According to FDCF, 2020 Florida Youth Substance Abuse Survey State (FYSAS) report, substance use among students in Florida continues to decline. Among middle and high school students in Florida, between 2010 and 2020, the prevalence of lifetime alcohol use decreased from approximately 52% to 35% and the past-30-day prevalence of alcohol use decreased from 29% to 15%. Regarding marijuana use, the prevalence of lifetime and past-30-day marijuana use among middle and high school students also decreased between 2010 and 2020. Lifetime prevalence decreased from approximately 24% to 20% and past 30-day prevalence decreased from 13% to 11%. According to estimates from the 2022 FYSAS, among high schoolers the lifetime prevalence is 2.8% for opioid misuse, 4.1% for stimulant misuse, and 5.7% for opioid and stimulant misuse.⁴⁵

Section 381.0038(4), F.S., or the Infectious Disease Elimination Act (IDEA), was passed by the Florida Legislature in 2016 and in 2019, the Governor signed a bill amending IDEA to allow county commissions to authorize syringe exchange programs in their county by way of county ordinance. The IDEA legislation mandates that SSPs operate a one-to-one exchange; provide or make referrals for HIV and HCV testing; provide access to substance use prevention, education, and treatment; and provide emergency opioid antagonist kits (naloxone kits). A CDC Determination of Need for Florida for SSPs was approved on February 1, 2020. The CDC Determination of Need supports federal funding applications for SSPs and other organizations. In Florida, there are five approved and currently operational SSPs: IDEA Exchange Miami (located in Miami-Dade County) operated by the University of Miami Miller School of Medicine, the SPOT (in Broward County) operated by Care Resource, the Rebel Recovery SSP (in Palm Beach County) implemented by Rebel Recovery FL, IDEA Exchange Tampa (in Hillsborough County) implemented by Tampa General Hospital and the University of South Florida, and IDEA Orlando (in Orange County) implemented by Hope and Help. An SSP in Pinellas County will be opening their doors in 2022.

Apart from federal funds, grants and donations are the only authorized funding sources for SSP operations in Florida. The five currently operating SSPs receive funding for harm-reduction supplies and services from private grants, donations, and foundations. FDCF donates naloxone nasal spray kits to the SSPs. All sites report that the biggest barrier to effective implementation and operation of their program is funding for harm-reduction supplies. Current funding is inadequate to support the foundational operation of the exchanges, with one site reporting continuous supply shortages that have led to the SSP closing on certain days of the week at a time when the program was experiencing rapid growth.

Since the inception of FDCF's Overdose Prevention Program, the five operational SSPs have distributed over 30,000 naloxone kits and reported 5,602 reversals or rescues. About 29% of all reversals reported to FDCF are through the SSPs. Supplying SSPs with naloxone kits therefore remains a top priority. As other harm-reduction organizations, recovery community organizations, and peer networks, expand and evolve in ways that engage and maintain relationships with the hardest to reach, most at risk individuals in their communities, they should also receive priority support for naloxone distribution. Additionally, in March 2022, the Florida Harm Reduction Collective (FLHRC) established a mail-based naloxone distribution program. The FLHRC comprises of recovery community organizations, overdose prevention programs, SSPs, CBOs, and other stakeholders working to decrease the harms of drug use and eliminate

the stigma associated with harm-reduction. Since March 2022, FLHRC has distributed 1,482 naloxone kits and received 104 reports of overdose reversals through their mail-based naloxone distribution efforts.

Florida's overdose epidemic continues to pose a considerable challenge that the Department addresses through surveillance, prevention, education, and policy efforts. The Florida Overdose Data to Action (OD2A) program has a direct connection to the State Health Improvement Plan and the Department's Strategic Plan. The Department also recently launched an initiative to make naloxone kits available at all 67 CHDs. In 2021, as part of the nationwide opioid litigation undertaken by more than a dozen states, Florida was able to secure more than \$1 billion in settlement funds which will be used to support prevention, treatment, and recovery related services.

The Department supports the IDEA Exchange Miami to provide training and technical assistance to new SSPs, as well as education to local communities on the evidence behind SSPs in the prevention of HIV, HCV, and overdose. Another project, supported by the congenital syphilis grant routinely screens women who inject drugs for HIV and syphilis to reduce the likelihood of babies born with congenital syphilis and link women to treatment and care. Lastly, we will create tangible and measurable steps in addressing viral hepatitis statewide by developing a robust hepatitis elimination plan. We will focus on priority populations disproportionately affected by hepatitis A, B, and C through improving access to prevention, diagnosis, and treatment and increasing vaccination among those priority populations. Also, we will increase access to medication-assisted therapies and linkage to HCV treatment among PWID.

During FY 2021–2022, FDCF deployed HIV Early Intervention Services set-aside funding from the SAMHSA Substance Abuse Prevention and Treatment Block Grant to conduct 18,313 HIV tests across 47 treatment provider sites. A total of 163 tests were positive for HIV.

Comprehensive Health Education and Interventions for Youth

In 2020, more than 31,656 persons between 15 and 19 years of age in Florida were diagnosed with a bacterial STI (syphilis, chlamydia, gonorrhea), for a rate of 2,611 per 100,000 population as shown in Figure 24. These numbers are down slightly from previous years due to the lack of testing and access to testing during the COVID-19 crisis. The presence of an STI increases a person's risk of acquiring HIV. The teen birth rate in Florida has decreased by 59.7%, from 37.2 per 1,000 population in 2009 to 15.0 per 1,000 population in 2020. Of the 4,708 HIV diagnoses in Florida in 2021, 13% (634) were among 13 to 24-year-olds, of whom 53% were Black, 33% were Hispanic/Latino, 12% were White, and 2% were multiracial/other. Most youth diagnoses were attributed to sexual contact, with only 2% attributed to other risks. Of the 2,678 young PWH in Florida in 2021, 67% had a suppressed viral load (versus 69% for all PWH in Florida).

FIGURE 24: TEEN STI RATES

Section 1003.42(2)(n), F.S., requires comprehensive health education that incorporates disease prevention and includes language on the benefits of sexual abstinence and the consequences of teenage pregnancy. Additionally, section 1003.46, F.S., allows school boards to include additional instruction regarding HIV/AIDS. Such instruction may include information about “means used to control the spread of [AIDS].” As outlined in section 1003.42, F.S., parents may submit a written request to the school principal to exempt their child from “the teaching of reproductive health or any disease, including HIV/AIDS, its symptoms, development, and treatment.” Specific content in any subject matter is determined by local school district policy, which gives districts the latitude to determine the type of education program that is implemented. Florida plans to look for alternative settings in which to provide HIV education to youth such as recreation centers, after-school programs, faith-based programs, youth coalitions, and juvenile justice facilities.

Perinatal HIV Prevention Efforts

Perinatal transmission of HIV is when HIV is passed from a woman with HIV to her child during pregnancy, childbirth, or breastfeeding. The use of HIV medicines and other strategies have helped to lower the rate of perinatal transmission of HIV to 1% or less in the US and Europe.³⁷ In Florida, the Department is actively managing the following perinatal HIV initiatives:

- Targeted Outreach for Pregnant Women Act (TOPWA)** – Section 381.0045, F.S., also known as the “Targeted Outreach for Pregnant Women Act of 1998” provides a state funding appropriation for programs to provide outreach and linkage services to pregnant women who may not seek proper prenatal care, who suffer from substance-use disorders, or who are living with HIV or are at increased risk for HIV acquisition. TOPWA providers serve pregnant women who are HIV negative and those living with HIV to ensure they are linked to and receive adequate prenatal care and adhere to medical treatment to prevent perinatal transmission. There are seven funded TOPWA programs in Florida and they provided services to 1,772 clients in 2021. Black females represented 45% of enrollees, Hispanic females represented 44%, and White females represented 7%. Females living with HIV made up just under 8% of TOPWA enrollments.

- **Fetal Infant Mortality Review (FIMR)/HIV Prevention Methodology** – The Department is developing a FIMR/HIV Prevention Methodology in conjunction with a Community Action Team. These efforts are part of a larger effort the Department is undertaking to reduce communicable diseases in WCBA to include congenital syphilis, HBV, and HCV.
- **Baby Rxxpress** – The Department’s Baby Rxxpress program provides a six-week course of ARV medication to newborns with HIV exposure, lowering the risk of mother-to-child HIV transmission to less than 1%. In 2020, Baby Rxxpress filled 344 prescriptions for ARV medications for 256 newborns with HIV exposure at a cost of \$13,556.00, or just under \$53 per baby. Baby Rxxpress maintains over 85 participating pharmacies across the state. Participating partners include Empath Health Pharmacy, Health Matters Pharmacy, Walgreens Co., Jackson Pharmacy (three specialty locations), Scripts Pharmacy, and Jackson Drugs.

HIV High-Impact Prevention (HIP) Provider Network

In early 2019, the Department made awards for HIP Request for Applications (RFA) 18-001. HIP RFA 18-001 was released in fall 2018 and provided non-profit organizations an opportunity to apply for funding provided by the Department through the state’s integrated HIV prevention and surveillance grant. A total of \$10 million from this grant was allocated and 44 awards were made to organizations throughout the state that serve Florida’s priority populations. Three-year contracts were executed beginning January 1, 2019, and ending on December 31, 2021, with the option for up to three, one-year renewals. These awards have the ability to be continued through December 31, 2024.

Funded HIP providers deliver a wide array of services, depending on the category of funding and includes, but are not limited to, routine and prioritized testing; integrated STI screening, linkage and reengagement to prevention and care services; interventions for PWH and persons at increased risk of acquiring HIV; PrEP and PEP services; condom distribution; outreach, education, and community engagement; social media and marketing; and essential support services.

In 2021, a total of 12,281 PWH received risk-reduction interventions through contracted HIP providers. Of the PWH receiving risk-reduction interventions, 39.5% identified as MSM, 29% identified as heterosexual males, 28.7% identified as heterosexual females, and 2.8% identified as transgender. Interventions for PWH include Partnership for Health, CLEAR, ARTAS, Healthy Relationships, Connect, Peer Support, and personalized risk-reduction counseling.

Forty-one of the 44 funded HIP providers deliver PrEP screening and referrals and 16 of the providers are able to prescribe for PrEP onsite. In 2021, approximately 42,138 clients of HIP providers were found to be eligible for PrEP services, and, of those, 24,562 were referred for PrEP services and 1,211 were prescribed PrEP.

Risk-reduction interventions for HIV-negative persons at increased risk for acquiring HIV are also delivered by contracted HIP providers. In 2021, a total of 16,235 HIV-negative persons received risk reduction interventions through contracted HIP providers and of those, 43% identified as heterosexual

females, 38% identified as heterosexual males, 18% identified as MSM, and 1% identified as transgender. Interventions for persons with a negative or unknown HIV status include VOICES, CLEAR, Social Network Strategy, Mpowerment, Popular Opinion Leader, Personalized Cognitive Counseling, RESPECT, Community PROMISE, HIV and STD educational sessions, and personalized risk reduction counseling services.

HIP providers are also required to screen clients and refer them to essential support services to assist with housing, transportation, mental health, substance use disorder, and other barriers to care. In 2021, HIP providers screened 51,306 clients for essential support services; 21,224 were referred to services and 2,032 were linked to essential support services.

HIV Minority Media Campaign

In 1999, the Department established a statewide minority media campaign for HIV prevention, as required by section 381.046, F.S. This campaign was most recently rebranded in 2017 with the theme “Protect Yourself.” In 2020, the campaign evolved to include the stories and testimonials of real individuals from Florida impacted by HIV. Figure 25 provides an example of how the Protect Yourself campaign images were used.

FIGURE 25: PROTECT YOURSELF CAMPAIGN IMAGE

The Protect Yourself campaign is implemented across all industry standard platforms including broadcast radio and television, digital and mobile advertising, out-of-home advertising (billboards, bus stops), a dedicated website, social media, and public outreach events. The Department works with local areas to supplement media buys as applicable. The Department updates the campaign annually with input from local and statewide advisory and work groups. During COVID-19, the HIV media campaign was instrumental in getting out social media messaging and website content to populations at risk for or living with HIV. More recently, the HIV media campaign was used to quickly disseminate information and messaging for HIV priority populations related to hepatitis A, meningococcal disease, and Mpox virus. Moving forward, the Department plans to broaden the scope of the campaign to address syndemics (STIs, viral hepatitis).

As previously discussed in Section 2.5, the Department announced its endorsement of the Prevention Access Campaign’s U=U in June 2020. In becoming a U=U partner, the Department joined nearly 1,000 organizations around the world supporting the science-backed message that PWH who use antiretroviral

therapy and have an undetectable viral load in their blood have effectively no risk of sexually transmitting HIV.

4.4 RESPOND Quickly to Potential HIV Outbreaks to Get Needed Prevention and Treatment Services to People Who Need Them

Cluster Detection and Response Plan

The Department is actively conducting surveillance and investigation for HIV clusters. The Department routinely conducts monthly analysis to detect rapidly growing molecular clusters and time-space clusters of public health significance. Additionally, a state level cluster review committee is convened monthly to review cluster data, discuss challenges, and brainstorm strategies to improve the statewide response. Since fall 2021, the state health office has established routine communication with CHDs experiencing clusters to coordinate and guide local responses to investigate and respond to clusters. Florida's updated HIV Cluster Detection and Response plans were submitted to CDC in fall of 2021 and will be updated in 2023. The Department's Bureau of Communicable Diseases plans to engage community stakeholders in further development of the cluster detection and response plan and will accomplish this through the FCPN and associated workgroups, RWHAP partners, and other stakeholders.

Increase Receipt of Genotype Test Results

As the number of analyzable HIV-1 genotype sequences reported to the state has decreased and the number of physicians ordering those tests has also decreased, the Department will enhance physician capacity to order genotype testing for those newly diagnosed or those not on ART returning to care. Figure 26 breaks out resistance type with a genotype sequence.

FIGURE 26: HIV-1 ANTIRETROVIRAL DRUG RESISTANCE IN HIV DIAGNOSES WITH A GENOTYPE SEQUENCE 2021, FLORIDA

The Department is engaging laboratories to improve the completeness and timeliness of electronic laboratory reporting of all reportable HIV lab results including genotype consensus sequences used in transmission network analyses. To increase the receipt of genotypes test results, the Department and its partners are:

- Developing a protocol with the Department’s Bureau of Public Health Laboratories to facilitate access to HIV genotype testing.
- Engaging and educating providers on current HRSA recommendations to order baseline genotypes for newly diagnosed and those returning to care and increase understanding of clinical and epidemiological importance of these tests.
- Educating providers and laboratories on statutory reporting requirements for HIV.
- Educating provider population on response and genotype testing.
- Creating a health care provider letter demonstrating the importance of genotype testing.
- Collaborating with the University of Florida to conduct focus groups on molecular surveillance.
- Conducting laboratory survey on current types and volume of HIV testing in Florida.
- Conducting provider survey on current test ordering strategies.
- Creating of a laboratory report card for laboratories and providers to facilitate improvements.

Data to Care (D2C)

HIV is a reportable disease where routinely collected surveillance data are used as a strategic tool to trigger HIP activities. The D2C initiative is a HIP activity that relies on the use of surveillance data to generate lists of persons living with HIV not in care in Florida. Linkage services are offered to those not receiving treatment by connecting them with HIV care. Florida is a high-morbidity state that has implemented a statewide D2C program since 2015, with the goal of reaching individuals who were not linked to HIV care in one month of diagnosis or if not virally suppressed and part of an HIV transmission cluster and network. In partnership with the six RWHAP Part A programs located in the seven EHE counties and through funding received by Georgetown University, the Department is embarking on a data sharing effort to improve linkage to HIV care for persons out of care in those jurisdictions. Enhancing and expanding on the prioritization of D2C activities by focusing on priority populations that need linkage to care, for example, homeless persons, non-White minorities, non-U.S. born, and persons who inject drugs are populations with the highest rate (>21%) of being out of care (no care in the past 12 months) in 2021, compared to the state (20%). Furthermore, males with IDU, Black men, and persons aged 13 to 39 are populations with the lowest percentage of viral suppression rates (<68%) in 2021, compared to the state (69%). The Department is also increasing linkage-to-care staff training to promote diverse community wellness.

Education and Outreach

As part of the ongoing efforts to respond to HIV transmission clusters and outbreaks, the Department collaborates to provide education, outreach, and community engagement with Floridians at risk for HIV or currently living with HIV, informing them of available HIV prevention and treatment options and

other resources in their area. The Department will complete the following activities to improve awareness of HIV-related services and cluster detection and response actions:

- Generate an annual surveillance summary detailing the community-level response to transmission networks in areas of high HIV burden.
- Create and develop education materials to improve awareness and reduce anxiety surrounding HIV transmission network response activities citing standard public health practice.

Additionally, several of the RWHAP Part A jurisdictions receiving EHE funding from HRSA have purchased mobile medical units to improve their ability to take services and education to populations and communities.

HIV Criminalization

While molecular HIV surveillance (MHS) cannot determine the directionality of disease transmission, it remains a public and community concern that MHS data could be used in criminal transmission prosecutions. An often-required aspect of criminal prosecutions is the “intent to transmit” disease, which cannot be presumed through molecular surveillance or epidemiologic data. However, the ability to use these data in a criminal prosecution poses a threat to community buy-in of routine public health surveillance practices and the use of these data for improving HIV detection and prevention efforts.⁵⁴ In October 2022, the President’s Advisory Council on HIV/AIDS convened and developed recommendations related to MHS such as: local adaptations of MHS must be responsive to the needs in a given jurisdiction based on reviews of state and local HIV criminalization laws; establishment of community advisory boards focused on MHS and cluster detection and response; and plain language notifications be available to PWH about the types of surveillance being conducted and safeguards in place to protect access to and usage of those data. Education to the community at-large is needed on the recent advancements in biomedical interventions, since PWH on medication and virally suppressed (i.e., U=U) have effectively no risk of transmitting the virus to others through sex.

4.5 Priority Populations

Priority populations for primary HIV prevention are derived from the average proportion of each of the race and mode of exposure groups diagnosed with HIV in the last three years (2019–2021). This information is used to address those at the highest risk of acquiring HIV and with the greatest need for primary prevention services (i.e., services directed toward people who have a negative or unknown HIV status). As shown in Figure 27, the top five priority populations are Hispanic/Latino MSM (28% of new diagnoses over the past three years), Black heterosexuals (20%), Black MSM (18%), White MSM (15%), and Hispanic/Latino heterosexuals (8%).

FIGURE 27: PRIORITY POPULATIONS FOR PRIMARY HIV PREVENTION, FLORIDA, 2021

Priority populations for secondary prevention for PWH represent the proportion of each of the race and mode of exposure groups to the total PWH. Secondary HIV prevention activities are directed toward people with HIV, with the intention of preventing transmission to those who are HIV negative. This information is used to prevent HIV transmission through services provided to PWH in these affected demographic groups. As shown in Figure 28, for 2021, the top priority groups include Black heterosexuals (25%), White MSM (22%), Hispanic/Latino MSM (18%), Black MSM (15%), and Hispanic/Latino heterosexuals (6%). Efforts to reduce the transmission of HIV include improving viral suppression among Black males and females and among WCBA (aged 15 to 44).

FIGURE 28: PRIORITY POPULATIONS FOR SECONDARY HIV PREVENTION FOR PWH, FLORIDA, 2021

There were 120,502 persons with an HIV diagnosis living in Florida through 2021 which is estimated to represent only 86% of persons with HIV—the remainder of whom are unaware of their status (approximately 14%, based on the current CDC methodology used to calculate percentage unaware). Persons living with HIV but unaware of their status also need to be prioritized and underscore the

importance of implementing a status-neutral approach to HIV prevention and care. Routine screening is needed to diagnose persons with HIV who are unaware of their status and rapidly link them to care and treatment to achieve viral suppression.

The full Epidemiological Profile for HIV in Florida, 2021, will be provided as a separate attachment. It was developed in accordance with the Integrated HIV Prevention and Care Plan Guidance, including the SCSN, CY 2022–2026 issued by the CDC and HRSA in June 2021. This document provides a comprehensive data overview of HIV, STDs, and HCV in Florida. The full Epidemiological Profile for HIV in Florida, 2021, will also be used to address CDC-PS18-1802 grant requirements.

5 2022–2026 Goals and Objectives

In January 2021, HHS released the HIV National Strategic Plan: A Roadmap to End the Epidemic 2021–2025 which creates a collective vision for HIV service delivery across the nation. IPC Plans created for every jurisdiction address four goals:

- Prevent new HIV infections.
- Improve HIV-related health outcomes for people with HIV.
- Reduce HIV-related disparities.
- Achieve integrated, coordinated efforts that address the HIV Epidemic among all partners and stakeholders.

Objectives have been identified for each of the four goals, and the details of such are outlined in the subsequent section.

Table 10 outlines the goals and objectives for how Florida will address the strategies to diagnose, treat, prevent, and respond to HIV; the goals and objectives align with the NHAS. Actionable activities have been identified to address each of the goals and objectives, along with other pertinent information to inform a plan of action. Those additional details are described in Appendix 9.1 Strategy and Activity Table.

TABLE 10: GOALS AND OBJECTIVES

Goal	Objective
Goal 1: Prevent New HIV Infections	Objective 1.1. Increase awareness of HIV.
	Objective 1.2. Increase knowledge of HIV status.
	Objective 1.3: Expand and improve implementation of effective prevention Interventions.
	Objective 1.4 Increase capacity of health care delivery systems, public health, and health workforce to prevent and diagnose HIV.
Goal 2: Improve HIV-Related Health Outcome of PWH	Objective 2.1. Link people to care rapidly after diagnosis and provide low-barrier access to HIV treatment.
	Objective 2.2: Identify, engage, or reengage people with HIV who are not in care or not virally suppressed.
	Objective 2.3: Increase retention and adherence to treatment to achieve and maintain long-term viral suppression.

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Goal	Objective
	Objective 2.4: Increase the capacity of the public health, health care delivery systems, and health care workforce to effectively identify, diagnose, and provide holistic care and treatment for people with HIV.
	Objective 2.5 Expand capacity to provide whole-person care to older adults with HIV and long-term survivors.
	Objective 2.6: Advance the development of next-generation HIV therapies and accelerate research for HIV cure.
Goal 3: Reduce HIV-related Disparities	Objective 3.1. Reduce HIV-related stigma and discrimination.
	Objective 3.2. Reduce disparities in new HIV infections, in knowledge of status, and along the HIV care continuum.
	Objective 3.3. Engage, employ, and provide public leadership opportunities at all levels for people with or who experience risk for HIV.
	Objective 3.4: Address social determinants of health and co-occurring conditions that exacerbate HIV-related disparities.
	Objective 3.5: Train and expand a diverse HIV workforce by further developing and promoting opportunities to support the next generation of HIV providers including health care workers, researchers, and community partners, particularly from underrepresented populations.
	Objective 3.6: Advance HIV-related communications to achieve improved messaging and uptake, as well as to address misinformation and health care mistrust.
Goal 4: Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic Among All Partners and Interested Parties	Objective 4.1. Integrate programs to address the syndemic of HIV, STIs, viral hepatitis, and substance use and mental health disorders in the context of social and institutional factors including stigma, discrimination, and violence.
	Objective 4.2 Increase coordination among and sharing of best practices from HIV programs across all levels of government (federal, state, tribal, local, and territorial) and with public and private health care payers, faith-based and CBOs, the private sector, academic partners, and the community.
	Objective 4.3 Enhance the quality, accessibility, sharing, and uses of data, including HIV prevention and care continua data and social determinants of health data.
	Objective 4.4: Foster private-public-community partnerships to identify and scale up best practices and accelerate HIV advances.

6 2022–2026 Integrated Planning Implementation, Monitoring, and Jurisdictional Follow Up

To break down the approach for Integrated Planning Implementation, Monitoring and Jurisdictional follow up, the subsequent sections will detail how best to ensure the success of IPC Plan goals and objectives through the following five key phases:

- Implementation (Section 6.1)
- Monitoring (Section 6.2)
- Evaluation (Section 6.3)
- Improvement (Section 6.4)
- Reporting and Dissemination (Section 6.5)

6.1 Implementation

The Department will continue to coordinate and collaborate with internal and external partners and stakeholders to meet the objectives of the IPC Plan. The Department's RWHAP Part B; RWHAP Part A, C, D, and F programs; PWH; and other members of the FCPN-associated committees, workgroups, and advisory groups (e.g., FL Gay Men's HIV Workgroup, Community HIV Advisory Group, Florida Black Leaders Group, CQM Committee); EHE-funded jurisdictions and directly-funded providers; HIV prevention and care providers; state and local agency administrators; and persons at increased risk for HIV will be included in each step of the IPC Plan implementation, monitoring and evaluation. Through this coordinated implementation approach, the Department and partners can explore opportunities to better leverage funding streams supporting Florida's HIV prevention, care, and treatment services (e.g., CDC and HRSA funding to state and local entities). Implementation progress of the IPC Plan will also be used to identify where more resources (e.g., funding, staffing) may be needed to ensure IPC Plan objectives are met.

6.2 Monitoring

The goal of the monitoring and evaluation plan is to assess successful implementation of the unified IPC Plan as measured by:

- Completion of stated strategies and activities.
- Annual progress toward the target measurements of stated goals, objectives, and benchmarks.

Data are used to direct efforts to ensure the program achieves the intended results and to help identify additional operational and process improvement opportunities.

Through biannual meetings and monthly committee calls, the Department's HIV/AIDS Section and the FCPN will actively participate in regular monitoring of strategies and activities set forth in the unified IPC

Plan. The Department, in collaboration with the FCPN Coordination of Efforts Committee, will establish mechanisms and time frames the state will use to monitor, evaluate, and update the IPC Plan, as necessary. This committee leads efforts to ensure data indicators for plan activities are being tracked and that progress is communicated with appropriate programs and partners to meet plan objectives. Data on performance indicators will be collected and disseminated through a status report to statewide partners. Local planning body feedback will also be collected and shared by FCPN representatives for each respective area. The Department currently uses an electronic dashboard tool to collect EHE-related activity information and consideration is being given to using this tool to collect activity-related information for the IPC Plan. Regular FCPN meetings are the principal mechanism for updating planning bodies and stakeholders on the progress of plan implementation as well as soliciting and using feedback from stakeholders for ongoing plan improvements. A standing agenda item to review IPC activity progress will be added to the state's FCPN meetings. After each FCPN meeting, a summary report is provided to all attendees and shared with community partners; this mechanism will be used to share information on the IPC Plan's progress toward completing activities and achieving objectives.

The IPC Plan will receive a detailed annual review by the Department HIV/AIDS Section leadership. As part of the annual review, the section will use surveillance and program data to assess health outcomes along the HIV Care Continuum that impact the quality of the HIV service delivery system. This will allow for adjustments to be made in response to changing conditions, and information from the review will be provided to FCPN for feedback.

The Department's HIV/AIDS Section, with the engagement of stakeholders, will review the strategic plan using identified measures and indicators to analyze, assess, and evaluate outcomes and determine whether modifications to the IPC Plan are necessary. The diverse range of perspectives—knowledge, values, needs, and abilities—of stakeholders will be applied through a participatory planning and evaluation process. The collaborative approach, structured and arranged to interweave state and local community partnerships with shared discretion and responsibilities, will help to achieve the IPC Plan objectives more effectively than each program could on its own. This approach will align with, support, and advance the goals of the IPC initiative, the NHAS, and the Department, as well as meet CDC and HRSA requirements. As the state of Florida moves forward in ending the epidemic, regularly scheduled events to inform all stakeholders and researchers of relevant data and evidence for improving or, more precisely, monitoring and evaluating the implementation and impact of the IPC Plan is essential. These opportunities will ensure that plan implementers are working with the best available evidence to work toward ending the epidemic.

6.3 Evaluation

Meaningful measures and indicators will be used to monitor both operational performance and progress on objectives, strategies, and activities in the strategic plan. Data are used to make program decisions and direct efforts to ensure the state achieves the intended results and also to help identify additional operational and process improvement opportunities.

The IPC Plan will receive a detailed annual review by HIV/AIDS Section leadership subsequent to Florida's legislative session and the Department's budget planning process. As part of the annual review, the section will use surveillance and program data to assess health outcomes along the HIV Care Continuum which impact the quality of the HIV service delivery system. This will allow for adjustments to be made in response to changing conditions and information from the review will be provided for input and feedback to the FCPN.

Strategic planning, the process generating the statewide IPC Plan, helps focus resources on vital objectives chosen to move the Patient Care and Prevention programs toward fulfillment of the NHAS goals. The IPC Plan identifies key objectives that Florida will pursue in the next five years, along with strategies and activities that will guide and facilitate the necessary actions required to achieve the desired outcomes. Plan objectives each have a corresponding measure for ongoing monitoring. Using meaningful measures and data indicators will ensure Department HIV/AIDS Section leadership, RWHAP Part A partners and the FCPN planning body members are able to manage and track efforts toward the intended results, while identifying improvement opportunities over the course of the five-year period.

Evaluation ensures the strategies and activities are making changes that positively affect outcomes of the IPC Plan objectives. Evaluation that focuses on project outputs, provides accountability for public resources relating to specific actions. It establishes the empirical basis needed for the ongoing cycle of collaborative planning and the actions that need to be accomplished. The evaluation component is an extension of the integrated Plan, Do, Study, Act cycle which is a continuous process. The IPC Plan must be flexible to allow for adjustments as there are changes to external or internal conditions; yet a meaningful evaluation must be integrated in the planning process and include a review and analysis of the intended outcome. The HIV/AIDS Section, with the engagement of stakeholders, will review the strategic plan using meaningful performance measures and indicators to analyze, assess and evaluate outcomes and determine whether modifications to the IPC Plan are necessary. Through participatory evaluation and diverse range of perspectives, knowledge, values, needs, and abilities of stakeholders will be applied to the planning and evaluation process.

6.4 Improvement

Through routine (biannual) monitoring and communication of progress in achieving the goals and objectives outlined in the IPC Plan, the state will identify areas in need of improvement and make necessary adjustments to the IPC Plan. Revisions will be made on an annual basis and items for proposed revision will be reviewed with RWHAP Part A jurisdictions, members of the FCPN and associated workgroups and advisory bodies, and other key stakeholders, voted on, and implemented. The collaborative approach—structured and arranged to interweave state and community partnerships with shared discretion and responsibilities—will help to achieve the IPC Plan objectives more effectively than each program could on its own. This approach will align, support, and advance the goals of the NHAS, the Department, as well as meet CDC and HRSA requirements, to ensure improvement in the access to and quality of HIV prevention and care services throughout Florida.

6.5 Reporting and Dissemination

Summarized annual data are uploaded to the Department's HIV/AIDS Section web page (<http://floridaaids.org/>) and are also available on an internal SharePoint site for internal use at the state and CHD level. Annual data releases include a comprehensive epidemiological profile for the state and for each partnership area, a state slide set presented annually to FCPN and RWHAP partners, and other annual data products. The epidemiological (epi) profiles are an expanded Excel workbook with multiple tabs containing 5-year trend analyses of HIV (demographics, diagnosis, AIDS, deaths, and continuum of care), STIs, HBV, HCV, and TB.

Various factsheets are generated to portray epidemiology and disease highlights for a demographic population. These fact sheets highlight summary data for priority population groups and are updated annually, shared with community stakeholders, and uploaded to the Department's external web and internal SharePoint sites. Integrated slide sets and epidemiological profile tables are generated to support stakeholder engagement and planning. The Department's HIV/AIDS Section has generated compressive slides sets and epi profiles specifically for each of the 14 partnership areas each year since the 1990s. These slide sets and epi profiles are shared with the RWHAP Part A entities, community stakeholders, field surveillance staff, and others who may request these data. These data are frequently used as tools for program planning and evaluation.

Data Sharing and Use

De-identified HIV, viral hepatitis, STD, and TB data are routinely shared via ad-hoc requests to surveillance programs with outside entities including, but not limited to, academic institutions, community partners, RWHAP Parts, internal agency partners and collaborators, and the public.

Each of these programs provide annual data which are uploaded into FLHealth CHARTS (<https://www.flhealthcharts.gov/charts/CommunicableDiseases/default.aspx>). In addition, FL Health CHARTS is updating the FLHealth CHARTS website (a web-based platform that provides easy access to health indicator data at the community and statewide level for the state of Florida from a multitude of sources) with a new dashboard (at the county level) that will incorporate a multitude of HIV/AIDS indicators including, but not limited to, demographic and socio-economic indicators, partner services data, testing and treatment facilities, PrEP, and other data not previously included on FL Health CHARTS. By ensuring all these data and information are made readily accessible and user friendly, the new dashboard will help local and state planning bodies develop more effective and efficient programs and corresponding activities and monitor progress of IPC strategies and activities.

Along with HIV data, the Department also summarizes data from MMP and NHBS surveillance along with the Department's PrEP, Test and Treat, and HIV counseling and testing data. Data from the needs assessments are also shared in reports sent out to FCPN membership.

7 Letter of Concurrence

For the purpose of this plan, the FCPN membership served as the designated entity to certify concurrence with the content, strategies and activities included in the IPC Plan. The FCPN membership held the concurrence session on October 19, 2022, to officially adopt Florida’s Statewide Integrated HIV Prevention and Care Plan, 2022–2026. Moving forward, all updates to concurrence will be completed through the state’s integrated HIV planning process and with the FCPN.

The concurrence process included:

- Several virtual IPC Planning sessions that reflected the progression of the statewide IPC Plan to ensure that members of the planning body and other community stakeholders had an opportunity to provide input into the development of goals, objectives, strategies, and activities proposed in the IPC Plan.
- Opportunities for FCPN members and community stakeholders to submit their feedback to the state health office representatives with a response to their inquiries and recommendations.
- An opportunity for the FCPN to vote to accept the IPC Plan for submission to HRSA and CDC.

FIGURE 29: LETTER OF CONCURRENCE

F C P N

Florida Comprehensive Planning Network

Dear Colleague:

The Statewide Florida Comprehensive Planning Network (FCPN) concurs with the following submission by the Florida Department of Health in response to the guidance set forth for health departments and HIV planning groups funded by the CDC's Division of HIV/AIDS Prevention (DHAP) and HRSA's HMAIDS Bureau (HAB) for the development of an Integrated HIV Prevention and Care Plan, including the Statewide Coordinated Statement of Need (SC5N) for calendar year (CY) 2022–2026.

Members of FCPN include PWH and representatives across the state representing patient care and prevention groups, local planning bodies, CEOs, academic institutions, local and regional clinics, city, and county governments, RWHA Program recipients, the transgender community, advocacy groups, substance use and social service providers and behavioral science groups.

After a year of collaboration with our planning body members, federal/state/local partners, and community stakeholders, this plan reflects Florida's commitment to eliminating new HIV transmissions and reducing HIV related deaths in our state. FCPN members and guests helped to develop and prioritize the proposed strategies and activities for inclusion into the plan during the Summer 2022 meeting. FCPN members and guests reviewed and made suggestions to the first draft of the plan during the Fall 2022 in-person/virtual meeting. Comments and suggestions from FCPN members were then incorporated into the final draft of the plan.

The FCPN has reviewed the Integrated HIV Prevention and Care Plan submission to the CDC and HRSA to verify that it describes how programmatic activities and resources are being allocated to the most disproportionately affected populations and geographical areas with high rates of HIV.

The planning body concurs that the Integrated HIV Prevention and Care Plan submission fulfills the requirements put forth by the CDC's Notice of Funding Opportunity for Integrated HIV Surveillance and Prevention Programs for Health Departments and the Ryan White HIV/AIDS Program legislation and program guidance.

Asttie Co-Chairs of the FCPN, the signatures below confirm the concurrence of the planning body with the Integrated HIV Prevention and Care Plan 2022-2026.

9 Appendix

9.1 Strategy and Activity Table

The table below provides details on the activities suggested to address each strategy. Strategies are categorized by the goal and objective that they fall in.

9.1.1 Goal 1: Prevent New HIV Infections

9.1.1.1 Objective 1.1. Increase awareness of HIV

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

TABLE 11: STRATEGIES AND ACTIVITIES

Strategy 1.1.1		Develop and implement campaigns and resources to provide education about comprehensive sexual health; HIV risks; options for prevention, testing, care, and treatment; and HIV-related stigma reduction.			
Data Indicators		• Number of campaigns developed • Number of publicly funded HIV tests • Number of areas engaging with law enforcement • Stigma measure to be developed • Additional specific, quantifiable measures for each activity (TBD)			
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth			
Timeframe		Critical Partners		Activities	
By 12/31/2026		• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Case managers • Health educators • Peer workers • Community health workers • Linkage Coordinators • Faith-based Organizations		• Develop stigma toolkit and campaign and localized stigma task forces. • Engage with law enforcement around HIV awareness and stigma, and HIV information in their curriculum for youth intervention programs. • Increase culturally competent sexual health education outside of schools. • Increase the use of digital media resources to include messaging on dating apps (e.g., Grindr) and social media apps (e.g., TikTok). • Solicit and execute agreement with new media vendor to deliver HIV media services statewide and to add campaign material to increase awareness of HIV testing, PrEP, treatment, prevention, and stigma awareness among priority groups.	
Planning Areas					
Statewide					

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.1.2		Increase awareness of HIV among people, communities, and the health workforce in geographically disproportionately affected areas.	
Data Indicators	Priority Populations	• Number of publicly funded HIV tests • Number of BRTA/FRTA partnerships • Number of outreach and education efforts to specific priority populations • Additional specific, quantifiable measures for each activity (TBD)	
		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth; sex workers and human trafficking victims	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Case managers • Health educators • Peer workers	• Increase targeted outreach and education efforts specific to specialized groups, (e.g., FQHCs, local gang taskforces, and other geographically disproportionate communities). • Increase the number of BRTA and FRTA initiatives and partners statewide to increase HIV awareness and reach in communities. • Offer in-person learning opportunities for basic HIV 101 education and increase the number of trained HIV 101 educators (as a result of increased HIV 101 train the trainer opportunities). • Provide HIV education and information to school district stakeholders to encourage buy-in and adoption of culturally competent sexual health education curriculum. • Develop education materials that are both age appropriate and language appropriate.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.1.3	Integrate HIV messaging into existing campaigns and other activities pertaining to other parts of the syndemic, such as STIs, viral hepatitis, and substance use and mental health disorders.	
Data Indicators	• Number of campaigns with integrated messaging addressing syndemics • Number of new or non-traditional partnerships established to deliver education around syndemics • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth; individuals with dual diagnoses	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance use treatment settings • Mobile units • STD clinics • SSPs • Drug treatment programs • Case managers • Health educators • Peer workers • Community health workers	• Collaborate with local partners to educate providers across more platforms on syndemics and work to incorporate HIV messaging in messaging related to other communicable disease areas. • Increase awareness and collaboration with existing SSP to incorporate viral hepatitis, STIs, mental health and substance use disorder messaging in campaigns. • Collaborate with non-traditional and new partners to deliver HIV, STI, viral hepatitis, substance use disorder and mental health messaging across multiple platforms (e.g., radio, print, digital, social media, out-of-home, venue/event-based). Ensure all messaging is culturally and linguistically appropriate. • Identify and engage with other organizations and coalitions that have existing campaigns for STIs, viral hepatitis, substance use, mental health, behavioral health, etc. to encourage these groups to include HIV prevention and care messages in their efforts. • Partner with SAMHSA funding recipients update or create messaging related to the nexus between HIV/STIs and HCV, substance use, and/or mental health. • Collaborate with other local EMAs, RWHAP providers (e.g., Part C clinics), and FQHCs to incorporate additional HIV messaging into existing activities and/or campaigns.
Planning Areas		
Statewide		

9.1.1.2 Objective 1.2. Increase knowledge of HIV Status

Strategy 1.2.1		Test all people for HIV according to the most current USPSTF recommendations and CDC guidelines.	
Data Indicators		• Number of new HIV diagnoses • Number of publicly funded HIV tests • Number of HIV self-test kits distributed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs	• Develop messaging that normalizes routine HIV testing and reduces stigma surrounding HIV testing. Utilize peers and popular opinion leaders to increase testing in communities. • Ensure providers are kept up to date through education and communication. • Implement routine HIV and STIs screening in health care settings and priority testing in non-health care settings. Expand routine HIV testing to include additional medical settings (e.g., EDs, urgent care facilities, OB/GYN, and primary care providers). • Increase opportunities for HIV testing and address barriers to testing in traditional and non-traditional settings. • Increase testing accessibility through increased partnerships with outside-the-box providers, such as non-traditional medical settings, civic groups, local papers, event planners, FBOs, population-based care providers, and others. Ensure testing is where people are.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.2.2	Develop new and expand implementation of effective, evidence-based or evidence informed models for HIV testing that improve convenience and access.	
Data Indicators	• Number of new HIV diagnoses • Number of publicly funded HIV tests • Number of HIV self-test kits distributed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs	• Assess current HIV testing laws for opportunities to consider increasing testing requirements in additional circumstances. • Decrease barriers to testing by increasing testing beyond traditional venues and work hours and normalizing knowing your status. • Identify barriers to testing and care from people with lived experience and develop improvements to delivery. • Provide easy access to home test kits, including through self-serve vending machines and as add-ons to other self-tests (such as COVID, pregnancy); improve reporting structures to increase self-test linkage. • Routinize HIV testing as part of the standard of care during an annual physical as well as during other health or wellness visit appointments or opportunities.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.2.3		Incorporate a status neutral approach to HIV testing, offering linkage to prevention services for people who test negative and immediate linkage to HIV care and treatment for those who test positive.	
Data Indicators		• Number of new HIV diagnoses • Number of publicly funded HIV tests • Number of HIV self-test kits distributed • Number of people receiving prescriptions for PrEP • Percent of newly diagnosed PWH linked to HIV medical care in 7 days of diagnosis • Percent of newly diagnosed PWH linked to HIV medical care in 30 days of diagnosis • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs	• Develop and provide status-neutral resources around testing, treatment, prevention, and other services. • Educate private providers about status neutral HIV prevention and care services. • Ensure strong linkage to PrEP and PEP infrastructure that exists. • Increase the use of combined testing and vaccination efforts as a means of destigmatizing HIV prevention and testing services. • Support and expand the use of a “no wrong door” approach for HIV prevention and care services in a variety of organizations.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.2.4		Provide partner services to people diagnosed with HIV or other STIs and sexual or needle sharing partners.	
Data Indicators		• Number of people receiving HIV partner services interviews • Number of people receiving prescriptions for PrEP • Percent of newly diagnosed PWH linked to HIV medical care in 7 days of diagnosis • Percent of newly diagnosed PWH linked to HIV medical care in 30 days of diagnosis • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs	• Increase collaboration with needle exchange/harm-reduction programs. • Increase partner services capacity, whether by increasing funding for DIS positions, allowing additional Department staff to provide partner services, or allowing non-Department organizations to provide partner services. • Provide partner services during non-traditional hours and via telehealth to reduce barriers. • Reduce barriers around partner disclosure and referral. • Use partner services to provide negative partners access to PrEP, educational materials, and other preventative resources and services.	
Planning Areas			
Statewide			

9.1.1.3 Objective 1.3: Expand and Improve Implementation of Effective Prevention Interventions

Strategy 1.3.1		Engage people at risk for HIV in traditional public health and health care delivery systems, as well as in nontraditional community settings.	
Data Indicators		• Number of publicly funded HIV tests • Number of HIV self-test kits distributed • Number of people receiving prescriptions for PrEP • Number of primary care visits (AHCA report) • Number of FQHC visits for priority populations • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Correctional health settings • SSPs • AHCA (Medicaid/Medicare)	• Create local Prevention Interventions Taskforces to work collaboratively to raise awareness (e.g., utilizing non-health care events), share resources, and provide referrals. • Incorporate additional public health professionals in care settings • Increase academic detailing in Primary Care, Urgent Care, and Emergency Department settings to raise awareness for prevention interventions. • Increase the number of community mobilization initiatives and partnerships in communities, (e.g., FRTA and BRTA). • Partner with additional social service organizations, (e.g., domestic violence care providers, human trafficking organizations, United Way, YMCA, Boys and Girls club, and others) to expand HIV testing, prevention, and care services.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.3.2	Scale-up treatment as prevention/U=U by diagnosing all people with HIV, as early as possible and engaging them in care and treatment to achieve and maintain viral suppression.		
Data Indicators	• Number of publicly funded HIV tests • Number of people receiving prescriptions for PrEP • Percent of newly diagnosed PWH linked to HIV medical care in 7 days of diagnosis • Percent of PWH retained in care • Percent of PWH who are virally suppressed • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Correctional health settings • SSPs	• Use existing planning bodies to work collaboratively to expand and increase rapid ART access programs. • Increase viral suppression rates by increasing the use of peers in programs and using messaging that focuses on living a healthy life. • Review programs with low VL suppression to identify areas for technical assistance and increase the number of trained evidence-based Intervention (EBI) providers in those programs to assist in navigation services and other interventions to reduce community VL. • Scale up of injectable ARV programs (i.e., PrEP and HIV treatment).	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.3.3		Make HIV prevention, including condoms, PrEP, PEP, SSPs easier to access and support continued use.	
Data Indicators		• Number of condoms distributed statewide • Number of people receiving prescriptions for PrEP • Number of people receiving PEP • Number of operational SSPs • Additional specific, quantifiable measures for each activity (TBD)	
		Priority Populations PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Correctional health settings • SSPs	• Use existing planning bodies to work collaboratively to raise awareness and share resources on PrEP, PEP, condoms, and SSP, in order to provide referrals and increase accessibility of services. • Increase the number of PrEP providers through academic detailing and education. • Encourage that SSPs (including clean-needle distribution and exchange) are placed in proximity of known overdose events or deaths. • Increase awareness and promote the use of the Provider PrEP hotline.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.3.4		Implement culturally competent and linguistically appropriate models and other innovative approaches for delivering HIV prevention services.	
Data Indicators		• Number of cultural humility trainings performed • Number of engagement activities with local and state civic, community and spiritual leaders • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Correctional health settings • SSPs	• Embrace the adoption of assessing quality of life instead of limiting approach to focusing on health outcomes only. • Engage with local and state civic, political, community, and spiritual leaders to increase awareness of HIV and populations living with and affected by HIV. • Increase cultural humility trainings and other linguistically appropriate trainings for delivering HIV prevention services. • Partner with the Florida Department of Education (FDOE) to open conversations on how to evaluate outcomes of current health education programs for success. • Provide HIV messaging in English, Spanish, and Haitian-Creole.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.3.5	Support research into the development and evaluation of new HIV prevention modalities and interventions for preventing HIV transmissions in priority populations.	
Data Indicators	• Number of partnerships with HIV-related research entities • Number of HIV research sharing events and opportunities • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Academia • SSPs	• Expand frameworks for evaluation of EBIs through collaborative efforts and partnerships. • Expand the use of economic modeling to optimize public health strategies and interventions (e.g., PrEP 2-1-1) in additional jurisdictions. • Strengthen partnerships with HIV-related research entities (e.g., Florida Consortium for HIV Research [FCHAR]) to increase knowledge sharing and build expertise. Encourage attendance at Florida HIV Community, Providers & Researchers Conference.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.3.6	Expand implementation research to successfully adapt EBIs to local environments to maximize potential for uptake and sustainability.	
Data Indicators	• Number of partnerships with HIV-related research entities • Number of HIV research sharing events/opportunities • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Academia • SSPs	• Adapt interventions frameworks to be more inclusive of all communities. • Conduct listening sessions with those currently implementing interventions and those participating in interventions to uncover best practices and lessons learned. • Increase collaboration with state and national entities, subject matter experts (SMEs) and CBA and TA providers to share information and findings that may lead to innovation and strategies.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.1.4 Objective 1.4 Increase capacity of health care delivery systems, public health, and health workforce to prevent and diagnose HIV

Strategy 1.4.1	Provide resources, incentives, training, and technical assistance to expand workforce and systems capacity to provide or link clients to culturally competent, linguistically appropriate, and accessible HIV testing, prevention, and supportive services especially in areas with shortages that are geographic, population, or facility based.		
Data Indicators	• Number of cultural humility trainings performed • Number of public health workforce trainings on PrEP and PEP, mental health, and substance use and misuse • Number of partnerships with rural health networks • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	Community-based organizations, health care delivery systems, public health, and health workforce		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • STD clinics • Drug treatment programs • Correctional health settings • SSPs • Case managers • Health educators • Peer workers • Linkage coordinators	• Collaborate with local, state, and national training partners to increase and expand training cultural humility trainings. • Collaborate with local, state, and national training partners to provide additional training for the public health workforce and front-line staff on PrEP and PEP prescribing, mental health, and substance use and misuse. • Expand awareness and use of the Collaborative Pharmacy Practice Agreement which gives pharmacists authority to provide specific patient care services, including PrEP. • Expand partnerships with rural health networks. • Explore opportunities to incentivize the expansion of the health care workforce and health care facilities. • Identify language barriers and use stigma-free language for vulnerable populations.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.4.2		Increase the diversity of the workforce of providers who deliver HIV prevention, testing, and supportive services.	
Data Indicators		• Number of cultural humility trainings performed • Number of HIV testing providers in rural areas • Number of partnerships with rural health networks • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		Community-based organizations, health care delivery systems, public health, and health workforce	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • STD clinics • Drug treatment programs • SSPs • Case managers • Health educators • Peer workers • Linkage coordinators	• Determine areas that lack providers and find ways to incentivize organizations to serve as HIV CBOs. • Encourage HIV testing as a workplace activity. • Engage community hubs and community leaders to broaden their social services by provided HIV testing. • Use all available training resources (local and national) to create a diverse testing force across the state in both traditional and non-traditional settings.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.4.3	Increase inclusion of paraprofessionals and SMEs on prevention teams by advancing training, certification, supervision, financing, and team-based care service delivery.	
Data Indicators	• Number of partnerships with private entities • Assessment of ART barriers conducted • Number of peer navigators or near-peers • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Community-based organizations, health care delivery systems, public health, paraprofessional, and health workforce	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Case managers • Health educators • Linkage coordinators • Peer and near-peer workers • CHWs	• Assess barriers to antiretroviral therapy (HIV treatment or PrEP) in communities • Develop a community-based workforce that is able to provide more services in a single visit • Find creative ways to combat critical workforce attrition • Increase the number of peer navigators providing services. • Leverage partnerships with private entities to increase access to prevention services. • Develop pathways which promote career growth for paraprofessionals.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 1.4.4	Increase the diversity and capacity of health care delivery systems, community health, public health, and the health workforce to prevent and diagnose HIV.	
Data Indicators	• Number of academic institutions receiving education and outreach • Number of local providers, peer navigators and near-peers that reflect priority populations • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Community-based organizations, health care delivery systems, public health, paraprofessional, and health workforce	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Case managers • Health educators • Linkage coordinators • Peer workers, Near Peers • CHWs	• Increase the number of local care providers, peer navigators, and SMEs of color in order to reflect the burden of the epidemic in a county. • Increase the number of inclusive sexual health services being offered by providing training on sexual orientation and gender identity. • Provide education and outreach to academic institutions (e.g., public health programs, nursing, other paramedical programs) to encourage integration of testing and prevention training into curriculum to increase the number of certified testers. • Require HIV education and training of school personnel. • Require HIV education in clinical licensure. • Establish best practices for responsible parties to hire and retain employees that reflect the epidemic.
Planning Areas		
Statewide		

Goal 2: Improve HIV-Related Health Outcomes of Persons with HIV (PWH)**9.1.2.1 Objective 2.1. Link people to care rapidly after diagnosis and provide low-barrier access to HIV treatment**

Strategy 2.1.1		Increase linkage to HIV medical care in 30-days of diagnosis, as early as the same day.	
Data Indicators		• Number of new HIV diagnoses • Number of PWH engaged in care through T&T • Number of PWH engaged in care through telehealth • Number of PWH linked to same-day treatment (rapid ART) • Percent of newly diagnosed PWH linked to HIV medical care in 30 days of diagnosis • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		Persons living with diagnosed HIV	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Local RWHAP Part A and EHE partners		• Facilitate the ability of peers, medical providers, and eligibility staff to link clients to care and access rapid ART medications. • Collaborate with local partners and providers across multiple platforms to incorporate more T&T facilities that will offer rapid access to ART and PrEP and PEP medications. • Increase awareness with local providers to incorporate messaging on T&T and rapid ART protocols. • Support the use of incentives such as food and transportation vouchers and phones to assist with linkage to care activities.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.1.2	Provide same-day initiation or rapid start (within 7 days) of ART for those who are able to take it.	
Data Indicators	• Number of new HIV diagnoses • Number of PWH engaged in care through T&T • Number of PWH engaged in care through telehealth • Number of PWH linked to same-day treatment (rapid ART) • Percent of newly diagnosed PWH linked to HIV medical care in 7 days of diagnosis • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Local Part A and EHE programs	• Establish youth ambassadors and advocates; collaborate with academic institutions (e.g., Scale It Up Florida). • Expand routine HIV and STI testing to include additional medical settings (e.g., pediatricians, primary care, and student health centers). • Increase targeted outreach and education efforts specific to specialized youth and teen groups. • Increase the number of culturally competent sexual health education in educational, recreational, and faith-based organizations, facilities, and groups.
Planning Areas		
Statewide		

9.1.2.2 Objective 2.2: Identify, engage, or reengage people with HIV who are not in care or not virally suppressed

Strategy 2.2.1	Expand uptake of data-to-care models using data sharing agreements, integration and use of surveillance, clinical services, pharmacy, and social/support services data to identify and engage people not in care or not virally suppressed.	
Data Indicators	• Number of new HIV diagnoses • Number of PWH linked to same-day treatment (rapid ART) • Number of PWH reengaged through D2C • Number of PWH engaged in care through telehealth • Percent of PWH retained in care • Percent of PWH who are virally suppressed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Local RWHAP Part A and EHE partners	• Collaborate with local partners and providers across more platforms to incorporate more T&T facilities that will offer rapid ART and PrEP and PEP medications. • Develop a single-point eligibility data system that will support all RWHAP partners to assist with linkage and retention services. • Execute cooperative agreements and data sharing agreements with local providers, jails, and prisons to link and refer clients to care who are soon to be released from an institution. • Support data sharing efforts and educate peers, DIS, medical providers, pharmacists, and eligibility and outreach staff on how to assist in linking clients to care and accessing rapid ART medications.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.2.2		Identify and address barriers for people who have never engaged in care or who have fallen out of care.	
Data Indicators		• Number of new HIV diagnoses • Number of PWH linked to same-day treatment (rapid ART) • Number of PWH reengaged through D2C • Number of PWH engaged in care through telehealth • Percent of PWH retained in care • Percent of PWH who are virally suppressed • Additional specific, quantifiable measures for each activity (TBD)	
		Persons living with diagnosed HIV	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Local RWHAP Part A and EHE partners		• Expand opportunities to increase awareness and education of local providers on how to incorporate messaging and services for mental health, substance use, homelessness, and other wrap-around services. • Expand routine HIV/STI testing, and substance use counseling to additional settings such as homeless shelters, urgent care centers, substance use treatment centers. • Expand RWHAP drug formularies to include more treatment drugs for comorbidities. • Expand the use of mobile units to assist with linkage and reengagement efforts. • Support the use of peers to assist with linkage, reengagement, and retention efforts.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.2.3 Objective 2.3: Increase retention and adherence to treatment to achieve and maintain long-term viral suppression.

