Positives*)

- Strategies to prevent transmission of HIV to uninfected partners and to prevent acquisition of sexually transmitted diseases, hepatitis, and other infections
- Safer-sex approaches, including the use of condoms or other latex barriers during sexual contacts
- Safer use of recreational drugs

Nutrition

- Maintaining a healthy weight
- Nutritional support resources, if appropriate
- Importance of including a nutritionist in medical care

Mental health

- Stress reduction
- Rest and exercise to enhance a healthy mental state

Adherence

- Importance of keeping medical appointments
- Need for adhering to any medication regimen and the consequences of missed HIV medication doses

Initial Physical Examination

Background

Many of the conditions that put immunocompromised patients at risk of disease can be detected early, by means of a thorough history and physical evaluation.

HRSA HAB Performance Measures

Percentage of female patients with a diagnosis of HIV who have a **Pap screening** in the measurement year

(Adult and Adolescent measure)

S: Subjective

See chapter *Initial History*.

O: Objective

Assess the patient’s general appearance, affect and demeanor in answering questions, body language, and other relevant characteristics. Measure vital signs; perform a physical examination.

Table 1. Vital Signs	
(These measurements establish a baseline against which future measurements can be compared.)	
Vital Sign	Recommendation/Notes
• Height • Weight • Temperature • Blood pressure • Heart rate • Respiratory rate • Oxygen saturation • Waist, hip circumferences	• Should be measured at baseline and annually. • Record at each visit. • Record at each visit. • Record at each visit. The BP cuff size should be appropriate for the patient’s arm circumference. • Record at each visit. • Record at each visit. • Record at each visit. • Waist and hip circumference should be measured at baseline for comparison in case the patient later develops obesity or lipoaccumulation related to antiretroviral therapy (ART); repeat as indicated. Abdominal circumference: >102 cm (39”) in men = abdominal obesity >88 cm (35”) in women = abdominal obesity Waist-hip ratios: >0.95 in men = increased risk of coronary heart disease (CHD) >0.85 in women = increased risk of CHD

Body mass index (BMI)	BMI can be helpful in assessing underweight or overweight conditions, HIV/AIDS-related weight loss, and ART-related weight gain. Perform at baseline and upon changes in weight. BMI calculation: $\frac{\text{(weight in pounds)}}{\text{(height in inches)} \times \text{(height in inches)}} \times 703$ or, $\frac{\text{(weight in kilograms)}}{\text{(height in meters)} \times \text{(height in meters)}}$ BMI: <table border="0"> <tr> <td><18.5 = underweight</td> <td>25-29.9 = overweight</td> </tr> <tr> <td>18.5-24.9 = normal range</td> <td>≥30 = obese</td> </tr> </table>	<18.5 = underweight	25-29.9 = overweight	18.5-24.9 = normal range	≥30 = obese
<18.5 = underweight	25-29.9 = overweight				
18.5-24.9 = normal range	≥30 = obese				