Strategy 2.3.1		Support the transition of health care systems, organizations, and clients to become more health literate in the provision of HIV prevention, care, and treatment services.	
Data Indicators		• Number of in-person and virtual learning opportunities for staff providing prevention, care, and treatment services • Number of plain language processes and materials developed to assist clients who are newly diagnosed or returning to care • Number of peers and near-peers providing linkage, reengagement, or retention efforts • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		Persons living with diagnosed HIV, health care systems, community-based organizations	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Local Part A and EHE programs	• Develop plain language processes and materials to assist clients who are newly diagnosed or returning to care. • Offer in person and virtual learning opportunities for basic HIV 101 education and increase the number of trained HIV 101 educators and clients (as a result of increased HIV 101 train the trainer opportunities). • Support the use of peers and near-peers to assist with linkage, reengagement, and retention efforts.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.3.2		Develop and implement effective, evidence based or evidence-informed interventions and supportive services that improve retention in care.	
Data Indicators		• Number of peers, near-peers, and/or CHWs providing retention support • Number of peer programs implemented • Number of provider educational opportunities around syndemics • PWH reengaged through D2C • Percent of PWH retained in care • Percent of PWH who are virally suppressed • Additional specific, quantifiable measures for each activity (TBD)	
		Persons living with diagnosed HIV	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Peers and near-peers • CHWs • Linkage coordinators • Local RWHAP Part A and EHE partners		• Collaborate with local partners to educate providers across more platforms on syndemics and work to incorporate HIV (including aging HIV population) into primary care practice. • Expand the use of peers, linkage coordinators and CHWs to implement the ARTAS intervention strategies and adherence measures. • Identify and integrate best practices for peer programs from similar states and jurisdictions. • Review EBIs for effectiveness by using validated tools to predict engagement. Ensure EBIs include target audience. Establish rapid response protocols. • Streamline clinical protocols to eliminate client burden by reducing the frequency of CD4/VL labs, providing 3–6 months of medications at one time, and offering telehealth clinical and case management services.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.3.3	Develop and implement effective, evidence-based, or evidence-informed interventions such as HIV telemedicine, accessible pharmacy services, CHWs and peer navigators, and others, that improve convenience and access, facilitate adherence, and increase achievement and maintenance of viral suppression.	
Data Indicators	• Number of PWH linked to same-day treatment (rapid ART) • Number of PWH reengaged through D2C • Number of PWH engaged in care through telehealth • Number of peers, near-peers, and CHWs providing linkage and retention support • PWH reengaged through D2C • Percent of PWH retained in care • Percent of PWH who are virally suppressed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, health care systems, academic institutions, community-based organizations	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Pharmacies • Peers and near-peers • Case managers • CHWs • Linkage coordinators • SSPs • Local RWHAP Part A and EHE partners	• Allow 3–6 months of ART medications to be dispensed at one time. • Create funding opportunities for community-based providers to support recruitment and retention of staff. • Develop a single-point eligibility data system integrated with multi-data systems that will support all RWHAP parts. Implement a centralized eligibility determination system for all RWHAP Parts. • Expand access to health insurance coverage to eligible clients. • Provide training to health workers and peers that will support or increase adherence measures.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.3.4	Support ongoing clinical, behavioral, and other research to support retention in care, medication adherence and durable viral suppression.	
Data Indicators	• Number of collaborations with academic institutions engaged in HIV research • Number of updates to providers on ongoing or recruiting efforts on clinical trials • Number of FQHCs and other community health settings engaged in research • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, health care systems, academic institutions, community-based organizations	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Local RWHAP Part A and EHE partners	• Encourage persons living with HIV to participate in the research by making research findings easier to understand. • Engage and collaborate with local colleges and universities to increase research opportunities at the local level. • Engage local organizations such as FQHCs to assist with research and interventions. • Provide paid incentives to encourage persons living with HIV, students, or researchers to get involved in the research. • Provide updates to providers on ongoing or recruiting efforts on clinical trials.
Planning Areas		
Statewide		

9.1.2.4 Objective 2.4: Increase the capacity of the public health, health care delivery systems, and health care workforce to effectively identify, diagnose, and provide holistic care and treatment for people with HIV

Strategy 2.4.1	Provide resources, value-based and other incentives, training, and technical assistance to expand workforce and systems capacity to provide or link clients to culturally competent and linguistically appropriate care, treatment, and supportive services especially in areas with shortages that are geographic, population, or facility based.	
Data Indicators	• Number of cultural humility trainings performed • Number of public health workforce trainings on PrEP and PEP, mental health, and substance use or misuse • Number of PWH engaged in care through telehealth • Number of peers, near-peers, and CHWs providing linkage and retention support • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, community-based organizations, health care delivery systems, public health, and health workforce	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, community health centers, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Pharmacies • Peers and near-peers • Case managers • Linkage coordinators • CHWs • SSPs • Local RWHAP Part A and EHE partners	• Collaborate with the AETC to assist with training efforts. • Establish a statewide conference for medical providers. • Expand telehealth to increase capacity for services and use mobile units to increase outreach efforts. • Increase culturally competent HIV trainings to local providers. • Increase targeted outreach and education efforts specific to specialized providers.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.4.2		Increase the diversity of the workforce of providers who deliver HIV and supporting services.	
Data Indicators	Priority Populations	• Number of public health workforce trainings on basic HIV education • Number of peers, near-peers, and/or community health workers providing linkage and retention support • Number of provider educational opportunities around syndemics • Additional specific, quantifiable measures for each activity (TBD)	
		Persons living with diagnosed HIV, community-based organizations, health care delivery systems, public health, and health workforce	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Peers and near-peers • Case managers • CHWs • SSPs • Local RWHAP Part A and EHE partners		• Facilitate the ability of peers, medical providers, and eligibility staff to link clients to care and access rapid ART medications. • Collaborate with local partners to educate providers across more platforms on syndemics and work to incorporate HIV (including aging HIV population) into primary care practice. • Increase providers of color in communities. • Offer in-person and virtual learning opportunities for basic HIV 101 education and increase the number of trained HIV 101 educators (as a result of increased HIV 101 train the trainer opportunities). • Modify contractual language in HIV contracts to encourage staffing reflects the local demographics of the HIV population.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.4.3	Increase inclusion of paraprofessionals on teams by advancing training, certification, supervision, reimbursement, and team functioning to assist with screening/management of HIV, STIs, viral hepatitis, and mental and substance use disorders and other behavioral health conditions.	
Data Indicators	• Number of peer navigators or near-peers • Number of public health workforce trainings on basic HIV education • Number of peers, near-peers, and CHWs providing screening and adherence support • Number of provider educational opportunities around syndemics • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, community-based organizations, health care delivery systems, public health, paraprofessional, and health workforce	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • Peers and near-peers • Case managers • CHWs • SSPs • Certified addiction professionals and counselors • Local RWHAP Part A and EHE partners	• Collaborate with social service organizations on screening and management of HIV, STIs, viral hepatitis, and mental and substance use disorders and other behavioral health conditions. • Identify support staff who can be trained to provide support services in a range of industries (i.e., medical COE). • Develop and implement a statewide peer certification program. • Increase training and inclusion opportunities for CHWs. • Collaborate with other social service providers to increase screening and management of HIV, STI, viral hepatitis, and mental and substance abuse. • Expand collaborations with school health services to provide support to the younger population. • Identify and promote trainings for paraprofessionals regarding social determinants of health and the syndemics facing Florida.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.2.5 Objective 2.5 Expand capacity to provide whole-person care to older adults with HIV and long-term survivors

Strategy 2.5.1	Identify, implement, and evaluate models of care that meet the needs of people with HIV who are aging and ensure quality of care across services.		
Data Indicators	• Number of partnerships with organizations that serve PWH aged 50+ • Assessment of barriers to care for PWH aged 50+ • Number of educational opportunities for PWH aged 50+ • Number of collaborations with service providers that specialize in services for the aging population • Number of educational opportunities in settings where persons aged 50+ may reside or congregate (senior centers, retirement communities) • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	Persons over the age of 50 living with diagnosed HIV		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Local RWHAP Part A and EHE partners	• Broaden the scope of partnerships to include established entities who serve PWH over the age of 50 providing primary, specialty and pharmacy services. • Utilize statewide advisory groups to identify barriers in models of care for PWH who are aging. • Collaborate with existing service providers (e.g., Eldersource, Department of Elder Affairs, Visiting Angels) that work with the elderly to integrate in HIV prevention, care, and support services. • Increase HIV and aging education in senior centers, assisted living facilities, retirement communities, and others. • Collaborate with geriatric care providers to educate on risk of aging PWH. Also educate them on risk for older patients who may be at risk of acquiring HIV, e.g., how to talk to and engage older adults in sexual health conversations.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.5.2	Identify and implement best practices related to addressing psychosocial and behavioral health needs of older people with HIV and long-term survivors including substance use treatment, mental health treatment, and programs designed to decrease social isolation.		
Data Indicators	• Number of partnerships with organizations which address psychosocial and behavioral health for PWH aged 50+ and long-term survivors. • Number of educational opportunities on substance use and mental health for PWH aged 50+ • Number of educational opportunities in settings where persons aged 50+ may reside or congregate (senior centers, retirement communities) • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	Persons over the age of 50 living with diagnosed HIV		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • FDEA • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Area Agencies on Aging • Local RWHAP Part A and EHE partners	• Collaborate with local partners to educate providers across more platforms on syndemics and work to incorporate HIV (including aging HIV population) and behavioral health into primary care practice. • Increase provider knowledge on the aging HIV population and the effects on dementia. • Expand partner networks to include organizations already addressing psychosocial and behavioral health for persons with HIV aged 50+ and long-term survivors. • Engage national aging institutions to advise on establishing the most effective program design to address psycho-social and behavioral needs of the aging population including substance use and mental health treatment. • Review existing research and evidence-based practices from mainstream non-HIV oriented care providers and integrate into HIV-oriented care. • Establish Long Term Survivor Empowerment Teams which can foster individual virtual or in-person mental health sessions assessing the needs of patients and ensuring their needs are met accordingly. • Reach out to existing elder services providers to learn more about what they offer and what's working and ask how HIV prevention and support could be added into their efforts.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.5.3	Increase HIV awareness, capability, and collaboration of service providers to support older people with HIV, including in settings such as aging services, housing for older adults, substance use treatment, and disability and other medical services.		
Data Indicators	• Number of partnerships with organizations which address psychosocial and behavioral health for PWH aged 50+ and long-term survivors. • Number of educational opportunities on substance use and mental health for PWH aged 50+ • Number of educational opportunities in settings where persons aged 50+ may reside or congregate (senior centers, retirement communities) • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	Persons over the age of 50 living with diagnosed HIV		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • FDEA • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Area Agencies on Aging • Local RWHAP Part A and EHE partners	• Collaborate with local Area Agencies on Aging. • Collaborate with local partners to educate providers across more platforms on syndemics and work to incorporate HIV (including aging HIV population) and behavioral health into primary care practice. • Establish a long-term survivor peer empowerment team (statewide).	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.5.4	Promote research, cross-agency collaborations, and sharing of research discoveries that address specific aging-related conditions in people with HIV, and other comorbidities and coinfections that can impact people with HIV of all ages.	
Data Indicators	• Number of collaborations with service providers that specialize in services for the aging population • Number of educational opportunities on substance use and mental health for PWH aged 50+ • Number of educational opportunities provided by HIV long-term survivor groups • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, academic institutions, community-based organizations, health care delivery systems, and public health systems	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • FDEA • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Academy of HIV Medicine • Area Agencies on Aging • Association of Nurses in AIDS Care • Local RWHAP Part A and EHE partners	• Create housing opportunities for the aging HIV population. • Expand funding to allow medical and support care for comorbidities. • Integrate cross-agency collaborations to include access to all client-level data to all RWHAP parts. • Provide education around HIV and aging to local partners and service organizations • Provide HIV education to the Florida Insurance Commission's office to promote less insurance burdens on HIV care. • Collaborate with HIV long-term survivor's groups to provide education to various stakeholder groups.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.5.5	Develop and optimize collaborative multi-agency and multi-sectoral approaches and strategies to address emergent and evolving challenges facing people living with HIV at various life stages to support healthy aging with HIV.	
Data Indicators	• Number RWHAP programs offering geriatric case management services • Number of collaborations with service providers that specialize in services for the aging population • Number of educational opportunities on substance use and mental health for PWH aged 50+ • Number of educational opportunities provided by HIV long-term survivor groups • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, academic institutions, community-based organizations, health care delivery systems, and public health systems	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • FDEA • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Mobile units • STD clinics • Drug treatment programs • SSPs • Academia • Area Agencies on Aging • Assisted living and skilled nursing facilities • Local RWHAP Part A and EHE partners	• Expand RWHAP services to offer geriatric case management and offer partner prevention services. • Explore opportunities to educate local and state legislators on the important role medical marijuana plays in the management of HIV disease. • Increase awareness with local providers to incorporate messaging on T&T and rapid ART protocols, HIV stigma and care, and aging HIV population. • Increase provider knowledge on aging HIV population, including persons with perinatally-acquired HIV • Revise service delivery models to address healthy aging and address comorbidities.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.2.6 Objective 2.6: Advance the development of next-generation HIV therapies and accelerate research for HIV cure.

Strategy 2.6.1		Promote research and encourage public-private partnerships to accelerate new therapies to achieve sustained viral suppression and to address drug toxicity, viral resistance, adherence, and retention in care and stigma associated with ART use.	
Data Indicators		• Number RWHAP programs offering geriatric case management services • Number of collaborations with service providers that specialize in services for the aging population • Number of collaborations with academic institutions focusing on HIV therapies and HIV cure research • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		Persons living with diagnosed HIV, academic institutions, community-based organizations, health care delivery systems, and public health systems	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Local RWHAP Part A and EHE partners		• Collaborate with academic institutions to explore opportunities for research around HIV therapies and an HIV cure. • Explore ways to leverage RWHAP Part A funding to support services for aging PWH. • Provide HIV education to the Florida Insurance Commission's office to promote less insurance burdens on HIV care.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 2.6.2	Increase investment in innovative basic and clinical research to inform and accelerate a research agenda to discover how to sustain viral suppression, achieve ARV-free remission, reduce, and eliminate viral reservoirs, and achieve HIV cure.	
Data Indicators	• Percent of ADAP clients using injectable ART • Number of collaborations with academic institutions focusing on HIV therapies and HIV cure research • Number of collaborations with academic institutions engaged in clinical research and ART clinical trials • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Persons living with diagnosed HIV, academic institutions, community-based organizations, health care delivery systems, and public health systems	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Local RWHAP Part A and EHE partners	• Engage with medical providers and insurance companies to on ways to reduce the burden of medication interruption. • Collaborate with academic partners and institutions on clinical research and ART clinical trials. • Collaborate with academic partners and institutions to explore opportunities for research around HIV therapies and an HIV cure. • Increase access to ART injection medications through ADAP and other payer sources.
Planning Areas		
Statewide		

**Goal 3: Reduce HIV-related Disparities and Health Inequities****9.1.3.1 Objective 3.1. Reduce HIV-related stigma and discrimination**

Strategy 3.1.1	Strengthen enforcement of civil rights laws (including language access services and disability rights), reform state HIV criminalization laws, and assist states in protecting people with HIV from violence, retaliation, and discrimination associated with HIV status, homophobia, transphobia, xenophobia, racism, and sexism.	
Data Indicators	• Number of educational and skills building opportunities for PWH • Stigma indicator to be developed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Advocates • Local and state law enforcement • First responders • Department of Justice and U.S. Immigration and Customs Enforcement satellite offices • Correctional facilities • HIV Justice Coalitions • RWHAP partners	• Educate local and state law enforcement agencies on culturally competent HIV basics, civil rights, and trauma informed care. • Educate local and state legislators, political and civic. Leaders and organizations, and policy makers on basic HIV transmission, prevention, and care; include HIV data specific to local areas. • Support education and skill building opportunities for PWH to promote understanding of civil rights and engagement in policy making.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.1.2	Ensure that health care professionals and front-line staff complete education and training on stigma, discrimination, and unrecognized bias toward populations with or at risk for HIV.	
Data Indicators	• Number of continuing education opportunities and trainings for health care professionals and front-line staff • Number of HIV stigma materials developed and/or disseminated • Stigma indicator to be developed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	Health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • State and local law enforcement • First responders • RWHAP partners	• Develop and/or identify and disseminate HIV stigma materials and resources for health care professionals and front-line staff. • Identify and disseminate continuing education opportunities and training for health care professionals and front-line staff on HIV stigma; include working with the AETC and Area Health Education Centers. • Work with professional organizations to encourage the adoption of HIV stigma training as part of professional standards for health care professionals and front-line staff.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.1.3	Support communities in efforts to address misconceptions and reduce HIV-related stigma and other stigmas that negatively affect HIV outcomes.	
Data Indicators	• Number of outreach and education opportunities to recruit peers • Number of community and faith-based leaders engaged in trainings that address HIV stigma and misconceptions • Stigma indicator to be developed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • RWHAP partners	• Conduct outreach and education campaigns to train and employ peers to provide education, navigation, and support services. • Create opportunities and invite marginalized individuals to speak and join virtually (and anonymously) to present their perspectives, educate, and stay protected. • Engage community- and faith-based leaders at local and state levels to develop and host culturally tailored trainings that address stigma and HIV misconceptions. • Support local areas to develop general education and social media campaigns and materials to de-stigmatize HIV and those living with or affected by HIV.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.1.4	Ensure resources are focused on the communities and populations where the need is greatest, especially Black, Latino, and American Indian/Alaska Native and other people of color, particularly those who are also gay and bisexual men, transgender people, people who use substances, sex workers, and immigrants.	
Data Indicators	• Number of new diagnoses in communities and priority populations at increased risk for HIV • Number of mobile medical units providing services to priority populations • Number of ongoing and new initiatives for priority populations • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • RWHAP partners	• Identify or develop information to educate potential funders and philanthropic organizations to increase awareness of HIV-impacted populations and communities. • Support ongoing and new initiatives and programs specifically focused on priority populations. • Use HIV data to target HIV and STI education and outreach to high-priority populations and ZIP codes which reflect the residents and effectively represent the community. • Use mobile medical units and street outreach to bring services and resources to communities and populations where the need is greatest.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.1.5		Create funding opportunities that specifically address social determinants of health (SDOH) as they relate to Black, Latino, and American Indian/Alaska Native and other people of color.	
Data Indicators	Priority Populations	- Number of funding opportunities which support programs that address SDOH in Black, Hispanic and other racial/ethnic communities - Number of educational opportunities which address SDOH - Additional specific, quantifiable measures for each activity (TBD)	
		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners		Activities
By 12/31/2026	- The Department - Community- and faith-based organizations - Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites - Behavioral health care and substance abuse settings - Drug treatment programs - SSPs - Academia - Tribal organizations - RWHAP partners		- Approach private corporations and other entities for sponsorship and educational opportunities to address SDOH. - Develop mini grants and create other opportunities to support programs that address SDOH in Black, Hispanic/Latino, and other racial/ethnic communities. - Explore opportunities to expand the use of MAI funding and assess outcomes.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.3.2 Objective 3.2. Reduce disparities in new HIV diagnoses, in knowledge of status, and along the HIV care continuum

Strategy 3.2.1		Increase awareness of HIV-related disparities through data collection, analysis, and dissemination of findings.	
Data Indicators		• Number of materials developed and disseminated which highlight HIV-related disparities • Number of HIV data dashboards available • Number of educational opportunities and listening sessions for impacted communities • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • RWHAP partners	• Develop and expand the use of easy-to-read materials (e.g., infographics, one pagers) to help audiences of varying types (general public, clients, providers) to highlight HIV-related disparities. • Expand the use of data dashboards and provide education to relevant groups on how to access and use the information to increase awareness of HIV-related disparities. • Focus efforts to educate and gather information from populations and communities impacted by disparities. Include client perspectives and needs in addition to quantitative data.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.2.2	Develop new and scale up effective, evidence-based, or evidence-informed interventions to improve health outcomes among priority populations and other populations or geographic areas experiencing disparities.	
Data Indicators	• Number of collaborations with academic institutions and other partners (outside of HIV) • Number of funding opportunities which focus on improving health outcomes in priority populations • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Community-HIV Advisory Group • RWHAP partners	• Collaborate with academic institutions and other partners (outside of HIV) to develop EBIs focused on priority populations and geographic areas impacted by disparities; other partners include mental health, substance use, SAMHSA providers, local homeless coalitions, and others.). • Develop funding mechanisms to support the development or scale up of interventions to improve health outcomes (e.g., mini-grants, RFAs, purchase orders). • Support opportunities at local and state levels to develop or scale up EBIs, including developing internship programs to engage young professionals. • Use local economic modeling to determine those interventions for scale up (e.g., interventions that have the greatest potential to reduce HIV in communities and populations experiencing disparities).
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.3.3 Objective 3.3. Engage, employ, and provide public leadership opportunities at all levels for people with or who experience risk for HIV

Strategy 3.3.1		Create and promote public leadership opportunities for people with or at risk for HIV.	
Data Indicators		• Number of people with or at risk for HIV on planning bodies and other advisory groups • Establishment of peer navigator certification program • Number of training and mentorship opportunities for PWH to build leadership and advocacy skills • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • Community-HIV Advisory Group • SSPs • Academia • RWHAP partners	• Develop and support opportunities for people living with or affected by HIV to serve in leadership roles at state and local levels (e.g., HIV Speaker's Bureau). • Establish a statewide peer navigator and educator certification program. • Increase and expand education, training, and mentorship opportunities for PWH to build skills for engaging in a variety of leadership and advocacy roles (social, political, civic, spiritual). • Create an inventory of chairs and co-chairs for local area advisory and planning groups	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.3.2	Work with communities to reframe HIV services and HIV-related messaging so they do not stigmatize people or behaviors.	
Data Indicators	• Number of HIV-related materials reviewed by the state’s educational material review panel • Number of engagement activities conducted with priority populations and local leaders to develop HIV-related messaging • Stigma indicator to be developed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Community-HIV Advisory Group • Educational material review panel • RWHAP partners	• Engage with priority populations and local leaders/influencers to develop HIV-related messaging that does not stigmatize. • Ensure the intentional use of people-first and inclusive language in HIV service delivery, educational materials, and informational campaigns (review existing and incorporate into new products). • Expand the use the state’s health education review panel (i.e., Carlos Alvarez Educational Material Review Panel) to ensure HIV-related messaging and materials are culturally and linguistically appropriate and use people-first language.
Planning Areas		
Statewide		

9.1.3.4 Objective 3.4: Address social determinants of health and co-occurring conditions that exacerbate HIV-related disparities

Strategy 3.4.1		Develop whole-person systems of care that address co-occurring conditions for people with HIV or at risk for HIV.	
Data Indicators		• Number of syphilis diagnoses in communities and priority populations at risk for STIs • Number of HCV diagnoses in communities and priority populations at increased risk for HCV, including PWID • STI, HCV, and TB co-infection rates among persons diagnosed with HIV • Number of new diagnoses in communities and priority populations at increased risk for HIV • Viral suppression percentages in communities and priority populations at increased risk for HIV • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • RWHAP (all parts) and EHE partners		• Expand local partnerships and collaborate with local providers to address and alleviate barriers to accessing care. • Identify opportunities to centralize eligibility, enrollment services, and health care services for PWH (e.g., HOPWA, RW, ADAP). • Incorporate other health screenings and services into HIV care. • Pilot health care models and interventions for people at risk for or living with HIV who have co-occurring conditions e.g., SUD and mental health conditions.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.4.2	Adopt policies that reduce cost, payment, and coverage barriers to improve the delivery and receipt of services for people with or at risk for HIV.	
Data Indicators	• Number of HIV service providers offering after hours and weekend services for HIV clients • Number of training and cross-training opportunities for medical case managers, RWHAP Part B, HOPWA, and CBOs • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • RWHAP Part A and EHE partners • RWHAP Part B • Health care and related policy and advocacy orgs. • Insurance providers • Pharmaceutical industry partners	• Centralize eligibility processes and cross-train medical case managers, RWHAP Part B, HOPWA and CBOs. • Streamline clinical practices, reduce annual number of visits, CDH, PVC tests. Three or 6-month ART prescriptions. • Explore cost-effective programs that reduce cost, payment, and coverage barriers to improve the delivery and receipt of services for people with or at risk for HIV and use their findings for adopting related policies. • Create consistencies in the RWHAP system of care (Part A, Part B) to eliminate barriers to HIV care (e.g., longer time in between recertification, reciprocal eligibility). • Explore the incorporation of afterhours and weekend services for HIV clients to assist with retention in and adherence to care. • Engage in discussions with Florida Office of Insurance Regulation, Medicaid/Medicare (ACHA), and other entities to identify policies that create barriers for delivery of HIV services for people with or at risk for HIV.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.4.3		Improve screening and linkage to services for people with or at risk for HIV who are diagnosed with and/or are receiving services for co-occurring conditions.	
Data Indicators		• Number of educational opportunities for providers specializing in co-occurring conditions • Number of partnerships with agencies implementing routine screening and linkage services • Number of mobile units offering HIV/STI screening, treatment, and prevention services during non-traditional hours • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • STD clinics • Mobile units • Drug treatment programs • SSPs • Academia • RWHAP and EHE partners	• Educate providers specializing in co-occurring conditions. • Expand collaboration with FQHCs (and FQHC look-alikes) at state level to improve screening. • Expand partnerships with agencies to expand routine screening and linkage to care services for persons newly diagnosed with HIV or for persons previously diagnosed who are returning to care. • Address challenges and barriers to screening and linkage to services for people with or at risk for HIV who are diagnosed with and are receiving services for co-occurring conditions. • For those at risk, educate non-HIV providers to conduct sexual health and substance use risk assessments routinely. Work with medical certification boards to ensure ongoing education and compliance. • Increase the use of mobile units offering HIV and STI screening, treatment, and prevention services beyond traditional testing hours. • Explore opportunities to modify electronic medical records to increase routine screening and facilitate information sharing	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.4.4	Develop and implement effective, evidence-based- or evidence-informed interventions that address social determinants of health among people with or at risk for HIV including lack of continuous health care coverage, HIV-related stigma and discrimination in public health and health care systems, medical mistrust, inadequate housing and transportation, food insecurity, unemployment, low health literacy, and involvement with the justice system.	
Data Indicators	• Number of mobile units providing outreach services to priority populations • Number of educational materials identified and disseminated on client rights and health literacy • Stigma indicator to be developed • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Peers and near-peers • CHWs • RWHAP (all parts) and EHE partners • Local and state law enforcement • Housing coalitions • Health care and related policy and advocacy orgs. • Transportation agencies	• Expand the use of mobile outreach units and telehealth technology to address SDOH and provide linkage referrals. • Explore opportunities to use peers and CHWs as mentors outside of the health care system. • Identify and disseminate information and trainings for clients on their rights, grievance policies, customer feedback, and health literacy.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.4.5	Develop new and scale up effective, evidence-based/informed interventions to improve health outcomes and QOL for people across lifespan including youth and people over 50 w/ or at risk for HIV, and long-term survivors.	
Data Indicators	- Establishment of telehealth provider network - Number of cultural humility trainings for providers - Number of non-traditional HIV/STI testing and treatment sites - Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons aged 50+; youth; long-term survivors	
Timeframe	Critical Partners	Activities
By 12/31/2026	- The Department - FDEA - Community- and faith-based organizations - Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites - Behavioral health care and substance abuse settings - Drug treatment programs - SSPs - Academia - Area Agencies on Aging - Elder services agencies	- Develop a telehealth provider network. - Expand access to HIV/STI testing and treatment outside of public health; include public-private partnerships. - Identify and disseminate trainings that include cultural humility trainings for providers. - Identify best practices for consortia to find and identify EBIs. - Promote long-term survivor groups and the Florida Gay Men's HIV Workgroup.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.4.6	Develop new and scale up effective, evidence-based/informed interventions that address intersecting factors of HIV, trauma and violence, and gender especially among cis- and transgender women and gay and bisexual men.	
Data Indicators	• Number of trainings identified and disseminated on TIC • Number of training opportunities for evidence-based interventions addressing mental health • Number of training opportunities to educate the HIV, STD, hepatitis/substance use, and mental health workforce on intersecting issues • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; persons in high-seroprevalent areas; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Correctional settings • RWHAP and EHE partners • Correctional settings • Advocacy groups	• Create opportunities to support providers and agencies implementing EBIs that address trauma and violence. • Identify and disseminate provider trainings on trauma informed care (TIC). • Identify and develop training-of-trainers for TIC to ensure all RWHAP are using a TIC approach. • Provide training opportunities for existing EBIs in the mental health practice. • Identify existing effective, EBIs that address intersecting factors of HIV, trauma and violence, and gender. • Recruit staff with lived experience that reflect the PWH they are trying to serve. • Educate the HIV, STD, hepatitis, substance use, and mental health workforce on the intersecting issues. Ensure diverse organizations are involved in the development of new cross-sectional interventions. Seek out or directly provide funds to support collaborative efforts.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

- 9.1.3.5 Objective 3.5: Train and expand a diverse HIV workforce by further developing and promoting opportunities to support the next generation of HIV providers including health care workers, researchers, and community partners, particularly from underrepresented populations.

Strategy 3.5.1		Promote the expansion of existing programs and initiatives designed to increase the numbers of racial/ethnic minority research and health professionals.	
Data Indicators		• Number of trainings for HBCUs around HIV prevention, care, and treatment • Number of partnerships established with HBCUs • Development of inventory of SPNS projects and opportunities for replication • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		Racial/ethnic minority research and health professionals	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • HBCUs • Health care providers • Health care professional organizations		• Create a state-funded program to fill federal gaps. • Cross-train CHWs. • Increase promotion of the HIV field in academic institutions (e.g., MPH programs, Schools of Medicine, Pharmacy, Nursing, and Social Work) through career fairs and supporting certifications and training programs. • Provide training and opportunities for partnership with HBCUs around HIV prevention, care, and treatment. • Develop an inventory of SPNS and support funding opportunities to replicate effective programs.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.5.2	Increase support for the implementation of mentoring programs for individuals from diverse cultural backgrounds to expand the pool of HIV research and health professionals.	
Data Indicators	• Number of organizations identified that have mentorship programs • Number of training opportunities identified for PWH to build leadership and advocacy skills • Number of professional groups and associations engaged • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • HBCUs • Health care providers • Health care professional organizations	• Identify and support the use of mentorship programs for individuals from diverse backgrounds • Elevate voices of people living with HIV through increased advocacy and training. Encourage their participation through support groups. Ensure people who represent the population are in positions to assist with peer support services. • Support implementation of mentoring programs for individuals from diverse cultural backgrounds to expand the pool of HIV research and health professionals. • Identify organizations that have existing mentoring programs and disseminate the information with other agencies to coordinate efforts. • Reach out to professional groups that emphasize memberships of color like the National Association for Black Social Workers, HBCUs, sororities and fraternities, civic organizations, and others.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.5.3		Encourage the implementation of effective recruitment of community partners through community-based participatory research and social networking approaches.	
Data Indicators		• Number of opportunities to collaborate with the Florida Center for HIV/AIDS Research • Number of research study opportunities shared with community partners and planning bodies • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWI and persons who use drugs	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • HBCUs • Health care providers • Health care professional organizations	• Develop professional articles for publication. • Identify opportunities to collaborate with the FCHAR. • Provide information on and encourage community participation in legitimate research studies and grants. • Recruit youth and young adults to participate in local and state HIV planning bodies and advisory workgroups. • Support the use of community opinion leaders and social networking strategies. • Amplify and encourage efforts to share research output with participants.	
Planning Areas			
Statewide			

9.1.3.6 Objective 3.6: Advance HIV-related communications to achieve improved messaging and uptake, as well as to address misinformation and health care mistrust.

Strategy 3.6.1			Develop and test strategies to promote accurate creation, dissemination, and uptake of information and to counter associated misinformation and disinformation.
Data Indicators	• Number of educational and community sharing opportunities to share information and address misinformation • Number of anti-stigma campaigns and materials developed to dispel HIV myths • Assessment of common myths and misconceptions held in and among priority populations • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth		
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Peers and near-peers • CHWs • Academia • Media partners • Digital content providers • RWHAP and EHE partners		• Assess common myths and misconceptions in and among priority populations and identify strategies to combat misinformation. • Promote the use of community sharing experiences and educational opportunities (e.g., community forums, celebrations, observance days). • Ensure messaging is succinct, culturally appropriate, consistent with HIV treatment guidelines, and delivered by persons credible to diverse populations across the state. • Develop and disseminate anti-stigma campaigns which focus on dispelling myths and misconceptions about HIV. • Expand the use of community gatekeepers and social network strategies to deliver HIV information through culturally appropriate methods. • Use existing workgroups to assist with developing and testing strategies to promote accurate creation, dissemination, and uptake of information and to counter misinformation.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.6.2		Increase diversity and cultural competence in health communication research, training, and policy.	
Data Indicators		• Number of collaborations with HBCU medical colleges and other schools of health • Number and type of training opportunities for cultural humility in health communication research • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • HBCUs • Professional and policy organizations and associations	• Create opportunities for advancement among diverse candidates. • Identify ways to create more targeted messaging for specific populations of PWH and consistently use language that is both people-first and inclusive. • Work with HBCU medical colleges such as Pharmacy, Social Work, Nursing, Medical Schools, and others. • Provide training opportunities for diversity and cultural competence in health communication research, training, and policy (e.g., conferences, webinars, lunch-and-learns). • Train and hire PWH who are qualified for roles in HIV leadership, research, training, peer support, and others. • Work with statewide advisory groups and SMEs to identify ways in which diversity and cultural humility can be incorporated into health communication trainings.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.6.3		Expand community engagement in health communication initiatives and research.	
Data Indicators	Priority Populations	• Number and type of engagements with CBOs, social service agencies and community resource centers • Assessment of populations that may not be receiving accurate health information • Number of collaborations with academic institutions to solicit feedback on health communication initiatives and research • Additional specific, quantifiable measures for each activity (TBD)	
		HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Community gatekeepers • RWHAP and EHE partners	• Identify ways to engage priority populations and communities in HIV media and messaging initiatives and research. • Increase engagement with CBOs, community resource centers, and social service agencies to help develop new health communication initiatives; activities could include townhall meetings, focus groups, health fairs, community celebrations, cultural events, and others. • Assess populations that may not be receiving accurate health communications, recruit leaders from those populations and train them to disseminate communications (through staffing agreement). • Engage with academic institutions (e.g., HBCUs) to solicit feedback on health communication initiatives and research. • Amplify and encourage efforts to share research output with participants.	
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.6.4	Include critical analysis and health communication skills in HIV programs to provide participants with the tools to seek and identify accurate health information and to advocate for themselves and their communities.	
Data Indicators	• Number and type of needs assessments conducted • Number of educational opportunities for providers, peers, and staff on health literacy identified and disseminated • Number and type of health literacy resources identified and developed for clients • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • AETC • Community gatekeepers • CHWs • Peers and near-peers	• Explore ways in which to incorporate critical analysis and health communication skills into HIV programs and services to increase client skills needed for health literacy and advocacy. • Ensure that needs assessments are conducted regularly, including questions related to provider communication skills and HIV-related messaging, in order to better respond to community needs and identify areas for improvement. • Identify and disseminate educational opportunities for providers, peers, and staff on health literacy, and encourage providers to screen clients for health literacy in order to be able to ensure the successful transfer of health information and health communication. • Identify and develop health literacy resources for clients that are new to care in order to help orient them to ways they can become more knowledgeable about their health and actively participate in their plan of care. • Increase provider and staff knowledge for strategies to identify and address misinformation and for strategies that increase the sharing of accurate health information.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 3.6.5			Expand effective communication strategies between providers and clients to build trust, optimize collaborative decision-making, and promote success of evidence-based prevention and treatment strategies.
Data Indicators			• Number of local leaders, influencers, and gatekeepers recruited to assist with communication initiatives • Number of CHWs and peers • Number of education and training opportunities on leading with empathy, active listening, patient experience, and on TIC • Additional specific, quantifiable measures for each activity (TBD)
Priority Populations			HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • AETC • Community gatekeepers • CHWs • Peers and near-peers	• Identify best practices for effective communication strategies between providers and clients to address medical mistrust. • Recruit local leaders, influencers, and gatekeepers to assist with communication initiatives designed to build trust. • Use CHWs and peers help to bridge communication gaps between clients and providers. • Offer education and training on leading with empathy, active listening, patient experience, and TIC to promote understanding amongst clients and providers to build trust in the client to provider relationship. • Research best practices in effective communication and explore the creation of a health communication resource compendium. • Increase the reach of messaging and media by engaging with community leaders and expanding partnerships to include organizations and agencies of all size. • Offer third-party encryption messaging to strengthen consumer trust.	
Planning Areas			
Statewide			

Goal 4: Achieve Integrated, Coordinated Efforts that Address the HIV Epidemic Among All Partners and Interested Parties

9.1.4.1 Objective 4.1. Integrate programs to address the syndemic of HIV, STIs, viral hepatitis, and substance use and mental health disorders in the context of social and/or institutional factors including stigma, discrimination, and violence

Strategy 4.1.1	Integrate HIV awareness and services into outreach and services for issues that intersect with HIV such as intimate partner violence, homelessness/housing instability, STIs, viral hepatitis, and substance abuse/mental health disorders.	
Data Indicators	• Development of community of practice to share expertise and collaborate on focus areas • Number of trainings identified and disseminated related to human trafficking, domestic violence, and sexual assault • Number of partnerships with mobile providers • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • PWH engaged in services • Housing coalitions • HOPWA providers • State and local law enforcement	• Develop a Community of Practice program (HUD, Homeless Coalition, FDOE, FDC) to learn, share expertise, and collaborate on focus areas. • Expand marketing and advertising campaigns of internal and external partners to promote and increase awareness of resources and services. • Identify and disseminate trainings and technical assistance on human trafficking, domestic and intimate partner violence and sexual assault for health care staff. • Increase partnerships with mobile service providers. • Leverage social media and outreach to disseminate program results and lesson learned.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.1.2	Implement a no-wrong-door approach to screening and linkage to services for HIV, STIs, viral hepatitis, and substance use and mental health disorders across programs.	
Data Indicators	• Number of reciprocal agreements established with local community partners • Number of HIV service providers using a no-wrong-door approach to screening and linkage services • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Health care providers • RWHAP and EHE partners	• Adopt a no-wrong-door approach focused on streamlining referral processes and linkage to care. A no-wrong-door approach provides individuals with or links them to appropriate services regardless of where they enter the system of care. This principle commits all service agencies to respond to the individual's stated and assessed needs with appropriate treatment or supportive linkage with programs capable of meeting the client's needs. • Establish local referral networking system to increase access to care through assignment of health care navigators. • Establish reciprocal agreements with local community partners.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.1.3	Identify and address funding, policy, data, workforce capacity, and programmatic barriers to effectively address the syndemic.	
Data Indicators	• Number of local information sessions conducted with stakeholders to identify barriers to service delivery • Analysis of data from the state’s HIV/AIDS hotline • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health and human rights advocates • HIV/AIDS policy experts • Health care providers • STD clinics • RWHAP and EHE partners • Local planning bodies	• Analyze and explore ways to use data from the state HIV/AIDS hotline to assess barriers. • Access statewide resources to identify gaps in service and funding opportunities to combat programmatic barriers. • Conduct local information sessions/workshops with stakeholders to analyze data and identify problematic areas as it relates to the delivery of service. • Create incident reporting system to identify individuals in need of assistance (e.g., assault, discrimination, housing). • Engage with local and state legislators to educate and inform on workforce capacity and impacts of staffing shortages.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.1.4		Coordinate and align strategic planning efforts on HIV, STIs, viral hepatitis, substance use disorders, and mental health care across national, state, and local partners.	
Data Indicators	Priority Populations	• Development of collaborative forum to share and learn about OD2A programs • Number of local health care facilities participating in local community health needs assessments • Additional specific, quantifiable measures for each activity (TBD)	
		HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • FDCF • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings and providers • Drug treatment programs • SSPs • Academia • Health care providers • RWHAP and EHE partners • Local planning bodies		• Ensure the Community Health Improvement Plan and Community Health Assessment is inclusive of internal and external partners. • Create a collaborative forum to share and learn about (OD2A programs across multi-agencies (e.g., faith-based organizations, CBOs, providers, the Department, FDCF). • Ensure the State Health Improvement Plan process and planning is inclusive of external groups and partners. • Establish a role or function in existing local planning bodies to conduct research into opioid initiatives and networks. • Invite local health care facilities to participate in local community health needs assessments.
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.1.5	Enhance the ability of the HIV workforce to provide naloxone and educate people on the existence of fentanyl in the drug supply to prevent overdose and deaths and facilitate linkage to substance use disorder treatment and harm reduction programs.	
Data Indicators	• Number of opportunities to education state and local legislators on harm-reduction practices • Number of local planning bodies supporting or participating in opioid initiatives • Number and type of naloxone access points • Number of naloxone training courses identified and disseminated • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • State and local law enforcement • Local planning bodies • RWHAP and EHE partners	• Educate local and state legislators on the use of fentanyl test strips and alignment with harm-reduction practices. • Establish a role or function in existing local planning bodies across multiple agencies (CHD, community, state, FCPN, OD2A project opioid providers) to support and/participate in opioid initiatives or the development of an opioid initiative. • Implement Naloxone Training Course and Training Program (CDC) • Increase the number of access points for naloxone (statewide). • Integrate OD2A into RWHAP service delivery system at local levels.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.4.2 Objective 4.2 Increase coordination among and sharing of best practices from HIV programs across all levels of government (federal, state, tribal, local, and territorial) and with public and private health care payers, faith-based and CBOs, the private sector, academic partners, and the community

Strategy 4.2.1		Focus resources including evidence-based and evidence-informed interventions in the geographic areas and priority populations disproportionately affected by HIV.	
Data Indicators		• Development of interactive locator for mobile service providers • Number of public-private partnerships established at local levels • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • RWHP and EHE partners • Digital resource providers (e.g., AIDSVu)		• Develop a mapping tool/interactive map locator/pin map of mobile units. • Develop regular partnership meetings with internal and external service providers at the local level. • Foster strong public-private partnerships to accelerate advances in HIV by inviting stakeholders outside of typical HIV partnerships to attend awareness days and generate new approaches to addressing the HIV epidemic. • Identify best practices and interventions from other jurisdictions that address similar priority populations. • Increase the use of outreach and education to reach priority populations and geographies.
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.2.2	Enhance collaboration among local, state, tribal, territorial, national, and federal partners, and the community to address policy barriers that contribute to persistent HIV-related disparities and implement policies that foster improved health outcomes.	
Data Indicators	• Development of centralized information platform to collect integrated HIV planning information • Number of and type of materials developed and disseminated in three languages (i.e., English, Spanish and Haitian-Creole) • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health and human rights advocates • HIV/AIDS policy experts • Health care providers • PWH engaged in services • Tribal organizations • Minority leadership programs • RWHAP and EHE partners	• Appoint community liaisons among local, state, tribal, territorial, national, and federal partners to assess and address barriers and social determinants via policy change and enhanced communication. • Create a centralized information platform to house local, county, state, consortium planning body meeting information, and proposed activities, and projects. • Create opportunities to bring a wide variety of partners and stakeholders together to increase cross-collaboration. • Foster strong public-private partnerships to accelerate advances in HIV by inviting stakeholders outside of typical HIV partnerships to attend awareness days and generate new approaches to addressing the HIV epidemic. • Incorporate three-language formula in marketing and advertising materials to overcome social barriers in disproportionate communities.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.2.3		Coordinate across partners to quickly detect and respond to HIV outbreaks.	
Data Indicators		• Number and geographic location of HIV transmission clusters identified • Number of intersectional teams developed at local levels for outbreak response • Number of mobile units using HIV transmission cluster data to direct positioning • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations		PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • RWHAP and EHE partners	• Create a centralized system for outbreak detection, reporting, and notification (e.g., meningitis, Mpox, HIV, STD, viral hepatitis). • Develop intersectional teams and protocols that include Department DIS, RWHAP programs, funded EHE providers, case managers, local medical and support services providers to share information and rapidly identify and link individuals diagnosed with HIV to care and treatment. • Establish response planning teams across multi-agencies and multi-sectors of the community (e.g., faith-based organizations, CBOs, providers, the Department) to track HIV outbreaks and provide rapid access to HIV treatment and care. • Use HIV transmission cluster data to direct the positioning of mobile units to respond to clusters of active transmission.	
Planning Areas			
Statewide			

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.2.4	Support collaborations between CBOs, public health organizations, education agencies and schools, housing providers, and health care delivery systems to provide linkage to and delivery of HIV testing, prevention, care, and treatment services as well as supportive services.	
Data Indicators	• Inventory of multi-agency collaborations at local levels • Number of partnerships with non-traditional sites to provide HIV awareness, prevention, or linkage services • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; gay, bisexual, and other MSM of all races/ethnicities; Black and Hispanic heterosexuals; transgender individuals; PWID and persons who use drugs; youth; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Educational institutions • Health care providers • Housing providers • RWHAP and EHE partners	• Advocate for the revision of MOAs and contracts to include specific standards, wrap-around services (e.g., housing, mental health services, and participation in planning). • Assess and review state and national collaborative frameworks to identify and adopt approaches that enhance current and future public-private partnerships that help scale up best practices and advances in HIV prevention and treatment. • Educate local and state legislators on the state's priority populations and geographies. • Form partnerships with non-traditional sites (e.g., gas stations, sporting events, public restrooms, rest stops) for the extension of providing HIV prevention and treatment services or awareness. • Identify best practices for increasing collaborations among CBOs, public health organizations, education agencies and schools, housing providers, and health care delivery systems to provide linkage to and delivery of HIV testing, prevention, care, and treatment services as well as supportive services.
Planning Areas		
Statewide		

9.1.4.3 Objective 4.3 Enhance the quality, accessibility, sharing, and uses of data, including HIV prevention and care continua data and social determinants of health data

Strategy 4.3.1 Promote the collection, electronic sharing, and use of HIV risk, prevention, and care and treatment data using interoperable data standards, including data from electronic health records, in accordance with applicable law.		
Data Indicators	- Development of centralized dashboard to share aggregate HIV-related data - Number of data sharing agreements developed with RWHAP partners - Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	- The Department - Community- and faith-based organizations - Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites - Behavioral health care and substance abuse settings - Drug treatment programs - SSPs - Academia - Health care providers - RWHAP and EHE partners - AHCA - Correctional settings - Community HIV Advisory Group	- Create centralized system or dashboard to share aggregate HIV-related data (e.g., testing, treatment, surveillance) internally and externally that can be readily used to understand local area disease burden, obtain information for grant requirements and using data for action and response. - Design a data system and process for improving data sharing amongst all RWHAP Parts, Florida ADAP, and service providers to improve client-level data sharing and HRSA RSR reporting requirements. - Develop a process to improve and simplify the sharing of HIV-related data both internally and externally to the Department to improve service provision. - Develop a process to increase working with external partners such as VA, private providers, Medicare, and others to improve data sharing at state and local levels. - Ensure that forms and policies around release of information and methods for release (e.g., text, email, phone) are continuously updated and shared with providers.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.3.2	Use interoperable health information technology, including application programming interfaces (APIs), clinical decision support tools, electronic health records and health IT products certified by the Office of the National Coordinator’s Health IT Certification Program, and health information exchange networks, to improve HIV prevention efforts and care outcomes.	
Data Indicators	• Evaluation of digital resources and clinical decision support tools • Development of reciprocal client-informed consent and release of information • Number of local areas with electronic referral systems • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • RWHAP and EHE partners • Community HIV Advisory Group • AHCA • Correctional settings	• Assess the ability to create a Health Information Exchange (HIE) and master client index among HIV service providers and link the current Florida HIE to data in the HIV/AIDS Section to improve linkage to care efforts. • Create a reciprocal (e.g., across agencies and all RWHAP parts) client-informed consent and release of information to acknowledge that data may be shared to improve service provision and linkage to care needs. • Develop a process and system to initiate and track electronic referrals to HIV-related prevention, treatment services and other ancillary services. Consult with the AIMS workgroup to review current resources. • Evaluate and promote the use of digital resources and clinical decision support tools. • Identify ways to improve data collection efforts for HIV prevention efforts (e.g., HIV self-test kit information).
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.3.3			Encourage and support patient access to and use of their individual health information, including use of their patient-generated health information and use of consumer health technologies in a secure and privacy supportive manner.
Data Indicators	• Development of client-centered training module around public health data collection and uses of patient information for public health • Development of reciprocal client-informed consent and release of information • Number and type of information shared around use of patient portals to facilitate client access to medical information • Assessment of information sharing methods best suited for rural communities and other areas with limited internet access • Additional specific, quantifiable measures for each activity (TBD)		
Priority Populations	PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers		
Timeframe	Critical Partners	Activities	
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • PWH engaged in services • RWHAP and EHE partners • AHCA • Correctional settings • Community HIV Advisory Group	• Create a client-centered training module around public health data collection and uses of patient information for public health purposes to assist with alleviating fears about misuse and privacy concerns. • Provide guidance and supportive information to encourage the use of patient portals from providers and laboratories to ensure that clients have direct access to their medical information. • Ensure health communication and messaging from provider to client is private, secure, and accessible, and occurs through a HIPAA-compliant platform or channel. • Explore the incorporation of a centralized patient portal or health information application. • Encourage providers currently using patient portals to offer additional client-centered education on patient portal functionality and utilization. • Explore the increase of in-app or in-portal patient health education opportunities. • Assess methods to increase information sharing and patient health education opportunities for people living in rural communities or other areas with limited internet access.

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

9.1.4.4 Objective 4.4: Foster private-public-community partnerships to identify and scale up best practices and accelerate HIV advances.

Strategy 4.4.1	Adopt approaches that incentivize the scale up of effective interventions among academic centers, health departments, CBOs, allied health professionals, people with HIV and their advocates, the private sector, and other partners.	
Data Indicators	• Number and type of public-private partnerships established and maintained • Development of statewide conference on HIV • Number of non-traditional partners participating in local HIV awareness events • Number of HIV prevention and treatment sites using ARV starter packs • Additional specific, quantifiable measures for each activity (TBD)	
Priority Populations	PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners	Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • PWH engaged in services • RWHAP and EHE partners • AHCA • Correctional settings • Community HIV Advisory Group	• Review and assess state and national collaborative frameworks to identify and adopt approaches that enhance current and future public-private partnerships that help scale up best practices and advances in HIV prevention and treatment. • Conduct an annual statewide conference on HIV and invite a wide range of traditional and non-traditional partners to participate and attend and share best practices. • Foster strong public-private partnerships to accelerate advances in HIV by inviting stakeholders outside of typical HIV partnerships to attend awareness days and generate new approaches to addressing the HIV epidemic. • Identify public-private partnership EBIs to scale up the use of ARV starter packs.
Planning Areas		
Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.4.2		Expand opportunities and mechanisms for information sharing and peer technical assistance in and across jurisdictions to move effective interventions into practice more swiftly.	
Data Indicators	Priority Populations	• Development of centralized information repository on best practices programs and interventions for addressing the HIV epidemic • Number and type of information sharing mechanisms used in local areas • Number of multi-agency collaboratives supporting data and information sharing • Additional specific, quantifiable measures for each activity (TBD)	
		PWH; HIV research and health care professionals and front-line staff, community-based organizations, health care delivery systems, and public health systems; HIV prevention and treatment providers	
Timeframe	Critical Partners		Activities
By 12/31/2026	• The Department • Community- and faith-based organizations • Health care settings including hospitals, FQHCs, private physician practices, and reproductive health sites • Behavioral health care and substance abuse settings • Drug treatment programs • SSPs • Academia • Health care providers • PWH engaged in services • RWHAP and EHE partners • AHCA • Correctional settings • Community HIV Advisory Group		• Create a centralized information repository to house and disseminate information on best practices, meeting information, and other information that will assist with addressing the HIV epidemic. • Develop local e-newsletters or other mechanisms to disseminate information quarterly on available resources and EBIs being used in the state. • Identify and establish local area collaborative coalitions across multi-agencies and multi-sectors of the community (e.g., faith-based organizations, CBOs, providers, the Department and others) to support data and information sharing and identify best practices that address the HIV epidemic. • Identify state and local subject matter experts and create a state specific technical assistance network.
Planning Areas	Statewide		

State of Florida Integrated HIV Prevention and Care Plan, 2022–2026

Strategy 4.4.3			Develop and optimize collaborative multi-agency and multi-sectoral approaches and strategies to address emergent and evolving challenges facing persons of all ages living with HIV.
Data Indicators	• Development of centralized information repository on best practices programs and interventions for addressing the HIV epidemic • Number and type of information sharing mechanisms used in local areas • Number of multi-agency collaboratives supporting data and information sharing • Additional specific, quantifiable measures for each activity (TBD)

9.4 Epidemiologic Profile

The full Epidemiologic Profile of HIV in Florida, 2017–2021 will be made available separately.

9.5 Other Supporting Documentation

9.6 Glossary

Acquired Immunodeficiency Syndrome (AIDS): A condition that exists when a person has tested positive for HIV and has one or more of 26 listed opportunistic illnesses/infections and/or a T-cell count of 200 or less per micro-liter of blood.

Business Responds to AIDS (BRTA): Modeled after the CDC initiative by the same name, developed initially in 1992, BRTA programs support targeted HIV prevention efforts through partnerships with local businesses. BRTA programs mobilize businesses and labor organizations to respond to HIV/AIDS in the workplace and the community with subtle, noninvasive approaches to raise awareness, promote services, and break down stigma. BRTA activities involve the use of promotional and incentive items that businesses can use to generate conversations around HIV/AIDS with their customers.

Community-Based Organization: A non-profit organization with a 501(c)(3) designation.

Community Engagement: The process of working collaboratively with and through groups of people affiliated by geographic proximity, special interest, or similar situations to address affecting the well-being of those people.

Community Health Worker: Trusted, knowledgeable frontline health personnel who typically come from the communities they serve. CHWs bridge cultural and linguistic barriers, expand access to coverage and care, and improve health outcomes.

Counseling, Testing and Linkage: Provision of counseling, testing and direct assistance in getting a client enrolled into the health and social service system.

Culturally Appropriate: Conforming to a culture's acceptable expressions and standards of behavior and thought. Interventions and educational materials are more likely to be culturally appropriate when representatives of the intended target audience are involved in planning, developing, and pilot testing them.

Epidemic: The occurrence of cases of an illness, specific health-related behavior, or other health-related events in a community or region in excess of normal expectancy.

Ethnicity: The cultural characteristics that connect a particular group or groups of people to each other, such as people of Hispanic or Latino origin.

Faith-Based Organization: A non-governmental agency owned by religiously affiliated entities such as (1) individual churches, mosques, synagogues, temples, or other places of worship or (2) a network or coalition of churches, mosques, synagogues, temples, or other places of worship.

Faith Responds to AIDS (FRTA): Built on the same framework as BRTA, FRTA is a Florida adaptation of the BRTA initiative but for faith-based organizations. FRTA programs are faith-based initiatives that mobilize churches and other faith-based institutions to raise awareness and reduce stigma around HIV/AIDS. FRTA programs are particularly effective at reaching minority communities. FRTA activities involve the use of promotional and incentive items that faith-based organizations can use to generate conversations around HIV/AIDS with their members.

Females: Individuals of the sex that produces large and generally immobile gametes (ova or eggs).

High-Impact Prevention (HIP): Using combinations of scientifically proven, cost-effective and scalable interventions targeted towards the highest risk populations in the right geographic areas to reduce new HIV infections.

HIV Mode of Exposure: Specific behaviors or actions that expose people to HIV and can potentially lead to HIV acquisition. Examples include unprotected anal or vaginal sex with a person living with HIV, injecting drugs with non-sterile, shared drug injection equipment, and male-to-male sexual contact.

Human Immunodeficiency Virus (HIV): The retrovirus virus can lead to AIDS, if not treated. The virus occurs in two types—HIV-1 and HIV-2. Both types are transmitted through direct contact (e.g., through sexual intercourse or sharing injection drug equipment) with HIV-infected body fluids, such as blood, semen, and genital secretions, or from an HIV-positive mother to her child during pregnancy, birth, or breastfeeding.

Incidence: The occurrence of new cases of disease or injury in a population over a specified period of time.

Integrated Prevention and Care Plan: A plan based on the Integrated HIV Prevention and Care Plan Guidance that requires a collaborative process between CDC and HRSA to identify and address: statewide goals for HIV prevention and care; emphasize the populations and communities most affected by the epidemic; highlight areas of need, service gaps, and barriers; identify health disparities and social determinants of HIV-related health; outline activities for implementing goals; and, identify factors for measuring success in achieving goals.

Intervention: A specific activity (or set of related activities) intended to reduce the risk of HIV transmission or acquisition. Interventions may be either biomedical or behavioral and have distinct process and outcome objectives and protocols outlining the steps for implementation.

Linkage: Actively assisting clients with accessing needed services through a time-limited professional relationship. The active assistance typically lasts a few days to a few weeks and includes a follow-up component to assess whether linkage has occurred. Linkage services can include assessment, supportive counseling, education, advocacy, and accompanying clients to initial appointments.

Males: Individuals of the sex that produces small, mobile gametes (sperm).

Men who have Sex with Men (MSM): Men who report sexual contact with other men and men who report sexual contact with both men and women (i.e., bisexual contact), whether or not they identify as gay.

National HIV/AIDS Strategy for the United States: A comprehensive plan focused on reducing HIV incidence, increasing access to care and optimizing health outcomes, and reducing HIV-related health disparities.

Navigation Services: Patient navigation assistance is the process of helping a person obtain timely and appropriate medical or social services, taking into account provider preferences,

insurance status, scheduling issues, and other factors that may complicate access or utilization of services.

Navigator: Patient navigators are peers, volunteers, and/or staff members of clinics, health departments, and community-based organizations. Patient navigators may be lay persons, paraprofessionals, or medical professionals (e.g., RNs, LPNs).

Partner Services: A systematic approach to notifying sex and needle-sharing partners of PWH of their possible exposure to HIV so they can be offered HIV testing and learn their status or, if already diagnosed, prevent transmission to others. Partner Services helps partners gain earlier access to individualized counseling, HIV testing, medical evaluation, treatment, and other prevention services.

Peers (or Near-Peers): Specially trained individuals from the community who may or may not be living with HIV/AIDS, but ultimately have lived experience.

Perinatal: Occurring during the period around birth (5 months before and 1 month after)

Post-Exposure Prophylaxis (PEP): The provision of antiretroviral medications to prevent transmission of HIV following an occupational or non-occupational exposure. Non-occupational post-exposure prophylaxis is referred to as nPEP.

Pre-Exposure Prophylaxis (PrEP): Antiretroviral medication taken to prevention acquiring HIV.

Prevalence: The number of people with a specific disease or condition in a given population at a specific time.

Race: A person's self-reported classification of the biological heritage with which they most closely identify.

Rapid HIV Test: A point-of-care HIV screening test used in both clinical and non-clinical settings, usually with blood from a finger stick or with oral fluid.

Ryan White Treatment Modernization Act: The name given to the Ryan White Comprehensive AIDS Resources Emergency (CARE) Act when it was reauthorized in 2006. This is the primary federal legislation that addresses the needs of persons in the United States living with HIV/AIDS and their families. The original CARE Act was enacted in 1990.

Seroprevalence: The overall occurrence of a disease or condition within a defined population at one time, as measured by blood tests.

Sex: Either of the two main biological categories (male and female) into which humans and most other living things are divided on the basis of their reproductive functions.

Social Determinants: The economic and social conditions that influence the health of persons, communities, and jurisdictions and include conditions for early childhood development; education, employment, and work; food security; health services; housing; income; and social exclusion.

Surveillance: The ongoing and systematic collection, analysis, and interpretation of data about occurrences of a disease or health condition.

Syndemic: The aggregation of two or more concurrent or sequential epidemics or disease clusters in a population with biological interactions, which exacerbate the prognosis and burden of disease.

Transgender: A person who does not identify with their sex at birth and may undergo gender transitionary care including hormone therapy and/or surgical procedures. This is also recognized as gender dysphoria.

Executive Summary

The United States (US) Department of Health and Human Services (HHS); the Centers for Disease Control and Prevention (CDC) National Center for HIV, Viral Hepatitis, Sexually Transmitted Diseases (STDs), and Tuberculosis (TB) Prevention (NCHHSTP); and the Health Resources and Services Administration (HRSA) HIV/AIDS Bureau (HAB) convened a meeting of the CDC/HRSA Advisory Committee on HIV, Hepatitis, and STD Prevention and Treatment (CHAC) on April 26-28, 2022.

CDC and HRSA Welcome and Updates

The meeting began with detailed updates from CDC and HRSA. The CDC update highlighted a number of important areas of interest from the NCHHSTP HIV, STD, viral hepatitis, and school/adolescent health programs including: a brief update on the continuing impact of COVID-19; NCHHSTP's equity initiative and strategic plan; harm reduction and Syringe Services Programs; discussion of mental health concerns in youth; Ending the HIV Epidemic (EHE) update; discussion on updated hepatitis B vaccination and screening and testing recommendations; and integrating STI and HIV services to address the syndemic. Highlights from the HRSA/HAB presentation included the introduction of a new Administrator, launch of a new Ryan White website, release of the National HIV/AIDS Strategy (2022–2025) in December 2021, and policy and data updates. CHAC members discussed recent policy changes and their potential impacts on LGBTQ (lesbian, gay, bisexual, transgender, and questioning) youth's access to information, resources, and equitable care.

Strategizing an Approach to Providing Comprehensive STI Services

During this panel, CHAC heard from programs in Mississippi, New York, and Minnesota that highlighted innovative strategies they are employing to increase access to testing and comprehensive STI services. These strategies included using the school space to increase access to health services for young people, leveraging technology, and the effort to align that with the COVID-19 pandemic response to: 1) innovate and modernize the public health infrastructure, which can serve as a good model moving forward in jurisdictions; and 2) determine how to secure and sustain funding to support these efforts moving forward in a post-COVID world.

Leveraging Policy to Advance HIV, VH, and STI Priorities

This panel focused on utilizing policy as a public health intervention as an approach to solving expansive issues in public health. The National Viral Hepatitis Roundtable presented on the state of Medicaid access with respect to Hepatitis C. The California Department of Public Health (CDPH) Office of AIDS provided an update on Senate Bill (SB) 159 pertaining to HIV pre-exposure and post-exposure prophylaxis (PrEP & PEP) for California pharmacists and the STD Control Branch presented on leveraging policy changes for STI and VH prevention, testing, and treatment. The Louisiana Office of Public Health STD/HIV/Hepatitis Program described Louisiana's *Hepatitis C Elimination Plan: 2019-2024*. The Transitions Clinic Network described issues pertaining to the Medicaid Inmate Exclusion Policy (MIEP) which reduces barriers to care for post-incarceration, reintegrating individuals.

Turning the Tide on Self-Testing and Sample Collection

This special presentation focused on self-testing and sample collection, highlighting the pipeline and approval process for self-collection kits. CHAC heard data on how impactful self-collection kits could be on communities that historically have not utilized traditional brick-and-mortar structures. The availability of self-collection kits has been demonstrated to increase testing practices in a number of communities. Discussion focused on how the Food and Drug

Administration (FDA) views HIV versus HCV and manufacturers' willingness to produce self-testing kits and seek FDA approval. Additionally, CHAC members discussed the differences in the criteria used for regulatory authorization of collection kits/methods domestically versus internationally and the potential for the review and revision of FDA process to increase access to and use of self-test kits.

Applied Syndemic Approach to HIV, VH, and STIs: Focusing on People

This panel focused on implementation of programmatic syndemic approaches, which underscored the need to take a "whole person" approach in terms of the issues that influence an individual's ability to access the resources that are being put forward, utilize them effectively, and achieve successful health outcomes. The New Mexico Department of Health (NMDOH) described its comprehensive harm reduction program focused on meeting people where they are to support HCV treatment and syphilis services. The North Dakota State Correctional Health Authority emphasized that corrections health is an important part of public health and represents a vulnerable and underserved population and can be an ideal setting for delivering comprehensive services. The San Francisco Unified School District (SFUSD) described policies and mandates, community partnerships, resources, training, and initiatives that help support comprehensive sexual health services to SFUSD youth. Finally, CDC's Division of HIV Prevention (DHP) provided an update focused on advancing syndemic approaches through cluster detection and response, emphasizing that cluster detection and response can guide tailored implementation of proven treatment and prevention strategies for HIV and other syndemic conditions where transmission is occurring most rapidly.

Telehealth/Telemedicine Working Group (WG)

The Telehealth/Telemedicine WG put forth several recommendations focused on enhancing routine screening through virtual services for all populations, health equity's relationship to telehealth service provision, and deployment of the Tele-PrEP initiative for Federally Qualified Health Centers (FHQCs).

Presidential Advisory Council on HIV/AIDS (PACHA)

CHAC was provided an update on PACHA's 73rd full council meeting that was convened virtually on March 14-15, 2022. This presentation emphasized the importance of hearing the voices of the community that will help guide PACHA in moving forward in terms of making recommendations to support EHE and in implementing the National HIV/AIDS Strategy (NHAS).

Business Session

The Business Session focused on CHAC actions and proposed future agenda topics. The next CHAC meeting is scheduled for November 1-3, 2022.

Future Agenda Topics Proposed

- Gender-affirming care, coverage, and outcomes
- Barriers to providing PrEP for uninsured and under-insured individuals
- Lessons that can be learned from the global setting (e.g., task-sharing to enhance the workforce, availability of self-testing and self-collection of specimens, et cetera)
- Issues specific to pregnancy (e.g., perinatal transmission of HIV, HCV, HBV, and congenital syphilis; underuse of PrEP in at-risk pregnant women; mental health; intimate partner violence; breast and chest feeding; et cetera)
- The effects of COVID-19 in a variety of areas (e.g., healthcare overall, HIV, persons ≥50 years of age, disparities, and comorbidities post-COVID, et cetera)

CHAC Actions

During this meeting, CHAC members voted unanimously to:

- Adopt the November 2021 CHAC meeting minutes, with no edits proposed.
 - Send the letter of recommendations presented by the Telehealth WG to the HHS Secretary, with a minor revision of repositioning the health equity recommendation as the first bullet.
 - Develop and send a letter to the HHS Secretary regarding LGBTQ youth.
 - Create a Self-Collection Self-Testing WG to consider issues related to self-testing, potentially including: 1) Differences in FDA risk classification of HCV and HIV; 2) Criteria required and data available for the FDA approval process; and 3) Downregulation to class II diagnostics. In addition, this WG will draft a letter to be presented to CHAC for a potential vote during the November 2022 meeting.
 - Establish a Workforce WG to liaise with PACHA on their efforts, to discuss the main issues CHAC is to consider on workforce including exploring the role of other professionals and community health workers (CHWs) in this space, and to discuss topics to potentially inform a panel for the November 2022 CHAC meeting.
-

**US DEPARTMENT OF HEALTH AND HUMAN SERVICES
CENTERS FOR DISEASE CONTROL AND PREVENTION
HEALTH RESOURCES AND SERVICES ADMINISTRATION
CDC/HRSA Advisory Committee on
HIV, Viral Hepatitis, and STD Prevention and Treatment
April 26-28, 2022**

Minutes of the Meeting

The United States (US) Department of Health and Human Services (HHS); the Centers for Disease Control and Prevention (CDC) National Center for HIV, Viral Hepatitis, Sexually Transmitted Diseases (STDs), and Tuberculosis (TB) Prevention (NCHHSTP); and the Health Resources and Services Administration (HRSA) HIV/AIDS Bureau (HAB) convened a meeting of the CDC/HRSA Advisory Committee on HIV, Hepatitis, and STD Prevention and Treatment (CHAC) on April 26-28, 2022.

The CHAC is a committee chartered under the Federal Advisory Committee Act (FACA) to advise the Secretary of HHS, Director of CDC, and Administrator of HRSA on objectives, strategies, policies, and priorities for HIV, viral hepatitis, and STD prevention and treatment efforts for the nation. Information for the public to attend the CHAC meeting virtually was published in the *Federal Register*, in accordance with FACA rules and regulations. All sessions of the meeting were open to the public. Please see Appendix A for Membership Attendance.

Day 1: Opening of the Meeting and Roll Call

Marah E. Condit, MS

Public Health Analyst, Advisory Committee Management Lead
Office of Policy, Planning, and Partnerships
National Center for HIV, Viral Hepatitis, STD, and TB Prevention
Centers for Disease Control and Prevention

Ms. Condit welcomed participants to the CHAC meeting, called the proceedings to order at 11:00 AM Eastern Time (ET), reviewed ground rules, and provided instructions for discussion periods. She indicated that members of the public would have an opportunity to provide oral comments at 3:30 PM ET during the second day, and that public comments would not be accepted at any other point during the meeting.

Jonathan Mermin, MD, MPH (RADM, USPHS)

Director, National Center for HIV, Viral Hepatitis, STD and TB Prevention
Centers for Disease Control and Prevention
CHAC Designated Federal Officer
Centers for Disease Control and Prevention

On behalf of CDC and HRSA, Dr. Mermin welcomed those present and reminded everyone that CHAC meetings are open to the public and that all comments made during the proceedings are a matter of public record. Members should be mindful of potential conflicts of interest (COIs) identified by the Committee Management Office (CMO) and recuse themselves from voting or participating in any discussions for which they could be conflicted. He then conducted a roll call to determine the CHAC voting and *Ex-Officio* members who were in attendance and establish quorum. Quorum was maintained during all 3 days of the meeting.

Conflict of Interest Disclosures

CHAC Voting Member Institution/Organization	Disclosure of Conflicts
Jean R. Anderson, MD Johns Hopkins Medical Institutions	Stocks: Apple, Amazon, Cisco, Alphabet, Splunk Research Funding: Merck, Gilead
Wendy Armstrong, MD Emory University School of Medicine	Research Funding: HRSA/Ryan White Parts A, B, D that supports part of her salary as well
Jodie Dionne-Odom, MD, MSPH University of Alabama, Birmingham	Research Funding: NIH
Shannon Brown Dowler, MD North Carolina Medicaid	None
Daniel Driffin, MPH D3 Consulting	None
Travis Gayles, MD, PhD Hazel Health	Self-recusal for Telehealth related topics
Meredith Greene, MD University of California, San Francisco	Research Funding: Gilead, NIH Works in a Ryan White-funded clinic
Vincent Guilamo-Ramos, PhD, MPH, LCSW, RN, ANP-BC, PMHNP-BC, AAHIVS, FAAN Duke University	Research Funding: NIH, ACF
Kali Lindsey amfAR, Foundation for AIDS Research	None
Christine Markham, PhD University of Texas Houston	Research Funding: NIH, ACF, OMH
Shruti Mehta, PhD, MPH Johns Hopkins Bloomberg School of Public Health	Research Funding: NIH, USAID Materials Support For Research Studies: Abbott
Johanne Morne, MSED AIDS Institute, New York State Department of Health	Research Funding: CDC and HRSA/Ryan White HIV/AIDS Program
Kneeshe Parkinson Washington University/Project ARK	Research Funding: HRSA/Ryan White HIV/AIDS Program Parts A, B, C, and D
Robert Riester Denver Element	Research Funding: CDC and HRSA/Ryan White HIV/AIDS Program, Part A
Leandro Rodriguez, MBA Latino Commission on AIDS	Research Funding: HRSA/Ryan White HIV/AIDS Program, CDC, SAMHSA, Gilead, ViiV
Samuel So, MD Stanford University	Research Funding: CDC, NIH

Ex-Officio members in attendance included Dr. Pradip Akolkar of the Food and Drug Administration (FDA), Dr. Maureen Goodenow of the National Institutes of Health (NIH), Dr. Neerja Gandotra of the Substance Abuse and Mental Health Services Administration (SAMHSA), Ms. Kaye Hayes of the HHS Office of HIV/AIDS and Infections Disease Policy (OIDP), Mr. Rick Haverkate of the Indian Health Service (IHS), and Dr. Richard Wild of the Centers for Medicare and Medicaid Services (CMS). Liaison member Dr. Ada Steward of the

Presidential Advisory Council on HIV/AIDS (PACHA Liaison Representative) organization, Eau Claire Cooperative Health Centers, receives Ryan White Funding Parts B and D.

Dr. Mermin confirmed that a quorum of 22 was achieved and that CHAC could move forward with conducting its business on April 26, 2022.

Welcome and Agenda Review

Travis Gayles, MD, PhD

CHAC Co-Chair, CDC Appointee

Jean Anderson, MD

CHAC Co-Chair, HRSA Appointee

Dr. Gayles and Anderson welcomed everyone to the April 26-28, 2021 CHAC meeting. Dr. Gayles thanked CHAC members, federal officials, CDC and HRSA staff, and the general public for their attendance and commitment. He expressed particular gratitude to Dr. Stewart for her efforts to promote vaccination in the pediatric population, as well as her commitment across the full breadth of public health issues. He reviewed the agenda for the day, pointing out that it highlighted the continued need to be nimble and versatile in the ever-changing post-COVID world with the increased attention on public health issues and budget demands and supplies. He observed that many of the topics to be discussed during this meeting demonstrated how CHAC must continue to evolve in terms of considering what should be included in a comprehensive STI testing program in 2022, determining the types of policies that need to be put into place to impact service delivery in a more meaningful way, and examining how federal policies might influence the delivery of those services. As always, they looked forward to great presentations, robust discussions, and tangible action items.

CDC DFO Welcome and Updates

NCHHSTP Update

Jonathan Mermin, MD, MPH (RADM, USPHS)

Director, National Center for HIV, Viral Hepatitis, STD and TB Prevention

Centers for Disease Control and Prevention

CHAC Designated Federal Officer

Dr. Mermin welcomed new CHAC Voting Members, Mr. Kali Lindsey and Dr. Christine Markham. He also welcomed Dr. Maureen Goodenow, Director of NIH's Office of AIDS Research, who is replacing Dr. Paul Gaist as the NIH *Ex-Officio* member.

To update CHAC correspondence, responses were sent on March 7, 2022, for the HIV and HCV classification letter; the Viral Hepatitis Workgroup (WG) letter; the Youth Engagement letter; and an interim response to the Perinatal Infection WG letter. CDC and HRSA are working on a detailed response currently and hope to have that finalized in the next couple of months.

In terms of COVID-19 pandemic, the number of deaths officially attributed to COVID-19 is close to 1 million in the US and there have been over 80 million total cases. Although mortality and hospitalizations decreased with the decreasing incidence of COVID-19 in the early part of 2022, cases and hospitalizations increased as the new subvariant began to spread. Challenges continue for all of public health and clinical care, as well as policies and other aspects of trying to keep America healthy in an environment where there are various other pressures

simultaneously. NCHHSTP continues to have multiple deployments for the COVID-19 response, with over 700 employees deployed since the beginning of the epidemic, over 1600 cumulative deployments, 53 people currently deployed, and 17 staff soon to deploy. NCHHSTP also is taking responsibility for several aspects of the incident management structure as CDC begins to reorganize its response to COVID-19, with the understanding that this is going to be a long-term effort.

NCHHSTP's Equity Initiative Strategy launched in 2021. This long-term strategy is intended to help achieve workplace equity and eliminate health disparities by addressing racism and other systems of oppression that hinder the center's mission. An implementation plan was developed that outlines the first steps of this process, though NCHHSTP already has been implementing many of the strategies. The overall goal is to help integrate health equity and equity in the workplace as core activities to which NCHHSTP is committed. NCHHSTP is focused on pervasive disparities associated with HIV, viral hepatitis, STDs, and TB, as well as adolescent health. The Equity Initiative involves all aspects of the center, with each division developing action plans that they have been implementing for some time.

An assessment was completed of external work for improving public health, internal workforce, organizational change, and analysis. Based on the analysis of the workforce, over 50% of NCHHSTP's staff are racial/ethnic minorities and close to 70% are women. The proportion of racial/ethnic minorities has increased at least 20% over the past decade. NCHHSTP also was the first group at CDC to conduct a survey of staff regarding sexual orientation and gender identity. Approximately 18% of NCHHSTP staff identified as LGBTQ (lesbian, gay, bisexual, transgender, questioning), with that proportion being the same in lower and higher General Schedule (GS) levels. NCHHSTP is committed to continue to perform these demographic analyses, develop fact sheets, and improve the inclusiveness of the day-to-day experience of staff within the center.

Part of the Equity Initiative is the development of an external public health dashboard that assesses the overarching measures of inequity in the diseases under NCHHSTP's purview. There are relative comparative measures and absolute measures, which follow current scientific practices for analyzing inequities. While these measures vary for each condition and population, the center is committed to reducing health inequity.

CDC's cross cutting strategic plan to reduce the infectious disease consequences among people who use drugs is complete. The mission is to decrease morbidity, mortality, and incidence of infectious diseases associated with injection drug use, as well as stigma experienced by people who use drugs. Several strategic priorities have been identified, including expanding the infrastructure of syringe services programs (SSPs) nationwide and integrating SSPs into the public health system, and establishing coordinated surveillance, monitoring, and program implementation. "Strengthening Syringe Services Programs" Notice of Funding Opportunity (NOFO) was issued recently that will expand SSP and support a network of SSPs across the country.

Additionally, this year CDC is implementing the 6th surveillance cycle among people who use drugs via the National HIV Behavioral Surveillance or NHBS which monitors prevalence and trends of HIV infection, risk behaviors, and prevention services among populations at increased risk for HIV, across 20-23 cities in the US. CDC is also launching the Microinfluencing project with the CDC Foundation and the Public Good Projects. This is a pilot to engage social media influencers to grow support for SSPs starting in West Virginia and other jurisdictions across the country. The campaign launched mid-April called "Appalachian Influencers," recruiting both paid

and volunteer influencers to begin posting messages, focusing on 4 audiences including law enforcement, health care, faith leaders, and community leaders.

Similar to what has been experienced in other infections, tuberculosis (TB) cases decreased in 2020 for a variety of reasons that are still under exploration and increased by 9% in 2021, however, not to the levels of 2019. Factors likely contributing to the observed decline include delayed or missed TB diagnosis due to disruptions in health care access, underdiagnosis, or a true decline from the reduced TB transmission due to pandemic mitigation efforts and fewer new arrivals from high TB incidence countries. TB incidence in the US continues to decrease over time, but not at the pace that would be necessary to achieve TB elimination goals.

Division of Adolescent and School Health (DASH) Update

Kathleen Ethier, PhD

Director, Division of Adolescent and School Health
National Center for HIV, Viral Hepatitis, STD and TB Prevention
Centers for Disease Control and Prevention

Dr. Ethier reminded everyone that DASH has been presenting to CHAC for a number of years about what has been observed through the Youth Risk Behavior Survey (YRBS) regarding the health and wellbeing of young people in the country. New data recently were released that were collected through the Adolescent Behaviors and Experiences Survey (ABES), a version of the YRBS that was implemented in Spring 2021. Students were recruited through schools, same as is done for the YRBS, but they were able to complete the survey online instead of in a classroom. This engagement allowed sample students who were learning virtually, as well as those who were learning in-person in school to participate.

These data reveal the magnitude of challenges that youth are experiencing, particularly related to mental health, experiences of abuse in the home during the pandemic, experience of racism in schools, and a variety of other issues. There is a continuing mental health crisis among youth, which was seen prior to the pandemic, particularly among female students and students who identify as being LGBTQ. These data show 26% of students who identify as LGBTQ attempted suicide in the year prior to the data collection during the pandemic and more than 50% of all students experienced emotional abuse in the home (e.g., verbal abuse by a parent or other adult), speaking to the level of stress experienced by students and families. Among respondents, 64% of Asian students and 55% of Black and Multiracial students reported having experienced racism in school not related to the pandemic.

Youth who identify as LGBTQ have been disproportionately impacted by the pandemic, experiencing higher levels of poor mental health, more than 3 times the likelihood to have attempted suicide in the past year, and more emotional abuse at home during the pandemic compared to their heterosexual peers. This data shows that access to schools and other places in the community where students can be supported is critical and was limited due to the pandemic. One of the hopeful findings was that connectedness mitigated mental health issues. Students who reported that they felt connected were less likely to experience mental health problems and were less likely to consider or attempt suicide. At the same time, students who identify as LGBTQ and students who experienced racism were less likely to feel connected to others at school. This sets up a challenge for those who work in schools in how to make schools safer and more supportive, particularly for those youth.

CDC's "What Works in Schools" approach improves adolescent health and wellbeing. This approach includes quality sex education, systems to connect youth to services, and a set of activities around improving school connectedness and providing support for LGBTQ students. In schools implementing this approach within CDC-funded districts, students were less likely to have ever had sex, have 4 or more sexual partners, be currently sexually active, miss school because of safety concerns, be forced to have sex, and/or use marijuana.¹ Sexual assault is known to be a predictor of lifelong trauma as well as posing STD and HIV risks.

Schools that put a set of policies and practices in place to support LGBTQ students such as identifying safe spaces, having professional development for educators, and having anti-harassment policies that are enforced leads to improvements in mental health outcomes and reductions in suicidal thoughts and behaviors. Improvements are observed in all students including LGBTQ in schools that put these policies and practices in place. The reverse is also the case—that when these policies and practices are not in place, mental health problems are exacerbated for students who identify as LGBTQ and also for heterosexual students. This has significant implications for the currently state of schools across the country. As schools are made less toxic for the most vulnerable students, schools are made less toxic for everyone and the reverse is also the case.²

Division of HIV Prevention (DHP) Update

Demetre Daskaliakis, MD, MPH

Director, Division of HIV Prevention

National Center for HIV, Viral Hepatitis, STD and TB Prevention

Centers for Disease Control and Prevention

Dr. Daskaliakis reminded everyone that has CDC requested \$310 million in the FY23 President's Budget in order to continue its focus on the 4 pillars of EHE, as well as to amplify these efforts by investing in key strategies to advance health equity. Some of the highlights are to focus efforts on increasing access to testing by scaling up self-testing, and to think specifically about the use of self-testing in high impact settings such as community-based organizations (CBOs), LGBTQ-focused clinics, correctional facilities, and SSPs. Syndemic approaches would be expanded to create efficiencies and broaden the reach to many key populations. Lessons learned during the COVID-19 pandemic will be assessed to identify ways to better improve capacity in small priority population-focused CBOs to increase the benefit of EHE prevention and care services. The focus on PrEP uptake would continue to be promoted and delivered, including a newly available injectable PrEP and working on increasing delivery of tele-PrEP. This funding also would support expanding implementation of innovative status neutral approaches to care delivery by providing peer-to-peer training and implementation support to health departments that currently are not providing such services. This all part of EHE and is one of the 5 equity interventions and is part of the focus to increase the reach of HIV prevention and care services to Black, Brown, and LGBTQ people as well as other priority populations.

¹ Robin L, Timpe Z, Suarez NA, Li J, Barrios L, Ethier KA. Local Education Agency Impact on School Environments to Reduce Health Risk Behaviors and Experiences Among High School Students. *J Adolesc Health*. 2022 Feb;70(2):313-321. doi: 10.1016/j.jadohealth.2021.08.004.

² Centers for Disease Control and Prevention, National Youth Risk Behavior Survey (YRBS), 2015 & 2017; Centers for Disease Control and Prevention, School Health Profiles (Profiles), 2014 & 2016

DHP is in the midst of a renaissance of community engagement with a focus on 3 types of engagement:

1. Information gathering, an example of which is a refresh of the domestic HIV program strategic plan
2. Topic-specific discussion, examples of which are cluster detection and response and status neutral approaches
3. Ongoing community-centered engagement. Community-centered engagement began in March when regional Town Halls were convened to educate, encourage, and focus on empowering local community implementation of the EHE Initiative. The goal is to work together to understand and address longstanding inequities and strategies that can be used to further nuance addressing those inequities.

At the beginning of April, CDC funded 36 CBO grantees in 18 states with \$400,000 in funding per grantee to focus on HIV prevention with young men of color who have sex with men and young transgender persons of color.³ Since the last group of grantees, 6 more organizations were identified, and each received an increased funding level. CDC also recently announced and received applications for a funding opportunity⁴ to support organizations that work in transgender clinics and partner with CBOs that focus on transgender populations to develop community-to-clinic models to integrate status-neutral HIV prevention and care services where people seek gender-affirming care. This takes advantage of navigation and other strategies that are designed to increase knowledge, confidence, and use of PrEP and other interventions.

One of the great innovations that came out of the COVID-19 pandemic was the self-testing program, which is being expanded and will be funded over the next 5 years to distribute 150,000 self-tests per year. Conversely, there were significant interruptions in care services due to the pandemic that have made surveillance data harder to interpret and more complex. The HIV Surveillance Data Tables will be released when the full reports are available and the commentary is able to guide how this is interpreted. Because of the disruptions, there are some derived estimates (incidence, knowledge of status, prevalence) that will not be possible to produce for 2020. Work is underway to update data collection to better capture these data, for which approval is expected by the end of 2022 from the Office of Management and Budget (OMB) and collection will begin in early 2023.

Division of Viral Hepatitis (DVH) Update

Carolyn Wester, MD MPH

Director, Division of Viral Hepatitis
National Center for HIV, Viral Hepatitis, STD and TB Prevention
Centers for Disease Control and Prevention

Dr. Wester shared some of the work that the DVH has accomplished recently to address health disparities in viral hepatitis (VH). VH elimination has moved from risk-based to universal recommendations among adults. In November 2021, the Advisory Committee on Immunization Practices (ACIP) voted unanimously to update the hepatitis B vaccination recommendations to include the following recommendations:

1. All adults 19-59 years and adults ≥ 60 with risk factors should receive hepatitis B vaccines
2. Adults ≥ 60 without known risk factors may receive hepatitis B vaccines

³ <https://www.cdc.gov/hiv/funding/announcements/ps22-2203/index.html>

⁴ <https://www.cdc.gov/hiv/funding/announcements/ps22-2209/index.html>

CDC formally published these guidelines in the *Morbidity and Mortality Weekly Report (MMWR)* on April 1, 2022.⁵ The move away from risk-based recommendations will help reduce health disparities by eliminating the need for patients disclose potentially stigmatizing risk factors and also provide healthcare providers with a simplified vaccine decision-making process.

As reported during previous CHAC meetings, CDC is currently updating its hepatitis B screening recommendations from risk-based to universal recommendations as well. This will complement the vaccination approach, as well as the hepatitis C and HIV screening guidelines among adults. The proposed updated recommendations are 2-fold. The first recommendation is that screening be performed at least once in a lifetime for all adults ≥ 18 years of age and the second is to expand existing risk-based testing recommendations for ongoing testing for additional groups, including people who are currently or formerly incarcerated people with a history of STIs, and people with a history of hepatitis C virus infection. These recommendations are currently available on the *Federal Register*⁶ for public comments, which closes on June 3, 2022. Formal publication of this update is anticipated later in the year.

The prevalence of hepatitis C is increasing among reproduction aged individuals and pregnant persons, with approximately 6% of perinatally exposed children becoming infected.⁷ Of the recommendations currently available, the most consistent is to test exposed children with a hepatitis C antibody test at or after 18 months of age. There is no clear guidance regarding hepatitis C RNA testing beginning at 2 months of age despite the fact that this testing may possibly decrease loss to follow-up and misidentification. CDC is working to develop evidence-based hepatitis C testing recommendations for perinatally exposed children to ensure that exposed infants and children are appropriately tested and linked to care and curative treatments. Peer review and public comments for these recommendations are expected to take place in Fall 2022, with publication anticipated in early 2023.

Viral hepatitis cannot be eliminated without also addressing the challenges posed by the national opioid crisis. People who inject drugs (PWID) are at high risk for viral hepatitis, HIV, and other infections. They also experience unique barriers to testing and treatments. Harm reduction service programs are a proven effective component of community-based programs to prevent the spread of infectious consequences from injection drug use. In 2019, the DVH established the National Harm Reduction Technical Assistance Center (NHRTAC) to strengthen the capacity of SSPs.⁸ DVH first partnered with the National Alliance of State and Territorial AIDS Directors (NASTAD) to build the infrastructure of this center. As the program grew, partnerships were expanded to include the National Harm Reduction Coalition (NHRC) and the University of Washington. Now in Year 3, the center has broadened involvement of the NHRTAC to include CDC's Injury Center and SAMHSA and National Association of County and City Health Officials (NACCHO) and 6 additional TA-providing organizations are joining for bridging expanded expertise and offering harm reduction from health departments and recovery communities, as well as experts from SAMHSA's Addiction and Prevention Technical Training Centers.

As part of the effort to build up comprehensive programs to support the needs of PWID, CDC released a NOFO in March 2002, Strengthening Syringe Services Programs (CDC-RFA-PS22-2208), with 2 key components that will increase access to harm reduction services for PWID. Component 1 will support the development of a national network of SSPs to facilitate

⁵ <https://stacks.cdc.gov/view/cdc/115806>

⁶ <https://www.federalregister.gov/d/2022-07050>

⁷ Centers for Disease Control and Prevention. 2019 Viral Hepatitis Surveillance Report. <https://www.cdc.gov/hepatitis/statistics/SurveillanceRpts.htm>

⁸ harmreductionhelp.cdc.gov

communication among SSPs and other harm reduction programs and health organizations trusted by the PWID community and improve data about SSPs by conducting an annual national survey of SSPs to document capacity, needs, access, and service gaps. Component 2 will increase support and resources to SSPs for implementation of these programs, including syringe distribution and disposal, testing, treatment, and prevention of the infectious complications of infections of injection drug use. This program will enhance and expand harm reduction services leading to reductions in new viral hepatitis infections.

In conclusion, the DVH will continue to promote innovative and holistic approaches to reduce health disparities and meet the needs of people living with or vulnerable to viral hepatitis.

Division of STD Prevention (DSTDP) Update

Leandro Mena, MD, MPH, FIDSA

Director, Division of Viral Hepatitis

National Center for HIV, Viral Hepatitis, STD and TB Prevention

Centers for Disease Control and Prevention

Dr. Mena reported that DSTDP is in the process of developing a new division strategic plan for 2022-2025. This effort will include alignment with the Sexually Transmitted Infections National Strategic Plan for the United States | 2021–2025.⁹ The new proposed goals will be to:

1. Prevent new STIs
2. Improve the health of people by reducing adverse (harmful) outcomes of STIs
3. Accelerate progress in STI research, technology, and innovation
4. Reduce STI-related health disparities and health inequities
5. Achieve integrated, coordinated efforts that address the STI epidemic

The new plan is projected to be finalized in early Fall 2022. DSTDP envisions a whole nation response to preventing and controlling STIs in the US that goes beyond disease to address the health and wellbeing of the individual, recognizing that this will require support of partners and collaborators.

The National Strategic Plan and the DSTDP strategy call for reductions in disparities and health inequities. This key approach will be reflected in NOFOs and activities to ensure that there is high population-level impact. The strengthening of STD prevention and control for health departments has had a tremendous response, with an additional \$200 million going to recipients each year for the next 5 years for which there is an emphasis on expansion of the workforce and to strengthen disease outbreak and response capacity by bringing on an additional 1800 staff members. DSTDP continues to strengthen its supplemental surveillance projects, including strengthening US surveillance of drug-resistant gonorrhea with the use of whole genome sequencing (WGS) to better understand the epidemiology of gonorrhea. Investments are being made in innovation, particularly in syphilis diagnostics and in training of Disease Intervention Specialists (DIS). Some of these innovations and trainings will be funded from the \$1.13 billion that was allocated to DSTDP last year through the America Rescue Plan Act.

⁹ <https://www.hhs.gov/sites/default/files/STI-National-Strategic-Plan-2021-2025.pdf>

The 2020 STD Surveillance Report¹⁰ was released in early April 2022 along with preliminary 2021 syphilis data. In 2020, there were increases in gonorrhea, syphilis, and congenital syphilis. Increases are being seen in syphilis and congenital syphilis for 2021 as well. Conversely, there was a 12.7% decline in cases of chlamydia from 2019. This decline is likely due to decreasing STD screening and diagnosis during the pandemic rather than a reduction in new infections since chlamydia is usually asymptomatic. While syphilis cases are increasing, they do present an opportunity for HIV prevention. Since 2015, the number of primary and secondary syphilis cases reported among HIV-negative MSM has surpassed the number of cases reported among HIV-positive MSM. While overall cases reported among HIV-positive MSM may be leveling off, there are no signs of syphilis slowing down among heterosexuals. Reported cases of primary and secondary syphilis cases increased 420% among women from 2011-2022. The intersection of HIV and syphilis presents a clear opportunity in which syndemic approaches can be beneficial to addressing these infections, as well as the conditions that contribute to their occurrence.

Along with the new plans, some key actions DSTDP is taking include identifying opportunities for collaboration and integration of services, increasing access to stigma-free healthcare, expanding partner services and DIS programs, improving STI diagnostics and therapeutics, and enhancing surveillance systems to inform public health actions and better understand root causes of increasing STIs at the national and local levels. For each of these activities, DSTDP is committed to a process that prioritizes access to and extension of services that address disparities and inequities. Social health services can be a gateway for overall health and wellness. DSTDP will move from a disease-focused approach to a social health promotion and wellbeing framework.

HRSA DFO Welcome and Update

Laura Cheever, MD, ScM

Associate Administrator, HIV/AIDS Bureau
Health Resources and Services Administration
CHAC Designated Federal Officer

Dr. Laura Cheever extended her welcome to new CHAC Voting Members, Mr. Lindsey and Dr. Markham. She also welcomed new NIH *Ex-Officio* member, Dr. Goodenow, and expressed her gratitude to Dr. Gaist for his years of service to CHAC as the NIH *Ex-Officio* member.