Table 2. Physical Examination

Regions	Recommendation/Notes																					
General	• State of nourishment, physical appearance, well or ill appearing																					
Eyes	• Examine visual acuity by Snellen chart, visual fields by confrontation. • Test extraocular movements and pupillary size and reactivity. • Perform funduscopic examination, with or without mydriatics. Note any retinal lesions, white or yellow retinal discoloration, infiltrates, or hemorrhages (could indicate cytomegalovirus retinitis, retinal necrosis, or ocular toxoplasmosis). • Referral to ophthalmologist for retinal examination every 6 months if the CD4 count is <50 cells/μL. • Refer immediately if the patient has retinal lesions or new visual disturbances.																					
Ears/Nose	• Examine ear canals and tympanic membranes. • Visualize nasal turbinates. • Palpate frontal and maxillary facial sinuses.																					
Oral Cavity	• Good lighting is essential for this examination. • Examine: • Gingiva and teeth (note loss of teeth, decay, or inflammation) • Mucosal surfaces (with dentures removed) (note any lesions or discolorations) • Posterior tongue • Tonsils (note absence or presence; any abnormality in tonsil size) • Pharynx (note lesions or exudate) • Refer to oral health specialist for examination.																					
Endocrine	• Check thyroid for enlargement, tenderness, nodules, and asymmetry.																					
Lymph Nodes	• Document site and characteristics of each palpable node. <table><thead><tr><th colspan="2">Node Sites:</th><th>Characteristics:</th></tr></thead><tbody><tr><td>• Posterior cervical chain</td><td>• Supraclavicular</td><td>• Size (two dimensions, in millimeters)</td></tr><tr><td>• Anterior cervical chain</td><td>• Submental</td><td>• Consistency (hard, fluctuant, soft)</td></tr><tr><td>• Submandibular</td><td>• Axillary</td><td>• Tenderness</td></tr><tr><td></td><td>• Epitrochlear</td><td>• Mobility</td></tr><tr><td></td><td>• Inguinal</td><td>• Definition (discrete, matted)</td></tr><tr><td></td><td>• Femoral</td><td>• Symmetry</td></tr></tbody></table>	Node Sites:		Characteristics:	• Posterior cervical chain	• Supraclavicular	• Size (two dimensions, in millimeters)	• Anterior cervical chain	• Submental	• Consistency (hard, fluctuant, soft)	• Submandibular	• Axillary	• Tenderness		• Epitrochlear	• Mobility		• Inguinal	• Definition (discrete, matted)		• Femoral	• Symmetry
Node Sites:		Characteristics:																				
• Posterior cervical chain	• Supraclavicular	• Size (two dimensions, in millimeters)																				
• Anterior cervical chain	• Submental	• Consistency (hard, fluctuant, soft)																				
• Submandibular	• Axillary	• Tenderness																				
	• Epitrochlear	• Mobility																				
	• Inguinal	• Definition (discrete, matted)																				
	• Femoral	• Symmetry																				

Table 2. Physical Examination (continued)

Regions	Recommendation/Notes
Lungs	- Inspect, auscultate, and percuss. - Note any abnormal sounds including crackles or wheezes (e.g., signs of infections, asthma, and congestive heart failure). - Note any absence of air movement (e.g., pneumothorax, pleural effusion).
Heart	- Examine for jugular venous distention (JVD). - Palpate for point of maximal impulse (PMI). - Note rate and rhythm, heart sounds, murmurs, extra heart sounds.
Breasts	- Palpate for breast masses in both men and women. - Check for symmetry, nipple discharge, dimpling, and masses.
Abdomen	- View: examine for distention, obesity, undernutrition, vascular prominence, petechiae. - Auscultate; note bowel sounds. - Percuss; record liver size. - Palpate for hepatomegaly, splenomegaly, masses, tenderness or rebound tenderness.
Genitals / Rectum	- Inspect the genitalia and perirectal area; note lesions, warts, etc. - Look for discharges, ulcerative lesions, vesicles, or crusted lesions; take samples for diagnostic studies (e.g., for chlamydia, gonorrhea, herpes simplex virus, syphilis, chancroid, as appropriate).
Female Patients	- Perform speculum examination; note any lesions on vaginal walls or cervix. - Obtain a Papanicolaou (Pap) test. - Obtain endocervical swab for gonorrhea and chlamydia, and a posterior pool swab for wet mount evaluation for trichomoniasis, candidiasis, and bacterial vaginosis. - Consider anal Pap test, especially if the patient has a history of an abnormal cervical Pap test or genital warts (perform before introduction of lubricant).* - Bimanual examination; note size of uterus and ovaries, shape, and any tenderness or pelvic pain. - Rectal examination (e.g., for anorectal lesions, warts) and evaluation of posterior uterine abnormalities.
Male Patients	- Examine external genitalia; note whether patient is circumcised; note any lesions, discharge, or other abnormalities, as above. Perform testicular examination for masses, tenderness. - Consider anal Pap test (perform before introduction of lubricant).* - Digital rectal examination to evaluate rectal tone, discharge or tenderness, masses, or lesions; perform prostate examination if appropriate.
Extremities / Musculoskeletal	- Joints; note any enlargement, swelling, or tenderness. - Muscles; for the major muscle groups, evaluate muscle bulk (normal or decreased), tenderness, or weakness. - Look for evidence of peripheral fat atrophy. - Consider measuring baseline arm, thigh, and chest circumferences for later comparison. - Note nail changes (clubbing, cyanosis, thickening, discoloration). - Assess for pedal or leg edema.
Habitus	- Look carefully for signs of lipoatrophy or lipohypertrophy, wasting, or obesity. - Subcutaneous fat loss (face, extremities, buttocks). - Central fat accumulation (neck, dorsocervical area, breasts, abdomen).