Dr. Cheever announced that Carole Johnson was named the HRSA Administrator in January 2022. Before coming to HRSA, Ms. Johnson served as the Testing Coordinator on the White House COVID-19 Response Team. She also served as the Commissioner of the New Jersey Department of Human Services, leading the state's largest agency and providing healthcare and social services to 1 in 5 New Jerseyans. During her tenure as Commissioner, the Department expanded Medicaid coverage of mental health and substance use disorder (SUD) services, created new Medicaid benefits to improve maternal health outcomes, and integrated Medicaid into the newly launched state-based Affordable Care Act (ACA) marketplace. Ms. Johnson served for more than 5 years as the Domestic Policy Council public health lead in the Obama White House, working on the Ebola and Zika responses, implementation of the ACA, and combatting the opioid epidemic. In addition to several key positions on Capitol Hill, Ms. Johnson was Policy Director for the Alliance of Community Health Plans, Program Officer with the Pew Charitable Trust health program, and Senior Government Relations Manager with the American Heart Association (AHA). Dr. Cheever welcomed Ms. Johnson back to HRSA where

¹⁰ <https://www.cdc.gov/std/statistics/2020/default.htm>

she previously worked in workforce policy, and she thanked Diana Espinosa for leading the agency as the Acting Administrator for the last year and a half. HRSA is fortunate to have someone with Ms. Johnson's experience and deep knowledge of HRSA's programs, as well as her passion about health equity in the work the agency does.

HRSA's HAB vision is optimal HIV care and treatment for all to end the HIV epidemic in the US. The mission is to provide leadership and resources to advance HIV care and treatment to improve health outcomes and reduce health disparities for people with HIV and affected communities. Health equity is a core concept of the RWHAP, which has been working many years to reduce disparities. It is very exciting to have a new environment in which health equity is in the forefront across the entire federal government.

HRSA is excited that the HAB website has been officially relaunched with a new look and the new URL of <https://ryanwhite.hrsa.gov/>, which should help people searching for information on the Ryan White HIV/AIDS Program (RWHAP). The website navigation has been updated and the content has been reorganized to help visitors find information and resources more efficiently.

Since the last CHAC meeting on December 1, 2021, the *National HIV/AIDS Strategy (NHAS, the Strategy)*¹¹ was released and provides stakeholders across the nation with a roadmap to accelerate efforts to end the HIV epidemic in the US by 2030. In order to guide the nation toward realizing the vision, the strategy includes 4 overall goals, which are to:

1. Prevent new HIV infections
2. Improve HIV-related health outcomes of people with HIV
3. Reduce HIV-related disparities and health inequities
4. Achieve integrated, coordinated efforts that address the HIV epidemic among all partners and stakeholders

The strategy has been used across HRSA and government to help focus efforts and refine the work that is being done in this area.

HRSA is developing an NHAS Implementation Plan that outlines specific actions to achieve the Strategy's goals and objectives. Representatives from across HAB and HRSA have been working to identify strategic policies, programmatic activities, and initiatives to leverage support of the goals, objectives, and strategies outlined in the plan as part of the Strategy implementation. Partnering across the federal agencies is a very important part of this step in the work. HRSA has actively engaged CDC, Administration for Community Living (ACL), Housing and Urban Development (HUD), and others in thinking about the work that needs to be done in order to achieve the goals. Given the Strategy's whole of society approach, HAB leadership conducted a series of listening sessions to engage directly with the RWHAP stakeholder community to hear thoughts and ideas on ways HRSA can support the goals and objectives outlined in the NHAS in the effort toward EHE. Key stakeholder groups included patient advocacy organizations, HIV provider organizations, constituency-based organizations, and coalition groups. Dr. Cheever expressed gratitude for the contributions of the many divisions and offices that took part in this collaborative effort, including HRSA's regional offices and CDC that were part of all sessions.

¹¹ <https://hivgov-prod-v3.s3.amazonaws.com/s3fs-public/NHAS-2022-2025.pdf>

The NHAS also calls for the development of a quality of life (QOL) indicator. The White House Office of National AIDS Policy (ONAP) asked CDC and HRSA to Co-Chair a federal WG to make recommendations. The WG's charge from the White House was to use existing federal datasets that include measures of QOL or measures that can assist in gauging QOL. ONAP held a community listening session to receive input on these datasets. The WG was asked to complete its work by May 2021. QOL has been part of the fabric of the RWHAP over many years. In the absence of a method to measure QOL, HRSA has been addressing it through various domains, such as housing instability, employment, and food insecurity. Critical thought also is being given to domains around health, wellbeing, and psychological factors and work has begun on a framework to conceptualize the efforts and identify work that still needs to be undertaken.

HAB has a relatively new and productive partnership with ACL. ACL's mission is to foster safe, high quality health care for the aging population. This is particularly important for the RWHAP where many clients are aging with HIV. In 2020, about 48% of clients in the RWHAP were over 50 years of age. The goal of this partnerships is to work together to share resources among recipients and cultivate partnerships with other federal and non-federal partners. HAB and ACL have collaborated on several webinars to share information about the RWHAP and to hear from ACL about their programs and services. HAB and ACL also have teamed up with training for ACL grantees and Ryan White recipients on the Older Americans Act (OAA) and Area Agency on Aging (AAA). There is a tremendous amount of expertise in the community on aging, which should be leveraged in the efforts to expand the work in the RWHAP in order to improve services for older people with HIV quickly.

HAB also has a longstanding committed partnerships with HUD. HAB is currently assessing how the RWHAP can better address the housing needs of people with HIV. Because HAB is not primarily a housing provider, they are grateful for the partnership with HUD. The focus traditionally has been on the federal Housing Opportunities for People with AIDS (HOWPA) program. HAB also is working to expand its efforts with HUD beyond the HOWPA program and to continue to work together to address the needs of RWHAP clients. HAB and HUD will continue to partner on educational events at the intersection of housing and HIV and other opportunities broadly across HUD programming.

The 2022 National Ryan White Conference (NRWC) on HIV Care & Treatment will be convened August 23-26, 2022. Dr. Cheever thanked the RWHAP community providers, recipients, and partner organizations who submitted a total of nearly 400 abstracts for consideration in the 2022 conference. Abstract approvals were sent out the week of April 12, 2022. In light of the constantly evolving COVID-19 pandemic, HAB has made the decision to host the 2022 NRWC virtually. This is a shift from the initially proposed hybrid format that included both virtual and in-person components. The conference dates will remain the same, but times will be adjusted to accommodate the different time zones. Recognizing the unpredictability of the COVID-19 pandemic over the last several years, HAB holds true to its commitment to providers, recipients, stakeholders, partner organizations, planning council members, and more than the half million people they serve every day to reduce any risk of potential COVID-19 transmission. All of the recipients, providers, stakeholders, and people with HIV who are a part of the RWHAP will have an opportunity to attend the conference and not be taken away from the communities HAB serves. This means that the RWHAP part-specific caps that were applied to the hybrid format no longer apply. The virtual format will utilize the same platform as the 2020 conference that had incredible engagement during the chat as sessions were occurring. All breakout sessions will be pre-recorded.

Turning to policy updates, transgender people with HIV continue to be a priority for HAB. There are tremendous disparities for this particular population. In December 2021, HAB released a letter to RWHAP service providers reaffirming the importance of providing culturally-affirming health care and social services to the transgender community as a key component of improving the lives of transgender people with HIV and eliminating health disparities. The letter is not a new policy or approach to the services delivered by the RWHAP, but builds upon HAB-funded initiatives that support patient-centered, trauma-informed, and inclusive environments of healthcare for people with HIV to help reduce medical mistrust and other barriers to adherence from transgender populations.¹²

To highlight a few RWHAP updates, 2 new Executive Summary documents have been published that are on the RWHAP website. The first is a high-level summary of what was learned during the 2021 EHE in the US listening sessions with public health leaders and communities mentioned earlier. This document discusses the key themes from those sessions and provides a high-level look at how HAB is moving forward to build on what has been learned. The second Executive Summary is based on the telehealth white paper that shares how RWHAP have been leveraging telehealth during the COVID-19 pandemic. Both of these publications should be useful to RWHAP.¹³

Moving to data updates, all states showed improvements in viral suppression among RWHAP clients by state from 2010 to 2020. However, some states continue to have room for improvement—particularly in the Southeast US. Also notable was a significant improvement in viral suppression in 2020 even though at that time, states and recipients were responding to the COVID-19 pandemic. Among key populations served by the RWHAP, viral suppression of all RWHAP clients was 69.5% in 2010 and 89.4% in 2020. The improvement in suppression occurred across all key populations. However, it is important to note that challenges remain in achieving viral suppression for certain populations. Most notably in 2020, there were disparities in viral suppression overall for African Americans and Blacks at 86.7%, transgender clients of 84.5%, youth 12-24 years of age at 81.5%, and clients with unstable housing at 76%. This illustrates that more work needs to be done.

Viral suppression increased for all RWHAP clients nationally by about 19.9 percentage points from 2010-2019. Key populations had even greater improvements in viral suppression. For example, viral suppression increased by 23.4 percentage points among African Americans. This demonstrates that while disparities remain, the disparity gap has been decreased. Among youth transgender populations and people who are homeless, larger disparities remain with significant work to do.

The inaugural *2020 HRSA HAB Ending the HIV Epidemic in the U.S. Data Report* was released and is posted on the HRSA HAB website. This is the first publication to highlight data submitted through the EHE Triannual Module data system. This module collected aggregate-level data 3 times a year on the number of new and existing clients receiving services and the number of clients prescribed antiretroviral therapy from EHE-funded providers. EHE recipients, sub-recipients, and stakeholders have been doing important work in response to the COVID-19 public health emergency to meet the needs of clients during that emergency while simultaneously doing incredible work in this new EHE Initiative that launched in March 2020 simultaneously with the COVID-19 pandemic nationally and submitting high-quality, complete EHE triannual data to HRSA HAB.

¹² <https://ryanwhite.hrsa.gov/sites/default/files/ryanwhite/hiv-care/gender-affirming-care-rwhap.pdf>

¹³ <https://targethiv.org/library/innovation-rwhap-telehealth>

Many EHE recipients used their EHE funding to expand and innovate the delivery of existing RWHAP service categories. For example, RWHAP EHE recipients focused on what could safely be accomplished during the pandemic such as emphasizing self-care within the community, leveraging virtual spaces, and staggering or scaling back activities in order to provide them safely. Recipients also introduced flexibilities that prioritize health and safety, such as offering telehealth and remote work for staff, contactless prescription delivery, e-prescribing, providing 90-day supplies of antiretrovirals, and delivering socially distant case management and navigation—something most providers had not done previously.

EHE recipients scaled up services to address new activities or activities where there was greater demand, such as transportation, rental assistance, emergency financial assistance, and food or delivered meals. Recipients also worked to streamline the client experience, including consolidating services in clinics and creating policies and procedures to simplify future client interactions. Beyond EHE, recipients were able to leverage their existing RWHAP knowledge, partnerships, experiences, and resources so their jurisdictions could respond to the COVID-19 pandemic. It is amazing what recipients have been able to achieve throughout this pandemic.

CHAC Member Discussion On CDC & HRSA Updates

The following questions, observations, and suggestions were raised:

- Dr. Gayles observed that all of the teams demonstrated the ability to be flexible in pivoting to new ways to deliver services to meet the needs of those who utilize CDC and HRSA services. Mental health crisis in children was significant before COVID-19 and is further exacerbated. This is a key moment in terms of responding to this need in terms of building infrastructure. Equity remains important as disparities continue to be seen in incidence across populations and continued gaps in access to services such as PrEP. There are exciting new funding opportunities from CDC and HRSA and continued inclusion of the SDOH and the impact that those play on service delivery. It also was affirming to hear the continuing commitment from both agencies in providing affirming services to different communities, given the political environment in many places across the country that potentially affect the way services are delivered. Given the increased attention on mental health in young people and the impact that mental health issues can play on risk-taking behaviors, he inquired as to how services are being implemented across the board in various divisions in thinking about rolling out new projects.
- Dr. Ethier said that from a school health perspective, DASH has layered in additional resources received from Coronavirus Aid, Relief, and Economic Security (CARES) Act dollars to transition some of the school services into the virtual setting and to help support the infrastructure that already had been created to connect youth to sexual health services and to mental health services. Schools received an influx of funds and an array of additional resources, but it is not clear whether they were able to use those funds effectively toward these efforts. There have been discussions with partner organizations to establish services outside of schools and determine the best way to connect with school districts. As often is the case with community-based services, a 2-pronged approach is needed. Something is needed to motivate the school district to create infrastructure to connect to services in the community, but that is not sufficient. It is also important to make a connection to the community to help them establish connections in schools. They have consistently seen that it is not going to be possible to “mental health professional” our way out of this. There are not sufficient trained mental health providers to be able to deal with the influx. Mental health services are just not available for adolescents. This also speaks to the pipeline issues. In

order to convince providers to train or retrain to work with youth, the mental health professional pipeline has to be made possible, affordable, and attractive.

- Based on the data Dr. Cheever presented, Mr. Driffin noted that close to 90% of people living with HIV return back to care. He wondered whether the data team would pose additional inquiries to determine why those individuals decided to stop care and ultimately return to care during the pandemic or connected to EHE activities, and how those findings could be incorporated into better healthcare delivery for people living HIV.
- Dr. Cheever indicated that they are not collecting this from the recipients. The reporting is kept high-level because of the burden on recipients. Many EHE programs do inquire about what keeps people out of care so that they can better respond in the future. A challenge over time has been the difficulty in finding people who are out of care, understanding who they are and the challenges they face. Dr. Cheever will take this idea back to the Project Officers.
- Dr. Mermin observed that the viral load suppression data highlighted by Dr. Cheever showed remarkable increases in viral load suppression with a 30-point absolute increase in 10 years and an almost elimination of racial and ethnic disparities in viral suppression. He wondered what the most important factors were that led to that increase, as well as how to get to the next 10% to achieve 100%. He also requested an update on the HRSA-initiated hepatitis C program that screened, diagnosed, and cured people in RWHAP of hepatitis C.
- Dr. Cheever noted that HAB has been focused on data quality and quality improvement. There have been several large collaboratives with hundreds of thousands of patients in which individual recipients assess their data and then experts, including people with lived experience, to help figure out what works through a quality improvement rapid cycle. A number of these over the years have been successful and the rates of improvement in these initiatives have been remarkable. That is why they are adamant about developing best practices communication so people can demonstrate improvements by publishing what works in this key population so others are able to replicate. There is some improvement with easier drugs to take, but overall improvement is due partly to specific quality improvement activities. The hepatitis C chart abstraction work slowed down during the pandemic because it is difficult to collect data at the national level, especially regarding treatment and sustained viral response. HAB has a chart abstraction contract through which these data were going to be collected in individual clinics, but that was delayed significantly by the pandemic. All they have at this point are anecdotal inputs.
- Given that many cities are experiencing increasing problems with homeless populations, Dr. So inquired as to whether CDC has programs to try to improve prevention, testing, and treatment for HIV and hepatitis in homeless populations and whether SSPs across the country are experiencing any pushback by states.
- Dr. Mermin indicated that there is a lot of interest in homeless populations at CDC. They have been engaging with HOPWA and HUD in general, and DDID has taken on a role of looking across the agency to determine whether there are ways to work at the more fundamental social determinants side. Housing and homelessness affect almost all aspects of public health, so CDC is increasingly trying to work in that field. In terms of SSPs, it is a project that takes concerted effort and continual monitoring and support over time. In some places, SSPs have been initiated and expanded and sometimes there is not a lot of pushback. SSPs become normalized with engagement with the community and law

enforcement, and when there is supportive legislation in the state or local areas that enable SSPs to continue over time. There are other places where SSPs are going well and then there is pushback for a variety of reasons (e.g., political conflict in the community, certain events that result in loss of trust with law enforcement or politicians, et cetera). There are a lot of services that cannot be offered now due to minimal resources, lack of technical capacity, and or lack of infrastructure.

- Dr. Daskalakis added that really great work is occurring with HUD beyond HOPWA in a more status-neutral space. One exciting area is the work with HOPWA to think about housing as an outbreak intervention which is moving in a great direction. They are looking at ways testing interventions can be deployed specifically in those environments as social determinants are also being addressed. DHP's most recent NOFO for young MSM and transgender women of color has a component that asks the grantees to select areas of social determinants to pursue, one of which is housing.
- Dr. Wester added that people who use drugs, injection and non-injection, and people experiencing homelessness are some of the populations most heavily impacted by the multistate outbreaks of hepatitis A, which now include 37 states and over 44,000 cases. The TA efforts that have been provided to states and other jurisdictions experiencing that have made a lot of inroads into those communities.
- Dr. Anderson emphasized how impressive the increases in viral load suppression and reduction in disparities were that Dr. Cheever presented. She asked how DASH plans to follow up on the data regarding mental health issues among adolescents, particularly the data on LGBTQ adolescents and the outsized concerns in these issues. This includes more than individuals who are HIV-affected. She asked whether the data on LGBTQ includes transgender and lesbian, gay, bisexual or if they were separated out. The issues are probably slightly different.
- Dr. Ethier indicated that for the ABES data, they were not able to include a question on transgender identify. At this point, that question is on the state optional list. However, they were able to include the transgender identify question on the ballot process for the questions to be included in the 2023 YRBS. They are optimistic that this question will be included on the national survey. Hopefully for the next CHAC meeting, she will be able to provide an update on some of the improvements they will be able to make for the 2023 survey. ABES was done in Spring 2021 and the regular YRBS was moved to Fall 2021. Approximately 30 states and locals included the transgender identify question on the state YRBS. This allows them to group those data together to look in more depth at those students.
- Mr. Lindsey noted that substance use is an area that has not had as much data to contribute to prevention efforts and healthcare engagement efforts, and that he was happy to hear about the marijuana data in Dr. Ethier's presentation. Particularly given the increase in stimulant use over the past couple of years due to isolation and other social dynamics that have arisen, especially in urban communities. He wondered if they have been able to or plan to collect those data.

- Dr. Ethier indicated that they do assess stimulant use as one of the substances. They did not find an impact of the program on stimulant use, but that could be because it was relatively low for young people—at least when those data have been collected. Prior to the pandemic, all substance use apart from alcohol and marijuana had been decreasing. They have not collected opioid data for long enough to know whether there has been an increase or decrease.
- Dr. Daskalakis added that the National HIV Behavioral Surveillance (NHBS) survey is able to tease out stimulant use, which is something that DHP is following.
- Dr. Cheever added that they are taking a deeper dive into SUD and what people are actively using in their chart abstraction survey, so that will be a topic every other year.
- With the current political climate regarding LGBTQ in Florida, Dr. So asked Dr. Ethier whether she is worried about the coming year in terms of how much progress can be made. Already there are mental health issues. He wondered whether the politicians know how much harm they are doing. He also asked whether it would be appropriate for them to raise this concern through a CHAC statement, perhaps.
- Dr. Ethier responded that as a federal employee, she was unable to comment on any particular state law or policy. She said that she is extremely concerned about whether the gains made over time in implementing the policies and practices that she mentioned are effective for all youth with respect to mental health and wellbeing. In 2018, close to 80% of schools had safe spaces for LGBTQ students, more than 90% had anti-harassment laws, and about 75% had professional development on inclusivity for teachers. That had improved dramatically over time, but now changes have been made to directly take some of those important practices out of schools. She is extremely worried about the mental health crisis for young people. Taking away those supports will be threatening not only for LGBTQ students, but also for other students. As she mentioned earlier, making schools more toxic for anyone makes them more toxic for all students.
- In terms of whether there is something CHAC can do, Drs. Gayles and Anderson will discuss this offline and will get back to the group about what is/is not within CHAC's purview as a committee.
- Mr. Riester noted that a bill recently passed the House that would criminalize certain amounts of fentanyl, which could increase the number of people who are incarcerated and also would require mandated substance use counseling. There is a very large problem with fentanyl across the country, so this is something to think about in the future. Regarding mental health status and LGBTQ youth, he asked whether there is a correlation to visibility, inclusion, awareness, and/or a specific geographic prevalence.
- Dr. Ethier responded that the ABES data is nationally representative, so it does not tie back to specific geographic areas. They do not ask about visibility, inclusion, and awareness in this survey. Therefore, they do not know whether the more "out" someone is increases the reaction and stigma associated with their identity. However, this is a very important question. It might be possible to look at some of these difference by state in the 2021 YRBS data. This did come up to some extent with regard to parental abuse questions related to

issues around whether healthcare providers and school personnel are required to report back to parents if they have conversations with young people about their sexual identity. They do not ask these questions, but it is difficult to imagine that there is not some aspect of being out to one's family and then experiencing abuse, otherwise they would not see the difference between students who identify as heterosexual and those who identify as LGBTQ.

- Dr. Markham added that as a youth sexual health researcher in Texas, she echoed Dr. Ethier's concerns. They hear a lot from school-based personnel and clinicians that the climate in Texas is definitely a concern in terms of the mental health of youth and also their families trying to be supportive of them. With the abuse cases and reporting cases, it is getting quite dire. Whatever CHAC might be able to do, she would love to be part of that. She also expressed interest in information about additional initiatives for provider training, influences, and other programs to address rises in congenital syphilis, for which Texas may be #1. There also is an overlap with teen STI rates in Texas.

Panel 1: Strategizing an Approach to Providing Comprehensive STI Services

Moderator: Robert McDonald, MD, MPH, LCRD, USPHS; Medical Officer, Division of STD Prevention, NCHHSTP, CDC

Addressing STIs in Mississippi

Thomas E. Dobbs, MD

State Health Officer

Mississippi Department of Health

Dr. Dobbs first shared a photograph from an 1881 photograph atlas on cutaneous syphilis to illustrate that history is reality and that a lot of work remains to be done. For instance, based on the 2020 published STD rates, Mississippi ranked first in chlamydia per capita by a substantial margin of almost 100/100,000 population higher than Louisiana, ranked second highest for gonorrhea, and tied for first place in primary and secondary syphilis rates. This is the worst STI performance he has seen during his tenure at the State of Mississippi. While that is awful and embarrassing, there are interventions for improvement.

There has been a transition in the landscape of care. The health department and its STD clinics traditionally have been thought of as a go-to location for STD treatment and diagnostics in Mississippi. However, data by ordering facility type in 2020 showed that the majority of STD cases were being identified primarily in private physician offices and other health clinics. Some reasons for this are the general transition away from public health services for clinical care and funding issues. Compared to 10 years ago, they have half of the nurses they had in 2010. They have less nurses now in 2022 than in 2019—even with the COVID-19 pandemic funds. While there is a paucity of providers in general, nurses are responsible for much of the frontline work in STI treatment. If the Mississippi Department of Health is addressing only 10% of the pie, they are missing 90% of the opportunity and must rethink how to address STIs in Mississippi.

To demonstrate a parallel lesson, the fertility rate in Mississippi has been declining gradually since 2001 other than an interesting increase from 2006 to 2008 that was observed across the country for unknown reasons. There also has been a decline in teen births in Mississippi, with the exception of an increase in 2007. Although fertility and teen birth rates have been

decreasing, the health department has been losing ground in providing reproductive health services. This suggests that there are solutions to the problem that transcend what a county health department or STD division can do, but depending upon third parties who do not have the same authorities or a more holistic view of STI intervention also raises a number of challenges in addressing STIs and HIV.

Community health centers offer an opportunity for interventions in Mississippi where there are 11 Federally Qualified Health Centers (FQHCs) that operate 69 school-based clinics. This presents an excellent opportunity to provide sexual health resources to young people who are at risk. The majority of chlamydia and gonorrhea cases occur among older teens and young adults in their early 20s. While there are only 69 school-based clinics currently, there are 530 high schools in Mississippi. This means that there are many uncovered locations that could be served.

As pointed out in Healthy People 2020, one of the correlates associated with STD transmission is social determinants of health (SDOH). Mississippi Department of Health has struggled to expand its role beyond just STDs. While they can get shots in people's arms, test for chlamydia, et cetera, they must address SDOH—most of which pertains to racial and ethnic disparities. Otherwise, they will continue to try to “bail water from a sinking ship.” The majority of STD cases are now among African Americans, which are a minority population. SDOH issues must be addressed to get ahead of the problem. These include racial and ethnic disparities, structural issues (including structural racism), poverty and marginalization, access to healthcare, substance abuse, stigma pertaining to sexuality and secrecy and/or HIV transmission, risky sexual network, and so forth.

Most adults and the vast majority of children in Mississippi have health insurance. However, about 24% of adults are uninsured. Mississippi adults 19-25 years of age represent a high-risk group who do not have access to care and impoverished communities are over-represented. There are multiple difficulties in Mississippi. They do not have contact tracing and treatment, especially within private clinic settings. If someone is diagnosed within the health department, they will be given a referral card. While Mississippi does not yet have partner expedited therapy, an effort to offer this option is underway. The private clinic setting does not have the same public health focus that county health departments and STD-focused clinics have. Stigma and reluctance to discuss sexual health among patients and providers is a major problem, especially in the era of a 15-minute medical visit—10 minutes of which are spent on a computer. Ensuring that clinicians are up front diagnosing people with STIs and that there is access to care are critical issues. Mississippi is a non-expansion state with no anticipation of that changing in the near future. This state also has a very high poverty rate, is a rural location, and has a low provider to population ratio. People with STIs or symptoms do not want to go to a local clinic for various reasons, which results in major delays in care.

There are many potential opportunities, such as using some of the lessons learned from the COVID-19 pandemic to move forward. COVID-19 provided an opportunity to build remarkable new partnerships that included making remarkable inroads with the Spanish-speaking community, faith communities, local leaders, and others. These partnerships should be fostered and translated into successes in sexual health and STI prevention, treatment, and diagnosis. Continued work must be done to advance partner expedited therapy, though it is going to be challenging to move that outside of the health department to places where the majority of people are being seen. Mississippi plans to perform targeted contact tracing. For a small state with a shrinking workforce and 30,000 cases of chlamydia, comprehensive contact tracing poses a major challenge, but an effort must be made to try to interrupt some high-risk sexual networks.

Telehealth offers a major opportunity. While Mississippi Department of Health already offers universal PrEP through free telehealth, it is currently underutilized. It also is important to break down silos such that all services are providing comprehensive care that are not focused only on STIs or HIV. Mississippi has a major challenge within its epidemiology infrastructure and is underfunding its workforce. Mississippi has one epidemiologist for HIV/STDs. The state also is traditionally unfriendly to government employees and tries to keep the wages artificially low. Hence, people who complete top-notch training programs are not flocking to the Mississippi workforce. Despite the challenges, Mississippi will continue to seek opportunities for improvement.

Innovative Models to Support New York City (NYC) Sexual Health Clinics

Joaquin Aracena, MA

Assistant Commissioner, Division of Disease Control
New York City Department of Health and Mental Hygiene

Christine M. Borges, MPH

Director of Program Implementation and Evaluation
New York City Department of Health and Mental Hygiene

Dr. Aracena described innovative models that the NYC Department of Health and Mental Hygiene (NYC Health) have incorporated during the COVID-19 pandemic to reach and continue to serve New Yorkers with sexual health services. NYC Department of Health went through a reorganization during the pandemic, so the Bureau of STI no longer exists and the clinics have been folded into the Bureau of Public Health Clinics (BPHC). Bringing innovative services to the community was done through innovative approaches such as telemedicine, an STI Hotline, STI Quickie, and a COVID-19 Pivoting Model.

The BPHC was created on July 1, 2021 and oversees the health department's clinics that offer direct services to New Yorkers. This includes 8 Sexual Health Clinics (SHCs), 4 Tuberculosis Chest Centers, and 9 COVID Express Testing and Vaccination Clinics. The rationale behind this reorganization was that under centralized clinical operations, they are in a better position as a bureau and agency to achieve their goals to integrate services where common interventions are effective; create new pathways to expand services, especially telehealth services that are new for NYC Health; implement innovative approaches; and improve resilience to budget challenges.

Pre-pandemic in 2017, NYC Health serviced close to 80,000 patients. Among them, 53% are MSM and 47% percent are men who have sex with women (MSW). The 4 clinics operating in 2021 saw less than 50,000 patients, the demographics continued to narrow, and they were still reaching similar populations. Interestingly, there was an increase in MSW presenting for services or who received services via telemedicine. In terms of the SHCs' annual volume, there was a peak in 2019 and a major decline in 2020 during the height of the COVID-19 pandemic. Clinic visits and telemedicine visits began trending back up in 2021. In terms of efforts to reduce sexual health disparities, the clinics offer same-day HIV testing and PrEP and post-exposure prophylaxis (PEP) and PrEP Jumpstart. Other services include STI screening and treatment, condoms, partner services, emergency contraception, QuickStart contraception, crisis counseling, and substance use services.

In terms of the impact of COVID-19 on SHCs, the BPHC is within the Division of Disease Control. Therefore, many NYC Health staff were deployed to the pandemic response and 7 of 8 clinics had to be closed as part of the deployment and lockdown. The Chelsea clinic in Manhattan remained open and NYC Health quickly had to identify a model on how to continue to serve New Yorkers during this time in the absence of the clinics. The telemedicine operation was launched by the end of March 2020 to provide all EHE services. Not only were they able to assess individuals during this time, but also they were able to prescribe. They quickly published an RFP to contract with a pharmacy to deliver medications to individuals' homes at no cost to the patient. An additional layer was added to the pharmacy delivery that included home HIV test kits.

In May 2020, they were able to reopen the Fort Greene Clinic with limited services, given that many staff were still deployed to the COVID response. In June 2020, express visits resumed, and long-acting reversible contraception (LARC) services resumed at one clinic. Express visits and LARC services resumed in the 4 currently operating SHCs in July 2020. The Jamaica clinic reopened in July 2020 with limited services and telemedicine was expanded as staff came off of deployment. By August 2020, COVID Express Clinics were opened in SHCs and Tele-PrEP began. They had about 12 weeks to convert spaces that were not previously laboratories into laboratories to be able to respond to COVID testing. Morrisania opened in November 2020 for limited services, so now there is representation in 4 of 5 boroughs. They do not have a presence in Staten Island. In July 2020, they were able to pivot one of the instruments being used for COVID testing to be able to do STI testing in parallel.

Telemedicine services included management of positive/abnormal STI tests results, with HIV treatment initiation for those diagnosed with HIV who wished to start HIV treatment for the first time; consultation for PrEP initiation for NYC residents ≥ 13 years of age, including daily PrEP and PrEP on demand; medical evaluation for those who think they have signs or symptoms of HIV; medical evaluation for those who might have or have been exposed to a HIV; contraception services, including emergency contraception and consultations for other contraceptive methods (e.g., pills, ring, patch, shot, LARC); and prescriptions for STI treatment and HIV home test kits. To highlight telemed trends, there was an increase in the volume of calls during the peak of the pandemic. However, this declined when clinics began to reopen and it was possible to work with community partners to link individuals to services. There were 523 Tele-PrEP visits in 2021. Among these, 376 (72%) patients visited a SHC post-telehealth visit within 14 days of the telehealth visit and 332 (88%) patients received PrEP medication on the day of their visit.

Services offered at STI Quickie Clinics include provision of services such that individuals are in and out of a clinic within a cycle time of under 30 minutes compared to 1.5 hours in regular SHC. Services offered include HIV testing with 1-minute results; and CT/NG testing with 24-hour or less results; syphilis serology testing and hepatitis serology testing for HEP A-B-C with results in 3-5 days. There continues to be an increase in STI Quickie Clinic visits that now reach capacity each day. The positivity rate of either gonorrhea or chlamydia is over 13%, which provides an opportunity to test/diagnose someone who is asymptomatic and engage in conversations with them on PrEP and additional services they may need. BPHC now operates 8 Covid Express clinics across Bronx, Brooklyn, Manhattan, and Queens within existing SHCs.

To highlight some expansion plans, STI Quickie Services will be scaled up in the outer boroughs with Fort Greene anticipated to come online in Summer 2022. A patient-facing scheduling platform will be implemented. A PrEP Continuity Clinic will open in Summer 2022. There are plans to build up an Emergency Response Unit to allow for pivoting between COVID

Express Clinics and STI services as needed, and future reagent cartridges will be explored for implementation as they are FDA-approved.

Minnesota Community Care

Erica Drake APRN, CNP

Medical Director, Health Start Clinics-School Based Health Clinics
Minnesota Community Care

Sandy Naughton, BA, CCE

Health Education, Health Start Clinics-School Based Health Clinics
Minnesota Community Care

Ms. Drake and Ms. Naughton described Minnesota Community Care's Health Start Clinics-School Based Health Clinics in St. Paul Public Schools (SPPS) and their comprehensive STI outreach. The Health Start School-Based Clinics began as a maternal and child health (MCH) organization housed in a hospital across the street from a high school. They realized quickly that teens, especially pregnant teens, were not keeping their appointments, even though the organization and school were across the street from each other. They were then given space within the school and now have 10 school-based clinics. Young people who have access to school-based care have much better health outcomes, and the mantra at the time was to make those clinics acceptable, accessible, and available and they still view their provision of services this way.

The clinics are designed with an integrated team approach that includes an Advanced Practice Provider, Mental Health Provider, Health Educator, Registered Dietician, Medical Assistant, and Clinic Coordinator. One of the school-based clinics is open to adolescents 13-22 years of age regardless of ability to pay. Confidential care is provided under the Minnesota Minors Consent Law, without notification to adolescents' families. Given that the Health Start School-Based Clinics can help to provide this care for free, it overcomes a barrier in other types of clinics that may bill insurance and send home an explanation of benefits (EOB). The 10 clinics within the SPPS see an average 4,000 unique patients a year between the 4 disciplines and have a total of approximately 25,000 visits.

In addition to the 4,000 students seen in the clinics, about 100,000 students are seen through classroom visits provided all year. They are often invited to Health and Social Studies classes to talk about a variety of topics (e.g., hygiene, risk reduction, risk management et cetera). Each year, CRUSH (Community, Restoring, Urban Youth, Sexual, Health),¹⁴ a partnership of youth serving organizations and community members, holds a statewide STI Day in June. CRUSH focuses only on chlamydia and gonorrhea on the day that youth come in. During the summer, 3 clinics are kept open so that young people never lose their access to health care. Even though the focus is on chlamydia and gonorrhea on the testing day, adolescents are invited back for a fuller panel of testing. On the CRUSH testing day, clinics can see as many as 50 to 70 young people in this stigma-free situation. When this began, the idea was to do testing for students who felt they might need testing. That felt very stigmatizing, so now it is presented as visiting the clinic to talk about staying safe for life.

¹⁴ <https://www.health.state.mn.us/diseases/chlamydia/crush.html>

This teen-friendly, stigma-free introduction to the clinics that focuses on outreach into the classrooms and beyond the clinic walls, offers walk-in testing and basic sexual health screening, and makes it fun and exciting (e.g., decorate the clinic, play music, have a raffle for attendees, provide treats, incentives, et cetera). These testing days are the first time some young people visit the clinic. This is the first time that they have visited the clinic, so there is visibility. While this was the first clinic to open in a school building, there are now thousands of school clinics. This is a wonderful way to provide adolescent healthcare. The SPPS school-based clinics are holistic in that they teach, test, and treat in a stigma-free manner. A longer screening form has been shortened just for CRUSH STI Day. Every adolescent who attends completes the screening form, which helps to determine what kind of care they need and provides contact information so that they can be reached for follow-up care if needed. They do make it clear that adolescents do not have to have had sex to attend a CRUSH STI Day, because it also includes education and outreach.

For ease of flow, only a urine screen is done for chlamydia and gonorrhea. The screening tool is used to schedule further education and screening for additional STI testing, including blood draws and throat and rectal screening. Condoms are provided to all students and as noted, the clinics can provide care for all students regardless of parental consent under the Minnesota Minor Consent law. The clinics within SPPS require parental consent for all services except reproductive healthcare. Clinic staff can help uninsured students apply for the Minnesota Family Planning Program (MFPP)¹⁵ to help assist with reimbursement rates for the services the clinic is able to provide.

The last CRUSH STI Day event was in Spring 2019 because SPPS did not return students to in-person education until the middle of April 2021. CRUSH STI Day 2022 is now being kicked off. During these events, approximately 400 teens are seen and about half of them are screened based on their sexual history and risk factors. There is about a 10% positivity rate.

CHAC Member Discussion on Panel 1

To focus the discussion, Dr. Anderson reminded CHAC members of the advice related to this topic that was requested from CDC/HRSA and asked them to be thinking about action items CHAC might address and vote on later in the business section related to these questions:

1. How can CDC/HRSA support the expansion of STI care to include ART and PrEP services in clinical care sites and service areas?
2. How can CDC/HRSA support the integration of comprehensive care into school health clinics?
3. How do we equip school districts with a means to improve the linkage of healthcare in communities?
4. What else does CDC/HRSA need to consider when expanding STI care?

The following questions, observations, and suggestions were raised:

- Dr. Gayles noted that during COVID times, health department directors often have been met with surprise and confusion from political and community leaders for not having tons of contact tracers or a sophisticated surveillance system to follow COVID cases, which health department directors frequently pointed out that this was a side effect of years of budget cuts due to under development/underfunding of public health infrastructure. He asked how NYC was able to leverage CARES Act funding to support their rebranding and if they were

¹⁵ https://www.dhs.state.mn.us/dhs16_137813

able to identify new potential funding streams for other public health programs to support their work.

- Mr. Aracena indicated that there was a lot of cross-collaboration among agencies and hospitals throughout the city leveraging any current infrastructure.
- Dr. Dowler reported that North Carolina also is a non-expansion state, and they experienced a lot of the same issues as Mississippi. She has worked very hard over the last couple of years to expand PrEP access within the Medicaid family planning benefits. While this is a much smaller benefit, she encouraged Mississippi to reach out to their Medicaid partners. North Carolina was able to get everything within that program except for the drug, which can be obtained through HRSA's program to make it reimbursable for folks and to encourage health departments and FQHCs to reach out to that population that is essentially uninsured. An important part of North Carolina's initiative was that men need family planning as well.
- Dr. Dobbs indicated that Mississippi does have a full benefit for a family planning waiver for PrEP and they pay for the medicine as well. The problem is that it is underused.
- In terms of EOBs, Dr. Dowler indicated that North Carolina has viewed the EOBs being suppressed as a requirement for any Medicaid Claim. Particularly for managed care companies, EOBs cannot go out to the homes because North Carolina Medicaid does not want that to be a barrier for care. They want school-based health clinics or health departments to bill Medicaid as a payer source whenever possible so they can save their dollars for the uninsured. Some areas of the country experience barriers with school boards as well.
- Ms. Drake clarified that the public assistance program does not send home EOB, but private insurance does. Minnesota has only a handful of Planned Parenthood and other types of clinics left since so many have been closed over the last 10 years. Adolescents without access to school-based clinics suffer even more without access to other types of clinics. They are able to have a pharmacy in their school-based clinics through their 340B funding that permits them to provide various types of oral contraceptives, and they work with their obstetrics team to get IUDs placed.
- In terms of CHAC's role on advising CDC and HRSA, Dr. Greene inquired as to how the committee could support expansion and perhaps advise on how federal support could help with the interplay with local or state policies that are more restrictive. Given that the workforce is a challenge across all sectors right now, she also wondered what would help to increase the workforce or work in Mississippi or other areas that perhaps are not as desirable.
- Dr. Dobbs said that while he knew it was a pipe dream, the most beautiful thing that happened during COVID-19 was the HRSA portal. People used that like it was a de facto way for things to happen. His dream would be to have a HRSA portal for these other needs. In a non-expansion state, there are still major financial barriers for people to get access even to FQHCs. People who are undocumented are really in trouble because they do not have proof of income and are paying market rates for healthcare in a community health center. It would be helpful to find a way to have no cost visits for community health centers. The health department is the only place with no cost care, except for a few free clinics that do not provide reproductive health services. A lot of activities must happen, but there often are not enough people to get to the desired depth. Part of the issue pertains to deciding

what to do and handing off other activities to partners who are better suited for them. The issues with the epidemiology component involve low pay and the need to create a training program locally since people in Mississippi tend to stay there. Some strides have been made in pay, but now they do not have enough human resources (HR) staff to bring on new people. It is literally like trying to build a sandcastle in a hurricane.

- Dr. So commended NYC Health for thinking about expanding the usage of the laboratory capacity they built for COVID-19 to test for other diseases. He asked whether hepatitis A, B, and C testing is offered to all the patients who have no history of previous testing, infections, and/or who have not been vaccinated. CDC recently published a study that showed that in addition to the current recommendation, offering people a one-time hepatitis B test also would identify an estimated 1000 people every year who acquire hepatitis B from sexual activities and will save vaccine doses if they already have been infected or have immunity.
- Mr. Aracena said it was based on certain categories originally. Recently, they began offering testing and vaccination to all patients.
- Mr. Lindsey pointed out that while there is discussion about “risky sexual networks” and “social sexual networks” in the HIV area, he had not heard that as much in terms of STIs. He wondered whether there were opportunities to evolve the language to talk about “open sexual networks” instead of “risky sexual networks” in the future in terms of engaging communities in thinking about getting tested for STIs. He asked whether prophylactic interventions are a dead conversation in terms of STIs, even after the success of COVID-19 vaccines and some promising thoughts about the potential for an mRNA HIV vaccine. Consideration also should be given to work that is being done at the global level and whether that might make sense for local communities, such as the Dean Street Clinic in Atlanta that used some of the resources from the EHE planning. There are a lot of advantages to 24/7 online access to schedule STI screening and treatment, order HIV self-tests, order condoms and lubricants, obtain information to connect with health literacy training online or in-person, et cetera.
- Dr. Dobbs noted that Mississippi is making an effort to implement interventions in the community at the highest impact points. Part of that involves targeted contacts investigation and work with community partners to find the engagements that can pay the most dividends. When there are many bottlenecks, it creates “inverse energy” and more bottlenecks. Mississippi cannot even do GIS mapping because they cannot assemble staff. There is a lot of infrastructure to build out, but this is hard, laborious, boring, and no one wants to fund generalized infrastructure that is self-sustaining and builds on each piece.
- Mr. Aracena noted that like the Dean Street Clinic, the Quickie model was born out of being so busy during that pandemic that there were no opportunities for static. They were able to innovate and continue to evolve to try to stay ahead of the curve of not just the pandemic, but also in order not to lose sight of EHE as well. They were fortunate at NYC Health to have one STI Quickie model at Chelsea that they were quickly able to mirror and convert to a COVID-19 express testing model, which gave them the opportunity to expand out and extend their vision. It would have taken decades to stand up laboratories at all of the SHCs. Due to the pandemic, all sites have them. Now it is a matter of finding the funding to be able to turn them on and pivot them to extend the service.

- Dr. Gayles emphasized that with the pandemic funding streams drying up, consideration must be given on how to sustain the work that everyone has put in place. This is likely to be an ongoing conversation. As Mr. Lindsey raised earlier, what happened to creative science and technology to improve and prevent STDs and HIV (e.g., better diagnostics, point-of-care self-tests, better vaccines and more of them for a lot of infections, better treatments, et cetera)? These are all areas that respective parts of NCHHSTP have been exploring in terms of their role in moving these efforts forward, including working with NIH, FDA, and industry partners. This is a nascent topic that is ripe for growth, and it is possible that in the next CHAC or the one after that, it may be possible to talk more practically about what can be done about it. CDC is going to be funding new diagnostic research into syphilis testing.
- Dr. Mermin observed that telemedicine is a great opportunity to provide services and reduce inequities. One of the biggest obstacles for Tele-PrEP is the diagnostics. That is also true for STD diagnosis. There are good scientific data showing that the OraQuick® HIV test is insensitive compared to other tests in early infection and that it can be problematic particularly in regard to PrEP. Some anecdotal cases have reported several months before seroconversion with OraQuick®. He asked whether NYC Health has capacity to use surveillance and/or other data sources to look back at all of the people who participated in Tele-PrEP and use some form of person years of PrEP use and then HIV seroconversion rates. If it is low, that could be very useful for other jurisdictions that are considering this kind of programming and it could be compared to people who are taking PrEP in-person.
- Mr. Aracena clarified that their Tele-PrEP was more of a consult in which everything would be started for the individual, but it would not be initiated until the first day at the clinic. The at-home test kits were provided with a prescription for any STI treatment. They are still considering ways to evolve their Tele-PrEP initiative.
- Ms. Borges added that they did perform a surveillance match with their colleagues in HIV to assess HIV seroconversion.
- Dr. Anderson observed that the presentations offered nice snapshots of the urban, rural, and school-based settings. She asked whether the individuals presenting the Quickie Clinics differ from those who are accessing different services, and whether they were advertised differently. She asked to what extent each group was using peers or community-based workers in all settings, which could be enormously helpful in extending health services, reducing stigma, education, and using a task-sharing and task-shifting model.
- Mr. Aracena indicated that the demographics of the people accessing the Quickie and COVID Express services were very similar. When they expand to Fort Greene in the summer, they will be able to do further comparisons. NYC Health funds a lot of community organizations, FQHCs, and various institutions, so there is a lot of cross collaboration in NYC and they also have CBO liaisons within the BPHC who work closely with community partners. During this pandemic, they have been able to expand their reach and collaboration in different settings that they did not work closely with previously, so they want to continue to leverage those partnerships going forward as they begin to pivot their instruments as well.
- Ms. Naughton indicated that Minnesota Community Care was partnering with a college in St. Paul on a Youth Advisory Board (YAB) that was taking off and doing well until COVID hit, so it all has been very distanced. Before COVID, they had representatives in each of the schools working with these college students who helped develop materials that are used in

the clinics, as well as advising them on activities they can host, distance learning, et cetera. They plan to continue this YAB work as COVID restrictions are lifting.

- Dr. Anderson asked whether anyone was using Peer Navigators (PN) as part of a telehealth system for education, counseling, linkage to care, et cetera.
- Ms. Naughton said that they have done a great deal of peer education around issues of sexual safety, especially in terms of HIV. They have not done this in telehealth, partly because of the need to be careful about not providing incorrect information. In previous peer education, a professional staff member went with peer educators to assist them with answering questions.
- Dr. Akolkar asked if/how compliance is being monitored of those people who are receiving PrEP via telehealth.
- Dr. Dobbs said it is early and they do not have enough data to support it, but it is challenging for them to keep folks on PrEP regardless. Telehealth is no different.
- Ms. Borges said that in New York they are not currently retaining patients who they start on PrEP. They start it and then refer to a community provider. The most they do is make sure the patient attends the appointment made for them. They are given a prescription for the first month, except during COVID-19 it was 3 months because it was a lot harder to get a quick appointment in most places. Once they are connected to their community provider, they are no longer a patient.
- In terms of funding streams, Dr. Mermin pointed out that they are interested in becoming as efficient as possible with providing holistic services to certain people and in certain venues. That applies to STIs at STI clinics, community health clinics, or student health clinics. Yet the funding streams tend to come from multiple sources. With that in mind, he asked what could be done better.
- Dr. Dobbs suggested finding a clearer way to braid funding. Project Officers see things very black and white, it is almost impossible to blend multiple streams of funding.
- Ms. Naughton added that something that makes school-based clinics work so well and have such good outcomes is that the team is very integrated. That is always hard to find support for, especially considering the effects of SDOH on every kind of behavior and health outcome. They are very attached to their integrated program and when they have had a chance to do that in their larger ambulatory care sites, they find better outcomes as well.
- Mr. Aracena noted that because things are so selective in these buckets, they have to continuously seek additional funding to complete the wheel on the vision and the pathway they are trying to reach.
- Ms. Borges agreed, emphasizing that they all do their best to piece together different funding sources. That can be complicated in terms of reporting and justifying/explaining to Project Officers the best they can.

- Dr. Gayles asked Ms. Drake and Ms. Naughton to speak more about having achieved a higher level of integration of services in the school-based program comparable to community services and to share more about how within that integration, how they have tapped into the community resources to improve and enhance linkage to care services and any particular best practices that could be scaled up into a community model that CDC and HRSA could support.
- Ms. Naughton indicated that within their own system, they have a very comprehensive health history and they are very careful about linking within their own system to all the disciplines and they have developed community resources that go beyond what they can do within their clinics, which are widely available to everyone within their full organization. That is a constant build and a constant nurturing of those resources.
- Ms. Drake added that having the services that are most needed for adolescents within the school-based program results in easy access to care (mental health, nutrition, therapist for counseling, et cetera) and students do not have to leave school to go outside for services. While the mental health team is able to bill and get reimbursed, health educators and registered dietitians cannot except through private insurance. There is a lot of frustration with medical assistance and public funding in terms of not getting reimbursement for those services. Seeking funding for these services is a never-ending process.
- Mr. Lindsey asked whether the NCHHSTP retired program coordination and service integration (PCSI) in the reorganization.
- Dr. Mermin indicated that PCSI is not retired and is a core part of the center's strategy. They prioritized certain aspects of PCSI that they thought would make the biggest difference, but then COVID hit, and people were shifted in general. They have a new reinvigorated conceptual framework that initially was called PCSI 2.0, but now they are thinking of pulling in the conceptual framework of syndemics because it is very similar but more cutting-edge and pulls in a slightly different concept of population health and holistically valuing people, groups of people, and populations. PCSI was focused more on structured service provision. There is a lot of support from the Division Directors, but NCHHSTP recognizes the difficulty in identifying the specific interventions, research areas, programmatic areas, and policy areas that will make the biggest difference. That was part of the reason he asked the question about just funding streams, because that comes up a lot and has been insoluble at times. Congress allocates funds by diseases and conditions, but public health thinks about health by individuals, populations, and sometimes geography. COVID showed the importance of the skills, energy, and smarts of DISs. The new resources CDC has for DISs which Dr. Mena discussed is a comprehensive approach to COVID, infectious diseases, and STIs. Regardless of size, most health departments focus on at least HIV and STDs and sometimes venture into hepatitis and TB. They might be able to build on that.
- Dr. Anderson encouraged everyone to think about the advice that has been requested from CHAC by CDC and HRSA and potential motion, action items, suggested WGs, et cetera that they might discuss during the business meeting.
- Dr. Dowler emphasized the importance of standardizing payment for testing more broadly. Right now, this is very limited. She is in a state with 100 counties and every health department has its own funding stream that is different from the one next, none of which is patient-centered. A gold standard is needed for screening availability and provision of tests

for everybody regardless of where the testing is done (e.g., home, laboratory, clinic), geographies, political issues, or financial status.

- Dr. Gayles summarized that this panel discussion highlighted significant continued funding needs, the need to be flexible and nimble in services provision, reimbursement issues, the need to define what is included in a post-COVID approach, et cetera. Just as a zip code should not determine life expectancy, it also should not determine what type of STI services, testing, et cetera are available. Consideration should be given to the potential impact on the incidence of new cases that could be arrested and curved if services were readily available.

Panel 2: Leveraging Policy to Advance HIV, VH, and STI Priorities

Moderator: Michael Williams, MPH; Office of Policy, Planning, and Partnerships, NCHHSPT, CD

Hepatitis C: State of Medicaid Access

Adrienne Simmons, PharmD, MS, BCPS, AAHIVP
Director of Programs National Viral Hepatitis Roundtable

Julia Harvey, JD
Clinical Fellow, Center for Health Law and Policy Innovation
Harvard Law School

Dr. Simmons and Ms. Harvey provided an overview of a 5-year project called *Hepatitis C: State of Medicaid Access*,¹⁶ recent progress and the current state of hepatitis C treatment access in Medicaid programs; remaining barriers to care; and next steps for this project. To provide a brief history of hepatitis C treatment access in Medicaid, the first direct-acting antiviral (DAA) Sovaldi came to market in 2013. It was commonly known as the “thousand dollars a day pill.” Due to the high cost of treatment, most payers imposed restrictions on access to treatment. In 2014, a group of researchers published a preliminary review of Medicaid coverage policies, which showed that restrictions to hepatitis C treatment were common and commonly enforced by prior authorizations. In 2015, CMS issued guidance to states that Medicaid must cover medically necessary DAAs in the hope that Medicaid programs would voluntarily loosen their restrictions. Following little voluntary progress, in 2016 Washington Medicaid was sued for requiring severe liver damage in order to access hepatitis C treatment. In 2017, the Center for Health Law and Policy Innovation (CHLPI) and the National Viral Hepatitis Roundtable (NVHR) launched *Hepatitis C: State of Medicaid Access*, which detailed Medicaid restrictions by state.

At its core, the *Hepatitis C: State of Medicaid Access* project was developed in direct response to treatment restrictions occurring in the Medicaid Program. The project conducts individual state-by-state assessments of treatment access policy and tracks national trends in treatment access over time. This project is meant to serve as a resource to state officials and advocates to help provide a comparative lens across Medicaid programs as to the state of hepatitis C treatment access, and to identify clear opportunities for policy improvement within state Medicaid programs. Historically, this project has tracked 3 primary types of treatment restrictions in hepatitis C treatment Medicaid programs. The first type is restrictions based on fibrosis score or the amount of liver damage a patient would have to have before they were eligible for treatment. The second type is restrictions based on patient abstinence from alcohol

¹⁶ www.stateofhepc.org

and drugs, most often implemented as a required sobriety period of 1, 3, or 6 months to access treatment. The third type is restrictions based on which providers are eligible to prescribe treatment. In some cases, states would narrow the pool of providers eligible to prescribe (e.g., hepatologist, gastroenterologist, infectious disease doctors). These restrictions have been tracked because federal agencies and courts have declared that they are incompatible with federal law, and it is known that these types of restrictions have had severe impacts on individuals who are trying to access care who otherwise certainly would benefit from treatment.

In terms of progress over the last 5 years, there continue to be severe restrictions and states that have been hard-hit by hepatitis C. In terms of prior authorization (PA), 12 states now allow access to hepatitis C treatment without requiring a PA for most patients. Those states include: Washington, Louisiana, New York, California, Indiana, Wisconsin, Missouri, Michigan, Rhode Island, Virginia, Alaska, and Massachusetts. Oregon will soon be the 13 state to join this list. The majority (67%) of these states removed PA without using a subscription or what is called a “Netflix model.” This is a tremendous improvement that will help streamline access to treatment by eliminating burdensome paperwork.

Moving to fibrosis, the most progress made to date has been removing this barrier, with 33 states having either eliminated or reduced their fibrosis restrictions. Only 2 states have restrictions remaining. Regarding sobriety, many states have required patients to abstain from substances or alcohol for a specific period of time before approving hepatitis C treatment despite injection drug use driving new infections. Fortunately, 29 states have loosened their sobriety restrictions and the majority of states no longer require a minimum period of abstinence. While many improvements have been seen with restrictions related to substance use, this remains the most widespread barrier of the barriers that are currently tracked. Important improvements have been seen in removing prescriber restrictions, with 28 states having scaled back on prescriber restrictions. However, barriers remain in 18 states that require specialist involvement to prescribe hepatitis C treatment and 1 state that requires prescriptions to be written by a specialist.

Despite the progress that has been made in terms of access to hepatitis C treatment within Medicaid programs, it also is known that fibrosis, sobriety, and caregiver restrictions are not the complete universe of barriers to hepatitis C treatment. Over the last few months, in an effort to understand what some of these barriers are and specifically how they impact patients, the project team has been soliciting input from patients, providers, policy-makers, and others with the goal of understanding how to improve tracking and reporting out on state Medicaid programs to best meet the needs of individuals seeking access to hepatitis C treatment. Over the last few months, the team hosted a public listening session, disseminated a public survey, and convened a provider-led steering committee to identify the most pressing barriers. In terms of the breakdown of the 275 individuals who participated in the survey, the majority (~52%) of responses were from providers and other members of the healthcare team, followed by government staff (~23%), advocates (~11%), individuals personally impacted by hepatitis C and others (~6%).

What was learned from these conversations was that there are many key barriers to hepatitis C treatment and access beyond what has been tracked to date. Many of these have not previously been comprehensively tracked across Medicaid programs. This is not a complete list of everything that was identified, but barriers include the PA process, chronic infection diagnosis, time-based laboratory values, genotype reporting requirements, adherence assessments, retreatment restrictions, specialty pharmacy requirements, and differences in requirements between Medicaid fee-for-service and managed care. Responders indicated that all of these really play a role in meaningfully inhibiting access.

In terms of the impact of these barriers, they have heard anecdotally and objectively that these barriers result in delays, denials, and interruptions to care and ultimately impede the ability to eliminate hepatitis C by 2030, particularly among communities who are disproportionately impacted by hepatitis C. Rhode Island estimated that PA can take between 45 to 120 minutes per patient, not including time addressing denials and appeals. Patients are frequently lost to follow-up due to administrative barriers at every step of this process. The following quotes from the survey describe the impact of these barriers:

“In my state, there is actually investigation into adherence for other medications for the patient. For instance, if a person has picked up their diabetes meds late before, [Medicaid] will deny [hepatitis C] treatment.”

“The burdens include the wasteful cost of repeat labs and negative impact on patients regarding cost and access to transportation. Genotype results have a long turnaround time, sometimes creating delays.”

“Some of the specialty pharmacies have requirements to speak with the patient before mailing the medication. It becomes a barrier, and possibly even a delay in treatment.”

The impact of these barriers also is evident in data recently published by CDC, which shows that the number of people who initiated hepatitis C treatment in the US declined from 2015 to 2020.¹⁷ The National Academies of Sciences, Engineering, and Medicine (NASEM) has estimated that at least 260,000 people must be treated each year to eliminate hepatitis C by 2030. However, only 120,000 people on average are treated each year and that number continues to decline in the context of the COVID-19 pandemic.

In terms of next steps, the project team is currently in the process of updating *Hepatitis C: State of Medicaid Access* project to reflect what has been learned about these other barriers to care and to include many of them in the assessment process moving forward. Based on the stakeholder input received, the state evaluation criteria have been updated and the project team is in deep data collection mode. The release of the updated report cards and full report is targeted for late May 2022.

Senate Bill 159 (SB 159) HIV PrEP & PEP For California Pharmacists Leveraging Policy Changes for STI and VH Prevention, Testing, and Treatment

Marisa Ramos, PhD

Chief, Office of AIDS

California Department of Public Health

Dr. Ramos presented on Senate Bill 159 (SB 159), HIV Pre-Exposure and Post-Exposure Prophylaxis (PrEP & PEP) For California Pharmacists. As a reminder, oral PrEP is a once-a-day pill (Truvada/Descovy) that can reduce a person’s risk of acquiring HIV by up to 99% from sexual contact. Among individuals who inject drugs, there is a 70% reduction in acquisition of HIV. PrEP provides maximum protection when taken daily for 7 days after engaging in anal sex and 20 days for vaginal sex or injection drug use. It is important to note that while an injectable version of PrEP given once every 8 weeks has been approved by the FDA, it is not relevant for SB159. Pep is a regimen to reduce the risk of contracting HIV after an exposure. PEP is the

¹⁷ Eyasu H Teshale, MD, Henry Roberts, PhD, Neil Gupta, MD, MPH, Ruth Jiles, MS, MPH, PhD, Characteristics of persons treated for hepatitis C using national pharmacy claims data, United States, 2014–2020, Clinical Infectious Diseases, 2022; ciac139, <https://doi.org/10.1093/cid/ciac139>

“Plan B” of HIV that reduces the risk of contracting HIV if taken in the 72-hour window from the moment of possible exposure. PEP is most effective when started as soon as possible and typically consists of Truvada or Descovy plus another agent, which is usually an HIV integrase inhibitor. Unlike PrEP, PEP is a complete antiretroviral regimen against HIV. Once prescribed, it must be taken for 28 days.

SB 159 was introduced by State Senator Weiner and was signed into law on October 7, 2019. SB 159 provides authority for pharmacists to determine if patients meet clinical criteria for PEP or PrEP and allows them to furnish 30 or 60 days of PrEP once every 2 years or furnish 28 days of PEP. The pharmacist must inform the patient’s primary care provider (PCP) or provide the patient with a similar report to give to their provider themselves. The law also requires that before providing PrEP or PEP, pharmacists have to complete training that is approved by the California Board of Pharmacy or that is delivered by an accredited provider. Free training is available.¹⁸ Participants must pass a quiz with a 70% score, maintain the record of training for 4 years, and retrain every 4 years. There is a website¹⁹ to find pharmacists who are permitted to provide PrEP/PEP and who have signed up for the website. It is important to note that pharmacists are not automatically enrolled in this website.

Patients must meet certain conditions to qualify for pharmacist-furnished PEP. The pharmacist must screen the patient and determine that exposure occurred within the previous 72 hours. The patient must meet the clinical criteria for PEP consistent with CDC guidelines, and there must not have been any signs or symptoms associated with acute HIV. Given that education must be provided, the patient may not waive the consultation with the pharmacist. The pharmacist is required to provide information to the patient’s PCP or provide the patient with a list of where to seek care or start PrEP if they do not have a PCP. PEP initiation should not be delayed for baseline laboratory testing, but the patient should follow-up with a provider for laboratory testing.

To qualify for PrEP, the patient must have a negative HIV test in the previous 7 days (negative antigen/antibody test or negative rapid test) and no signs or symptoms associated with HIV infection. The patient must not be taking any contraindicated medication. As with PEP, the patient must receive education and may not waive the consultation. The patient must consent to follow-up with a PCP for additional prescriptions. The pharmacist must maintain a record of the prescription provided and provide information either to the PCP if the patient has one or provide a list where the patient may seek additional care for PrEP.

In summary, pharmacists have played an important role in HIV prevention for decades. They provide condoms, sterile syringes, and supporting adherence to HIV treatment. The notion behind SB 159 is that pharmacists are uniquely situated to improve access to new preventive tools, PrEP, and PEP—especially for patients who are underserved. There are typically pharmacies within walking distance or nearby. Pharmacists also have relationships with prescribers and can support linkage to care for ongoing PrEP prescriptions, HIV testing, and laboratory monitoring. Financial assistance is available on the PrEP-AP Webpage.²⁰ Evaluation of implementation of this program begins this year to assess use, barriers, and facilitators.

Leveraging Policy Changes for STI and VH Prevention, Testing, and Treatment**Rachel McLean, MPH**

Chief, Policy and Viral Hepatitis Prevention
 Sexually Transmitted Diseases (STD) Control Branch
 California Department of Public Health

Ms. McLean reported on additional policies and laws passed in California, as well as their implications. In terms of background, STD rates increased significantly in California between 1990-2019. As syphilis rates increased among people of childbearing age, congenital syphilis cases increased as well to an alarming 446 cases in 2019. This is included cases of fetal demise and stillbirths, which are preventable and should never have happened. California also bears a significant burden of chronic hepatitis B and C based on the most recent data. From 1989 to 2016, the cumulative total of chronic hepatitis B cases newly reported to CDPH was 287,087. From 1994 to 2018, the cumulative number of chronic hepatitis C cases reported to CDPH was over 700,000. This does not take into account the many people living with hepatitis B or C who remain unaware of their infection, meaning that these are probably under-estimates. STI testing volume decreased during the COVID-19 pandemic, which highlighted the need for alternative testing options.

Within that context, there has been interest in creative strategies that can be used to increase all hepatitis testing. Two bills were signed into law, Senate Bill (SB) 306 (Pan, Chapter 486, Statutes of 2021)²¹ and Assembly Bill (AB) 789 (Low, Chapter 470, Statutes of 2021)²² that healthcare providers (HCP) in California are now required by law to follow. Effective January 2, 2021, California law now requires syphilis screening in pregnancy per CDPH guidelines. This includes third trimester screening in pregnancy. SB 306 also provides liability protections for prescribers and pharmacists dispensing expedited partner therapy (EPT) for chlamydia and gonorrhea. This is very exciting, given that prescriber concerns about liability have been a barrier for a number of years. California also had stricter laws related to the use of Clinical Laboratory Improvement Amendments (CLIA)-waived rapid tests. SB 306 now will allow HIV test counselors who are trained and certified to use CLIA-waived rapid tests. AB 789 requires primary care facilities to screen adults for hepatitis B and C, which was modeled after the law in New York and appears to be the first law that requires screening for both.

SB 306 also requires health plans to cover at-home STD tests, which is particularly important due to the increased use and comfort that arose with home tests for COVID-19 that could help pave the way for at-home tests for other diseases. The SB 306 definition of at-home STD tests is, "A product used for a test recommended by CDC guidelines or USPSTF that has been CLIA-waived, FDA-cleared or -approved, or developed by a laboratory in accordance with established regulations and quality standards, to allow individuals to self-collect specimens for STDs, including HIV, remotely at a location outside of a clinical setting." CDPH has spent a lot of time examining each word in this definition, given that it is somewhat cryptic. It has been reported that FDA is working closely with companies to help them achieve FDA approval standards for at-home tests. The SB 306 at-home STD testing coverage requirement is complicated. Specific coverage requirements vary by payer depending on which state agency regulates their products. Medicaid (Medi-Cal) does not have to reimburse for at-home STD tests until specific billing codes are created, including American Medical Association (AMA) Common Procedural Terminology (CPT) Codes and CMS Healthcare Common Procedure Coding System (HCPCS) Codes.

²¹ SB 306 full text: https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=202120220SB306

²² AB 789 full text: https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=202120220AB789

In terms of next steps, CDPH is in the process of developing fact sheets to summarize various aspects of SB 306 and AB 789 for dissemination to HCP, payers, local health departments, and CBOs. The fact sheets are now going through the clearance process. They also are monitoring testing company efforts to request new CPT and HCPCS codes that will be needed for at-home test reimbursement. CDPH has a formal evaluation plan in place and is exploring options for how to evaluate the impact of these bills.

Louisiana's HCV Elimination Plan

Anthony James, MS, MA, MSHCM

Deputy Director of Programs
STD/HIV/Hepatitis Program
Louisiana Department of Health

Mr. James reported on the progress that has been made on Louisiana's HVCV Elimination Plan that was launched in July 2019 and is rooted in several strategies. One of the primary strategies is the establishment of an innovative payment model. The plan also seeks to expand provider capacity to treat hepatitis C; educate the public related to the availability of a cure; expand screening and expedite linkage to HCV treatment; strengthen surveillance systems to identify and diagnosis; and link those who are identified to care and treatment as part of Louisiana's "Big Bet." As part of the Big Bet, Louisiana Department of Health (LDH) has undertaken several large-scale projects to improve health conditions within Louisiana. Since the launch of the Big Bet in 2019, a total of 10,759 persons have access to treatment for hepatitis C. That includes 9,302 persons within the Medicaid population and 1,457 persons who are incarcerated.

In terms of the breakdown of characteristics of Louisiana's Medicaid and corrections populations, the majority of folks (60%) who have access within the Medicaid population are male and 40% are female. In the incarcerated population, 96% have been male and only 4% have been female. While there is a fairly good distribution race and ethnicity, approximately 59% of those accessing Medicaid treatment are white and 60% of those within the incarcerated population are Black. It is important to have that historical context to understand that a disproportionate number of persons of color are incarcerated compared to those who identify as White. The largest distribution of those accessing treatment within the Medicaid population are between 30-59 years of age, with a similar trend within the corrections population.

As everyone knows, even the best laid plans have hiccups. Since the launch of the plan in 2019, one of the biggest hiccups has been COVID-19. Being a Southern Gulf state, hurricanes also impact Louisiana significantly. Hurricanes Ida, Laura, and Zeta and an ice storm all had major impact on the Southwestern portion of the state in 2020 and 2021. Prior to this prescription model, about 61 persons on average were accessing a hepatitis C treatment. That number increased significantly to about 390 persons on average. Due to COVID-19 spikes, that average decreased to about 290. It is important to note that for persons on Medicaid, treatment is calculated using DAA claims data. Due to delays in reporting of claims data, numbers from recent months are preliminary and are an undercount.

Since July 15, 2019 over 9,300 persons have accessed treatment for HCV through Medicaid; 9,133 persons have started treatment for HCV through Medicaid for the first time; 7,930 persons who have accessed treatment have completed it; 6,394 persons have accessed treatment because of Medicaid Expansion; 612 providers have written prescriptions for DAAs for the first time; and last HCV RNA was positive for 585 persons who did not complete treatment. In order for all of this to work, it was necessary to examine some policy changes.

Several of those dealt with Medicaid in terms of lifting provider restrictions and the sobriety and fibrosis requirements.

It is important to understand that while over 9,300 individuals have been treated, others have been identified who are currently enrolled within the Medicaid group who are accessing one of the 5 managed care organizations (MCOs), which helps fulfil Medicaid's charge. Close to 16,000 persons with a positive RNA have been identified who are currently enrolled but who have not been treated. In terms of the last 2 years of this iteration of the statewide elimination plan, a lot of energy and attention will be placed on examining this group in more detail and on examining additional strategies that can be put in place to help lead these folks to a cure.

Based on data from July 15, 2019 through August 31, 2021, over 8,100 individuals in Medicaid had started treatment. Of those, over 7,000 (87%) completed treatment and over 5,200 (65%) had sustained virologic response (SVR) testing performed. Of those, approximately 4,700 (90%) achieved SVR and 514 (9.8%) had a failed SVR. Examining the Medicaid population by birth sex, 88% of females who started treatment completed treatment and 87% of the population of who started treatment completed treatment. There was a larger rate of SVR failure within the male population (10.5%) compared to the female population (8.7%).

By race and ethnicity, 93% of American Indian/Alaskan Natives (AI/AN), 87% of Blacks, 83% of Hispanic/Latinx, and 8% of Whites who started treatment have completed treatment. Of those who failed treatment, 10.2% were White, 9.3% were Black, 9.3% were Hispanic/Latinx, and 7.7% were AI/AN. By age, 80% of persons 18-29 years of age, 84% of persons 30-39 years of age, 89% of persons 50-59 years of age, and 88% of persons ≥60 years of age completed treatment and achieved SVR. Among those who experienced failure, the highest failure was among persons 18-29 years of age at 19%, followed by persons 30-39 years of age at 11.6%, persons 40-49 years of age at 9%, persons 50-59 years of age at 8.9%, and persons ≥60 years of age at 6.6%.

Assessing completions and failures by regions helps LHD prioritize regions that may be experiencing more difficult challenges. Also of interest is that 653 providers have prescribed for the first time. Determining where those providers sit within the state and using provider details can help identify and work with the regions with slower increases in new providers prescribing DAAs for the first time. From a regional perspective, Region 9 (13.7%), Region 2 (11.9%), and Region 1 (10.8%) had the highest rates of failure. Regions 4 (6.6%), 5 (6.9%), and 6 (6.5%) are doing somewhat better. Region 7 (3.7%) has had the most success, which is the Shreveport/Monroe area. Among persons who have identified as having an opioid use disorder (OUD), 84.9% have completed treatment versus 93.2% with no OUD. The completion rates for males and females seem to be fairly consistent, while there is slightly variation in terms of race and ethnicity and by age group. There are some variations from a regional perspective as well.

To summarize, Louisiana has made significant progress in addressing that HCV epidemic. If not for COVID-19 and severe weather conditions, it is anticipated that more people would have been treated. Based on data received earlier in the day, the number of individuals accessing treatment from the Medicaid and corrections populations is close to 11,000 combined.

Transitions Clinic Network**Shira Shavit, MD**

Family Physician

Executive Director & Co-founder

Transitions Clinic Network

Dr. Shavit explained that the Transitions Clinic Network (TCN) is a national non-profit organization that supports health system transformation for primary care clinics that are serving communities disproportionately impacted by incarceration. In San Francisco in 2006, TCN developed an evidence-based model of primary care for people returning home from incarceration. All of the community health centers employ CHWs with histories of incarceration within primary care teams to address the health and well-being of people returning from incarceration. To date, they have worked with 48 primary care clinics in 14 states and Puerto Rico.

People who are incarcerated are disproportionately impacted by a variety of chronic medical conditions, HIV, and substance use. People who are incarcerated have 3 times the prevalence of HIV, a much higher prevalence of hepatitis C with rates approaching 30% to 40%, and increased risks of STIs of 30% to 40%. Incarcerated people also have higher rates of chronic medical conditions and high rates of SUD and mental health conditions. With 95% of people returned home, the primary care system is a natural place to think about providing care to these individuals since they have multiple, complex, comorbid conditions. It is important to remember that in terms of cross-sector collaboration and working across systems, the carceral system and the health system have very different cultures and that really dictates a lot of what can be done and how. The punitive aspect of the carceral system sometimes plays out significantly and can impact what is known to be best practice for caring for people in the health system.

While people may not receive great care while they are incarcerated, people's health actually worsens when they are released from incarceration. Their HIV or SUDs may become worse, their viral loads may increase, they are more likely to be hospitalized post-incarceration, and they are more likely to die. A seminal study showed that people were 12 times more likely to die in the first 2 weeks post-incarceration from drug overdose, cardiovascular disease (CVD), suicide, or cancer. While great strides have been made on a policy front via ACA and Medicaid Expansion, many people who previously did not get Medicaid now have Medicaid and are eligible for services upon release. Having that Medicaid card is not always enough to get people in the door to treatment and it does not always translate to increased engagement or use of services.

That is because people face tremendous barriers when they come out of incarceration that are not just about access to care or having insurance. There is little continuity of care between systems. People may not even get medications or if they do, they get a shortened supply of medications that is not enough to bridge them to the health system. They have competing priorities, with all of the SDOHs evident (e.g., housing, employment, food on the table, stigma and mistrust with the health system due to negative experiences prior to incarceration, et cetera). These are Black and Brown communities that have experienced discrimination at the hands of health systems and then have negative experiences in the carceral system, so it is no wonder that they have a healthy mistrust of systems when released. They also face a lot of challenges in navigating complex services and services in the community that may not meet their needs.

The TNC Model of Enhanced Care was created to try to build capacity in the community health side. While it is easy to point the finger at the carceral system as not being a robust health system, the outside health system also was not meeting the needs of people returning home. Services need to be enhanced in community health systems to provide patient-centered services and engage people into care. In collaboration with communities, the TNC Model of Enhanced Care was created. This model is based on existing primary care clinics where each clinic hires CHWs who have experienced incarceration in prison or jail, most of whom have felony convictions. TNC also works with the clinics to ensure that they are providing patient-centered services like treatment of hepatitis C, HIV, OUD, behavioral health conditions, et cetera. They also work with the clinics to build cross-sector collaboration with the criminal legal system, as well as many other systems to address SDOH (e.g., re-entry organizations, community networks, faith-based networks, family systems, behavioral health system, public health system, tertiary care system, housing system, et cetera). This forces clinics to open their walls and be more contiguous with these important systems in supporting the care for people who are coming home.

This model has been successful because it follows what the community dictated as being needed. They have iterated on the model and have studied it, which has shown that this is an evidence-based model of care. Hiring CHW with lived experience in incarceration and embedding them into clinics has reduced urgent care utilization. For instance, a randomized control trial (RCT)²³ was conducted in San Francisco that assessed 200 people with chronic medical conditions or >50 years of age just released from prison. All of them were engaged into care by CHWs with lived experience. They were then randomized to either staying in the TNC or receiving primary care in the remainder of the system. They found that patients in the program had 50% fewer ED visits in the first 12 months post-release, and that having CHWs engaged study participants at much higher rates into primary care than is seen in the community.

Some information has come from unpublished administrative data from one of TNC's programs in Santa Clara County in California that works very closely with their jail.²⁴ Their health system is part of the jail health system as well, so they were able to make appointments in the jail for people pre-release, but only 33% of people were going to their appointments. When CHWs with lived experience go inside and meet people in the jail, the appointment attendance rates increased to 70%. This demonstrates that the CHW component is critical in bridging systems and engaging people in care.

A propensity-matched study²⁵ in Connecticut of enhanced primary care on contact with the criminal justice system among individuals recently released from prison to New Haven compared to individuals who were released to Hartford where there was no transition clinic program. This study found that individuals in the TNC program had fewer preventable hospitalizations and fewer probation and parole violations. They were spending 25 less days re-incarcerated in the first year post-release. The takeaway from this is that when investments are made in the health system to support these populations, costs can be reduced and outcomes can be improved in other sectors.

²³ E.A. Wang, et. al. AJP 2012 Jul 19

²⁴ Data provided by Dr. Ari Kriegsman, Santa Clara Valley Health & Hospital System 2017

²⁵ E.A. Wang, et. al. BMJ Open 2019

The last 2 years have laid the groundwork for the opportunity to build more bridges between carceral systems and health systems. Because of COVID-19, correctional leadership for the first time really understood what it meant to the importance of bridging these systems. Like everything else in the pandemic, many of these disparities and the need to address them became evident. Many of the statewide systems within TCN built stronger bridges with their carceral systems to be able to connect with people pre-release and provide care coordination systematically from those systems back to community health systems, and back to networks of patient-centered services in the community.

The timing of that groundwork has been fortunate in that some major policy shifts are emerging in the country, such as policies to waive the Medicaid inmate exclusion policy. When people are incarcerated, they are excluded from using Medicaid for their routine services. The idea would be to turn on Medicaid 30, 60, 90 days, pre-release from incarceration to allow health systems or other entities in the community to help provide care coordination from one system to the other. Another policy opportunity relates to providing targeted services to people returning home from incarceration. In California, individuals returning from prison or jail are eligible for enhanced care management services, which is a team-based approach to support people in navigation of the health system and around SDOH. Recent legislation that was passed and pending supports the idea of Section 1115 Demonstrations that would allow for states to turn Medicaid on at some point pre-release to bridge the carceral system and the community health system.

On paper this sounds feasible, but it is important to recognize that it requires a lot of system transformation. The primary care system requires tremendous system transformation to successfully care for this population. In the carceral system, there are many barriers to cross-sector collaboration and a lot of transformation is needed there as well. It is important to recognize that some of the barriers are structural. For instance, having 35 prisons across a very large geography could be a major barrier for local entities that support individuals coming out in terms of meeting with patients and supporting them in the transition home. Other barriers that may play a role include the leadership in place, lack of discharge planning services, lack of meaningful health information exchange, absence of timely identification/access to patients, lack of telehealth services, limited access for all types of community service providers, the siloed nature of carceral systems, patient mistrust, and/or isolation from/lack of community partners. Much remains to be done to build better capacity within the carceral system to enable partnerships with health systems.

The TCN has demonstrated that the policy strategy of supporting the integration of CHWs into health systems who have lived experience of incarceration means that these individuals can give back to their communities to make a difference to improve health outcomes, and health systems can contribute to reversing the harms of mass incarceration by providing job opportunities for people who normally are excluded from health systems because of their criminal record. This really is a win-win.

CHAC Member Discussion Panel 2

To focus the discussion, Dr. Anderson reminded CHAC members of the advice related to this topic that was requested from CDC/HRSA and asked them to be thinking about action items CHAC might address and vote on later in the business section related to these questions:

1. What policy changes are needed to improve access to care and prevention services and tools for HIV, other STIs, and viral hepatitis among populations disproportionately affected by these infections?
2. What policy-making partnerships should CDC/HRSA establish or expand to improve care and prevention among these populations?
3. What are the opportunities for CDC/HRSA to inform and collaborate with states on evidence-based policies that establish enabling environments to decrease HIV, other STIs, and VH?

The following questions, observations, and suggestions were raised:

- Regarding non-viral hepatitis and hepatitis C, Dr. Mehta said it is clear that barriers are disproportionately faced by PWID and other marginalized populations. Related to the barriers pertaining to testing, genotyping, and pharmacy pick-ups described, a recently published study demonstrated that in a global population, people with chronic hepatitis C can be treated with minimal initial monitoring and providing all 84 tablets with little in-person contact. The study demonstrated that it was safe and that SVR rates were comparable to other real-world studies of persons with hepatitis C. This is important to think about in terms of policies going forward and data collection on barriers and acceptability of providers on such an approach.
- Dr. Dowler emphasized that getting Medicaid Expansion in every state would be amazing and that establishing CPT and HCPCS codes for at-home testing is critically important in terms of billing and reimbursement. CHAC probably could have some influence on this effort and perhaps could make a recommendation about this.
- Dr. Mermin asked what advice Dr. Simmons and Ms. Harvey could give to CDC and CHAC about how the agencies could help states and local jurisdictions do X, Y, and Z to make a major difference in terms of helping them make the changes recommended.
- Ms. Harvey emphasized that there are many reasons why policies changed over the last 5 to 7 years. For instance, prices have changed, the Center for Health Law and Policy Innovation brought litigation in a lot of states based on the fact that the restrictions were illegal, and there has been a ton of very forceful patient advocacy around these issues. Thinking about the specific questions Dr. Anderson read is that federal guidance in this space would be very valuable. Thinking back to the 2016 Bulletin that was jointly put out in the HIV space around treatment and prevention by CDC, HRSA, and CMS has been an essential tool in some of her other work to help move the needle on Medicaid access. There is an opportunity for a similar initiative in the Hepatitis C space as well.
- Dr. Simmons added that another helpful tool states had over the last few years was the HHS Hepatitis C Medicaid Affinity Group (Affinity Group), which engaged in collaborative efforts between Medicaid, departments of health, corrections, et cetera to discuss innovative payment models. Many have cited this group as a catalyst for demonstrating that evidence-based policy change and evidence-based programming can make major impacts.

- Dr. So noted that it would be beneficial to know how many state Medicaid programs are covering hepatitis C treatment among incarcerated populations, particularly given that over 20% of incarcerated populations are estimated to have hepatitis C. It is clear that evidence-based policy change has made an impact, such as requiring pregnant women to be screened for syphilis, hepatitis B and C screening law, and linkage to care law. He emphasized the need to address health disparities/inequities and incentives/laws for providers to incorporate recommendations from various bodies (CDC, HRSA, USPSTF) into health records, waivers, and screening recommendations/requirements. CDC and HRSA should reach out to electronic medical record (EMR) providers to incorporate recommended screenings, linkage to care, and clinical support/decision tools to ensure that patients are identified and receive appropriate treatment.
- Dr. Anderson agreed that while there may be guidance or policies in place, in hectic daily 10- to 15-minute visits with patients, it is difficult for this to rise to a priority. Also, there may be issues related to lack of knowledge. Having decision aids in the EMR is invaluable.
- In terms of Dr. Shavit's comments about the policy suggestion Dr. Wester made during her presentation about ensuring the best price restrictions in Medicaid do not preclude access of strategies for incarcerated populations at the state or county level justice-involved populations, particularly for hepatitis C treatment and other expensive medications. Louisiana has used 340B pricing, but she asked whether there are any examples of jurisdictions that have successfully been able to put waivers in place for that.
- Dr. Shavit clarified that in the study in which they were assessing cost savings for patients who were receiving care in their program compared to other programs, they did a propensity match for another city in Connecticut and found that they had a reduction in preventable hospitalizations and parole probation violations. The cost savings was primarily on the criminal legal side with 25 days or less incarceration. While she was not specifically talking about pharmaceuticals, investments in Medicaid saves costs in other sectors. No states have successfully waived the Medicaid exclusion policy yet. CMS had a listening session and is developing some guidance based on that. Multiple states have applied, including California, but none have been approved yet to her knowledge. However, it is an emerging opportunity.
- Dr. Wester asked whether there has been any integration of a requirement for hepatitis C screening among pregnant persons. Through claims data, they are seeing about a 30% uptake of hepatitis C screening among pregnant persons and they would like to see that increase quickly.
- Dr. So indicated that the California law is based on recommendations from the USPSTF, which recommends screening for all adults for hepatitis C. Because universal screening has become the law in California, it makes it much easier to implement screening in EMRs. He has been trying to convince Kaiser and other large groups to introduce all of the USPSTF recommendations into EMRs. As of this month, Stanford has incorporated universal hepatitis B and C testing, even though the USPSTF recommendation is not quite universal for hepatitis B.
- Dr. Ramos indicated that they started a pilot project in Orange County, California to provide medication to individuals who are HIV-positive within that county incarceration system. It is paid through the CDPH AIDS Drug Assistance Program (ADAP), which is a mixture of general funds versus HRSA funds. They are currently going through an estimate package.

It looks like they will be able to expand to more counties if they are interested in participating in the program. Some of the more conservative counties were not testing everyone for HIV as they entered some of the jails. To ensure that screening is done, treatment for those found to be positive will be paid for by CDPH versus using the county's general funds. The hope is to expand to at least 6 more counties that have shown interest.

- Dr. Anderson said she was impressed with the recent state laws in California and their innovations have moved this topic along. She observed that one barrier seems to be that there are so many different county and state laws. While it is not clear if/how CDC/HRSA could impact that, perhaps a central compilation of innovative strategies as laws arise could be beneficial. Access to knowledge about innovations in some states might be very appropriate in terms of pushing the discussion forward in other states.
- Mr. Williams indicated that NCHHSTP funded the National Conference of State Legislatures (NCSL) to create a Legislative Data Tracking System.²⁶ That is exactly what the system is designed to do, and the system refreshes every 2 weeks. As states introduce pieces of legislation that fit certain key words across all of these areas, including laws that affect healthy youth and sex education curriculum, these will be displayed. It is easy to ask NCSL to make adjustments to the system to ensure that everything is captured.
- Dr. Dowler pointed out that even when there are laws, they are very hard to track and enforce. She noted that the Guttmacher Institute maintains a good listing.
- Dr. Mermin said he was intrigued by the differential aspects of the pharmacy program for PrEP that Dr. Ramos described. Based on the examples presented, it seems that the emergency aspects of receiving PrEP through pharmacies is harder than receiving PEP. The ongoing benefit of having a pharmacist as a provider is lost if they can give only a starting dose. While receiving a starting dose can be helpful, he wondered why the PrEP restriction of 30-60 days once every 2 years was included and whether it could be changed.
- Dr. Ramos indicated that there is a history. Originally, there was a push from some of the clinics that had a pharmacy within their organization since it would be easy for someone to present, be started on PrEP, and then go next door to see their PCP. While she did not have the data, PrEP has been under-utilized from what she has seen. However, the specialty pharmacies within those clinics would not like it to go away because they can administer and at least start PrEP. Implementation has been slow. The state is seeing more dispensing for PEP than for PrEP. Because of COVID-19, this was averted to do the training that is required.

Wrap Up Day 1

Travis Gayles, MD, PhD
CHAC Co-Chair, CDC Appointee

Jean Anderson, MD
CHAC Co-Chair, HRSA Appointee

Dr. Anderson observed that it had been a tremendous day with a lot of information that began with reports from CDC and HRSA. They heard some statistics on continued increases in syphilis and congenital syphilis, as well as increases in adolescent mental health concerns and

²⁶ <https://www.ncsl.org/research/health/state-public-health-legislation-database.aspx>

the need to find ways to address these. Some of these negative statistics were offset by the data CHAC heard about the dramatic improvement in viral load suppression overall and in key populations; demonstrable reductions in disparities; and very impressive successes reported in CDC-funded programs in schools to decrease risky sex behaviors, safety concerns, and sexual assault. She congratulated CDC and HRSA for their work and deep thinking in terms of integration and collaboration strategies and the use of the syndemic approach to deal with these interrelated problems, which is critical. In the afternoon, they heard about innovative models of care and continued challenges. Some of the innovations and the ability to address challenges are constrained by state- and county-level policies and legislation, funding, and lack of time or knowledge on the part of physicians. They also heard about a lot of flexibility and innovation during the COVID-19 pandemic and in many cases inspired by it. They heard about the role of integration of different relevant infections, as well as issues related to SDOH.

Dr. Gayles expressed his gratitude for the great presentations and for the work everyone does on a daily basis in order to be able to present the data that you provide. He further emphasized the continued notion of evolution in terms of the need to be modern and think outside the box moving forward with regard to funding to sustain programs and to continue to pivot to keep efforts moving. This includes the ability to speak fluently to young people to make sure that they are engaging and they are able to effectively communicate their needs in safe spaces. With regard to engaging in conversations about increasing services that folks need, it is important not to use mental health as a crutch to not do the necessary work to root out racism, systemic issues, bias, transphobia, and all of the other things that significantly influence the potential success of projects in the future in terms of being able to sustain funding and considering the significant variability in terms of the differences in geography and the level of services available. A lot of tremendous work has been done but there are still many headwinds in the way moving forward.

Adjourn

Dr. Mermin officially adjourned the meeting for April 26, 2022 and CHAC stood in recess until 11:00 AM ET on April 27, 2022.

Day 2: Welcome and Roll Call

Jonathan Mermin, MD, MPH (RADM, USPHS)

Director, National Center for HIV, Viral Hepatitis, STD and TB Prevention
Centers for Disease Control and Prevention
CHAC Designated Federal Officer
Centers for Disease Control and Prevention

The proceedings were called to order at 11:00 AM ET. Dr. Mermin welcomed participants to the second day of the CHAC meeting. He conducted a roll call and asked members to disclose any new COIs. COIs did not differ from the previous day and are reflected in the table on page 8 of this document. He confirmed that 21 members were in attendance, which established quorum for the CHAC to conduct its business on April 27, 2022.

Special Presentation: Turning the Tide on Self-Testing and Sample Collection

Moderator: Elizabeth DiNenno PhD; Division of HIV Prevention, NCHHSTP, CDC

FDA Regulation of HIV Self-Testing Devices and Self-Collection Kits for HIV Diagnosis

Julia Lathrop, PhD

Associate Deputy Director
Division of Emerging and Transfusion-Transmitted Diseases
US Food and Drug Administration

To lay the groundwork Dr. Lathrop explained that in vitro diagnostic devices (IVDs) are medical devices per Section 201(h) of the Food, Drug & Cosmetic Act (FD&C Act) [21 CFR 809.3] that defines medical devices as: “Reagents, instruments, and systems used in the diagnosis of disease or other conditions . . . in order to cure, mitigate, treat, or prevent disease intended for use in collection, preparation, and examination of specimens from the human body.” Clearly, self-testing and self-collection kits are considered to be medical devices. As such, they are subject to the provisions of the FD&C Act. It also means that regardless of whether a device is regulated either in the Center for Biologics Evaluation and Research (CBER) or the Center for Devices and Radiological Health (CDRH), it is subject to the provisions of the FD&C Act.

The review of all IVDs, regardless of where they are reviewed or what their use is, is based on the balance of the benefit and risk to the individual and that the data provide a reasonable assurance of safety and effectiveness of the device. A risk for an IVD is providing an incorrect result to the individual. For an HIV diagnostic, that would be a false positive or false negative. Risks from receiving a false negative could be that an individual is denied life-sustaining treatments and could transmit a life-threatening disease. The risk for having an incorrect result, especially a false negative for HIV, is very high. One element of assessing for reasonable assurance of safety and effectiveness and the balance of benefit/risk pertains to whether the device does what it is intended to do.

All IVD reviews begin with a review of the intended use because this is where the determination of the risk lies. Intended use pertains not only to the HIV diagnosis, but also the sample type, population, conditions (e.g., professional use only or self-collection). The risks all lie in the intended use and it is from the intended use that the review logically flows. It is important to keep in mind that one device may have more than one intended use and those uses can have different risks. For example, HIV diagnostics and viral load monitoring have very different risks

associated with incorrect results. The risk involved and what is necessary to mitigate the risk determine whether a device is categorized as a Class I, Class II, or Class III. Colloquially speaking, those mean low, moderate, and high risk, respectively. However, that is not entirely accurate because there can be a high-risk device like an HIV diagnostic that can be safely regulated as a Class II device. FDA is in the process of reclassifying HIV diagnostic supplemental and viral load tests from Class III to Class II. The risks associated with an incorrect result have not changed; these are still high-risk devices. Having approved many devices over many years allows FDA to establish special controls, which are provisions associated with the demonstration of the safe and effective use of the device. Establishment of special controls allows for successful mitigation of the risks in order for FDA to safely review these as Class II devices requiring a PMA. Special controls can be requirements such as performance criteria, post-market reporting, et cetera, that are necessary to provide reasonable assurance of safety and effectiveness of the device. Because reviews are based on intended use, there is no expectation that all Class II devices should have the same special controls since the risks associated with each intended use differ.

Turning specifically to FDA regulation of HIV self-testing devices (HIVST), HIV devices are Class III devices that require approval of a PMA before they can be marketed. There is one approved self-testing device on the market, the OraQuick® HIV self-test approved in 2012. HIVST devices were not included in the reclassification of HIV diagnostic, supplemental, or viral load tests due to a lack of sufficient experience with these devices to write special controls that will safely mitigate the risks so that they can be regulated as Class II devices. FDA does agree wholeheartedly that there is an urgent need to improve access to self-testing for HIV. To that end, FDA is working with manufacturers to consider alternative validation strategies and streamlining of the review and approval process to expedite entry into the market. When the OraQuick® HIV self-test was approved, the process was very laborious and very careful because there were a lot of concerns, even with the whole concept of self-testing, but HIVST has since been demonstrated quite clearly to be safe and effective. Thus, many of the concerns that caused the original process to be so laborious have been mitigated through experience with the devices. FDA has been working with manufacturers to determine ways they can use existing data, for example, especially if it is an already approved point-of-care device, and adding a self-testing claim to that. This differs from a manufacturer who is submitting a brand-new device never approved before.

HIV self-collection kits also require FDA approval. All self-collection kits are medical devices that require FDA authorization before they can be distributed regardless of their intended use, but the review pathway can vary based on the intended use of the device. For example, a device might be intended for home use or use in a clinic for self-collection that is supervised or unsupervised based on disease indications. The reason that FDA needs to review these devices is that adequate and appropriate sample collection is essential for device to meet performance expectations. Self-collection means that an untrained individual is collecting their own sample, so there is no automatic assurance that collection has been performed properly when the sample arrives at a laboratory. FDA reviews instructions for sample collection and the device's performance with the intended sample type to ensure a reasonable assurance of safety and effectiveness of the device.

In terms of the current landscape, FDA recognizes there is a need for self-collection kits for HIV diagnosis for individuals who are unable or unwilling to attend a clinic. However, HIV self-collection kits require approval of a PMA or clearance of a 510(k) following reclassification of HIV diagnostic device to comply with the FD&C Act. Distribution of unapproved HIV self-collection kits is a violation of the Act. There are no FDA-approved HIV self-collection kits that use blood samples currently on the market. FDA's goal is to bring unapproved/uncleared

devices into compliance with the law and regulations. In the interest of public health, FDA is committed to working with device developers to meet the requirements.

Turning the Tide on Self-Testing and Sample Collection Background and Need

Michele Owen, PhD

Associate Director of Laboratory Science
NCHHSTP, CDC

To ensure that everyone was on the same page, Dr. Owen first shared the following terminology and definitions:

- **Point-of-Care Test (POC):** Conducted near an individual also referred to as point of contact or rapid tests administered by trained staff or health care providers
- **Self-Test:** A complete test conducted by an individual for their own knowledge—also referred to as an over-the-counter test (OTC) or direct-to-consumer test (DTC).
- **Self-collection (self-collected test):** A scenario where an individual collects their own sample, and hands it off or ships the sample to a laboratory for testing

There are many considerations for self-testing and self-collection testing. It is very important for populations where clinic or laboratory testing is difficult or not feasible. However, it is very important to provide clear information regarding assay limitations. For example, the oral fluid assays will detect some early infections.²⁷ These are never the final diagnosis. They are used in conjunction with clinical testing for a definitive diagnosis. Ideally, these tests should be available at a price point that will allow wide access for many people to have the ability to use them. As noted, OraQuick® is the only FDA approved HIV self-test. This is an oral fluid test that costs about \$35 to \$40 retail. It is important to note that this test does not detect acute HIV infections (e.g., up to 90 days for positive result post infection) and there are limitations for its use in the context of PrEP. Based on delayed reactivity shown in PrEP trials, this test is not optimal for prescribing PrEP. There are currently no cleared self-tests for STIs or viral hepatitis.

In terms of HIV self-testing data in the US, CDC in conjunction with Emory University conducted a longitudinal randomized control trial (RCT) known as eSTAMP²⁸ that demonstrated the feasibility, acceptability, and benefit of distribution of self-test kits. The study used the FDA-approved OraQuick®, a fingerstick test under IDE (Sure Check®), and a dried blood spot (DBS) test. Infection was identified in first time testers and social contacts and no harmful adverse events (AEs) were reported. A partnership with CDC's Let's Stop HIV Together Campaign-to launch TakeMeHome distributed approximately 100,000 HIV self-test kits through a portal on the CDC website.²⁹ This event demonstrated that self-testing serves people who might be reluctant or unable to seek clinic- or community-based testing. This tool was identified by 80% of jurisdictions that are part of the EHE as being very important for their community EHE plans.

The World Health Organization's (WHO's) stance of self-testing is informative. WHO has made recommendations twice that self-testing should be part of eliminating HIV or identifying people and getting them into treatment. The first recommendations were in 2016. After reviewing the data in 2019, the WHO updated their recommendations to make a strong recommendation for HIV self-testing. They also pointed out that testing in this manner reaches high-risk people who

²⁷ Stekler et al, JCV 2013 and 2016; Luo et al JCV 2013

²⁸ MacGowan et al. JAMA Intern Med, 2019

²⁹ <https://www.cdc.gov/mmwr/volumes/70/wr/mm7038a2.html>

might not test otherwise, so it should be an ongoing approach for testing services.³⁰ There are a number of HIVST products available outside of the US with WHO pre-qualification.³¹

As mentioned earlier, there are no FDA-cleared self-collection test for HIV and Home Access is no longer on the market. Commercial laboratories have set-up laboratory-developed test (LDT) services, primarily because of testing during COVID for HIV, STIs, and PrEP initiation because it was known that people were not getting tested. This also was done for hepatitis B and C antibody tests. Multiple studies have been conducted on STI self-collection inside and outside the US. WHO also funded a meta-analysis of STI self-collection tests³² after which they published recommendations for self-collection testing for STIs. Similar to HIV self-collection, WHO pointed out that self-collection of samples for *Neisseria*, gonorrhea, and chlamydia are very important and reach people who might not normally be tested.

In the US, various institutions have set up programs for self-collection for STIs.³³ One of the most well-known program is I Want the Kit³⁴ that came out of Johns Hopkins where they are doing chlamydia and gonorrhea testing. Originating in Baltimore, this testing has now been expanded to Maryland, Alaska, and Arizona residents. The District of Columbia (DC) conducted a similar type of project called GetCheckedDC.³⁵ This is a mail-in STI testing program. Both programs have reached priority populations and data indicate that the methodology is feasible.

CHAC Member Discussion on Special Presentation

To focus the discussion, Dr. Gayles reminded CHAC members of the advice related to this topic that was requested from CDC/HRSA and asked them to be thinking about action items CHAC might address and vote on later in the business section related to these questions:

1. How important is self-testing and self-sample collection to overall public health efforts?
2. Are there specific analytes (e.g., antibody or antigen tests for HIV, HCV or treponemal/non-treponemal test for syphilis) that CHAC would consider a priority?

The following questions, observations, and suggestions were raised:

- Dr. So emphasized that there is a lot of value in having rapid tests for home use and use at outreach events for HIV, STIs, and hepatitis. He asked whether one reason for not having more approved rapid tests and self-tests was because industry is not submitting applications and if FDA should be sending out notices to welcome industry to submit applications.
- Dr. Lathrop indicated that FDA has engaged in increasing outreach to manufacturers to encourage them to submit all of these devices. There tends to be a lot of mythology around what FDA will and will not consider in terms of data. Some of that is because that is the way it used to be and some of it is because people talk amongst themselves and have decided this, or they may have gotten an unhappy answer and then decided that FDA would never consider using data from outside the US. In some cases in the past, that might have been true. However, FDA has been working hard to open up alternative validation strategies that might not have been considered in the past, and is trying to engage outreach to get people

³⁰ WHO recommends HIV self-testing. (2016) World Health Organization. <https://apps.who.int/iris/handle/10665/251549>; Consolidated guidelines on HIV testing services. <https://www.who.int/publications/i/item/978-92-4-155058-1>

³⁵ <https://www.getcheckeddc.org/>

to come in. Fundamentally, FDA can only review what people submit. People also can simply start conversations with FDA regarding what is/is not required. There is a pre-submission process that is simple and can be informational. They want people to talk to them about what they have and what the expectations are. There is no penalty or user fee to clarify what is needed. In a pre-submission, FDA's feedback is binding. If they say that a study design is acceptable, they cannot change their mind later unless the science changes. It also is confidential on the part of FDA.