Table 2. Physical Examination (continued)	
Regions	Recommendation/Notes
Skin	- Examine the entire body, including scalp, axillae, palms, soles of feet, and pubic and perianal areas. - Describe all lesions (e.g., size, borders, color, symmetry/asymmetry, distribution, raised/flat, induration, and encrustation). - Note evidence of folliculitis, seborrheic dermatitis, psoriasis, Kaposi sarcoma, fungal infections, prurigo nodularis, etc. - Note any tattoos or body piercings.
Neurologic	Assess the following: - Mental status, including orientation, registration, recent and remote memory, and ability to calculate (serial subtraction) - Cranial nerves - Peripheral sensory examination, including pinprick, temperature, and vibratory stimuli - Extremity strength and gait to discern myopathy, neuropathy, and cerebellar disease - Fine motor skills such as rapid alternating movements (often abnormal in dementia) - Deep tendon and plantar reflexes
Psychiatric	- Assess the patient's general mood (e.g., depressed, anxious, hypertalkative). - Note verbal content (e.g., whether the patient answers questions appropriately; unusual or odd content). - Note inappropriate or unusual behavior, such as extremes of denial, hostility, or compulsiveness. - See section <i>Neuropsychiatric Disorders</i> for more complete information on common pathologies. - If the possibility of an emergency situation exists (e.g., potential suicide or violence), refer to crisis mental health services for immediate evaluation.

* Anal Pap test: Consider this test if follow-up evaluation of an abnormal Pap test result is available. Rates of anal dysplasia and anal cancer are higher in HIV-infected women and men than in HIV-uninfected individuals; see chapter *Anal Dysplasia*.

A/P: Assessment and Plan

After completing the initial history and physical examination, do the following:

- Enter the information garnered through the history and physical examination into the patient's chart or database.
- Continue to develop the problem list, assessment, and plan for patient care.
- Complete follow-up or laboratory studies suggested by the history and physical examination. (See chapter *Initial and Interim Laboratory and Other Tests*.)
- Prescribe opportunistic infection prophylaxis as appropriate. (See chapter *Opportunistic Infection Prophylaxis*.)
- Arrange for any appropriate vaccinations. (See chapter *Immunizations for HIV-Infected Adults and Adolescents*.)
- Refer for dental, nutrition, and social services, as well as case management and mental health care, as appropriate.
- Refer for any additional specialty care needs identified in the history or physical examination.
- Make follow-up appointment with health care provider.
- Answer the patient's questions.

Initial and Interim Laboratory and Other Tests

Background

This chapter discusses the laboratory tests and other monitoring that should be performed for HIV-infected individuals. This involves testing for staging HIV infection, screening for comorbidities, establishing baselines before treatment with antiretroviral (ARV) medications, and monitoring responses to ARV therapy (ART).

Note that documentation of HIV infection by laboratory testing is essential for each patient, and it should be included in the patient’s chart.