- Dr. Anderson observed that there seemed to be no question about the need for self-testing and self-collection devices for various infections. Perhaps the barrier at this time is that more data are needed for validation. She wondered whether manufacturers and laboratories do not have the protocols, are not interested, et cetera. Obviously, the need for more data has cost implications. While FDA is reaching out to individual manufacturers for technologies that are already developed and being used abroad, she wondered what realistically could be done to move this along in the US such as some sort of incentive structure. It sounded to her like a lot of data already have been generated, at least in a global setting, some of which may be useable for US approval. She clarified that when she said "incentivize," she was not suggesting that they pay manufacturers. She just wondered what outreach mechanisms might be available.
- Dr. Lathrop said she could not speak to whether FDA has the ability to incentivize manufacturers and they do not sponsor trials. Manufacturers may assume that the barriers are so high that they could not possibly get approved, but validation is validation. FDA recognizes Clinical and Laboratory Standards Institute (CLSI) standards for measuring assay precision. These are voluntary standards, but they are best practices developed by the device manufacturers. CDC and FDA are on the panels for some of the standards and follow those principles. Good device validation follows the CLSI standards to be properly validated in many cases. FDA has a number of roundtables that are designed specifically to engage in open discussion with manufacturers. She agreed that finding ways to reach out to various manufacturers who are developing these tests is crucial.
- Dr. Owen added that CDC also has tried very hard to engage in outreach with manufacturers by interacting with the Advanced Medical Technology Association (AdvaMed) to discuss the needs for HIV, STI, and HCV tests. In addition, CDC recently convened a diagnostics conference that they have had for many years. Most manufacturers either attend and/or have booths. Manufacturers have said that they will not bring a test to the market if they do not see a market share for that. They are private companies and they want to make money. It is important to continue to emphasize the need for these devices and that there will be a market for them.
- Dr. Dionne-Odom inquired about the role of clinical investigators who design RCTs. In order to reach this vulnerable population who is at-risk and not accessing care, self-testing for HIV and STIs is critical. If researchers receive funding for trials from NIH to conduct this type of research with donated kits from companies that have told them the bar is high for validation through the FDA, she wondered whether that would be the type of data that would be compelling or if the real work needs to be done at the level of the company to put their specifications and QI in place.
- Dr. Lathrop indicated that the clinical data is part of the package, but someone has to actually sponsor and submit the application. There is nothing that says a clinical laboratory or a university cannot do that, but they have to have all of the information that supports the analytical validation for the device as well. That can be challenging. A kit can be made that

works on an already approved instrument, and that a laboratory or university could submit that as their test and take responsibility for it. It does not have to be the manufacturer. While there are some risks associated with that, it can be done. It is difficult when someone is just doing the trial component, because they may not have access to all of the information needed. That would have to be acquired from the manufacturer or the researcher working with the manufacturer to provide that for an FDA application. The data generated in those kinds of studies, if well-designed and potentially can be submitted to FDA in the end, speaking very generically, should be usable.

- Dr. Mermin observed that while the efforts to reach out to manufacturers are appreciated, it is extremely expensive to put forward an application for PMA for a Class III device. For a university to want to conduct the clinical trials is not an easy process, for HIV in particular.
- Dr. Lathrop indicated that the user fee for a PMA is substantial. One benefit for reclassification is that when diagnostics are 510(k), it is a much lower user fee. At the moment, a self-collection kit is a PMA because the assay is a PMA. Once the assays are reclassified as Class II, the self-collection kits can come in as a 510(k). FDA is awaiting the finalizing of the reclassification, but when that occurs, it should lower the financial cost. The clinical studies still need to be done with performance criteria that are in the special controls, but certainly the submission and maintenance of that application are much lower.
- Dr. Markham reported that the IWantTheKit program from Johns Hopkins has made an incredible impact in reaching Native American and Alaska Native communities working with colleagues at the Alaska Native Tribal Health Consortium (ANTHC) and the Inter Tribal Council of Arizona, Inc. (ITCA). They are expanding their work to the Southern Plains Tribal Health Board (SPTHB) in Oklahoma. This has been a phenomenal program and working with the Johns Hopkins team has been outstanding. Testing is only one part of it. There also is a need for funding the culturally sensitive outreach and marketing, because those testing kits are only as good as the folks that they reach. It also is important to have support to linkage to care in local communities. For remote tribal communities where youth do not want to go see their Auntie at the local clinic because that is not going to be confidential, the importance of having that self-testing and anonymous/confidential access and linkage to care is critical.
- In terms of the mention earlier that different centers within FDA have adopted different approaches, Dr. Mermin asked whether thought has been given to aligning the requirements of both centers so that there is more consistency.
- Dr. Lathrop clarified that they do not have different interpretations. They have different intended uses. The requirements for an HIV diagnostic will differ from the requirements for an HCV diagnostic because the risks associated with the intended uses are different. Both centers are assessing them in the same way in terms of the potential impacts of the incorrect results to the individual. For instance, the risk from an incorrect result for a viral load monitoring test versus a screening test are very different. The centers talk all of the time and try to align as much as possible.
- Dr. Mermin indicated that CHAC, CDC, and HRSA have discussed that they do not believe the distinction between hepatitis C and HIV diagnostics at the point of use are different. They talked with FDA about that as well. They are left with a situation in which they are an organization trying to get testing out to the people who need it, but see different routes being required by different centers in the FDA even when it is not clear why one is being treated differently than the other.

- Dr. Lathrop said she understood why it appears that way sometimes. FDA's feeling is that the risks from a wrong result for HIV are not the same as the risk of a wrong result from HCV, especially in terms of a false negative and a person believes they are not infected and go about their life. HIV is treatable when people know they are infected.
- Dr. Dowler expressed an interest in understanding from the payer perspective how they can pay for these tests so that companies will invest the resources to go through the process. No Medicaid program is going to pay for a self-collected test with no incentive to do that. There is an opportunity for CHAC to assess the rigor of going through the approval process, incentives for industry to want to do that, and making sure that tests are equitably distributed and accessible to various communities in terms of being offered and the payment structure.
- Dr. Daskalakis shared a resource for HIV self-testing:
Issue Brief: <https://www.cdc.gov/hiv/policies/data/self-testing-issue-brief.html>

Panel 3: Applied Syndromic Approach to HIV, VH, and STIs: Focusing on People

Moderator: Demetre Daskalakis, MD; Director, Division of HIV Prevention, NCHHSTP, CDC

Comprehensive Harm Reduction Supports Navigation to Curative Hepatitis C Virus (HCV) Treatment and Syphilis Services

Andrew Gans, MPH

HIV, STD and Hepatitis Section Manager
New Mexico Department of Health

Josh Swatek

Hepatitis and Harm Reduction Program Manager
New Mexico Department of Health

Mr. Gans and Mr. Swatek presented on comprehensive harm reduction supports navigation to curative HCV treatment and syphilis services provided by New Mexico Department of Health. Typically, when speaking about harm reduction and high-volume, high-quality, low-barrier harm reduction programs as a great access to services, it is normal to assume that there will be hepatitis C, maybe HIV testing, and syphilis services to build trust in the community. Unfortunately, with the release 10 days ago of the STD surveillance data for 2020, New Mexico is number one in congenital syphilis. Small number, high rate, and very alarming.

New Mexico is able to do navigation because they have such a high-volume harm reduction program. While previously they were performing rapid HIV and hepatitis C testing, they have moved away from rapid hepatitis C testing because they have clients who have been antibody tested repeatedly over a decade or more, but it does not actually get them into care. It is expected that all harm reduction includes navigation to substance use services. New Mexico's enhanced model is about navigation to services rather than just referrals. As part of the hepatitis C elimination plan, it is necessary to get people into curative treatment. This involves getting them insurance, getting them into primary care, getting them medication opioid use disorder (MOUD) treatment, syphilis services, and ensuring that the DIS who are involved in a lot of these services can be doing partner services, testing, and linkage to STD or hepatitis treatment as well.

New Mexico wants to be among the first, if not the first, to eliminate hepatitis C as a public health threat by 2030 meeting national and international goals. New Mexico has 5 wins and innovations in the state that really place them ready to do this:

1. Project ECHO, which was founded in New Mexico at the University of New Mexico specifically to increase access to HCV treatment.
2. New Mexico Corrections Department (NMCD) is actually providing STD treatment actively and was doing antibody testing upon entry for almost a decade, switched to do confirmatory testing as well, and now has funding in the legislature to do curative treatment for about 2,800 inmates.
3. New Mexico has one of the most progressive Medicaid policies, which opened up for hepatitis C treatment without pre-authorization, fibrosis restrictions, or sobriety restrictions in 2015. The consultant who pulled off this amazing feat is now their Cabinet Secretary for Health.
4. New Mexico has an innovation with a high-risk pool, which they have been using to ensure that everybody living with HIV has insurance coverage, even if they are categorically ineligible due to immigration. The New Mexico Medical Insurance Pool (NMMIP) was approved at the end of 2019.
5. Comprehensive harm reduction services are available statewide.

Project ECHO has a peer education program working with state corrections, which does a lot to promote referral to hepatitis C treatment. They have the funds now and the 340B discount, which has allowed them to increase from about 150 inmates being treated for hepatitis C prior to this innovation to an average of about 600 a year. They have to motivate people to ask for it. It is not just for people with advanced disease, fibrosis, et cetera. It is for everybody, but not everybody knows they need it. NMCD has a plan for HCV elimination and received a very large allocation of funds. Project ECHO is a key part of that in terms of consultation and includes the NM Peer Education Program that educates the population on HCV screening and treatment. Partnerships are highly essentially in New Mexico. New Mexico's innovative policies for hepatitis C treatment that began in 2015 increased access to treatment for Medicaid recipients. They have good coordination that is constantly improving with Medicaid MCOs, which helps somebody who leaves corrections who did not start or complete treatment get community treatment as well. A lot of people are cycling through jails where there is less excellent coverage, state prisons, and then back into the community for Medicaid.

New Mexico's innovative high-risk pool has done very well with wrap around insurance. Before ACA, New Mexico was a state that never had an HCV drug assistance program waiting list, because with this high-risk pool, they were ensuring everybody with HCV who could not get insurance 10 years ago. When ACA rolled out and there was Medicaid expansion, a lot of folks with HCV moved to Medicaid or to an ACA plan. Others still have employer insurance. The NMMIP is still the last option. There are only about 200 people with HCV in the state, but the hope is to be able to serve 50 to 100 people with hepatitis C who cannot get any other insurance. The exciting part is that they thought this would be a treatment model where the state health department and public health offices would be the wrap-around safety net. In some communities, one of the few providers in the county is the Department of Health Public Health office. Even in some of the larger communities, there may not be a lot of providers who are willing to provide hepatitis C treatment, so they hope to ramp this up. While they got set back about 2 years by the pandemic, they have a protocol for hepatitis C simplified treatment and can serve a lot of people who do not have advanced disease right in their health offices to be that safety that helps people get access to MOUD, which is essential for a lot of the population. New Mexico has comprehensive harm reduction program services available statewide. More than 18,000 unique people were provided with syringe services in 2021. An important piece of

that is that 87% of people have been tested for hepatitis C, but only 24% have had access to treatment. Harm reduction programs are a key place to provide services for viral hepatitis. Component 3 through the 2103 CDC DVH grant has allowed New Mexico to expand its services, which is essential for preventing reinfections.

Some of the strengths of the New Mexico model are negotiated exchange, which allows tailoring to client needs while still striving to maximize collection of used syringes. Services are comprehensive. Locations at NMDOH Public Health Offices offer HIV, HCV, and STD testing and services, WIC (Women, Infants, and Children), family planning, et cetera. Many sites are within FQHCs or other health care providers. Services are low threshold, meaning that new clients can enroll with just a brief interview. The program is confidential, but unique client identification codes can be used to ensure immunity from prosecution for possessing syringes. Program sites were an ideal venue to provide hepatitis A vaccines during an outbreak among persons experiencing homelessness.

This is a comprehensive model that provides new, sterile syringes. Safe disposal of syringes can be done through both program interactions and community drop boxes. Small sharps containers are provided to participants to return to the program. There also is provision of other “works” needed to prevent the spread of infectious disease, as well as overdose prevention services. Referrals and navigation are provided to substance use services, public health interventions, and social services. Some people might not be ready for treatment because of the circumstances of their lives (e.g., lack of childcare, food insecurity, lack of housing, et cetera). Active navigation helps to address those gaps first, with the eventual goal of getting people into treatment.

In terms of messaging, New Mexico’s older campaign had 6 messages for people in their services who may not have thought of PrEP, PEP, curative treatment, or rapid testing. The new campaign is being rolled out as harm reduction across the state around maternal testing for syphilis, which is very important for responding to congenital syphilis. The issue with New Mexico’s congenital cases is that a lot of people are not in prenatal care, very often due to substance abuse.

The New Mexico Harm Reduction Act passed in 1997. It authorized the Department of Health to compile data to assist in planning and evaluation, provided immunity for exchange or possession of hypodermic syringes from the Controlled Substances Act for both participants and providers, and approved community providers across the state. Program operations started in 1998. There were a lot of problems with the original policy. Original state rules were detailed in terms of data collection and reporting. This necessitated long intake interviews and some irrelevant questions (i.e., sexual behaviors). Eligibility is only for state residents aged 18 and over. Some educational messages that became outdated (i.e., use of bleach) were written into initial regulations. Exchange was one-for-one only with a limit of 200 syringes per interaction (hindering secondary exchange). However, policy changes have increased the scope of harm reduction services. House Bill 52 passed in the 2022 legislative session, with a lot of bipartisan support. It allows NMDOH to promulgate rules that reduce negative health outcomes associated with drug use such as overdoses and infectious disease and reduce harm by improving participant engagement in harm reduction.

Harm reduction is now being used to respond to maternal and congenital syphilis. New Mexico has a lot of moms who are not accessing prenatal care due to immigration status, using substances, experiencing homelessness, engaging in transactional sex work, et cetera. They fear that if they get connected to a system of care, they will lose custody of their baby. A lot of training is being done for providers to make sure those who do come in are tested. Harm reduction efforts include strategies to engage at-risk persons in harm reduction, including meth users and those who do not inject; rapid and conventional syphilis testing; incentives for testing, including for male partners of persons of child-bearing age; social network strategies (SNS) to recruit; and integration with DIS to ensure treatment, disease investigation, and better quality services.

Corrections Health is Public Health for the Justice-Involved Community!

John J. Hagan, MD

State Correctional Health Authority

North Dakota Department of Corrections and Rehabilitation

Dr. Hagan noted that he has the privilege of leading a small but mighty team of medical and psychiatric professionals who provide care to a unique and vulnerable population. Together, they change the lives of residents in the North Dakota Department of Corrections and Rehabilitation (DOCR). There is an epidemic of incarceration, with 1.43 million adults held in federal or state prison facilities currently. There are about 735,000 persons in jails. Across the country, about 0.7% of the adult population are held in jail or prison. The North Dakota State Prison system houses 0.3% of the adult state population. That does not include folks on parole or probation. North Dakota is a very rural state of 774,000 total humans. The adult count in the prison system is very small at 1,685. They are happy to be small and are trying to go out of business if they can. Their average turnover is 1,500 admits per year, the median length of stay about 16 months, and the recidivism rate has been about 40% over 5 years.

North Dakota residents are a vulnerable and underserved population. People of color are over-represented in prison in probation and on parole. Someone who is Black in North Dakota is 4.2 times as likely to be under DOCR control compared to their White counterparts. Latino North Dakotans are 1.8 times as likely and Native Americans are 5 times as likely to be incarcerated. Residents arrive uninsured with very fragmented medical care. They suffer significantly higher rates of hepatitis C, SUDs, serious mental illness, diabetes, and hypertension. The goal is simple. The mission of the North Dakota DORC is to transform lives, influence change, and strengthen the community. They work hard because they believe the work is worth doing. They practice dynamic security, the goal of which is to create a humane, normalized environment to the extent possible. They have security available if having issues, but they found that when their patients are treated normally, they respond normally. They are trying to get folks ready to head home by creating an environment in which residents attain and practice prosocial skills in a setting where they are safe.

DOCR's plan for success in treating STIs, hepatitis C, and HIV is straightforward. DOCR is tremendously well-supported by the North Dakota Department of Health (NDDOH). DOCR partners with NDDOH to bring screening and treatment service to the DOCR system, and they form a large platform for DOCR's more comprehensive treatment programs. DOCR would have no opportunity to do this without the superb NDDOH, which underpins everything DOCR does.

One of the things that drives DOCR's programming at every level of operations and security is that their residents are going to become their neighbors. Of the individuals in DOCR's care, 98% will be discharged to North Dakota, South Dakota, or Minnesota. They ask themselves with their programming what kind of neighbors they want. They are very much person-centered rather than diagnosis-centric. DOCR considers what these folks need to be successful in the community, and challenge their clients to work to remodel and revitalize themselves. The testing and treatment programs that they offer are concrete actions that convey to the residents that DOCR is heavily committed to investing in their future. This is a great place to find and treat folks. Upon arrival, 31% of DOCR residents identify themselves as PWID. It is suspected that the numbers are higher. About 15% of the residents suffer from chronic hepatitis C with elevated viral load. In the last 10 years, DOCR has had 2,388 unique patients arrive with hepatitis C antibodies and 80% of them are typically HIV-positive. Only 0.6% of DOCR residents test positive for HIV. The chlamydia rate is 20.7/1000.

The goal is to build trust from day one. In the first 30 days, there is an orientation program during which the DOCR Nurse teaches health-related issues and answers questions. The result of offering a stable and humane environment is that residents asked for treatment on arrival. There is an opt-out program for testing. Virtually nobody opts out. For the first time in 6 months, only one individual in the state of North Dakota asked not to test, so the environment definitely is right for this. The only reason DOCR succeeds with this program is because of the unwavering support of the NDDOH. This translates to 20% of adult men on arrival are antibody positive and 15% overall have active virus, while 37% of women are antibody positive and 25% have active virus. This is known due to the ability to perform universal testing on arrival. The reason they can do this is because their cost for HCV antibody is \$26 underwritten by the NDDOH. The HCV RNA/Genotype is \$55. The average screening cost for hepatitis C is \$37 dollars per arrival. DOCR cannot come close to that anywhere in the private world, so that helps them a great deal. That turns out to be important because NDDOH reports that 15% of individuals in North Dakota who have an HCV positive laboratory result reported to NDDOH each year have at least one HCV associated laboratory report in a correctional setting.

DOCR cures hepatitis C. They have the support of leadership and their legislature. DOCR treats and cures 43% of the people who come through the door who are infected and they test everybody. Because we partner with the NDDOH and have access to 340B pricing, their average cost is \$12,560. Their 2021-2023 budget is \$1.9 million. For an additional \$2.4 million for a joint program, they can get to micro-elimination and treat everybody they see. This is a great opportunity to impact the state. Since NDDOH steeply discounts their laboratory costs through Section 318 of the Public Health Service Act (PHSA), DOCR's GC and chlamydia tests are \$10 and HIV tests are \$10. They treat by protocol for GC and chlamydia. As soon as they are notified, their staff completes Level I contact tracing on behalf of NDDOH. They also are the first to notify patients on HIV results on a regular basis. People have wanted testing, they have feared testing, but they feel safe at DOCR. Fortunately, they have immediate counseling, psychiatry, psychology, primary care, and infectious disease services available.

Prisons face challenges in treating justice-involved individuals. Most states do not have a unified system. Jails and prisons look the same on television, but they are not at all the same in real life. They are separate organizations. They speak to each other and about each other, but they are not in the same organizations. Jails are funded by county budgets and prisons are funded out of state budgets. The scope and breadth of services differ by county and by state. Some counties have comprehensive services, while some counties have no services. DOCR does not have direct control over prisons. They have a relationship, but programs written for jails and prisons may not work in one setting or the other.

It is important to note that justice-involved individuals are ineligible for Medicaid, Medicare, VA, or private insurance as soon as they are incarcerated—even if they are still paying premiums. States pay cash for all DOCR services. They negotiate and pay out of the general fund. Public funding opportunities for these services is fragmented and separate programs exist for hepatitis C, GC and chlamydia, HIV, SUD, serious mental illness, and wraparound services. For all of the issues that this vulnerable group is expected to have, support disappears when the door is slammed shut by law. Another challenge is attracting and retaining providers. Medical staff are state employees who are underpaid compared to the community. State medical and mental health case management for transition is badly underfunded in most states, so they do not have the services that are known to have a high impact. Jail resources for education, screening, and treatment are very sparse and jails are unable to shoulder the burden as a result.

The next step is to expand the import model. The ultimate goal is to engage the community and patients. That is working well. DOCR partner with federal, state, and local agencies to bring services that already exists into the prison system. The advantages include a steady and predictable volume for agency partners, a solid source of reliable care for this vulnerable population, and continuity of care on release. A great example is DOCR's cooperation with the UND Family Medicine Residency Program, which runs the Center for Family Medicine and also takes care of Custer Family Planning, which is the public health STD treatment programs. For its residents, DOCR also uses the HerCare clinic to bring in onsite prenatal/obstetric care and reproductive health services (e.g., LARC, reversible contraceptives, education). There also is continuity of care, in that those leaving DOCR's care are plugged into that service and they continue to work. Another example like this would be the use of methadone and opioid treatment providers in the community to perform services. DOCR's goal is to expand this important model.

The takeaway messages are that prisons and jails are ideal settings intervening in the syndemic of HIV, STIs, and VH. Justice-involved individuals are a vulnerable population at high-risk for these conditions and are eager to accept treatment. Corrections health is community public health in its purest form. It is important to remember that these individuals are not always in prison or jail. There are actions that can improve the health of justice-involved community members dramatically. While DOCR has 1,685 folks in prison and 800 in jail currently, the total count is 7,500 to 8,000 who are in prison or jail and on parole or probation. It is important to envision justice-involved individuals as a community, and jails and prisons as an ideal location to deliver impactful programming. Further developing programming to discount the cost of syndemic testing in jails and prisons has been highly effective. It is entirely the low cost that allows them to be universal. It is no longer risk-based, there is no stigma, and people are very accepting of it. Allowing flexibility to unify and align existing programs to meet the unique needs of this vulnerable population is very beneficial. Restoration of the HRSA/HPSA special designation for determining workforce shortages for jails and prisons that is independent of the surrounding community represents a major need. This is an incredibly effective way to add staff.

Providing Comprehensive Sexual Health Services to SFUSD Youth

Rosalia Lopez, M.Ed

Student Family Services Division
San Francisco Unified School District

Dr. Lopez shared information on how comprehensive sexuality education and how sexual health services or appointments outside of the school system work in the San Francisco Unified School District (SFUSD) in the context of policies and mandates that support programs, community partnerships, and the tier systems of support. It is extremely important to have intentional policies and mandates that support programs at the state, local, city, and school district levels. Several policies and mandates are highlighted below:

- **Health Education Content Standards for the State of California**³⁶ for which 2 examples of interest are: 1) 1.9.G, which explains laws related to sexual behavior and the involvement of minors; and 2) 3.2.G, which identifies local resources concerning reproductive and sexual health, including all FDA-approved contraceptives, HIV/STD testing, and medical care.
- **The California Healthy Youth Act (AB 329)**,³⁷ which went into effect in January 2016, requires that schools provide comprehensive sexuality education for students in grades 7-12 at least once in middle schools and at least once in high school.
- SFUSD Board Policy **6142.1 Sexual Health and HIV/AIDS Prevention Instruction**³⁸ requires comprehensive sexual health education and HIV prevention education shall be offered to all students in grades 7-12, including at least once in junior high or middle school and at least once in high school.
- **Sensitive Services/Minor Rights: California Family Law Code Section 6920-6929**³⁹ Parental/guardian consent is not required for minors under the age of 18 to access sensitive services. These services may include treatment having to do with drugs/alcohol, reproductive health, sexually transmitted diseases, and mental health.
- **Condom Availability Program - SFUSD Board Policy 5141.25, California Education Code 19-24- Sp1** requires a Condom Availability Program at all SFUSD Middle and High Schools; delineates guidelines, parent/guardian notification, exclusions, education component, and abstinence message; and creates alliance with schools and community health care providers.
- **Meeting the Needs of LGBTQ Students - SFUSD Board Policy 610-8A6, California Bill AB537** prescribes a variety of activities, interventions, accountability, and support to ensure that schools are a safe place for LGBTQ youth; and ensures that sexual orientation and gender identity be included as protected categories in all non-discrimination policies and procedures applying to all SFUSD students, teachers, staff, administrators and other employees.

³⁶ <https://www.cde.ca.gov/be/st/ss/documents/healthstandmar08.pdf>

³⁷ https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201520160AB329

³⁸ <https://go.boarddocs.com/ca/sfusd/Board.nsf/goto?open&id=BDVSWC74A618>

³⁹ <https://law.justia.com/codes/california/2005/fam/6920-6929.html>

In terms of partnerships, SFUSD has a cooperative agreement with CDC-DASH, San Francisco Department of Public Health (SFDPH), and other CBOs to implement programs that support sexual health, education, sexual health services, and safe and supportive environments. SFUSD uses a multi-tier system of support, including health education, wellness programs, and LGBTQ student services programs. Because of the partnerships with the SFDPH and other CBOs, SFUSD has been able to support comprehensive sexuality curriculum to ensure that there is a common language (Be Ready, Be Real for High School; Healthy Me, Healthy Us for Middle School; Healthy Me Resource Guide). Staff training is provided on policies and procedures to providing youth-friendly services; providing sensitive services and referring students to local clinics if needed; and logging services and follow-up one-on-one services to youth when needed.

The SFUSD team work closely with the Wellness Program and the LGBTQ Student Services Program for consistent assessment of the health education curriculum to determine where it needs to be updated to meet the needs of LGBTQ and all other students. One example would be if the topic of human trafficking is being discussed, a social worker is in the classroom in case students need services beyond just awareness. Because of policy, schools are not allowed to pass out condoms and the role of the teacher is just awareness. The nurse in the Wellness Center would provide students with condoms. Because a student would need to go to the Wellness Center to complete a quick needs assessment and receive condoms, there is relationship-building between the teacher, the nurse, and the students in terms of where students receive services. Those who need further services beyond what the Wellness Center can offer are referred to a local teen clinic.

SFUSD's Sexual Health Services & Multi-Tier Systems of Education has 3 tiers: Intensive, Targeted, and Universal. Health education is considered Tier 1, given that it is for everyone. Tier 2 is for those who need smaller social groups. Tier 3 is for those who need more support (e.g., testing, mental health services, medical issues, et cetera) for which students are referred out to partner organizations. This year more than ever, there is a lot going on in schools and the help of CBOs and health clinics has been key. Though it has been somewhat difficult to reconnect during the pandemic, this is a work in progress.

These innovative collaborations have yielded some excellent expected and unexpected results, including fantastic lessons, connecting classrooms to services, and increased collaboration of SFUSD partners with over 50 CBOs. The top 5 types of services based on number of students served include general counseling, case management, medical services, behavioral health counseling, and sensitive services.

Advancing Syndemic Approaches Through Cluster Detection and Response

Alexa Oster, MD, CAPT USPHS

Acting Chief, Detection and Response Branch
Division of HIV Prevention, NCHHSTP, CDC

Dr. Oster pointed out that cluster detection and response offers a framework to guide tailored implementation of proven HIV prevention strategies where transmission is occurring most rapidly. After an outbreak, detection helps to identify when HIV is spreading quickly and to work to stop that spread. The presence of a cluster or outbreak indicates a failure of care and prevention services that needs to be addressed to improve access to services, such as antiretroviral therapy, PrEP, and sub-transmission. This is an opportunity to identify the needs of affected communities and generate ideas for improving services, because cluster and outbreak response involves curating care and prevention services to be more accessible to the

people who need them most. Cluster response is an opportunity to identify gaps in services and curate tailored treatment and prevention interventions where standard population interventions have failed. Importantly, cluster detection and response involves adapting resources for those who use them rather than expecting people to adapt to access services in a system that has failed them.

Concurrent with the opioid crisis, there have been a number of HIV outbreaks among PWID in the US over the past several years, beginning with a large outbreak in Scott County, Indiana that was detected in 2015. PWID experience numerous syndemic conditions, including HIV, STDs, VH, SUD, and mental health challenges. In addition to these medical issues, they often face unstable housing, food insecurity, and other needs for social services.⁴⁰ Clusters and outbreaks affect a variety of populations, and these principles apply to sexual transmission as well as injection-related transmission.

In an example from Kanawha County, West Virginia, HIV diagnoses among PWID drugs increased rapidly beginning in 2019.⁴¹ As a result, the West Virginia Bureau for Public Health requested CDC assistance with an HIV outbreak investigation. CDC built its team with syndemics in mind. The CDC team, led by DHP, also collaborated with HRSA's HAB and the Department of Housing and Urban Development (HUD), both of whom have become very important partners for response support. This team collaborated to support the state and local health departments in conducting an investigation that included a medical record review and a rapid assessment with qualitative interviews. At the local level, a diverse set of partners from the state and local health departments and multiple other healthcare CBOs were involved.

To highlight some findings from qualitative interviews with 26 PWID and 45 key community members, many people described using substances to cope with feelings of hopelessness and despair associated with a confluence of health and social challenges, such as unstable housing, depression and anxiety, and unemployment. Among the numerous health and social conditions PWID faced at the time, HIV and SUD were just a couple of the many issues. This constellation of challenges underpins the complex needs of the populations served, as well as the challenges that can slow progress in implementing holistic approaches.

The medical record review, which included 496 healthcare encounters among 65 people with HIV, showed missed opportunities for prevention and care for a wide range of conditions, including low provision of naloxone and medication for OUD. Medical encounters for overdose and STIs were infrequent. Hepatitis C diagnosis was common and preceded HIV diagnosis by about 4 years. Most people were covered by Medicaid and housing instability and incarcerations were prevalent.⁴² Surge DIS staff from the Division of STD Prevention brought a syndemic approach to partner services, going above and beyond to ensure appropriate testing, treatment, and linkage to care for various syndemic conditions and working to meet a variety of other food and social service needs. The findings mentioned informed one of the team's recommendations, which was to improve access to HIV, hepatitis C, substance use, and mental health services through service integration by co-locating services and cross-training service providers to improve access to effective infectious disease prevention efforts. Co-location of services, along with multidisciplinary teams and intensive case management, can help to address important barriers to care for multiple conditions. Low barrier, one-stop-shop models can help. It also is important to involve people with lived experience in the development, implementation, and monitoring of programs.

⁴⁰ Lyss SB et al., JID 2020

⁴¹ Hershov R et al. MMWR 2022

⁴² Bonacci R et al. CROI 2022; Hudson A et al. CROI 2022; https://oeeps.wv.gov/hiv-aids/documents/data/EpiAid_Report.pdf

In terms of challenges to syndemic success, integrating data sources from multiple conditions can be difficult, but is essential to understand the various needs of the people served. Silos in data systems can reflect silos in programs, and bridging those programs silos can be critical to facilitating integration of data. Policy barriers also can be a major challenge. For example, expanding harm reduction services and SSPs was a primary recommendation of the investigation. Although SSP policies were changed where possible, state laws and city ordinances related to SSP limited the ability to expand these services to meet the need. Likewise, limitations to eligibility for hepatitis C treatment for people covered by Medicaid meant that testing and linkage ended up being deprioritized. Limited eligibility led to misconceptions that affected the care-seeking behaviors of even those who were eligible for treatment. Program and funding silos are an important consideration. This is relevant at a macro-level, including how federal funds are distributed, but also applies to how health departments are structured with separations between infectious diseases and behavioral health and also at a micro-level where providers and systems have incentives to only address immediate needs, including in EDs and correctional settings. Finally, health department capacity limitations also were a challenge. Even when funds are available, health departments sometimes have difficulty hiring and retaining staff, and this limits their ability to perform recommended activities, including partner services for every new diagnosis of HIV and syphilis. CDC can provide surge support to help address a backlog of cases or additional cases during an outbreak, and federal support provides an opportunity to build program and systems capacity, but this can be limited by other capacity issues at that health department.

It is important to note that although outbreaks among PWID have been highly visible due to concerns about rapid transmission in these populations, most clusters of rapid transmission are related to sexual transmission. Among 144 clusters first identified through molecular analysis in 2018-2019, 82% were primarily among gay and bisexual men. Among the largest clusters that had grown to more than 25 people as of September 2021, 72% were among gay and bisexual men. These clusters were typically small when they were first detected, but grew to be just as large as the concerning outbreaks seen among PWID. Many of the same syndemic issues and others apply to gay and bisexual men, who also face homophobia and other systemic injustice.

To share an example of a cluster related to sexual transmission that resulted in response to syndemic issues, Michigan identified a molecular cluster of rapid transmission in 2021 in Wayne County affecting a network that included Black or African American transgender women. About half of the network members indicated participating in sex work or having partners that engaged in sex work. The health department immediately began engaging with community partners that serve trans communities to talk through potential gaps in services and how to improve them. Over a few months, 13 meetings were held with these community partners. The health department also spoke with members of the network, who were supportive of the response efforts and willing to share information about the community's needs and also helped to indicate additional people in need of services. They indicated that there were not enough providers who provide gender-affirming care. As a result, Michigan has created a mobile services initiative to offer gender-affirming care that includes general health and wellness checks, immunizations, a food pantry, and HIV and STI testing. Michigan is also developing community-oriented social media and messaging campaigns developed with input from the trans community.

Although value and opportunity have been demonstrated in advancing syndemic approaches through cluster detection and response, there are a number of needs and considerations, most of which are not unique to cluster and outbreak response. Those at the federal level can support syndemic approaches by communicating the priority of a syndemic approach from federal funders to state and local recipients consistently across all federal funding programs

and partners. This work cannot be successful if driven by a single program. This includes working to minimize silos between federal funding that serves as a disincentive to collaboration. Teams need to be designed with syndemics in mind, modeling at the federal level what is thought to be needed at state and local health levels. This collaboration cannot occur only when there is an escalated response, but must involve long-term work to integrate and align programmatic guidance and technical assistance.

Additionally, policy issues are often at the heart of the most stubborn barriers and where possible, state and local partners must be supported to address these policy issues. It also is important to build systems to meet the needs of the people served rather than expecting people to adapt to systems. To do so, it is necessary to listen to people with lived experience. Qualitative interviews have been a powerful tool to identify what is broken in systems and get ideas for how to fix them. Often the barriers to delivering seamlessly integrated services are issues like funding, training, separate service organizations, time, or physical space. Funding and program requirements can help to dismantle these barriers. That core set of integrated services should be a primary goal and not a bonus or afterthought. Solutions need to address syndemic health conditions that people are facing, but that is not enough. Intervening only on health concerns may not be effective if social conditions are not considered and addressed.

Identifying partners well-equipped for syndemics is key to success. Local health departments, health centers, or community organizations that receive broader funding that is not siloed or who receive funds from various sources already are well-positioned to support this work. Likewise, providers that recognize their clients' holistic needs and meet clients where they are have the most success in linking and engaging them in services. Community outreach workers and partner services staff can embody this approach and this trust is so critical for populations stigmatized on many levels. Moving from the current systems to a gold standard syndemic approach, while an important goal, will take time, so it is important to be prepared to accept incremental progress. Setting expectations too high can sometimes have the unintended effect of disincentivizing staff from initiating response efforts and other work that can unmask the many changes that are needed. Syndemic approaches rely on building cross-cutting teams that can best support this work and the people served.

CHAC Member Discussion on Panel 3

To focus the discussion, Dr. Anderson reminded CHAC members of the advice related to this topic that was requested from CDC/HRSA and asked them to be thinking about action items CHAC might address and vote on later in the business section related to these questions:

1. What priority policies and actions should be considered in operationalizing a syndemic approach to service provision?
2. What settings should be considered for the highest public health impact?
3. How can CDC and HRSA make syndemic strategies and programs more common and effective?
4. What are the best practices for integrating non-HIV-specific services into HIV systems?
5. What strategies would better link youth to clinical services through school health programs with collaboration with public health departments?

The following questions, observations, and suggestions were raised:

- Dr. Anderson noted that one of the fun aspects of these meetings is hearing about all of these impressive programs that a lot of them would not hear about otherwise.
- Mr. Driffin said one of his finals for ethical consideration for one of his DrPH classes is on HIV sequencing and non-positive response. He wondered whether the presenters could share additional insight on racial and ethnic demographics that have been observed in response to the cluster response teams.
- Dr. Oster indicated that they looked at people who were in clusters of rapid transmission nationwide and found that about a third were White, about a third were Black or African American, and about a third were Hispanic or Latino. Rapid transmission is occurring in a variety of populations, and it is important to ensure that they are assessing the gaps that are driving this and supporting changes in programs and services along with those populations. In the analyses that assessed large clusters among gay and bisexual men, they found that most were in the South and West.
- Mr. Lindsey noted that a key barrier to syndemic approaches has been segregated funding streams in the past, which also was a barrier to personnel or workforces who are unable to work together because of segregated funding streams. He wondered whether it is all state funds or if there is anything else that can be done to address ideological or financial barriers to allow more of these population focuses and syndemic approaches to flourish.
- Mr. Gans responded that New Mexico integrated HIV, STD, hepatitis, and harm reduction into one section in 2015. Because they are a centralized health department, having all programs under one roof and operating on the statewide and local levels gives them a lot more flexibility. New Mexico is unique in a couple of ways. First, they have a lot of state support for a variety of programs and second, they have a lot of flexibility as long as they meet performance measures globally. For instance, they have had a long-term shortfall in their harm reduction budget, but they have about \$1 million in state funds in harm reduction. When he started it was \$4 million or \$5 million a year and now it is closer to \$12 million. It has dipped somewhat as people moved to fentanyl and smoking rather than injecting. While they could not afford that out of that budget, they could use state general funds in HIV prevention, HIV care, STD, et cetera. The other thing is that they have other revenue sources. They generate pharmacy revenue, which sustains a lot of HIV PrEP programs around the country, including community health centers. They do something similar with their direct services. Generally, they do not have a huge amount of flexibility in federal grants but when there is flexibility, they use it. They always have had fully integrated DIS who are largely funded in HIV and STD, and they are all cross-trained in HIV, hepatitis, harm reduction, and other navigation along with STD as the focus. New Mexico is always looking for ways to be creative. It is easier to have a syndemic approach at the local level, when they are all located in the same building and talk about their budgets all of the time across the agency.
- Dr. Hagan responded that they have syndemic issues with treating different illnesses. More importantly, most of their program availability begins and ends at their doorstep. There is a sharp cutoff when folks are detained or when they are incarcerated. When incarceration ends, the transition of services is a particularly weak section for them. That is where the natural silos have occurred as people try to create programs for incarcerated folks and folks in the community. That crossover is missing for them because there is not longitudinal thinking. They have the same problems in prisons and jails. When the door slams or opens,

programs begin or end and they are not well-connected. A lot of efficiency is lost that could be capitalized on. We track data out into the community and have tremendous longitudinal data for parole, probation, and recidivism, and recognize the continuum of care. We are taking actions based on the data. Prisons have the infrastructure, and it is shocking how much data they have, but do not crunch it. He can say which of his residents bought FUNYUNS® last week and other incredible data. They have to be careful with it, but they do have incredible data. They just do not use it as well as they might.

- Dr. Lopez stressed the importance of working together in order to provide universal services for everyone and to avoid duplication of efforts.
- Dr. Greene said she was hearing themes throughout about meeting people where they are, low barrier and low thresholds to care, flexibility, and how self-testing could help facilitate people where they are. As someone who works in geriatrics, she pointed out that this is very relevant to older adults, people with mobility limitations, and people with other issues that affect their access to care across all of these systems.
- Dr. Hagan replied that their approach in jails has been largely to try to get services. For instance, for some of the large local jails, they have worked hard to bring the university residents on site. These folks need customers, need to meet people, and need to understand their population. They do have folks with serious mental illness (e.g., schizophrenia, bipolar psychosis, major depression) who come off of their medication and cannot operate well within the social system. Once someone has had a single felony, they become felonized. He thinks there should a DSM-5 diagnosis called “felonized” because they never again will go to public health or mental health care. They will go to prison or jail. The first thing is linking work and bringing folks on site, irrespective of the ability to pay. In jails the focus is largely on getting patients what they need most and establishing trust. Some folks will be up to a year in jail depending on the jail, but most are not. The focus in jails is to get them basic services.
- Dr. So congratulated Dr. Hagen for running such a great program in the prison system. It is a model program. He asked whether they test their prisoners for hepatitis B and whether they are offered hepatitis B vaccination. Some prior CDC studies showed that about 2% of the incarcerated population have chronic hepatitis B and as many as 6% will develop acute hepatitis B infection in this country who have a history of prior incarceration.
- Dr. Hagan said that while they do not do universal testing, they do offer universal immunization. On arrival, they check everybody in the immunization registry, which is very complete in North Dakota. They are proud to be the state’s number one provider of adult hepatitis B immunizations. They have lost their funding for hepatitis A immunizations. The American Correctional Association’s goal is to fully immunize everybody for hepatitis A and B and fully test everyone for C. They do not do the testing unless there is a question clinically, but immunization is offered to everybody on arrival as a public health function.
- Dr. So suggested considering testing before vaccination, because the Medicare cost of a 3-panel hepatitis B test is only \$30. If they had prior infection or already have a chronic infection, it would save on vaccine cost since the vaccines are still very expensive. They also would pick up those who have chronic hepatitis B and may need antiviral therapy.
- Dr. Mermin said he was struck by the fact that in some ways, they were doing too good a job. Each of the presenters showed so much of what could be done with screening, comprehensive SSPs, comprehensive student health services, et cetera. He wondered

whether there were policies that would need to be put into place that would prevent people from getting hepatitis C, HIV, STDs, TB, et cetera—something that would have an effect even more upstream to make the work easier.

- Mr. Gans indicated that New Mexico wanted to get ahead on hepatitis C curative treatment to move towards elimination because they had some of the highest prevalence in the country. They are working to improve their surveillance system because the quality of active risk factor and race/ethnicity surveillance in hepatitis C is not the quality of HIV because it has not been funded as well. It is probably too late for the upstream changes, but they are probably a good model for all of the best policies He wished Medicaid expansion was universal, but it is not.
- Dr. Lopez said that while California has some of the strongest policies, the problem is that they are unfunded policies. That is well-intentioned, but it becomes challenging to address the policies.
- Dr. Hagan said he would like to see much better availability for needle exchange, which is still a taboo subject in his state. The state is really good at taking care of incarcerated folks. The rationale is simple. Everybody is someone's brother, cousin, uncle, daughter. Everyone knows somebody. He also would like to see better access to SUD treatment in the community. One place to focus is on jails since many people enter and cycle out of jails a number of times. Before they ever get to prison, they have been to jail 10 or 15 times.
- In terms of specific policies, Dr. Guilamo-Ramos said that from his point of view, the "low-hanging fruit" is to look at the workforce. The example shared about limitations on pharmacists and PrEP could be applied to other disciplines. The largest segment of the healthcare workforce is nurses, yet they have many regulatory limitations around the country that do not make any sense and limit the ability to improve access to prevention and treatment. Another thing that was striking to him in terms of settings was that he had not heard a lot about the important role of families, biological or non-biological. Families are an important setting, particularly for young people. Thinking about SDOH is impressive in terms of trying to integrate services, co-locating, and cross-training. Consideration must be given to how particular groups or communities thrive and overcome adversity despite significant challenges. He is a little concerned about the narrative, given that it has been focused on vulnerability but does not provide a path forward in terms of how to use the science of how people overcome and what has worked as being important to understand.
- Mr. Driffin suggested that more consideration be given to additional community engagement strategies that can continue to be lifted between CDC, HRSA, and other federal partners to ensure that communities move along with them to beef up strategies.
- Dr. Oster indicated that they are collaborating on some sessions with HRSA HAB for the Ryan White conference that relate to cluster detection and response. Some of the topics include community engagement, partnering with community organizations and providers, how everyone can come together to ensure that they are responding to clusters in a way that helps to make services better for these populations, et cetera. Community engagement around this topic is a major focus. She and Dr. Daskalakis have been spending a lot of time together working to have discussions with lots of different partners, community organizations, policy partners, healthcare organizations, and public health partners over the past few months.

- Ms. Hayes indicated that PACHA is hosting an HIV molecular surveillance small group think-tank that will include their community and federal partners.
- Dr. Anderson indicated that there is a current ECHO program related to the intersection of HIV, substance abuse, mental health, and intimate partner violence (IPV) for which she could share information.

Telehealth/Telemedicine WG Report

Dr. Shannon Dowler, Lead CHAC Telehealth WG

Dr. Dowler reported that the Telehealth WG had engaged in several meetings since its launch during the last CHAC meeting. The first thing the WG did was dig into the benefits and risks of telehealth and summarized their findings into potential areas of interest for CHAC. In terms of benefits, telehealth broadly has the potential to improve various types of access (e.g., geography, transportation, provider limitations, et cetera). Particularly in the sexual health space, telemedicine offers a unique opportunity to reduce stigma. It results in decreased costs, such as non-emergency transportation, lost work time, and practice infrastructure. It has the potential to close care gaps and improve health equity. Telemedicine also has the potential to improve retention in care, empower folks who are receiving services to take control of their healthcare, be more patient-centered, and increase provider productivity. There are many reports showing that patient no-show rates using telehealth are improved and that the barriers that keep people from getting to a scheduled office visit are mitigated with virtual care. As an example, North Carolina Medicaid wanted to know what was happening with its beneficiaries, so they added an adult experience and child experience with telehealth into their Consumer Assessment of Healthcare Providers and Systems (CAHPS) survey. They found that people were generally as happy with their care whether they had telehealth or in-person care. There was not a statistically significant difference for adults or children. Beneficiaries/patients seem to be happy with this modality of care.

There also are risks and challenges to telehealth. The WG found that there is disparity in terms of access to technology and broadband access depending upon where someone lives and the ability to pay for technology and services. Maintaining confidentiality and privacy in the home setting can be a risk and challenge. Not everyone has a large home in which they have the benefit of spreading out or going somewhere private for telehealth visits. There is a loss of ability to identify IPV. There is a risk of influence or manipulation by people who are not seen in the visit, which has significant implications. It takes time and energy to train people to use telehealth technology. There is a potential to break up services and have multiple visits, which may not be ideal. From the standpoint of fragmentation of care, there is always the risk of breaking up the medical home experience, not having good communication, and creating challenges in continuity of care—particularly when there is not shared documentation. There is a risk of losing some of the components of in-person care. This raises questions about the percentage of visits using technology versus in-person visits so that critical pieces of care are not lost. The issue of language barriers comes up repeatedly. In terms of the payment and integrity standpoint, there is a risk of fraud and abuse, particularly in the telephonic arena where it is not possible to confirm someone's identity.

Another challenge in the field pertains to the fact that everyone is using different terms and has different rules. Until everyone can come together nationally and agree on certain terms and on what is/is not covered, there will continue to be of mixed-metaphor of what people are saying. When the terms telehealth, telemedicine, or virtual health are used, everyone is saying and

allowing for different services or benefits. North Carolina Medicaid has 2.8 million beneficiaries. They began an evaluation to determine what was happening. There was a huge plummet in visits when the stay-at-home order was issued by the Governor. Simultaneously, there was an exponential and steep rise in telehealth. There were essentially no services prior to the pandemic, so the baseline was zero. The dramatic improvement in access would have been lost if people had relied on in-person visits, because it completely dropped off the radar.

After studying these data for over 2 years and looking at the relative probability of adults using telehealth services as a function of race, ethnicity, and geography, Black and Hispanic persons and those living in rural areas were less likely to engage and there was not a tremendous amount of improvement over time. While there is a lot of discussion about all of the great opportunities Telehealth offers to improve health equity and access, the lived experience in North Carolina is that the odds are still against closing those gaps. On the other hand, people with chronic conditions leaned in hard and fast to use telehealth early in the pandemic. Over time, that number decreased. In the rural/urban space, there has been an increase in the last 6 months with people beginning to use the technology more consistently in rural areas.

Looking at some specific codes, North Carolina assessed child developmental services to decide what would be kept as permanent policy versus what would not. Consideration was given to a service as a function of whether it changed geographic, racial, or ethnic equity. Consistently, the findings did not identify changes. They found that urban individuals were more likely to engage in telehealth even though they have more child development centers than in rural areas. The same patterns were observed by ethnicity in that someone who was not Hispanic was more likely to engage in child development virtually. The same difference was seen in terms of whether someone was Black or White. Gaps were not being narrowed in this area, and this pattern was reproduced across multiple codes. The data show that the same people who are using telehealth are the same people who are using in-person care, and that new patients are not being entered into care.

The WG talked specifically about opportunities to improve sexual healthcare in the context of modernization of technology and proposed a few areas they think are the most important. One opportunity is with home or alternate testing for STIs. The conversations over the last 2 days of the CHAC meeting aligned nicely with these recommendations. Consideration should be given to ways to normalize home testing and increase home delivery of medications, which could reduce the stigma of going into a pharmacy to ask for something. PrEP access could be enhanced to have a more patient-centered approach. Inequities around access to PrEP are significant and broad across the country, and PrEP is just not getting to people in an equitable way.

With this background information in mind, the WG developed the following recommendations and invited input regarding any priority areas for which CHAC thought proposals might be made to CDC, HRSA, or both.

- **Build on the PrEP letter that went out early in the COVID-19 Pandemic (CDC):**
 - Recommend that CDC launch a formal campaign to teach providers how and where virtual services can assist in the EHE goals specific to PrEP
 - Recommend the potential for the same initiative related to retention in care for HIV

- **Explore how virtual services can enhance routine STI screening for all populations (CDC):**
 - Recommend that CDC fund pilot home testing service delivery models broadly to seek to understand the impact of this model
 - Award sites based on factors such as poverty indicators, payer mix, population and geographic disparities
- **Study health equity as it relates to telehealth service provision (CDC/HRSA):**
 - Early data suggest that telehealth has not overcome barriers to access to care
 - A formal study could spawn interventions that might impact equitable service delivery more effectively
- **Deploy a Tele-PrEP initiative for FQHCs (HRSA):**
 - Recommend that HRSA fund a Tele-PrEP initiative for FQHCs to pilot focused on areas with high need to PrEP ratio

CHAC Member Discussion and Vote on Telehealth/Telemedicine WG

Dr. Gayles noted that while he and Dr. Anderson would moderate this discussion, they both recused themselves from participating in the discussion and any related votes due to COIs related to telehealth.