HRSA HAB Performance Measures

Percentage of patients, aged 6 months and older with a diagnosis of HIV/AIDS, with at least two **CD4 cell counts or percentages** performed during the measurement year at least 3 months apart

(All-Age measure)

Percentage of patients, regardless of age, with a diagnosis of HIV who had an **HIV drug resistance test** performed before initiation of HIV antiretroviral therapy if therapy started during the measurement year

(All-Age measure)

Percentage of patients, regardless of age, with a diagnosis of HIV with a **viral load test** performed at least every 6 months during the measurement year

(All-Age measure)

Percentage of patients aged 3 months and older with a diagnosis of HIV/AIDS, for whom there was documentation that a **tuberculosis screening test** was performed and results interpreted (for tuberculin skin tests) at least once since the diagnosis of HIV infection

(All-Age measure)

Percentage of patients for whom **hepatitis C screening** was performed at least once since the diagnosis of HIV

(Adult and Adolescent measure)

Percentage of patients, regardless of age, for whom **hepatitis B screening** was performed at least once since the diagnosis of HIV/AIDS or for whom there is documented infection or immunity

(Adult and Adolescent measure)

Percentage of patients, regardless of age, with a diagnosis of HIV who were prescribed HIV antiretroviral therapy and who had a fasting **lipid panel** during the measurement year

(All-Age measure)

Percentage of adult patients with a diagnosis of HIV who had a **test for syphilis** performed within the measurement year

(Adult and Adolescent measure)

Percentage of patients with a diagnosis of HIV at risk of sexually transmitted infections who had a **test for gonorrhea** within the measurement year

(Adult and Adolescent measure)

Percentage of female patients with a diagnosis of HIV who have a **Pap screening** in the measurement year

(Adult and Adolescent measure)

O: Objective**Table 1. Laboratory Evaluations for HIV-Infected Patients**

Test	Rationale	Result		Frequency and Comments
HIV Confirmation, Staging and ART Monitoring				
HIV Antibody	Confirm diagnosis, if not documented previously			At entry to care
CD4 Count	- For HIV staging and prognosis - Helps guide urgency of ART initiation - Indicates risk of opportunistic illnesses and guides initiation of prophylaxis against opportunistic infections - Used to monitor immune reconstitution during ART	Reported in cells/μL		- Perform at baseline (twice). - Repeat every 3-6 months for stable patients on or off ART; may repeat every 6-12 months if stable and suppressed viral load. - Repeat if results are inconsistent with the clinical picture or with previous trends. - See chapter <i>CD4 and Viral Load Monitoring</i>.
CD4 Percentage	- Used in addition to the absolute CD4 count for monitoring trends; may be discrepant with absolute CD4 <i>Pneumocystis pneumonia</i> prophylaxis is indicated for CD4 percentage <14% regardless of absolute count	CD4 Count (cells/ μ L)	Expected CD4 Percentage	Usually obtained with absolute CD4 count.
		>500	>29%	
		200-500	14%-28%	
		<200	<14%	
Quantitative Plasma HIV RNA (HIV Viral Load)	- Estimates level of HIV replication - Used to monitor effect of ART - May be used to identify acute HIV infection; has high sensitivity in setting of acute infection, when antibody may be negative	- Reported in copies/mL - In untreated patients, detectable (with rare exceptions) and measured to the upper limit of detection (usually >500,000 copies/mL) - For patients taking ART, ideally suppressed to undetectable levels (usually <40 or <75 copies/mL)		- Perform at baseline (twice). - For patients on new or modified ART regimen: perform 2-8 weeks after initiation or change in ART, then every 4-8 weeks until viral load is suppressed. - For patients on stable ART: perform every 3-4 months (if stable and viral load suppressed >2-3 years, consider every 6 months). - For patients not taking ART: perform every 3-6 months; more frequently if CD4 count is low. <i>Factors that may temporarily increase viral load:</i> - Immunizations - Active infections

Test	Rationale	Result	Frequency and Comments
Predicting Safety and Efficacy of ARVs			
Drug Resistance Testing (Genotype, Phenotype)	To assess whether the patient's HIV virus is likely to be resistant to specific ARV medications	- Genotype: detects specific mutations to ARV medications - Phenotype: measures HIV viral replication in the presence of ARVs	- Genotype is recommended for all ARV-naïve patients. For greatest accuracy, should be done as early as possible in the course of HIV infection. - Acute or primary infection: recommended (genotype). - Chronic infection and treatment naïve: recommended before initiation of ART. (genotype). If resistance test was performed at entry, consider repeat testing. - Pregnancy: recommended before initiation of ART (repeat if done earlier) or for patients with detectable HIV RNA while taking ART. - Virologic failure: recommended. - Obtain genotype for integrase mutations if integrase inhibitor resistance is a concern. (See chapter <i>Resistance Testing</i> for more information.)
Coreceptor Tropism Test	Determine coreceptor tropism	If CXCR4-tropic (or dual/mixed tropic) virus is detected, CCR5 antagonist is not likely to be effective and should not be used	- Test before making decision to treat with CCR5 antagonist, or if virologic failure occurs while on a CCR5 antagonist (phenotypic assay preferred). - For standard assay, HIV RNA must be >1,000 copies/mL (a proviral DNA test is available for samples with HIV RNA below limits of detection; has not been clinically validated).
HLA-B*5701	Establish risk of hypersensitivity reaction to abacavir	If positive, high risk of abacavir hypersensitivity reaction; abacavir should not be used	Test before starting treatment with abacavir.

Test	Rationale	Result	Frequency and Comments
Baseline and Subsequent Hematologic, Renal, Hepatic, and Metabolic Screening			
Complete Blood Count (CBC) with Differential and Platelets	• Detects anemia, thrombocytopenia, leukopenia	• Normal	• Perform at baseline. • Repeat every 3-6 months.
		• Abnormal	• Requires follow-up evaluation as indicated; may influence choice of ARVs. • Repeat more frequently if the patient's results are abnormal or if the patient is taking bone marrow suppressive drugs (including zidovudine).
Chemistry Profile Electrolytes, Creatinine, eGFR (Estimated Glomerular Filtration Rate), Blood Urea Nitrogen Liver Transaminases, Bilirubin (Total and Direct)	• Detects electrolyte abnormalities, kidney disease, liver disease	• Normal/abnormal	• Perform at baseline; before starting ART. • Repeat 2-8 weeks after starting or modifying ART, then every 3-6 months if stable. • May influence ARV selection. • May be useful in monitoring drug toxicities. • Abnormalities should prompt evaluation of cause.
Urinalysis with Urine Protein and Creatinine	• Used to screen for kidney disease	• Normal/abnormal	Screen at baseline and before initiation or change of ART regimen. Repeat every 12 months. Repeat every 6 months for patients on tenofovir, more frequently if indicated. Abnormalities should prompt evaluation of cause. See chapter <i>Renal Disease</i>.

Test	Rationale	Result	Frequency and Comments
Baseline and Subsequent Hematologic, Renal, Hepatic, and Metabolic Screening (continued)			
Lipid Profile (Total Cholesterol, LDL, HDL, Triglycerides); fasting	Detects dyslipidemia, identifies risk factors for cardiovascular disease	Normal/abnormal	- Baseline; before starting ART. - Consider repeating 4-8 weeks months after starting or changing ART. - Repeat annually if normal (on or off ART), or more frequently (e.g., every 6 months) if abnormal or risk of cardiovascular disease. - May influence ARV selection. - May be useful in monitoring drug toxicities. See chapter <i>Dyslipidemia</i>.
Glucose (preferably fasting) or hemoglobin A1C	Detects diabetes and hyperglycemia	Normal/abnormal	- Baseline; before starting ART. - Repeat every 3-6 months if abnormal, every 6 months if normal on ART; every 12 months if normal and not on ART. - May influence ARV selection. - May be useful in monitoring drug toxicities. See chapter <i>Insulin Resistance, Hyperglycemia, and Diabetes on Antiretroviral Therapy</i>.
Hepatitis A, B, and C Screening			
Hepatitis A Serology			
Hepatitis A Antibody (HAV IgG)	Screen for immunity to hepatitis A; vaccinate those not immune	Negative	Offer hepatitis A vaccine if indicated. (See chapter <i>Immunizations for HIV-Infected Adults and Adolescents</i>.)
		Positive	Immune; no vaccine necessary.