The following questions, observations, and suggestions were raised:

- Dr. Driffin said the only thing he would add, especially for others as they begin, was that the processes address the nuts-and-bolts questions around what success looks like for communities. This means ensuring that Black and Brown people have access to the internet, tablets, and/or whatever other vehicles are necessary to get them to the option of telehealth/telemedicine.
- Dr. Mermin noted that the data presented were very impressive and showed that a smaller proportion of certain populations participated in telehealth during the pandemic. He wondered whether they still participated in health visits and if those using telehealth were the same as those presenting in-person. He thought it would be beneficial to understand whether people who did not participate in telemedicine dropped out of care entirely or continued care through in-person visits.
- Dr. Dowler indicated North Carolina found that the same people who are using telemedicine are the same people who are presenting in person. The Duke-Margolis Center for Health Policy also performed a data analysis and came to the same conclusion that the same people who are using telehealth are the same people that are presenting in-person and new patients are not getting into care. People who are engaged in health care are engaging in health care maybe in more convenient ways or in different ways, but access to care is not actually being broadened. The exception to that seen in North Carolina was in primary care homes. Rapid adopters picked up telehealth really quickly and made it a large part of their practice, increased the number of patients they saw overall and improved access to care. Generally, the beneficiaries who are accessing care are just accessing care differently. In terms of whether people who did not participate in telemedicine dropped out of care entirely would have to be analyzed specifically. While they saw overall engagement, the beneficiaries did not change. North Carolina Medicaid

maintained a lot of telehealth services, but their commercial partners have not been as clear. The things that they are keeping would allow people to use their smartphone. In the sexual health arena, there are many positive opportunities because of stigma in that people will feel more comfortable in using self-collected tests and it would feel more patient-centered.

- Dr. Mermin emphasized that technologies are increasingly being seen as tools for helping people stay healthy. Perhaps providing someone with a smartphone and software might make a difference in people participating. Consideration would have to be given to whether there could be reimbursement by Medicaid or private insurance. The upfront investment could be prohibitive for both providers and individuals unless it was covered by insurance, but this could eliminate some of the obstacles for people—particularly those with limited resources.
- In terms of the idea of a more formal campaign to teach providers how/where virtual services can assist in the EHE goals specific to PrEP, Dr. Daskalakis indicated that NCHHSTP's Capacity Building and Technical Assistance Branch has materials⁴³ for providers that focus on telemedicine around PrEP, which probably could be nuanced more to specifically identify places where telemedicine may be more or less appropriate.
- Dr. Greene suggested that perhaps the proposed recommendation to study health equity as it relates to telehealth service provision should be elevated to the first bullet.

CHAC Action

Mr. Riester made a motion to approve the proposed Telehealth/Telemedicine letter, with the suggestion of moving health equity to the top bullet in terms of prioritization. Dr. Markham seconded the motion. CHAC approved the letter with 8 affirmative votes and 2 abstentions.

Public Comment Period

Mark Misrok

Executive Director

National Working Positive Coalition

I am Mark Misrok. I'm Executive Director of the National Working Positive Coalition (NWPC), which works to strengthen responses to the long-ignored employment needs of people living with or at greater vulnerability to HIV. I'm a person living and aging with HIV and a member of the Steering Committee for the US People Living with HIV Caucus (US PLHIV Caucus). Last Summer, the CDC released their most recent data report from their ongoing collection of surveillance data of people living with HIV in the US from their MMP, or Medical Monitoring Project, surveillance data. This latest data report is for 2019, the last full year before the impacts of the COVID-19 pandemic in this country. This most recent data report presented 41% of people living with HIV as unemployed prior to the impact on employment and the job market of the pandemic. This extraordinary high unemployment rate among people living with HIV in this era of care and treatment reflects the profound lack of access to employment-related

⁴³ <https://www.cdc.gov/hiv/effective-interventions/library/telehealth/implementation-materials/cdc-hiv-ei-telehealth-practitioners-guide.pdf>

information, services, and resources within HIV supportive services that has continued unchanged across all areas of the epidemic. We know that communities most vulnerable to HIV and most impacted by COVID and a host of health crises are always also communities with long histories of unequal access to quality education and to employment and economic opportunities. Meanwhile, the HIV/AIDS Bureau has kept directives in place since the 90s that ban use of supportive services dollars by Ryan White HIV/AIDS program grantees to provide employment or job readiness services, suppressing growth of responses to the employment needs of people living with HIV, that could grow organically and community-based programs most trusted and often most committed to communities not prioritized in mainstream workforce development or vocational rehabilitation initiatives. It is time that our leaders, and advisory bodies, and government agencies shaping the US HIV response end the cruel abdication from understanding and addressing the employment-related needs of people living with or at greater vulnerability to HIV that has been our long-sustained pattern. Thank you.

Amy Killelea

Killelea Consulting (PrEP for all)

Hi everyone. My name is Amy Killelea. I am a consultant and for the purposes of what I'm going to talk about today, I've been working with Johns Hopkins University over the past about 12 months working on a proposal for a national PrEP program. Thank you for the opportunity to speak to you all today. I want to highlight that we have got an opportunity presented to us in the President's Budget for FY23, which was released a few weeks ago. It includes an incredible opportunity to expand access to PrEP in this country and includes a call for Congress to enact a new \$9.8 billion 10-year national PrEP program for the uninsured and underinsured, coupled with significant reforms to ensure that people on Medicaid who need PrEP can easily access it. I want to focus my remarks on both the opportunity before us with the new momentum from the Administration as well as what I think is a growing and should be a growing sense of urgency around PrEP. PrEP uptake, as I am sure this body has discussed in meetings prior, continues to be very low in the US, with only about a quarter of folks who could benefit from PrEP actually taking it and growing disparities among Black, Hispanic, and Latino communities in particular. I think it is becoming more and more apparent that we will not end the HIV epidemic without a drastically different approach to PrEP. A few things to really highlight in terms of the systems failures when it comes to PrEP. One is that we have a system for PrEP access, particularly for those who are uninsured and even those on Medicaid that is fragmented, that is confusing, and that is incomplete. For those who are uninsured, the medication is often available through a different program and mechanism than the lab services, which may also be separate from the ancillary services for PrEP. We also have put our thumb on the scale of a largely clinical approach to PrEP heavily dependent on primary care, on community health centers, and 340b entities who are big and savvy enough to navigate the complexities of PrEP financing. And let me be clear, because we heard from the previous presentation about community health centers and telehealth clinical entities are necessary for PrEP access, but they are nowhere near sufficient. And so the opportunity before us, I think, is to re-envision what a national PrEP program and functioning system for PrEP access could look like. What was submitted in the public comment was a sign-on letter from over 20 national, state, and regional organizations that really outlined a set of principles that provide a foundation for a national PrEP program, so I want to highlight just a few of those. First is that the program has to prioritize equity, has to invest in mechanisms that increase access to Black and Brown communities, trans folks, cisgender women, folks in the South, and others who are currently failed by our current PrEP delivery systems. The program has got to be simple and it has got to be accessible and include medication, labs, and the ancillary services needed to support PrEP access. I think the accessibility part means that it has to be available through a greater range of community-based access points outside of just clinical delivery sites and community health centers. By expanding

those touch points, the goal is also to increase PrEP demand in communities who are not well-served by, and not touching frankly, traditional healthcare delivery sites. Finally, a PrEP program has to be sustainable and it has to be based on evidence. We have got a generic form of Truvada, TDF/FTC, that is safe. It is highly effective. It is incredibly cheap. It is clinically appropriate for the vast majority of folks. But we aren't maximizing that potential to open the floodgates for PrEP, largely because we have a current system that incentivizes brand name drugs at every turn. We are also going to fail to maximize some of the newer forms of PrEP like long-acting cabotegravir if we don't insure that that drug and the drugs that are coming down the pipeline are available at fair public health prices and through a much broader network of public health providers. I will close with just saying that this is an opportunity and it's a challenge. We have a tough political environment to get this ambitious proposal through Congress, but I hope that through the CHAC and the folks on this call today that we can harness the momentum that we have with the President's Budget and build a better system for PrEP access. Thank you.

Chris Jowett

Chief Commercial Officer
Visby Medical

Good afternoon. Thank you for the opportunity to summarize our recommendations committee. I'm Christopher Jowett and I represent Visby Medical. I am the Chief Commercial Officer with Visby Medical based out of San Jose, California. Accurate STI point-of-care tests can revolutionize patient care. The "CDC's 2021 STD Treatment Guidelines" recommend nucleic acid amplification testing (NAAT) for the detection of chlamydia and gonorrhea and specifically call out chlamydia and gonorrhea in symptomatic women. In the "STI National Strategic Plan," there is a recurring theme requesting innovative solutions and approaches to address the ongoing and emerging challenges in STI prevention and control. Specifically, it calls out the need to develop point-of-care diagnostic tools. Visby Medical has developed such a tool which delivers PCR results in less than 30 minutes in the palm of your hand and received FDA clearance and CLIA waiver in August 2021. Visby Medical developed this rapid point-of-care platform with substantial support from the NIH and yet there remains significant hurdles to deliver these tests equitably nationwide. The CDC and other government agencies can help in the following ways. Support implementation science studies to assess clinical adoption in various settings. Implement policies and funding to provide equitable access to technologies that can improve patient health. Understand the true prevalence of trichomonas, a silent epidemic and not yet reportable. Support reimbursement incentives to promote breakthrough innovations. Breakthrough technologies come at a cost. Extraordinary pressure to reduce testing costs comes at the expense of patient care. Rather than reimbursement based on reagent and operational costs, CMS should consider the value that rapid and accurate point-of-care diagnostics provide to the patient and to public health. Visby has engineered out the need for highly trained lab personnel to interpret and operate the results. This and enabling specific targeted treatment based on PCR diagnostic results at the point-of-care is better for the patient, reduces the risk of antibiotic resistance, lowers operational costs, and reduces spending over the long-term by preventing more expensive sequelae, like pelvic inflammatory disease (PID), ectopic pregnancy, and infertility. As the CDC is focused on advancing health equity and insuring access to diagnostic innovations, the Visby medical sexual health test is designed to support that goal and can fundamentally transform patient care and the public health. This point-of-care test platform is patient-centered and convenient, which in-turn can address access and equity concerns across the country. We asked the committee to focus on the value of point-of-care diagnostic testing and consider how to incentivize its use to address the STI epidemic. We are eager to serve as a resource for you at the CDC, HRSA, and HHS to reduce and prevent STIs moving forward. We look forward to continued opportunities for collaboration

with the Visby medical sexual health preventive care product and our future direct-to-consumer STI product offering. Thank you.

Jules Levin

Executive Director/Founder
National AIDS Treatment Advocacy Project

Hi, everybody. This is Jules Levin. I'm the Executive Director and Founder of the National AIDS Treatment Advocacy Project (NATO). I come to you as a person today living with HIV for 40 years. I'm now 72. I've been an advocate for 25 years. I am HIV aging and am now what I call "elderly." I think the CDC, Jonathan, calls people over 65—that's the category "elderly." Over 50 is "aging." I also come to you as a person cured of hepatitis C 21 years ago with pegylated interferon and ribavirin. I'm going to discuss 2 things today, hepatitis C and aging and HIV in 3.5 minutes. Number one, hepatitis C. I think it's disgraceful that here in the United States where we have had a cure for a number of years for hepatitis C, where you can cure hepatitis C in an inexpensive, safe manner with 8 or 12 weeks of therapy that we don't have a national hepatitis C elimination program. It's beyond talk. It's beyond speech. The discussion over the past 2 days around hepatitis C at this CHAC meeting has not been fully comprehensive. The needs for people living with hepatitis C have not been adequately discussed or addressed. Curing hepatitis C requires, in my opinion, a program, a Ryan White Care Act type program, that can be done in 5 or 6 years of limited time or \$5 or \$6 billion dollars, which is in the full scheme of things nothing. A drop in the bucket for the federal government. We need full funding for screening. We need to use electronic health records. We already have new models of care that provide support services for IDUs that could be utilized. The CDC is not working. They are not doing their duty. They are not providing and meeting the needs of this community and what is needed. The CDC is not working with local departments of health, many of whom already have elimination plans. We need funding and the CDC does not seem to be working with the local and state DOHs to develop and push these programs forward and help support them further. They're not providing resources and collaborations. Yesterday, somebody said DAAs are expensive. Are you kidding? They're \$15,000 for a course of treatment. To treat someone like me with HIV for 20 years is \$400,000. Syringe exchange programs and needle exchange programs is only one issue in the full framework that needs to be addressed to eliminate hepatitis C. Aging and HIV. The response has been completely inadequate. It's also a disgrace that this CHAC meeting at CHAC meetings have not had a panel on aging and HIV. We are experiencing more comorbidities than people without HIV. We have reduced life expectancy. We're getting bad care. The 20-minute visit does not work. African Americans get the worst care. Suffice it to say and in summary, it's just really unfortunate and a disgrace that aging and HIV is not adequately addressed and is not part of the discussion in almost every circle that participates in that is a discussion amongst the leaders at the NIH, CDC, many circles around leadership and HIV, our federal government, and state governments as well. Thank you.

Lorren Sandt

Executive Director
Caring Ambassadors Program, Inc.

My name is Lorren Sandt. I am the Executive Director of the Caring Ambassadors Program in Portland, Oregon. We do education and advocacy for people living with hepatitis C and lung cancer since 1997. Dr. Mermin opened the meeting discussing the Center's equity initiative strategy to achieve equity and eliminate health disparities, and the need to address some syndemics. You said you wanted to become as holistic as possible and asked what you could do better. Well, with all due respect, funding holistically, break it down, break down the silos, include reimbursement silos across all agencies. If these funding silos are not broken down,

hepatitis and STIs, health disparities, and health equity will never come to fruition in our country. The \$40 million in funding is frankly something everyone at CDC should be ashamed of. One program highlighted yesterday gave 36 community-based organizations \$400,000 dollars in funding to address one part of HIV. The average funding each state receives in hepatitis funding is \$315,000 dollars. The last professional judgment from the CDC and 2016 called for closer to \$400 million in funding each year for 10 years. This is a finite number so we can reach our elimination goals. We have an elimination plan like HIV, but we have no implementation plan and we have no funding. In Oregon, we have 7600 people living with HIV. We have dozens of case managers and a room full of epidemiologists. We have 90,000 people living with hepatitis C, 1 case manager at 1 HIV organization, and 1 state epidemiologist that we just got after 15 years of no epi. Funding must be commensurate with the impact of the disease. Almost every presentation we've seen, and they've been great, has been a call to break down silos so programs can meet people where they are. We are missing too many opportunities to help people when they reach out for care to help them. There is a cost-savings when people are tested and treated for the disease they present with rather than sending them down the road to test for something else or go somewhere else for care. Every time someone is denied, we are telling them they are not worthy. Hepatitis care and treatment is cost-saving to our health system. I respectfully ask every member of CHAC to be bold. Consider asking the Administration and Congress for an expansion of Ryan White programs to fully integrate hepatitis care and treatment and STI care and treatment, and the CDC to fully integrate the Center with your programs and your funding. We're done PCSIs. We're done with demonstration projects. We know what works. We need the political will to change the policies that keep these funding and silos and place. Thank you very much. And one final comment. I never heard what the outcome was on the discussion of whether the CHAC should weigh in on the mental health of our children. I firmly believe that it is your duty to weigh in on that. I hope that you guys voted to do that and will be weighing in and helping our children to live fully as they grow. Thank you very much.

Daniel Raymond

Director of Policy

National Viral Hepatitis Roundtable

I'm Daniel Raymond. I'm the Director of Policy for the National Viral Hepatitis Roundtable (NVHR). You heard from my colleague yesterday, Adrienne Simmons, with our colleague from Harvard Law School, Julia Harvey, on the current state of Medicaid access to hepatitis C direct-acting antiviral. I just want to go back to their remarks and note that, John, when you asked for guidance that there was a recommendation that more guidance to state Medicaid programs would be enormously helpful. My colleague Adrienne specifically called out the value in recent years of the HHS Medicaid Affinity Working Group, which the Office of Infectious Disease Policies led, but wrapped up its work last year. That Affinity Working Group was really instrumental in aiding states, not only in removing barriers to coverage, but also serving as a catalyst and incubator for discussing innovative payment and financing models for comprehensive care, including elements like case management and peer patient navigation that can be especially vital for achieving health equity goals, but also for analyzing administrative data to construct care cascades for states' Medicaid beneficiaries. This kind of work has become even more important. As some of you may be familiar, the manufacturers of hepatitis C therapeutics have recently imposed greater restrictions on 340B-covered entities. The need for strategizing about ensuring access and scale-up of care is vital. I would encourage CHAC to consider opportunities for making recommendations to further that work through concerted efforts. And then secondarily, I wanted to note the release last week of the White House Office of National Drug Control Policy's "Drug Control Strategy," which included very strong discussion of harm reduction, including support for syringe services programs and

specifically in their performance measures, committed to increasing the number of counties with elevated overdose rates that had an operational SSP by 85% between a 2020 baseline and 2025. I would suggest that there's an opportunity here for CHAC to make recommendations that CDC and HRSA, as part of broader efforts, provide guidance, technical assistance, and policy development on accelerating SSP implementation. I would call attention particularly to opportunities through federally-funded facilities, including Ryan White-funded providers and clinics, STD clinics, and Federally Qualified Health Centers. As we heard earlier today in terms of, for example, the West Virginia experience with clusters and outbreaks, this work has taken on an increased urgency. With the leadership of the Biden/Harris Administration and the new drug control strategy, there is ample opportunity to dive in and make meaningful progress. Thank you.

Recap Day 2

Travis Gayles, MD, PhD

CHAC Co-Chair, CDC Appointee

Jean Anderson, MD

CHAC Co-Chair, HRSA Appointee

Dr. Anderson emphasized that CHAC heard some incredible presentations and some very important topics covered. Reflecting on those and high-level messages, they started the morning with a special presentation from FDA and CDC about self-testing and self-collection of specimens in the diagnosis of HIV, HCV, and STIs. There was broad agreement on the needs and advantages of these tools now more than ever. The technology is available. Many of these are available globally. However, there are some barriers that they learned more about during the day in terms of meeting regulatory requirements. Some of the barriers identified include a possible need for additional validation for some tests, the high cost to seek regulatory approval, perhaps the lack of incentives for manufacturers regarding return-on-investment (ROI) in putting in the time, effort, and funding. The take-home message is that there needs to be concerted outreach, which to some degree already is being done, to key players and key stakeholders. It seems like the first step is to discuss with FDA avenues to reduce cost and consideration of where and when manufacturers can be incentivized to provide these critical tools. In the afternoon, CHAC heard about exemplary programs from New Mexico, North Dakota, and San Francisco. All of them exemplify a syndemic approach. They also heard a presentation on CDC cluster response and interventions. The take-home messages include the fact that in New Mexico, North Dakota, and San Francisco, the local or state policies enabled some of these programs and were able to breakdown silos and address things in a cross-cutting way. The issue of silos has been a recurring theme of this meeting and every CHAC meeting in which Dr. Anderson has been involved. The issue of the importance of meeting people where they are intersects with the discussion on self-testing and self-collection. There is a need to link to care and to pay attention to certain high-risk key populations, including incarcerated individuals and pregnant and post-partum women in terms of congenital syphilis, mental health disorders, and SDOH. There also was mention of some of the workflow issues that brought to mind some of the work that has been done in low- and middle-income countries on task-sharing and task-shifting and how the US could do a much better job of that.

Dr. Gayles indicated that in addition to Dr. Anderson's very thorough and comprehensive summary of the day, he had only a couple of points to add. Everything that Dr. Anderson mentioned was a reminder of the importance that all of this work takes into consideration the whole person and not just one aspect as they continue to think through access to testing, access to healthcare, and the full picture of what people face in terms of being able to access

and fully utilize all of the available resources needed to be successful. Regarding a comment raised during the public commentary about looking into the issue of children's mental health, particularly in the face of different legislative efforts occurring across the country specifically tied to sexual and gender identities, he assured everyone that CHAC is looking into that and would be addressing that as a group during the next day's Business Session. CHAC does believe this is an important issue, does take their role as a committee seriously, and hopefully will be able to utilize this role to raise further awareness to the relevant parties who may have an opportunity to fill some of the gaps or address some of the issues that are secondary to the various efforts underway.

Adjourn

Dr. Mermin thanked everyone for another day of outstanding presentations and discussions. He then officially adjourned the meeting for April 27, 2022 and CHAC stood in recess until 10:00 AM ET on April 28, 2022.

Day 3: Welcome and Roll Call

Jonathan Mermin, MD, MPH (RADM, USPHS)

Director, National Center for HIV, Viral Hepatitis, STD and TB Prevention
Centers for Disease Control and Prevention
CHAC Designated Federal Officer
Centers for Disease Control and Prevention

Dr. Mermin called the proceedings to order at 10:05 AM ET and welcomed participants to the third day of the CHAC meeting. He conducted roll call and asked members to disclose any new COIs. COIs did not differ from the previous day and are reflected in the table on page 8 of this document. He confirmed that 21 members were in attendance, which established quorum for the CHAC to conduct its business on April 28, 2022.

Recap of Days 1 and 2

Travis Gayles, MD, PhD

CHAC Co-Chair, CDC Appointee

Dr. Gayles provided some high-level highlights from the previous 2 days. The first day began with updates from colleagues at CDC at HRSA describing the fantastic work that they continue to do, including efforts to better understand the increased presence of mental health concerns among children, the increased work at CDC regarding health equity and infusing equity into all aspects of their work, and the great work underway at HRSA and introductions to new key staff members there. There is a lot of great innovation and it is important that CDC and HRSA continue to lead the way at the federal, state, and local levels. One of the key issues that arose during the morning session regarded the role CHAC might play in terms of commenting on or putting forward recommendations to offset some of the political efforts that are putting the great work at CDC and HRSA have invested in at risk, as well as creating obstacles and challenges for communities in being able to take advantage of the programs and opportunities that result from the work of these agencies. Programs from Mississippi, New York, and Minnesota highlighted innovative strategies they are implementing to increase utilization and access to testing, such as using the school space to increase access to young people and leveraging some of the technologies and strategies that were put in place during the COVID-19 response to modernize the public health infrastructure. These programs underscored the importance of using COVID-19 pandemic innovations as models for securing and sustaining funding to continue to support these efforts and codify that work moving forward in a post-COVID world.

During the second day, CHAC heard presentations highlighting how impactful self-collection kits could be in communities that have historically not utilized traditional brick-and-mortar structures. As a result, the availability of self-collection kits increased testing practices in a number of communities. It is known that when people are tested more frequently, the incidence of new cases is reduced. Self-testing also can be used as an opportunity to connect people to clinical care, social-emotional support, and other services such as those that address SDOH. There were discussions with colleagues from FDA regarding the pipeline and approval process for self-collection kits, given concerns that arose with regard to how FDA views HIV versus HCV self-collection kits. CHAC wondered if/how manufacturers producing self-testing kits could be incentivized to increase production in the variety and availability of self-test kits. There are authentication methods domestically and internationally that could serve as models to increase the self-test kit approval process. CHAC also engaged in discussion related to key topics in syndemic analysis, which continues to underscore the need for all work to take a whole person

approach with respect to the various issues that influence an individual's ability to access resources that are being put forward, utilize them effectively, and have successful health outcomes. Exciting and impressive syndemic approaches were presented, along with limitations many jurisdictions will have in moving those creative ideas forward due to financing challenges, particularly in under-resourced districts that do not have significant financing outside of the federal government. While this may not lend itself to a letter at this point, this topic deserves further discussion and consideration in future CHAC deliberations. The Telehealth WG put forth an excellent letter, which was approved and will be sent out following the meeting. Suggestions were made for potential development of 2 letters, one to the Secretary of Health regarding LGBTQ youth and one to FDA regarding the pipeline and approval process for self-collection kits.

Business Meeting

Adoption of November 2021 CHAC Minutes

Jean Anderson, MD

CHAC Co-Chair, HRSA Appointee

Dr. Anderson indicated that members had been provided with a copy of the November 2021 CHAC minutes for review. No errors or omissions were identified, no questions or concerns were raised, and no edits were suggested.

CHAC Action

Dr. Mehta made a motion to approve the November 2021 CHAC minutes, which Dr. Greene seconded. CHAC members unanimously approved the minutes with no changes or further discussion.

Update from the Presidential Advisory Council on HIV/AIDS (PACHA)

Ada Stewart, RPH, MD, FAAFP, AAHIVS, HMDC

PACHA Liaison Representative for CHAC

Dr. Stewart reported that PACHA last met virtually on March 14-15, 2022 for its 73rd full council meeting where they had an opportunity to bring back "PACHA-to-the-People." When PACHA was re-established in 2019, the goals of the Co-Chairs recognized the importance of reaching out to the people on the ground—the individuals working in, living with, or at risk for HIV and AIDS—to help guide the work of the PACHA. She expressed gratitude to PACHA's current Co-Chairs for allowing "PACHA-to-the-People" and thanked them for a very successful virtual meeting. The first day consisted of a welcome from Dr. Rachel Levine, Assistant Secretary for Health at HHS, and Harold Phillips, Director of the White House Office of National AIDS Policy regarding NHAS and their commitment to EHE. Reports were presented from PACHA's Stigma and Disparities, EHE, and Global Subcommittees and the Stigma and Disparity Subcommittee's WG that prioritizes molecular surveillance and cluster detection issues. PACHA took this on as a priority due to the growing number of responses they have heard from individuals living with HIV and others regarding the application of this response tool, especially in terms of criminalization of HIV and other social justices.

During the PACHA-to-the-People interactive community engagement session, community members provided feedback in breakout sessions focusing on 2 main topics. The first breakout session focused on HIV prevention in the context of EHE. This group focused on prevention of HIV in women and adolescent girls, those 55 years of age and over, persons living with substance use and mental health disorders, the LGBTQ+ community, and PrEP assistance programs. In the NHAS and EHE Initiative breakout, community folks provided input about how the strategy is working in their states, cities, and territories and how PACHA can help. During these community engagement sessions, there were passionate and robust discussions from communities highlighting the need for whole person care; addressing QOL issues; the need to address aging with HIV; the need to address persons with physical and/or mental health issues, and/or SUDs; the importance of elevating U=U and recognizing the needs of all women, cisgender and transgender; ensuring that there is a national comprehensive program to address barriers to prevention and making sure that rural communities are engaged; and the importance of advocacy in terms of funding.

There was an update on the President's Emergency Plan for AIDS Relief (PEPFAR). PACHA's Global Subcommittee has worked diligently to ensure that HIV/AIDS is elevated from a global perspective, making sure that future guidance is sought from global and domestic lessons learned. There was an important panel discussion related to HIV amongst women and adolescent girls and why representation matters in response to HIV in this population. There was an emphasis on the importance of women, especially women of color, being part of clinical trials and addressing the bias that exists in prescribing of PrEP to women. There was a call to action to shift the narrative to ensure that all women living with HIV need to have a seat at the table and that IPV and QOL must be addressed for both cisgender and transgender women.

There was a panel discussion regarding PrEP for the nation and how to get PrEP to everyone who wants and needs it. There was discussion and approval of a draft letter to the HHS Secretary with PACHA's recommendation on scaling up PrEP to the nation. There also was a panel discussion on strengthening the HIV workforce. Dr. Wendy Armstrong and Vincent Guillermo-Ramos presented as part of the panel about how this important goal can be accomplished. They discussed the importance of removing regulatory barriers that place restrictions on practice at the highest level of training and licensure to ensure that the talents of Advanced Practice Nurses (APN), Nurse Practitioners (NPs), and Social Workers can be leveraged to the fullest of their ability to increase the HIV workforce; ensuring that CMS offers reimbursement for decentralized, team-based, whole person, HIV prevention and care services; supporting a shift toward education and training for the future health workforce that emphasizes key competency of team-based, whole person, HIV care; providing training for those not only pursuing full-time HIV work, but also those who are intimately involved in that; having the knowledge to be able to address co-morbidities using training tracks, residency programs, access to experts, et cetera; investing in infrastructure; developing decentralized and differentiated HIV prevention and care such as telehealth and community-based services; and allocating funding toward HIV using specific demonstration projects.

CHAC Member Observations/Suggestions: PACHA Update

The following questions, observations, and suggestions were raised:

- Dr. Guilamo-Ramos noted that this speaks to the issue of meaningful engagement of people living with HIV in the workforce and expanding definitions of the workforce beyond the clinical to think about a range of important actors who could help to end the epidemic in the country.
- Mr. Lindsey pointed out that there is a community health worker apprenticeship program that came out of the broader HRSA environment.
- Dr. Armstrong indicated that HRSA established and put many resources behind a Community Health Worker Training Program (CHWTP). More programs such as this are needed, but do require additional resources for childcare, transportation, and other supports peers will need to take advantage of such opportunities.
- Dr. Driffin emphasized that it is important to be mindful of diversity, equity, and inclusion in the workforce so that there is racial and gender diversity in key health departments along HIV jurisdictions and such that the community sees more people who look like them in key leadership and executive decision-making roles.
- Dr. Gayles said that he was hearing that perhaps it would be beneficial to stand up a CHAC Workforce Development WG. There previously was a CHAC HIV and Aging WG. Perhaps it would be beneficial to hear an update on this WG and the status of its efforts.

Action Item #1: Potential Letter Regarding LGBTQ Children/Youth**Jean Anderson, MD**

CHAC Co-Chair, HRSA Appointee

Dr. Anderson reminded everyone that the work that CHAC does and the advice they can give to CDC and HRSA is somewhat limited between meetings. The reason they chose the 2 action items for this business meeting was because they felt that there was some sense of urgency for these topics and that some bullet points could be created that CHAC could vote on during this meeting, which could then be developed into a letter over the next few weeks. She then reviewed the proposed components for the letter:

- Background:
 - In December 2021, the Surgeon General warned of a “devastating mental health crisis among adolescents.”
 - There was a 60% increase in major depressive disorders from 2007 to 2019 (National Survey of Children’s Health. HRSA October 2020).
 - Suicide rates increased nearly 60% in youth 10-14 years of age from 2007-2018 (National Vital Statistics Reports September 2020).
 - These problems are magnified among LGBTQ youth (CDC Adolescent Behaviors and Experiences Survey (ABES) 2021).
 - More than 60% of LGBTQ students experiencing poor mental health during the pandemic, which is over twice that seen in heterosexual students.

- LGBQ students were more than 3 times as likely to have attempted suicide in the past year.
 - Three-quarters of LGBTQ students experienced emotional abuse at home during the pandemic.
- For youth to thrive in schools and communities, they need to feel socially, emotionally, and physically safe and supported.
- There are ample data showing that LGBTQ students experience more bullying, harassment, and physical assault as compared to heterosexual students (2015 National Youth Risk Behavior Survey).
 - Young gay/bisexual men are at increased risk for HIV infection (**need update**). In 2014, they accounted for 8 of 10 new HIV diagnoses among youth (HIV Surveillance Report 2014).
- LGBTQ-supportive school policies and practices support all youth with decreases in depressive symptoms, decreases in suicidal thoughts and behaviors, and decreases in suicide attempts—especially among LGBTQ students (National YRBS 2015 & 2017; CDC School Health Profiles 2014 & 2016).
- From 2015-2019, over 200 pieces of anti-LGBTQ legislation were proposed in 35 states. In 2022 alone, over 300 bills have been introduced in state legislatures, often focusing on restricting school curricula, access to books or other educational materials relating to gender identification/gender-affirming care, or sexual orientation (<https://childtrends.org/publications/anti-lgbtq-policy-proposals-can-harm-youth-mental-health>; NYT 4/27/22)
- Implications/Concerns:
 - These legislative efforts send a clear message to LGBTQ youth that they are not okay.
 - Legislative efforts at the state level likely will create significant gaps in access to health care and social support services critical to these youth, including mental health services.
 - These legislative actions also can cause significant anxiety and depression that can further impact adherence to and engagement in medical care.
 - These legislative efforts will put HRSA and CDC efforts (demonstration projects, funding mechanisms) at risk and will impair successful delivery of services.
 - These gaps in care introduce spaces for the federal government to step in and provide a connection to support services that fill that void.
 - Recommendations:
 - Develop and disseminate resources at the federal level for youth and their families, as well as teachers and school counselors, to try to mitigate the potential harmful effects of any LGBTQ legislation.
 - Develop and disseminate resources at the federal level targeted to healthcare providers to better educate them about LGBTQ health and mental health and risk reducing strategies, and to provide information about assistance when problems are identified.
 - Develop public service messages (PSAs) and social and other media to educate the public about these harms and the need to reduce/prevent stigma and discrimination for these vulnerable youth.
 - PSAs also should be developed to target social media and other electronic platforms most utilized by youth, including LGBTQ youth, to provide information and resources.

CHAC Member Observations/Suggestions: LGBTQ Letter

The following questions, observations, and suggestions were raised:

- Consider forming a CHAC WG around these issues.
- Be explicit about promoting ways to encourage healthy sexual behaviors.
- Be specific about risk reduction strategies for at-risk adolescents, such as availability and provision of PrEP.
- Recognize the importance of school counselors at the state and county levels, and support school connectedness in general.
- Thinking particularly about youth who are in the foster care system, target information to social service providers outside of the schools.
- Discuss the potential need for housing assistance, which often goes unnoticed as part of their lived experience.
- Discuss the lack of gender-affirming care and the lack of provision of services/information that involves gender identity, and be more explicit about the mental health challenges that entails. There are efforts to prohibit conversations about sexual or gender identity, some of which is legislative and is actively seeking to bring child abuse charges against anyone who provides gender-affirming services and/or information.
- Perhaps there should be something about starting earlier than the education system. For instance, Oklahoma wants to ban any markers of non-binary gender identities on birth certificates. This seems to be going even further in an effort to erase identities that have been long and hard fought for.
- Highlight the importance of safe spaces, including safe spaces in which families can receive high quality and accurate information. For youth who already feel isolated or for whom the online space or social media is exacerbating their mental health issues, perhaps there could be some opportunities for in-person convening or collective healing through safe spaces or similar avenues. Parental consent was raised during the presentations. Sometimes, parents may be the bullies. Youth need to have safe places where they can speak freely about bullying from one or both parents, as well as school and/or social bullying that is occurring.
- Willful disinformation campaigns should be mentioned in the background section.
- Discuss funding.
- Perhaps there could be a leading bullet point before getting specifically into LGBTQ youth to recommend enhanced effort across the board to increase access to mental health services for all children, particularly around connectedness, coping mechanisms, access to therapy in a timely manner that addresses their mental health needs. That could be the big take home since all youth are currently behind the metaphorical 8 ball. Then it could go on to say, because of everything Dr. Anderson laid out, there needs to be special attention to

LGBTQ youth given particular legislative efforts and include the data showing the implications and connections within all of that.

- Dr. Cheever noted that the topic pertains to LGBTQ issues. If the letter and recommendations are made more general, this topic could be swept into a more general set of discussions around mental health for children. While this is critical as well, it would not focus specifically on the needs of trans and LGBTQ youth who are in places where there have been specific political movements to make it more complicated for them.
- Dr. Mermin added that there are data that support the idea that not only is there a disproportionate effect on mental health among LGBTQ youth, but also there is a fairly large proportion of youth who identify as LGBTQ and, therefore, this has public health importance in this political and social environment that CHAC has been discussing. It is possible to make a difference and it seems like a very important issue, particularly because for STDs (though maybe less) and HIV, there is a highly disproportionate rate among gay and bisexual youth, males particularly. This is a strong rationale for the focus. Based on the discussions, it is very hard for parents, youth, and teachers to obtain information about how to deal with this. The idea for the first bullet to focus on dissemination and access to credible resources is the next generation. CDC/HRSA and other partner organizations have a responsibility to get information out that can be useful and there is also the legal/policy level.

CHAC Action

Dr. Anderson made a motion to approve the letter for LGBTQ youth, which will be developed and circulated for review by CHAC before sending it out, including the 4 original recommendations presented and the addition of the following 4 recommendations:

- Increase efforts across the board to develop and disseminate information and resources for youth and their families, as well as teachers/school counselors addressing the mental health crisis in adolescents.
- Develop and disseminate messages about healthy sexual behaviors and resources to improve access to PrEP and other preventive services to at-risk youth.
- Encourage development of safe spaces for youth in general and LGBTQ youth specifically to access accurate information and support.
- Ensure that resources for LGBTQ youth are available to address disparities in care related to social determinants of care (including homelessness, domestic violence, and racial/ethnic discrimination).

Dr. Dowler seconded the motion. CHAC unanimously approved the LGBTQ letter.

Action Item #2: Letter on Self-Collection and Self-Testing

Travis Gayles, MD, PhD

CHAC Co-Chair, CDC Appointee

Dr. Gayles noted that while this proposed letter to the FDA was not fully fleshed out, the CHAC discussions prompted them to put this forward, recognizing that data will need to be identified in order to further shape the letter before it is ready to move forward. Some of the highlighted

points discussed as key areas of concern pertaining to self-collection testing included the following:

- There is a differentiation in how HCV and HIV are viewed, particularly around the impact of results.
- Criteria required for the authentication process domestically versus internationally. One of the major issues was that there are similar tests that are utilized internationally that are not accessible in the US.
- There is a need for incentives and an increased sense of urgency to foster and facilitate a production pipeline. This may involve proactive outreach to manufacturers to encourage them to seek approval for tests, beginning with a discussion with FDA to explore how to decrease the costs associated with premarket approval (PMA). As raised the day before, the cost is just shy of \$400,000 for that process. Consideration needs to be given to how to remove barriers, as well as the existing data related to the impact of self-collection in terms of increased testing in certain groups. It is important to figure out ways to increase the pipeline and help foster a smoother process to move things forward in order to increase access to these testing modalities for certain groups.

CHAC Member Observations/Suggestions: FDA Letter on Self-Collection Testing

The following questions, observations, and suggestions were raised:

- This seems like a critical place for CHAC to focus its efforts to intervene.
- It is important to remember that payers cannot pay for self-collection tests without CPT HCPCS codes for home tests. This was done for COVID-19, which opened the door for other tests. Perhaps someone could reach out to the AMA to discuss this.
- There are some incentives already. Companies would like to market their products and have them widely used, which is why they develop them. Some companies have said the barrier is too high at the FDA level to get approval. FDA spoke about the risk-benefit comparison, but that does not align with the true risks and the true benefits of home testing. A high-level conversation is needed with FDA to come to an agreement that everyone needs to work together to make self-collection kits available to the people who need them. Regulatory barriers were put in place 10 or 20 years ago and need to be revisited.
- There are larger issues to consider when tests are brought to market pertaining to affordability, awareness of availability among communities who need the tests, linking people to services, payer issues, et cetera. With that in mind, perhaps CHAC should consider standing up a Self-Collecting Testing WG to further explore the issues.
- Dr. Mermin asked CHAC to consider whether a very specific, short-targeted, single-pointed letter could be more effective than one that tries to redress all of the comprehensive issues related to testing, which may be better suited for ongoing discussions. The first and part of the third bullets contain the major points. Based on the CHAC discussions throughout the meeting, FDA is aware that the marketing in Europe is different than in the US. While articles have been written about Europe's more efficient process, it is not going to change the US approach to approval processes. While it has been explicitly stated that HIV is exceptional in that it is much more dangerous for someone to have a false negative HIV test than it is to have a false negative hepatitis C test, there are theoretical arguments

against that view. Many years of HIV self-testing are already in place, so the rationale is unclear about the danger. High-quality thoughtful letters are more effective than ones that have not been thought out as well.

- Dr. Akolkar, FDA, clarified that the user fee is not determined by FDA. It is legislatively determined by the Congress. There are also regulations FDA has to abide by, even though they may want to do something for both HIV and HCV. HCV approval was basically done on the basis of persons with signs and symptoms, which is different than for HIV. It is not just a simple equation that HIV and HCV are the same—there are historical nuances. FDA has learned a lot from the self-test experience for HIV and is working with the sponsor, but it is important to remember that the sponsor must approach FDA before a process can begin. They are open to have preliminary discussions with sponsors who believe they have something of value and some data to support that.
- There was CHAC support for the idea of crafting a pointed letter that addresses and engages on the first bullet point specifically, plus/minus some language around asking for the deeper conversation to revisit the processes and how they can be updated to match current thinking versus the thinking of 20 some years ago when self-collection reviews were beginning.
- Some CHAC members wondered if perhaps they were rushing this and that it might be better to establish a WG rather than trying to litigate everything during this meeting. It was noted that an alternative to a WG would be to convene an interim business meeting, which would allow time to assemble the facts and develop a draft letter. Establishing a WG could prolong the process.
- Dr. Gayles recapped that they were hearing that there is still much to be clarified in terms of what would best fit into such a letter, which would take more time to flesh out into more detail. There are 2 mechanisms for moving forward that could work, which are to: 1) convene an interim business meeting that probably could not be scheduled until September; or 2) create a WG to study the key points, with specific tasks of differentiating the bullet points, determining whether the letter to FDA should focus on one point or be more general, and then reporting back to the full CHAC during its November meeting. Given the timeframe, the reality seemed that creating a WG would offer more time to further explore the issues and develop action items.

CHAC Action

Dr. Gayles made a motion to create a Self-Testing and Self-Collection WG to study this issue with the specific task of obtaining more information on: 1) differences in risk classification of HCV and HIV; 2) criteria required and data available for the FDA approval process; and 3) downregulation to Class II diagnostics. The WG will then propose messaging that should go into the letter related to self-collection, including the development of a set of recommendations to be presented during the November 2022 CHAC meeting. Dr. Dowler seconded the motion. CHAC unanimously approved the motion to create a Self-Testing and Self-Collection WG.

Action Item #3: Stand Up a Workforce Development WG

Dr. Anderson reminded everyone that a suggestion was made during the meeting to consider standing up a Workforce Development WG with several specific tasks.

CHAC Action

Dr. Gayles made a motion to create a Workforce Development WG to study this issue with the specific tasks of: 1) formulating a potential panel for the November CHAC meeting in order to have a larger discussion on this topic; 2) liaising with PACHA to ensure that CHAC is not duplicating and is supportive of their efforts that are already ongoing in this space; and 3) exploring the role of other health-related professionals and CHWs to enlarge the workforce and to task-share when appropriate. Dr. Guilamo-Ramos seconded the motion. CHAC unanimously approved the motion to create a Workforce Development WG.

Next Meeting / Proposed Agenda Items

The next CHAC meeting is scheduled for November 1-3, 2022. The following future agenda items were proposed:

- Gender-affirming care, coverage, and outcomes
- Barriers to providing PrEP for uninsured and under-insured individuals
- Lessons that can be learned from the global setting (e.g., task-sharing to enhance the workforce, availability of self-testing and self-collection of specimens, et cetera)
- Issues specific to pregnancy (e.g., perinatal transmission of HIV, HCV, HBV, and congenital syphilis; underuse of PrEP in at-risk pregnant women; mental health; intimate partner violence; breast and chest feeding; et cetera)
- The effects of COVID-19 in a variety of areas (e.g., healthcare overall, HIV, persons ≥50 years of age, disparities, and comorbidities post-COVID, et cetera)

Recap and Closing

Dr. Gayles expressed his personal gratitude to everyone for their thoughtful input, continued and consistent engagement across 3 days of Zoom meetings, and great input and work. He recognized that the work they all do on regular basis contributes to their expertise and membership on CHAC. He thanked Dr. Anderson for keeping the meeting moving along and for being the epitome of comprehensiveness and thoroughness.

Dr. Anderson echoed that this had been a tremendous meeting in terms of the topics covered, the work done, and the exciting future topics identified. She complimented Dr. Gayles on his amazing abilities not only to summarize, but also to draw out all of the implications. She also expressed gratitude to their CDC and HRSA support.

Adjournment

Dr. Cheever thanked everyone, recognizing that very good panels had been assembled with excellent presenters who brought forward important information. Secondly, she recognized the CHAC members for their ability to listen carefully and reflect on the information presented and engage amazing discussions. She expressed her gratitude for Drs. Gayle and Anderson for their leadership as Co-Chairs and their wonderful abilities to synthesize the information and discussions.

Dr. Mermin expressed his gratitude, emphasizing that he had learned a great deal. At its best, an advisory committee provides useful advice that can help influence the thought process on various topics. CHAC's did exactly that over the past 2.5 days with their thoughtful input, which raised important issues for CDC and HRSA to think about as they consider many issues of importance. He recognized that it is time-consuming and that everyone is very busy. Especially in the time of COVID-19 when site visits have been reduced, it is very difficult to understand what is occurring. It is great to have input from people who are thinking about the issues and want to make a positive difference in these areas of diseases that are of great public health importance and that experience a lot of inequity. He thanked everyone for their time and effort and emphasized that he was looking forward to the November 2022 CHAC meeting.

Certification

I hereby certify that, to the best of my knowledge, the foregoing minutes of the proceedings are accurate and complete.

CDC/HRSA Advisory Committee on HIV, Viral
Hepatitis and STD Prevention and Treatment
Centers for Disease Control and Prevention
1600 Clifton Road NE, Mailstop US8-6
Atlanta, GA 30329-4027

Submitted by email to nchhstppolicy@cdc.gov

Subject: Spring CHAC Public Comment Registration

Dear Advisory Committee Members:

Thank you for the opportunity to submit written comments to the upcoming meeting of the CDC/HRSA Advisory Committee on HIV, Viral Hepatitis and STD Prevention and Treatment (CHACHSPT). Founded in 2015, Everly Health is an Austin, TX based company offering modern, diagnostics-driven care. Our goal is to meet the consumer where they are by leveraging our national clinical network composed of hundreds of physicians, nurses, genetic counselors, pharmacists, and member care specialists along with our digital platform and fully-owned CLIA certified, CAP accredited laboratories. We provide services both directly to the consumer through Everlywell as well as complete solutions for diagnostics-driven virtual care at scale to health plans and enterprises through Everly Health Solutions.

Everly Health is an industry leader in facilitating telehealth and at-home services for laboratory testing. In total, we offer over 2500 tests with our partner laboratories in addition to the thirty tests across six key categories within our own diagnostic laboratories. Our demonstrated success in at-home collection and testing enabled us to mobilize quickly and early in the pandemic to provide nationwide access to testing for COVID-19. We were the second company to receive emergency use authorization (EUA) from the Food and Drug Administration for our at-home collection kit and since March 2020, we have provided clinical oversight, care coordination, and physician services for tens of millions of tests for COVID-19. Everly Health Solutions' 50 state provider network can facilitate test ordering, follow up with patients who test positive, and offer assistance with accessing treatment.

Just released this month, the Centers for Disease Control (CDC) preliminary report on 2021 surveillance of sexually transmitted diseases (STDs) shows that rates of syphilis continue to increase, with a 34% increase among women.¹ The agency also reported that the pandemic led to underreporting of infections and increased transmission in 2020 due to reduced screening as healthcare clinics either closed or restricted in-person visits to limit spread of COVID-19.² Additionally, public health departments are already facing limited resources needed to move

¹ <https://www.cdc.gov/std/statistics/2020/preliminary2021.htm>

² <https://www.cdc.gov/std/statistics/2020/impact.htm>

everly health

personnel from STD prevention and control efforts to the pandemic.³ Recognizing this shift in access to STD prevention, in its 2021 update to its Sexually Transmitted Infections Treatment Guidelines, the CDC identified an opportunity to build upon the lessons learned from the response to COVID-19 including the use of at-home collection for STDs.⁴ The pandemic clearly illustrated the critical role at-home testing plays in responding to and controlling infectious disease outbreaks and for these reasons, we were very pleased to see that the agenda for the upcoming CHACHSPT meeting included a focus on self-testing and self-sample collection for STDs.

We currently offer a direct-to-consumer testing channel for men and women to self-sample within the comfort of their own home to test for chlamydia, gonorrhea, hepatitis C, HIV, syphilis, trichomoniasis and herpes simplex virus type 2. For those who test positive, we provide access to providers who can initiate access to appropriate treatment. We have found that patients prefer privacy when testing for sensitive conditions and the seamless access to treatment to quickly resolve their infection and symptoms. In 2021, we had 77,800 sexual health kits ordered and registered to 47,400 unique users. Of those, 6202 tested positive for one or more STD, and 8,604 consults were scheduled. We have surveyed our customers about their at-home testing experience and they consistently report high levels of satisfaction.

We hope that our experience in providing access to laboratory testing directly to consumers will help inform future policy recommendations that support self-testing and self-sample collection for testing for STDs. Our own experience has proven that the sampling technology and digital platforms exist to successfully enable at-home collection and testing for STDs. Not only will it remove major barriers to access, including during public health emergencies, but our data show that people prefer and desire this testing option. Now we just need proactive policy to support the delivery of these critical and innovative prevention and treatment tools directly to those at greatest risk.

Thank you for your consideration of our comments and we hope that you will look to Everly Health as a resource and partner as you consider the role of self-testing and self-sample collection in preventing STDs. Please do not hesitate to contact me at marisa@everlyhealth.com if I may be of further assistance.

Sincerely,

Marisa L. Cruz, MD

April 4, 2022

The Honorable Xavier Becerra
Secretary, U.S. Department of Health & Human Services
200 Independence Avenue, S.W. Washington, DC 20201

Dear Secretary Becerra:

We, the undersigned national, local, and state-based health, education, and civil rights organizations, outline our support for a national program to finance and distribute medications that prevent HIV infection, known as pre-exposure prophylaxis, or PrEP. A key goal of a national program is to scale up access to PrEP substantially in order to help end the HIV epidemic. A national PrEP program should be guided by these principles: accessibility, equity, simplicity, affordability, sustainability, and adaptability. We were pleased to see the historic investment in a national PrEP program included in the President's 2023 budget. We believe systems-wide reforms and innovative policies are needed to end the HIV epidemic in the U.S., and we look forward to working with the Administration to help make this ambitious proposal a reality.