Test	Rationale	Result	Frequency and Comments
Hepatitis A, B, and C Screening (continued)			
Hepatitis B Serology (See chapter <i>Hepatitis B Infection</i>.)			
Hepatitis B Surface Antigen (HBsAg)	Indicates active hepatitis B	sAg negative	- Most likely, no chronic infection (may be falsely negative). - Vaccinate if HBsAb negative (not immune).
		sAg positive	Indicates chronic or acute hepatitis B infection; requires further evaluation (check HBV DNA). (See chapter <i>Hepatitis B Infection</i>.)
Hepatitis B Core Antibody (Anti-HBc, IgG)	Indicates past infection or ongoing infection	Anti-HBc negative	The patient most likely has not been infected with hepatitis B; consider vaccination if HBsAb negative and HBsAg negative.
		Anti-HBc positive	- The patient most likely has been infected with hepatitis B; this test alone does not distinguish past exposure and active infection. - In rare cases, may be falsely negative in some patients with chronic infection. - If sAb negative and sAg negative, check HBV DNA to rule out active infection; vaccinate if HBV DNA is not detected. - If sAb is positive, patient is immune.
Hepatitis B Surface Antibody (Anti-HBs)	Indicates immunity status	Anti-HBs negative	The patient is not immune to hepatitis B; consider vaccination, unless patient has active hepatitis (sAg positive or HBV DNA positive).
		Anti-HBs positive	The patient is immune to hepatitis B either by previous infection or by immunization; may be negative in acute hepatitis B infection.

Test	Rationale	Result	Frequency and Comments
Hepatitis A, B, and C Screening (continued)			
Hepatitis C Serology (See chapter <i>Hepatitis C Infection</i> .)			
Hepatitis C Antibody (HCV IgG)	Hepatitis C status	HCV negative	- Patient is not infected with hepatitis C. - Screen at baseline; consider annual screening for high-risk patients, and if clinically indicated.
		HCV positive	Patient has chronic hepatitis C infection or past infection with spontaneous clearance (no protective immunity); confirm positive results with HCV RNA.
Other Opportunistic Infection Screening Tests			
<i>Toxoplasma gondii</i> IgG	Detects past exposure; if positive, patient has increased risk of developing CNS toxoplasmosis if CD4 count <100 cells/μL	Negative	Repeat if patient becomes symptomatic or when CD4 count drops to ≤100 cells/μL.
		Positive	- Note as baseline information. - Start toxoplasmosis prophylaxis if CD4 count drops to ≤100 cells/μL.
Tuberculosis (TB) Screening TST (Tuberculin Skin Test) or IGRA (Interferon-Gamma Release Assay) (if no history of TB or positive TB screening test in the past)	Detects latent TB infection (LTBI)	Normal	- Repeat every 12 months if high risk of repeated or ongoing exposure. - Repeat if CD4 count was <200 cells/μL on initial test but increases to >200 cells/μL on ART.
		Abnormal (TST induration ≥5 mm or positive IGRA)	Evaluate for active TB. (See chapter <i>Latent Tuberculosis Infection</i>.)
Chest X-Ray (if pulmonary symptoms are present or positive LTBI test)	Detects latent or active diseases	Normal	Repeat as indicated for pulmonary symptoms or positive LTBI test.
		Abnormal	Evaluate for TB, PCP, or other pathology.

Test	Rationale	Result	Frequency and Comments
Other Opportunistic Infection Screening Tests (continued)			
Papanicolaou Test (cervical for women; consider anal for women and men)	• Detects abnormal cell changes, dysplasia	• Normal	• Cervical: Repeat in 6 months, then annually if negative on two tests and no ongoing risk factors. • Anal: No national guidelines; consider screen at baseline. Follow-up interval has not been determined; consider same as in cervical Pap screening.
		• Abnormal	• Perform workup, treat (see chapters <i>Cervical Dysplasia</i> and <i>Anal Dysplasia</i>) and follow up as indicated by condition.
Pregnancy Screening			
Pregnancy Test	• Indicates pregnancy status	• Positive/negative	• Perform before starting efavirenz (given risk of teratogenicity). • If positive, consider ART initiation; avoid efavirenz in first trimester (see chapters <i>Reducing Perinatal HIV Transmission</i> and <i>Care of HIV-Infected Pregnant Women</i>).
Sexually Transmitted Disease Testing			
Serum VDRL (Venereal Disease Research Laboratory) or RPR (Rapid Plasma Reagin) (some centers screen using a treponemal test)	• Screen for syphilis at least annually in sexually active persons who are at risk; for men who have sex with men (MSM) with multiple partners: every 3-6 months	• Negative/nonreactive	• Counsel about safer sex and avoiding STDs. • Repeat every 3-12 months, depending on risk factors.
		• Positive/reactive: confirm with treponemal test	• Treat patient; refer partner(s) for evaluation and treatment; counsel about safer sex. (See chapter <i>Syphilis</i>.) • Perform serial testing if monitoring active disease. (See chapter <i>Syphilis</i>.)

Test	Rationale	Result	Frequency and Comments
Women			
Gonorrhea (GC) and Chlamydia (CT) Testing	Screen for STDs in sexually active women at risk according to CDC and USPSTF guidelines; screen all ≤25 years of age at baseline and at least annually; more frequently if risk factors Screen all sites of possible exposures: • Pharynx (recommended for GC screening) • Cervix/vagina • Rectum	• Negative	• Counsel about safer sex and avoiding STDs. • Repeat every 6-12 months; more frequently if at high risk (e.g., adolescents).
		• Positive	• Treat patient; refer partner(s) of previous 60 days for evaluation and treatment; counsel about safer sex. • Retest at 3 months.
Trichomoniasis Testing	• Wet mount (insensitive), culture or nucleic acid amplification test (NAAT) of vaginal secretions • Screen HIV-infected women annually	• Negative	• Counsel about safer sex and avoiding STDs. • Repeat every 12 months.
		• Positive	• Treat patient; refer partner(s) for evaluation and treatment; counsel about safer sex. • Retest at 3 months.
Men			
Gonorrhea (GC) and Chlamydia (CT) Testing	• Screen for STDs in sexually active men who are at risk according to CDC guidelines, especially MSM • Screen all MSM at baseline and at least annually; frequency of subsequent testing depends on risk factors • Screen sites of possible exposures: • Pharynx, if receptive oral sex (recommended for GC screening) • Rectum, if receptive anal sex • Urethra for MSM, if insertive oral or anal sex	• Negative	• Counsel about safer sex and avoiding STDs. • Retest every 3-12 months, depending on risk factors.
		• Positive	• Treat; refer partner(s) of previous 60 days for evaluation and treatment; counsel about safer sex. • Retest at 3 months.

Test	Rationale	Result	Frequency and Comments
Consider/Optional			
G6PD Level	Prevent hemolytic reactions to certain medications by screening higher-risk patients (African, Mediterranean, Asian, Sephardic Jewish descent); some would recommend screening all patients	• Normal range	• No intervention is necessary beyond documentation.
		• Abnormal range	• Avoid oxidant drugs such as dapsone, primaquine, and sulfonamides, if possible.
Cytomegalovirus (CMV) Antibody (anti-CMV IgG) (for those at low risk of CMV, especially those who are not MSM or injection drug users)	Detects exposure; may reveal future disease risk	• Negative	- Avoid exposure by practicing safer sex. - If blood transfusion is required, use CMV-negative or leukocyte-reduced blood.
		• Positive	• Be aware of disease risk in advanced HIV infection, when CD4 count is <50 cells/ μ L.
Varicella zoster (Varicella IgG) (for those without history of chickenpox or shingles)	Detects exposure	• Negative	• Consider vaccination, if CD4 count is >200 cells/ μ L.
		• Positive	• No intervention is necessary.
Dilated Retinal Examination	Detects CMV, ophthalmic toxoplasmosis, or HIV retinopathy	• Normal	- If CD4 count is >100 cells/μL, repeat annually. - If CD4 count is <50 cells/μL or symptoms of retinal changes are present, repeat every 6 months.
		• Abnormal	• Follow up immediately with ophthalmologist.

Patient Education