HIV in the United States (U.S.)

In 2019, nearly 37,000 people in the U.S. were diagnosed with HIV. Black and Latinx/Hispanic individuals comprised 42 percent and 29 percent of new diagnoses, respectively. Every person living with HIV requires a lifetime of treatment at an estimated individual cost of about \$501,000, with potential adverse effects that include liver toxicity and insulin resistance. HIV was the underlying cause of death for more than 5,000 people in 2019 in the U.S.

A major gap in U.S. efforts to address HIV is the under-utilization of medications that can virtually eliminate the acquisition of HIV. Fewer than 25 percent of people who could benefit from PrEP actually receive it, with large and growing disparities by race, ethnicity, gender, and geography. In 2019, the CDC found that 63 percent of White Americans recommended for PrEP received a prescription, compared to 14 percent of Latinx/Hispanic Americans and just 8 percent of Black Americans.

The current role of the federal government in HIV prevention

In 2019, the federal government launched a major new initiative called *Ending the HIV Epidemic*, investing more than \$500 million in HIV prevention, treatment, and research programs. The goal is to reduce new HIV infections in the United States by 90 percent by the year 2030. Though achievable, success will require substantial improvement over the modest 9 percent decline in new infections from 2015 to 2019.

The recently updated National HIV/AIDS Strategy for 2022-2025 recognizes the need for much greater use of PrEP. The major reasons for poor access include high prices, expensive and inaccessible laboratory tests, complex and confusing eligibility requirements to access PrEP services, limited provider availability in many parts of the country, and stigma. The Department of Health and Human Services (HHS)'s *Ready, Set, PrEP* Program, launched in 2019, aimed to reduce this gap by providing free PrEP medication for those without prescription drug coverage; however, the program does not cover the required associated clinic and lab costs for PrEP. The program also relies on high-cost, brand-name oral medications from a single manufacturer, despite the fact there are currently 12 manufacturers marketing generic PrEP in the U.S as well as a new long-acting injectable form of PrEP approved in December 2021.

Benefits of a national PrEP program

To scale up PrEP as part of an effective, sustainable strategy to end the HIV epidemic, a national PrEP infrastructure must move away from the current reliance on high-cost, brand-name drugs that have resulted in overly complex, difficult-to-navigate programs for the un- and under-insured and a relatively small number of access points in the Medicaid program. The [proposal from Killelea and colleagues](#) provides one potential path for a national PrEP program focused on these populations. A call for a national PrEP program builds off of recent efforts to secure congressional and Administration support for expanded access to PrEP. Any new funding must be strategically invested to ensure that scarce dollars are stretched to help the most amount of people and focused on reversing growing inequities in PrEP access. A multi-pronged approach will be needed to create a system in which individuals and providers can equitably and sustainably access PrEP.

To reduce the growing inequities enabled by our fragmented PrEP financing system, we seek your support for a national PrEP program which:

- Expands access to PrEP medications and lab services for people who are uninsured and on Medicaid
- Allows the federal government to negotiate with manufacturers and labs for fair public health prices
- Scales-up access to generic PrEP medication as a safe, effective, and cost-effective option for the majority of those indicated for PrEP and provides access to other PrEP options when indicated
- Creates an expansive provider network of non-clinical community-based PrEP providers and local health departments serving the uninsured and Medicaid that are paired with clinical providers via telehealth partnerships
- Works in tandem with existing PrEP funding and programs to supplement, not supplant programs and activities that are working
- Creates a platform for the effective and rapid deployment of novel PrEP medications

- Provides new opportunities to effectively raise awareness and combat stigma by enrolling and educating a new, broad network of providers and building community-led campaigns that connect key populations to this new PrEP infrastructure

A national PrEP program would help put the U.S. on track to end the HIV epidemic.

Re: Written Comments for the CDC/HRSA Advisory Committee on HIV, Viral Hepatitis and STD Prevention and Treatment (CHACHSPT)

Dear Members of the CHACHSPT:

On behalf of Visby Medical, Inc. (Visby), a medical diagnostics technology company headquartered in San Jose California, and the patients and providers we seek to support with our point-of-care (POC) testing, we appreciate this opportunity to submit comments for consideration during the spring meeting. Our mission is to "empower anyone to test for any infection anywhere with near-100% accuracy." As such, we very much support the CHACHSPT's focus on activities related to the prevention and control of sexually transmitted infections (STI) and stand ready to be a resource and partner with you in your important work.

About Visby

Visby Medical is transforming the order of diagnosis and treatment for infectious diseases so clinicians can test, talk with, and treat the patient in a single visit. The Company's proprietary technology development program culminated in the world's first instrument-free, single-use PCR platform that fits in the palm of your hand and rapidly tests for serious infections. Originally developed for sexually transmitted infections, the Company's FDA-cleared, CLIA-waived Sexual Health Click Test for women returns accurate results within 28 minutes. The Visby Medical technology is also helping to fight the global pandemic via the Visby Medical COVID-19 Test, and its robust pipeline includes tests for other infectious diseases. Visby Medical is accelerating the delivery of fast and accurate, palm-sized PCR diagnostics to the point of care, and eventually for use at home. Visby Medical has received Federal funding from NIH and BARDA to support the development and validation of the PCR platform. For more information, visit www.visbymedical.com.

Accurate POC Tests Can Promote and Protect Public Health

The nation is in the sixth year-over-year increase in chlamydia and gonorrhea cases and this silent – and neglected – epidemic will not wane unless we become more intentional as a nation in how we deploy accurate, rapid test modalities. The Centers for Disease Control and Prevention's (CDC) 2021 Sexually Transmitted Disease (STD) Treatment Guidelines recommends Nucleic Acid Amplification Tests (NAATs) for detecting chlamydia and gonorrhea. The 2021 STI National Strategic plan includes a recurring theme of the need for "innovative solutions and approaches to address the ongoing and emerging challenges to STI prevention and control" and specifically calls out the need to develop "point of care diagnostic tools."

Visby has developed and introduced such a test to the market. We have the first FDA-cleared and CLIA-waived instrument-free PCR platform that can detect and distinguish

April 19, 2022

between three of the most common and curable STIs – chlamydia, gonorrhea, and trichomonas. This test provides lab-accurate results in less than 30 minutes without the need for trained laboratory technicians to operate or interpret test results. These tests can be used in any POC setting that has a CLIA-waiver, including STI clinics, OBGYN offices, emergency departments (EDs), urgent care settings (UC), and mobile vans. Because this platform does not require an extra instrument, it lends itself well for use in resource-constrained and remote settings. Many tests can be run in parallel to meet surge capacity.

The standard of care (SOC) practice is to send-out STI test samples for PCR testing, which typically does not return results for at least 24 hours, oftentimes longer. In the absence of real-time test results, patients are presumptively treated based on symptoms and sexual history. While this generally no longer happens in any other disease-state, it is common practice for STIs. Often the initial diagnosis is incorrect, meaning that the patient will need to be contacted with the right diagnosis and a new prescription for treatment or the patient may have to return for a second appointment to get the appropriate treatment. Women bear the greatest burden of this delay in accurate treatment, where untreated STIs can result in pelvic inflammatory disease (PID), ectopic pregnancies, and infertility. Moreover, STI infection increases the risk of HIV transmission. In sum, the current SOC practice delays accurate treatment, inconveniences the patient, can burden providers, and increases costs – and decreases efficiency – within the health care system.

The reality is that we are treating patients before test results are available. The rates of overtreatment (e.g., patient is treated for chlamydia, but laboratory results show she is not infected with chlamydia) can be as high as 80%, especially in settings such as EDs and UCs where staff fear patients will be lost to care. The Visby STI test can prevent overtreatment thus reducing the unnecessary use of antibiotics and promoting antibiotic stewardship. Conversely, undertreatment (e.g., patients are not given treatment, but laboratory results show they are infected with chlamydia) are also high. The consequences of undertreatment are detrimental to both individual and public health as untreated STIs can lead to PID and other severe sequelae, and patients can continue to spread disease. Importantly, clinic staff spend time calling the patient back with their test results and, in many settings, can never get in contact with the patient. The patients lost to care can be as high as 40%, posing a risk to public health by continuing to spread untreated disease.

Because Visby test results are available during the span of a patient's clinic visit, this enables:

- Accurate treatment informed by real-time PCR results
- Patient education (treatment and how to avoid future infections)
- Expedited Partner Therapy (EPT) (this is permitted in most states)

POC STI testing is better for the patient because:

- Patients are accurately treated based on what they have. This in turn improves their outcomes directly and helps reduce the spread of STIs.
- Treatment in a timely fashion means chlamydia infection does not progress to pelvic inflammatory disease (PID), which if left untreated can result in infertility and

visby medical

2

April 19, 2022

ectopic pregnancies, which can be devastating for patients and expensive for the health care system.

- Accurate treatment means the patient does not receive an unnecessary antibiotic (and not subject to unnecessary side effects from the antibiotic).
- Unnecessary additional clinic visits are avoided and clinician effort spent trying to reach patients for follow-up is eliminated.

Taken together, these advantages reduce costs and decrease the burden on the health care system.

Visby's STI Test Helps Advance the 2021 STI National Strategic Plan

Deploying a test like the Visby sexual health test supports all of the goals in the STI National Strategic Plan that was released in 2021.

Goal 1: Prevent new STIs

- By treating patients with the right drug in the initial clinic visit patients are not at risk of transmitting disease to other sexual partners; this provides timely, appropriate care to the patient directly and results in a better outcome for public health
- The provider has an opportunity to educate the patient face-to-face in real time. This will help increase awareness of STI prevention and sexual health.

Goal 2: Improve health of people by reducing adverse outcomes of STIs

- By providing test results within a patient's clinic visit, morbidity is reduced:
 - Patients are accurately treated based on what they have, not the best guess of the physician.
 - Timely treatment will reduce morbidity and in turn, improve outcomes and reduce costs. As noted above, timely treatment means chlamydia, gonorrhea, or trichomonas infections do not progress to PID, which, if left untreated, can result in infertility and ectopic pregnancies. Because infection with these STIs can increase the risk of HIV transmission, it is important to test, educate, and treat patients quickly.
 - Accurate treatment means the patient does not receive an unnecessary antibiotic and is not subject to unnecessary side effects from the antibiotic: Antibiotic Stewardship.

Goal 3: Accelerate progress in STI research, technology, and innovation

- By using an innovative diagnostic like the Visby Sexual Health STI test, the government can support shifting the paradigm from syndromic treatment to 'test, talk, treat'. Evidence-based treatment and decision-making is strengthened by POC accurate testing.

Goal 4: Reduce STI-related health disparities and health inequities

- Making a POC test like this available as standard of care can help advance equity, reduce health disparities, and decrease implicit bias that may be a component in syndromic treatment and diagnosis.

visby medical™

3

April 19, 2022

- Innovations in diagnostic testing, like that of the Visby STI test, can fundamentally transform the patient experience, making it more patient-centered and convenient, which in turn can address access and equity concerns.
- STIs disproportionately affect women, and particularly minorities. For example, even though the population/clinic-based prevalence for trichomonas is 0.2%, black women bear the highest burden of disease (9%).
- The newly released 2020 STD Surveillance Report showed that while STDs are increasing across many groups, some racial and ethnic minority groups, gay and bisexual men, and our nation's youth continue to experience higher rates of STDs.

Goal 5: Achieve integrated, coordinated efforts that address the STI epidemic

- A key attribute of the Visby test is that it does not rely on a separate instrument, meaning that it is deployable almost anywhere, and lends itself well for surge capacity; as many people as possible can be treated contemporaneously.
- These tests can easily be deployed in the community and utilized in mobile clinic vans. For example, Visby is supporting a study to assess how this test can be used when deployed into a harm reduction mobile van that reaches rural individuals with substance use disorders.
- As a POC test the Visby test facilitates the delivery of integrated, coordinated care; all within one visit, the patient will be tested, diagnosed, educated about their infection, and prescribed a treatment pathway.

Call to Action

The potential for innovative, game changing POC STI tests to have a significant, positive impact on the STI epidemic is enormous. However, a number of barriers preclude the test becoming available to all who need it. As such, we respectfully call upon the CHACHSPT to support and recommend to Department of Health and Human Services (HHS), CDC, and the Health Resource and Services Administration (HRSA) the following:

1. *Implementation science studies* to assess clinical adoption in various settings, especially those settings where health inequities can be improved, such as with underrepresented groups, rural populations, novel health care delivery settings (e.g, mobile vans), and others.
2. *Policies, programs, and funding for equitable access to innovative technologies.* Access to innovative technologies should not be limited to those with means; innovation, especially that funded with taxpayer dollars, should be available to everyone. HHS should advance policies, programs, and funding that facilitate equitable access to technologies that can improve individual and public health.
3. *Efforts to uncover the true prevalence of Trichomonas* in all geographies and demographics. Trichomonas, as with other STIs, is a silent epidemic. Currently, Trichomonas is not required to be reported, so the true prevalence is unknown. Some clinics in the South report 30% prevalence in women and 10% in men, but in other geographies it appears to be less prevalent; however, this could be

visby medical

4

April 19, 2022

because people are not being routinely tested for *Trichomonas*. Knowing the true prevalence will help guide CDC treatment and reporting guidelines.

4. *Adequate coverage and payment policies for breakthrough innovative technologies that can make a difference to patient outcomes.* Patients and providers want, need, and deserve access to accurate, POC testing. However, reimbursement for such tests can be so low that it thwarts utilization of the technology when and where it is needed most. Moreover, the current federal coverage and payment system – as operationalized by the Centers for Medicare and Medicaid Services (CMS) – is built around laboratory-based testing and not POC. As many commercial payors and Medicaid often follow CMS, the adverse impact on the adoption rate for new diagnostic technology can be significant. The Visby test was built intentionally to engineer out the need for highly trained laboratory personnel to operate and interpret the test results so that it could be used nimbly in a variety of care settings to have the maximum positive impact on public health. Unfortunately, without improved coverage and payment policies, the test will not be adopted, and its promise will not come to fruition.

Conclusion

Again, on behalf of Visby and the patients and providers we seek to support with our POC testing, we thank you for your consideration of our views and recommendations. With sufficient reimbursement and intentional deployment, we feel strongly that our POC STI test has the potential to make a significant difference in addressing the STI epidemic. We are eager to serve as a resource to you, CDC, HRSA, and HHS to reduce and prevent STIs.

Sincerely,

Christopher J. Jowett
Chief Commercial Officer

EXHIBIT M

Integrated HIV Prevention and Care Plan Guidance, including the Statewide Coordinated Statement of Need, CY 2027- 2031

Division of HIV Prevention

**National Center for HIV, Viral Hepatitis, STD, and TB Prevention
Centers for Disease Control and Prevention**

HIV/AIDS Bureau

Health Resources and Services Administration

February 2025

Executive Summary

The Centers for Disease Control and Prevention (CDC) and the Health Resources and Services Administration (HRSA) developed this guidance to support the submission of the Integrated HIV Prevention and Care Plan (hereafter referred to as Integrated Plan), including the Statewide Coordinated Statement of Need (SCSN) for calendar year (CY) 2027-2031 (hereafter referred to as Integrated Plan Guidance). This guidance builds upon the previous guidance issued in 2015 and 2021, for the submission of the Plan for CYs 2017-2021 and 2023-2026, respectively. That guidance allowed funded health departments and planning groups to submit one integrated HIV plan to lead the implementation of both HIV prevention and care services. As in 2021, the Integrated Plan Guidance for CY 2027-2031 meets all programmatic and legislative requirements associated with both CDC and HRSA funding. It reduces grant recipient burden and duplicative planning efforts and promotes collaboration and coordination around data analysis. The Integrated Plan Guidance necessitates engagement from a wide range of collaborators and partners including communities disproportionately affected by the HIV epidemic and people with HIV. The Integrated Plan Guidance intends to accelerate progress towards meeting national goals while allowing each jurisdiction to design a HIV services delivery system that reflects local vision, values, and needs.

CDC and HRSA funded recipients will notice several key changes in the Integrated Plan Guidance for CY 2027-2031. These changes reflect feedback from internal and external collaborators, which include recipients and people with HIV as well as priorities detailed in national HIV goals and the implementation strategies outlined in the [Ending the HIV Epidemic in the U.S. \(EHE\) initiative](#). Specifically, recipients who have already conducted extensive planning processes in response to the CDC's *High-Impact HIV Prevention and Surveillance Programs for Health Departments (PS24-0047)* program or through other jurisdictional efforts (e.g., Getting to Zero plans, Fast Track Cities, HIV Cluster Detection and Response plans) may submit portions of those plans to satisfy this Integrated Plan Guidance as long as the Integrated Plan submission addresses the broader needs of the geographic jurisdiction and applies to the entire HRSA and CDC HIV funding portfolio. To that end, additional details on key changes can be found in the *CY 2027– 2031 CDC DHP and HRSA HAB Integrated Prevention and Care Plan Guidance Checklist (See Appendix I)*. This checklist details submission requirements and allows each jurisdiction to determine which elements may require new content and which elements were developed as part of another jurisdictional plan.

Integrated Plan submissions address the broader needs of the geographic jurisdiction and apply to the entire HRSA and CDC HIV funding portfolio. Additionally, jurisdictions should submit plans that follow national HIV goals and priorities and use data to devise strategies that reduce new HIV infections by 90% by 2030. Proposed strategies should include the implementation of activities that will diagnose all people with HIV as early as possible, treat all people with HIV rapidly and effectively to reach sustained viral suppression, prevent new HIV transmissions by using proven interventions, and respond quickly to potential outbreaks to get appropriate prevention and treatment services to people who need them.

Section I: Introduction

In the United States, we have the tools to end the HIV epidemic and continue to make progress toward that goal. From 2018 to 2022, estimated HIV infections in the U.S. decreased by 12 percent largely attributed to the decrease in new HIV infections among people aged 13 to 24.¹ The work of dedicated individuals across HIV prevention and care delivery systems have contributed to this decrease in HIV diagnoses and the increase in viral suppression rates for clients in the Ryan White HIV/AIDS Program (RWHAP) from 69.5 percent in 2010 to 90.6 percent in 2023.

Although rates of new HIV incidence have decreased overall and viral suppression continue to increase, racial and ethnic differences in diagnoses and treatment outcomes of HIV persist. To reach the national goal of reducing new HIV infections, our systems of HIV prevention and care must work together in unprecedented ways. This includes providing access to all available tools so that people and communities disproportionately impacted by HIV are not left behind and efforts to end the HIV epidemic are accelerated.

The Integrated Plan Guidance for CY 2027-2031 is the third five-year planning guidance developed by CDC and HRSA. This Integrated Plan Guidance builds on the previous iterations of the Integrated Plan Guidance by allowing each jurisdiction to develop new goals and objectives that align public and private sectors to leverage strengths from the last five years and to add or revise services to address local HIV care and prevention needs that may remain. The Integrated Plan Guidance speaks to the need for aggressive actions necessary to achieve national HIV goals and targeted efforts to end the HIV epidemic in the U.S. by the year 2030.

Specifically, the Integrated Plan Guidance was designed to:

1. Coordinate HIV prevention and care activities by assessing resources and service delivery gaps and needs across HIV prevention and care systems to ensure the allocation of resources based on data (e.g., other payors, number of ADAP-eligible clients on health insurance coverage, in-depth analysis of needs assessment of people with HIV and people who can benefit from HIV prevention services or are vulnerable to HIV acquisition);
2. Address requirements for planning, community engagement, and coordination established by the RWHAP legislation as well as programmatic planning and community engagement requirements established by both HRSA and CDC through guidance;
3. Improve health outcomes along the HIV care continuum by using data to prioritize people and communities who have been disproportionately impacted by HIV where systems of care are not adequately addressing high HIV morbidity and/or lower overall viral suppression rates;

¹ [HIV Surveillance Supplemental Report: Estimated HIV Incidence and Prevalence in the United States, 2018–2022](#)

4. Promote a whole-person approach² to improve the health of people with HIV and people who can benefit from prevention services;
5. Reduce recipient burden by allowing jurisdictions to submit portions of other significant planning documents (e.g., EHE Plans, Fast Track Cities, Getting to Zero, or HIV Cluster Detection and Response plans) to meet Integrated Plan requirements and by aligning submission requirements and dates across HIV prevention and care funding;
6. Advance health by ensuring that government programs promote effective delivery of services and engage people with lived experience in service delivery system design and implementation; and,
7. Leverage strategic partnerships to prioritize efforts, and focus resources and evidence informed interventions, to reach those who are diagnosed, but not engaged in care.

Relationship to other National Plans and Initiatives

HRSA and CDC recognize that many jurisdictions have established and implemented extended planning processes as part of other local initiatives including but not limited to EHE funding, Fast Track Cities, locally funded Getting to Zero initiatives, or Cluster Detection and Response Plans. To minimize burden and align planning processes, the jurisdiction may submit portions of these plans to satisfy the Integrated Plan Guidance requirements. Jurisdictions should review national HIV goals or subsequent updates by visiting www.hiv.gov and [subscribing to receive updates](#).

National Framework for Ending the HIV Epidemic

It is important to think about this Integrated Plan Guidance within the framework of national objectives and strategic plans that detail the principles, priorities, and actions that direct the national public health response and provide a blueprint for collective action across the federal government and other sectors (see *Appendix 5*). HRSA and CDC support the implementation of these strategies.

Each jurisdiction should create Integrated Plans that address national HIV goals³:

- Prevent new HIV infections
- Improve HIV-related health outcomes of people with HIV
- Reduce HIV-related disparities
- Achieve integrated, coordinated efforts that address the HIV epidemic among all partners and collaborators

² A whole-person approach to HIV prevention and treatment considers the multitude of factors affecting a person's health. Source: <https://www.cdc.gov/hiv/policies/strategic-priorities/hiv-and-whole-person-care/index.html#:~:text=A%20whole%2Dperson%20approach%20can,expand%20flexible%20and%20tailored%20interventions.>

In 2020, HHS began implementation of the Ending the HIV Epidemic in the United States initiative coordinated around four strategies – diagnose, treat, prevent, and respond – that leverage highly successful programs, resources, and infrastructure. The EHE initiative aligns with national HIV goals to reduce new HIV diagnoses in the United States, decreasing the number of new HIV infections to fewer than 3,000 per year. The EHE initiative focuses resources, expertise and technology in jurisdictions hardest hit by the HIV epidemic. For more information on the EHE initiative, visit: <https://www.hiv.gov/federal-response/ending-the-hiv-epidemic/overview>.

The Integrated Plan Guidance utilizes the HIV care continuum model and the whole-person approach. The HIV care continuum depicts the stages a person with HIV engages in from initial diagnosis through their successful treatment with HIV medication to reach viral suppression. Supporting people with HIV to reach viral suppression not only increases their own quality of life and lifespan, it also prevents sexual transmission to an HIV-negative partner, thus providing an additional strategy to prevent new HIV infections. Effective strategies to address barriers within HIV prevention, care, and treatment systems are needed to increase the number of people with HIV that reach and maintain viral suppression.

The adoption of a whole-person approach can improve HIV prevention and care service delivery and outcomes. Persons with positive test results should be linked to HIV care, treatment, and other social support services; and persons testing negative should be linked, as needed, to biomedical HIV prevention services, such as PrEP, and other social support services.

The HIV care continuum allows recipients and planning groups to measure progress and to direct HIV resources most effectively. HRSA and CDC encourage jurisdictions to use the HIV care continuum to identify people and communities who have been disproportionately impacted by HIV and for whom the service system may not be adequately engaging in HIV prevention services or may not support improved HIV health outcomes. Additionally, all jurisdictions should include performance measures in their Integrated Plan submission including the core performance measures that measure progress along the HIV care continuum for all people and communities who have been disproportionately impacted by HIV. Please see *Appendix 4* for links to suggested CDC and HRSA data sources, performance measures, and indicators.

Section II: Planning Requirements and Submission Guidelines

Integrated planning is a vehicle for jurisdictions to identify HIV prevention and care needs, existing resources, barriers and gaps, and outline local strategies to address them. The Integrated Plan submission should articulate existing and needed collaborations among people with HIV, service providers, funded program implementers, and other collaborators, including but not limited to other programs funded by the federal government, such as the Housing Opportunity for Persons with AIDS (HOPWA) program and providers from other service systems such as substance use prevention and treatment providers. The Integrated Plan submission should reflect

current approaches and use the most recent data available. To ensure coordinated implementation of their Integrated Plan submission, each jurisdiction should include information on the persons or agencies responsible for developing the plan, implementing the plan, coordinating activities and funding streams, and monitoring the plan.

HIV Planning Requirements

All CDC DHP and HRSA HAB funded jurisdictions (the 50 states, RWHAP Part A-funded Eligible Metropolitan Areas and Transitional Grant Areas, directly-funded CDC HIV prevention cities, Puerto Rico, the United States Virgin Islands, and the United States Affiliated Pacific Island jurisdictions) are required to have a planning process that includes the development of a system-wide plan for the delivery of HIV prevention and care services and the establishment of an HIV planning group, planning council, or advisory group, also known as a planning body.

By design, the HIV planning body must engage people with different interests, responsibilities, and involvement with HIV to inform and support the development and implementation of an Integrated Plan submission that guides the delivery of HIV prevention and care services. CDC and HRSA recognize and understand the value of individuals who receive services actively participating in the planning process for HIV service delivery, as this drives services that are tailored to the needs of clients in the jurisdiction, and these individuals must be engaged in the development and implementation process.

For the development of the Integrated Plan, jurisdictions should include and use their existing local prevention and care HIV planning bodies, as consistent with CDC and HRSA planning group requirements, and engage traditional collaborators and community members (e.g., people with HIV, people with certain risk factors for acquiring HIV, AIDS Education and Training Centers (AETCs), state Medicaid agencies, STI/sexually transmitted disease (STD) clinics and local education agencies (LEAs)) to get input. In addition, recipients should broaden their existing group of partners and collaborators to include other federal, state, and local HIV programs, local organizations, and community groups not previously engaged for the purposes of improving data sources, leveraging services, and assisting with key portions of the plan, such as the HIV prevention and care inventories.

When developing the Integrated Plan submission, the planning body should collaborate with the recipient to review and analyze data (e.g., resource inventory, needs assessments, satisfaction surveys, listening sessions) for program action and decisions, prioritize resources to those jurisdictions at highest risk for HIV transmission and acquisition, and improve HIV health outcomes in those jurisdictions for both people and communities disproportionately impacted by HIV. Through strategic collaborations among collaborators, HIV planning is based on the principle that local planning is the best way to respond to local HIV prevention and care service delivery needs and priorities. Please refer to CDC's most recent [HIV Planning Guidance \(HPG\)](#) and the [RWHAP Part A](#) and [Part B Manual](#) for more details about HIV planning processes.

Integrated Plan Components

The Integrated Plan submission should demonstrate an understanding of and considerations for all funding sources, service delivery, and system integration (entire system of HIV prevention and care). It should include the following sections:

1. Introduction
2. Community Engagement and description of Jurisdictional Planning Process
3. Contributing Data Sets and Assessments, including:
 - a. Epidemiologic Snapshot
 - b. HIV Prevention, Care and Treatment Resource Inventory
 - c. Needs Assessment
4. Situational Analysis Overview, including people and communities disproportionately impacted by HIV
5. CY 2027-2031 Goals and Objectives to be organized by national HIV goals and inclusive of the strategies: Diagnose, Treat, Prevent, and Respond. See *Appendix 2* for examples.
6. Integrated Plan Workplan

In addition to these sections, please use the checklist attached, as *Appendix 1*, to ensure the jurisdiction submits all of the documents needed to meet submission requirements, including existing materials and newly developed materials needed for each required section.

As part of a complete Integrated Plan submission, jurisdictions must provide a signed letter from the planning body(ies) documenting concurrence, non-concurrence, or concurrence with reservations with the Integrated Plan submission. In RWHAP Part A jurisdictions that cross state lines, the Part A Planning Councils/Planning Bodies need to submit signed letters to all RWHAP Part B jurisdictions included in the Part A jurisdiction. As part of the Integrated Plan submission, jurisdictions will need to outline the communities and collaborators represented in the planning and concurrence process (e.g., community members, people with HIV, service providers, governmental entities). Submissions that do not contain the required letters of concurrence will be deemed incomplete and returned for revisions.

See the table below for the required letters of concurrence depending upon the plan submission type. If there are additional planning bodies in the state/territory or jurisdiction, additional letters of concurrence should be submitted. Please see *Appendix 6* for a sample letter of concurrence.

Required Letters of Concurrence			
	Type of Plan		
Planning Body	Integrated State/City Prevention and Care Plan	Integrated State-Only Prevention and Care Plan	Integrated City-Only Prevention and Care Plan
RWHAP Part A Planning Council	✓ ⁴	✓ ⁵	✓
RWHAP Part B Planning Group	✓	✓	
CDC Prevention Planning Group	✓	✓	✓

⁴ RWHAP Part A recipients need to submit letters of concurrence to all states where 10% or more of the HIV cases in their jurisdiction reside.

Submission

The Integrated Plan submission must include all the components outlined in this guidance and include a completed *CY 2027- 2031 CDC DHP and HRSA HAB Integrated Prevention and Care Plan Guidance Checklist*. Plans must be comprehensive to ensure that all HIV prevention and care funding work together to reduce new HIV diagnoses and to increase viral suppression among all people with HIV. The new plan should use existing documents such as an epidemiologic profile, if documents are current. Existing versions of documents may be updated or modified if needed during the current integrated planning process.

Each HRSA and CDC-funded jurisdiction needs to participate in the completion and submission of an Integrated Plan and must include the following:

- Detailed information of who is responsible for developing the Integrated Plan within the jurisdiction (i.e., RWHAP Part A planning councils/body(ies), RWHAP Part B advisory groups, Integrated Planning Bodies and CDC HIV planning bodies).
- Well defined goals and objectives. Each jurisdiction should provide a descriptive detail and process for how it will address HIV prevention, care, and treatment needs in its service areas and accomplish national HIV goals.

All funded jurisdictions (funded by both CDC DHP and HRSA HAB) must submit an Integrated Plan and address all sections as outlined in the guidance. State and/or local jurisdictions (municipalities) have the option to submit to CDC and HRSA:

- Integrated state/city prevention and care plan,
- Integrated state-only prevention and care plan, and/or
- Integrated city-only prevention and care plan.

NOTE: All submissions should demonstrate an integrated prevention and care plan as a method to better coordinate a response to HIV among all partners and collaborators. Per legislative and programmatic requirements, CDC and HRSA expect coordination among funded entities and community collaborators in the development of the Integrated Plan.

The Integrated Plan submission may include several jurisdictions (e.g., the state, the RWHAP Part A jurisdiction(s) in that state, CDC directly funded cities in that state). Each HRSA and CDC-funded jurisdiction must participate in the completion and submission of the Integrated Plan.

- For jurisdictions submitting city-only plan, the city Integrated Plan should complement the state Integrated Plan, including the SCSN.
- Both the city-only and state-only Integrated Plans should describe how the jurisdictions will coordinate actions to prevent duplication.
- Both city-only and state-only plans should include and address the HIV epidemic within its jurisdiction.

The jurisdiction's Integrated Plan submission is due to CDC DHP and HRSA HAB **no later than 11:59 PM ET on June 30, 2026**. Submissions should be no longer than 100 pages, not including the completed checklist, and no smaller than 11 pt. font.

The submission package must contain the following documents:

- A CY 2027 – 2031 Integrated Plan that includes all components outlined in this guidance;
- A completed *CY 2027 – 2031 CDC DHP and HRSA HAB Integrated Prevention and Care Plan Guidance Checklist* detailing where CDC and HRSA may find each of the required elements; and
- A signed letter from all jurisdictional HIV planning groups/bodies indicating concurrence, concurrence with reservations, or non-concurrence with the plan.

Further detailed instructions on how to submit your jurisdiction's Integrated Plan will be addressed during the upcoming webinar. You may also reach out to your CDC and HRSA project officers for questions or concerns regarding your Integrated Plan.

While there is not a standard template for the Integrated Plan submission, the plan submitted must include all the components outlined in this guidance and include a completed *CY 2027 – 2031 CDC DHP and HRSA HAB Integrated Prevention and Care Plan Guidance Checklist*. Plans must be broad enough to ensure that all HIV prevention and care funding work together to reduce new HIV diagnoses and to increase viral suppression among all people with HIV. The new written plan should not redevelop existing products such as epidemiologic profiles, if these products are current and up-to-date. Existing versions of these documents may be updated or modified if needed for the current integrated planning process.

Workplan Monitoring

The Integrated Plan Workplan provides an overarching vehicle to coordinate approaches for addressing HIV prevention and care needs at the state and local levels. The Integrated Plan Workplan must contain goals, SMART (specific, measurable, achievable, relevant and time-bound) objectives, specific activities, responsible parties, key partners, and performance measures that address both HIV prevention and care needs.

In addition, the goals and objectives must be in alignment with national HIV goals and the four EHE strategies, listed below:

- Diagnose all people with HIV as early as possible
- Treat people with HIV rapidly and effectively to reach sustained viral suppression
- Prevent new HIV transmissions by using proven interventions, including pre-exposure prophylaxis (PrEP), post-exposure prophylaxis (PEP) and syringe services programs (SSPs)
- Respond quickly to potential HIV outbreaks to get needed prevention and treatment services to people who need them.

Monitoring the Integrated Plan Workplan will assist recipients and planning bodies with identifying ways to measure progress toward goals and objectives; selecting strategies for

collecting information; and analyzing information to inform decision-making and improve HIV prevention, care, and treatment efforts within the jurisdiction. Jurisdictions must identify how they will provide regular updates to the planning bodies and collaborators on the progress of plan implementation, solicit feedback, and use the feedback from collaborators for plan improvements. Each jurisdiction also will need to use surveillance and program data to assess and improve health outcomes, health disparities, and the quality of the HIV service delivery systems, including strategic long-range planning.

The Integrated Plan, including the Integrated Plan Workplan, is a “living document” and must be reviewed and updated at least annually or as needed. The process for annual review should include the identification of relevant data and data systems, analysis of data on performance measures, the inclusion of planning bodies in the ongoing evaluation of activities and strategies, a mechanism to revise goals and objectives as needed based on data, and an evaluation of the planning process.

To ensure progress on Integrated Plan activities and the Integrated Plan’s alignment with funding strategies, CDC and HRSA will engage in monitoring workplan activities both independently and jointly. Recipients will use established reporting requirements (i.e., applications, annual progress reports) to document progress on achieving the objectives presented in the Integrated Plan. These reporting updates should include the jurisdiction’s plan to monitor and evaluate implementation of the goals, strategies, and objectives included in the Integrated Plan. Project officers will also utilize the Integrated Plan Workplan as a tool in monitoring and supporting the jurisdiction’s progress. Additionally, CDC and HRSA project officers will continue to monitor progress during regularly scheduled calls and will conduct periodic joint monitoring calls with recipients.

CDC DHP and HRSA HAB remain committed to our ongoing partnership and the provision of technical assistance (TA) services. For TA services around integrated planning, please contact your respective project officers.

Appendix 1

CY 2027 – 2031 CDC DHP and HRSA HAB Integrated Prevention and Care Plan Guidance Checklist

Section I: Introduction of Integrated Plan and SCSN			
Purpose: To provide a description of the Integrated Plan, including the SCSN and the approach the jurisdiction used to prepare and package requirements for submission • Write a detailed summary: Ensure it shows how you have met the Integrated Plan requirements. • Combining materials: Explain how new and existing materials relate.			
Requirements	Materials	Title/File Name of materials	Page(s) for this section
1. Introduction Describe the Integrated Plan • Include SCSN • Explain how past plans/SCSNs inform this plan/SCSN. • Or provide an overall description of an existing plan/SCSN that meets all requirements and includes the information below.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
a. Approach Describe your approach to preparing the Integrated Plan submission. • Update existing plan: Modify and enhance previously submitted plan. • Integrate Existing Documents: Combine sections from current plans and documents. • Develop a New Plan: Create an entirely new plan from scratch.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
b. Documents submitted to meet requirements. Fill out for each requirement per column provided: • New or existing material • Title/File Name for materials • Page numbers within the section	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
Section II: Community Engagement and Planning Process			

Purpose: To describe how the jurisdiction’s planning approach engaged community members and collaborators, fulfilled legislative and programmatic requirements, and addresses the HIV care and prevention needs of people with HIV and people vulnerable to HIV.

Tips for meeting this requirement

1. This requirement may include submission of portions of other submitted plans including the EHE plans, and other jurisdictional plans (e.g., Getting to Zero plans, Fast Track Cities, Cluster Detection and Response plans).
2. Be sure to provide adequate detail to confirm compliance with legislative and programmatic planning requirements, including:
 - a. SCSN,
 - b. RWHAP Part A and B planning requirements including those requiring feedback from key collaborators and people with HIV, and
 - c. CDC planning requirements.
3. The community engagement process should reflect the local demographics.
4. The planning process should include key collaborators and broad-based communities that include but are not limited to:
 - a. People with HIV,
 - b. People and communities disproportionately impacted by HIV,
 - c. Funded-service providers, and
 - d. Collaborators, especially new collaborators, from disproportionately affected communities. See *Appendix 3* for required and suggested examples of collaborators to be included.
5. Explain how the jurisdiction will build collaborations including sharing of data and establishing/maintaining services agreements, among:
 - a. Systems of prevention and care, and
 - b. Other service systems relevant to HIV in the jurisdictions (e.g., behavioral health and housing services).
6. Include community engagement related to “Respond” and support of cluster detection activities. Describe what happens when a potential cluster is detected and how community partners and affected communities are engaged.

Requirements	New/existing Materials	Title/File Name of materials	Page(s) for this section
1. Jurisdiction Planning Process Describe Jurisdiction’s approach to planning • Planning Steps: explain steps in planning process. • Groups Involved: list involved groups for needs assessment and goal setting. • Usage of Data Sources: detail data sources used. • Representation from People and Communities Disproportionately Impacted by HIV: how were they included?	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.

Consider sections from other plans, like the EHE plan. Ensure you cover these points.			
a. Entities involved in the process. List and describe the types of entities involved in the planning process. Be sure to include: • CDC and HRSA-funded programs, • New collaborators (e.g., new partner organizations, people with HIV, people and communities disproportionately impacted by HIV), and • Other entities such as HOPWA-funded housing service providers or the state Medicaid agency that met as part of the process. See Appendix 3 for list of required and suggested collaborators	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
b. Role of the RWHAP Part A Planning Council/Planning Body Describe the role of the RWHAP Part A Planning Council(s)/Planning Body(s) in developing the Integrated Plan. Note: Jurisdictions submitting a State-Only Plan are not required to complete this narrative section; however, letters of concurrence must be submitted.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
c. Role of Planning Bodies and Other Entities <u>Describe how programs and planning bodies contributed to:</u> • CDC Prevention Program, • RWHAP Part B, • State/territory or jurisdiction prevention and care, • EHE, and • Community members and other entities. <u>Describe collaboration efforts.</u> • How did prevention and care bodies work together? Provide documentation of the type of engagement that occurred. EHE planning may be submitted as long as it includes updates that describe ongoing activities.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
d. Collaboration with RWHAP Parts – SCSN requirement Describe how jurisdictions incorporate RWHAP Parts A-D providers and Part F recipients in the planning process.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.

Describe how RWHAP Part A or Part B only plan: • Aligns with other Integrated Plans, • Avoids service duplication, and • Prevents gaps in service delivery systems.			
e. Engagement of people with HIV – SCSN requirement Describe how jurisdictions engaged people with HIV in all stages of the process including: • Needs assessment, • Priority setting, and • Development of goals/objectives. Describe how people with HIV will be involved in implementing the plan including: • Implementation, • Monitoring, • Evaluation, and • Improvement process.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
f. Priorities List key priorities that arose out of the planning and community engagement process.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
g. Updates to Other Strategic Plans Used to Meet Requirements If the jurisdiction is using portions of another local strategic plan (e.g., EHE, Ending the Epidemic, Getting to Zero) to satisfy this requirement, please describe: 1. How the jurisdiction uses annual needs assessment data to adjust that plan's priorities. 2. How the jurisdiction incorporates the ongoing feedback of people with HIV, people and communities disproportionately impacted by HIV, and collaborators in that plan. 3. Any changes due to updated assessments and community input. 4. Any changes made to that planning process as a result of evaluating the planning process.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.

Section III: Contributing Data Sets and Assessments

Purpose: To analyze the qualitative and quantitative data used by the jurisdiction to describe how HIV impacts the jurisdiction; to determine the services needed by clients to access and maintain HIV prevention, care and treatment services; to identify barriers for clients accessing those services; and to assess gaps across the HIV Prevention and HIV Care Continuums of Care. This section fulfills several legislative requirements including:

1. SCSN,
2. RWHAP Part A and B planning requirements including those requiring feedback from key collaborators and people with HIV, and
3. CDC planning requirements including those requiring feedback from key collaborators and people and communities disproportionately impacted by HIV acquisition.

Tips for meeting this requirement

1. This requirement may include submission of portions of other submitted plans including the EHE plan submitted as a deliverable for PS24-0047. *Please ensure that if using a previously developed plan that the data included describes the entire jurisdiction and not just a subsection of the jurisdiction such as an EHE priority county.*
2. Be sure to provide adequate detail to confirm compliance with legislative and programmatic planning requirements.
3. Include both narrative and graphic depictions of the health disparities in the area for people with HIV and people and communities disproportionately impacted by HIV including information about HIV outbreaks and clusters.
4. The data used in this section should inform both the situational analysis and the goals established by the jurisdiction.
5. Please refer to the [Integrated Guidance for Developing Epidemiologic Profiles \(cdc.gov\)](https://www.cdc.gov/eid/content/ed010104.htm) for HIV Prevention and Ryan White HIV/AIDS Program Planning.
6. *Appendix 4* includes suggested data resources to assist with this submission including the Epidemiologic Snapshot.

Requirements	New/existing Materials	Title/File Name of materials	Page(s) for this section
1. Data Sharing and Use Provide an overview of data available to the jurisdiction and how data were used to support planning. Identify with whom the jurisdiction has data sharing agreements and for what purpose.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
2. Epidemiologic Snapshot Provide a snapshot summary using: • Current data: by using both narrative and graphic depictions display trends using the most recent 5 years (most available data). • Key descriptors: people diagnosed with HIV (including newly diagnosed), people vulnerable to HIV, and those with HIV who do not know their HIV	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.

status. Highlight populations for prevention and care and align with national HIV goals. • Types of data: demographic, geographic, socioeconomic, behavioral, and clinical characteristics. • HIV clusters: outline key characteristics of HIV clusters and cases linked to these clusters. Note: Use the HIV prevention and care continuum in your graphic depiction showing burden of HIV in the jurisdiction.			
3. HIV Prevention, Care and Treatment Resource Inventory Develop an inventory that includes a table and/or narrative but must address <u>all</u> of the following information: Providers: • Agencies providing HIV care and prevention services in the jurisdiction. • Agencies providing substance use prevention and treatment services: describe the coordination strategy with HIV prevention and care services. Funding Sources: • HRSA (all RWHAP parts) and CDC funding sources. Funding amounts not needed. • Additional funding sources: HRSA's Community Health Center Program, HUD's HOPWA program, Indian Health Service (IHS) HIV/AIDS Program, Substance Abuse and Mental Health Services Administration programs, and foundations. <u>Provided Services:</u> • Services and activities by organizations • People and communities disproportionately impacted by HIV served • How services maximize the quality of health and support for those with certain risk factors of acquiring or with HIV	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
a. Assessment of Strengths and Gaps across the HIV Prevention and Care Continuum Assessment of Strengths and Gaps Inventory should include: • Geographic landscape	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.

• Occurrences of HIV clusters/outbreaks • Underuse of new HIV prevention tools (e.g., injectable antiretrovirals, environmental impacts) This analysis should include areas where the jurisdiction may need to build capacity for service delivery based on the items listed.			
b. Approaches and partnerships Please describe the approaches the jurisdiction used to complete the HIV prevention, care and treatment inventory. Be sure to include partners, especially new partners, used to assess service capacity in the area.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
4. Needs Assessment Identify and describe all needs assessment activities or other activities/data/information used to inform goals and objectives in this submission. Include a summary of needs assessment data including: HIV Testing Services: 1. Services needed for HIV testing access. 2. Services for staying HIV negative (e.g., PrEP, Syringe Services Programs) 3. Rapid linkage to HIV care after positive diagnosis. HIV Care and Treatment: 4. Services for maintaining HIV care and reaching and sustaining viral suppression. Barriers to access: 1. HIV testing barriers. 2. Challenges with state laws and regulations. 3. HIV prevention, care, and treatment service access issues.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
a. Priorities List the key priorities arising from the needs assessment process.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.

b. Action Taken List any key activities undertaken by the jurisdiction to address needs and barriers identified during the needs assessment process.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
c. Approach Please describe the approach the jurisdiction used to complete the needs assessment. Be sure to include how the jurisdiction incorporated people with HIV and people and communities disproportionately impacted by HIV in the process and how the jurisdiction included entities listed in Appendix 3.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
Section IV: Situational Analysis <u>Purpose:</u> To provide a snapshot summary that synthesizes information from the Community Engagement and Planning Process in Section II and the Contributing Data sets and Assessments detailed in Section III that in turn informs the goals and objectives of the Integrated Plan. The situational analysis provides an overview of strengths, challenges, and identified needs across the HIV prevention and care continuum. Tips 1. New or existing material may be used; however, if existing material is used, it needs to be updated to reflect the most current information. 2. This section not only provides a snapshot of the data and environment for goal-setting but meets the RWHAP legislative requirement for the SCSN. 3. Jurisdictions may submit the Situational Analysis requirement. <i>However, it must include information for the entire HIV prevention and care system and not just the EHE priority area or service system.</i> If using an updated or current version of your EHE plan to fulfill this requirement, be sure to include updates as noted below.			
Requirements	New/existing Materials	Title/File Name of materials	Page(s) for this section
1. Situational Analysis Based on the Community Engagement and Planning Process in Section II and the Contributing Data Sets and Assessments detailed in Section III. Provide a short overview across the HIV prevention and care continuum to include: • Strengths • Challenges • Identified needs.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.

• Analysis of structural and systemic issues impacting people and communities disproportionately impacted by HIV. Analysis should include each of the following areas: <u>Diagnose</u> all people with HIV as early as possible. <u>Treat</u> people with HIV rapidly and effectively to reach sustained viral suppression. <u>Prevent</u> new HIV transmissions by using proven interventions, including pre-exposure prophylaxis (PrEP) and syringe services programs (SSPs) <u>Respond</u> quickly to potential HIV outbreaks to get needed prevention and treatment services to people who need them. Note: Jurisdictions may submit other plans to satisfy this requirement, if they are current and applicable to the entire HIV prevention and care service system across the jurisdiction.			
a. People and Communities Disproportionately Impacted by HIV Based on the Community Engagement and Planning Process in Section II and the Contributing Data Sets and Assessments detailed in Section III, describe how the goals and objectives address the needs of people and communities disproportionately impacted by HIV for the jurisdiction	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
Section V: 2027-2031 Goals and Objectives <u>Purpose:</u> To detail goals and objectives for the next 5 years. Goals and objectives should reflect strategies that ensure a comprehensive, coordinated approach for all HIV prevention and care funding. Tips for meeting this requirement: 2. Recipients may submit plans (e.g., EHE, Getting to Zero, HIV Cluster Detection and Response plan) for this requirement as long as it sets goals for the entire HIV prevention and care continuum and geographic area. 3. Goals and objectives should be in SMART format and structured to include strategies that accomplish the following: a. Diagnose all people with HIV as early as possible b. Treat people with HIV rapidly and effectively to reach sustained viral suppression c. Prevent new HIV transmissions by using proven interventions, including pre-exposure prophylaxis (PrEP), post-exposure prophylaxis (PEP) and syringe services programs (SSPs) d. Respond quickly to potential HIV outbreaks to get needed prevention and treatment services to people who need them.			

4. The plan should include goals that address both HIV prevention and care needs.			
Requirements	New/existing Materials	Title/File Name of materials	Page(s) for this section
1. Goals and Objectives Description List and describe goals and objectives for the jurisdiction. Include 3 goals/objectives for each area: • Diagnose • Treat • Prevent • Respond to HIV Ensure goals address any barriers or needs identified during the planning process. See Appendix 2 for examples. Note: Jurisdictions may submit other updated plans to satisfy this requirement as long as they include goals that cover the entire HIV prevention and care service delivery system and geographic area.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
a. Updates to Other Strategic Plans Used to Meet Requirements If the jurisdiction is using portions of another local strategic plan to satisfy this requirement, please describe any changes made as a result of analysis of data.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
Section VI: 2027-2031 Integrated Planning Implementation, Monitoring, and Jurisdictional Follow-Up <u>Purpose:</u> To describe the infrastructure, procedures, systems, and/or tools that will be used to support the key phases of integrated planning. In this section jurisdictions will detail how best to ensure the success of Integrated Plan goals and objectives through the following 5 key phases: 1. Implementation 2. Monitoring 3. Evaluation 4. Improvement 5. Reporting and Dissemination Tips for meeting this requirement 1. This requirement may require the recipient to create some new material or expand upon existing materials. 2. Include sufficient descriptive detail for each of the 5 key phases to ensure that all entities understand their roles and responsibilities, and concur with the process.			

3. If you are submitting portions of a different jurisdictional plan to meet this requirement, you should include updates that describe steps the jurisdiction has taken to accomplish each of the 5 phases.

Requirements	New/existing Materials	Title/File Name of materials	Page(s) for this section
1. 2027-2031 Integrated Planning Implementation Approach 1. Describe the infrastructure, procedures, systems and/or tools that will be used to support the 5 key phases (see phases above) of integrated planning to ensure goals and objectives are met	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
a. Implementation 2. To achieve the jurisdictions Integrated Plan goals and objectives. Describe the process for coordinating partners: • New partners • People with HIV • People and communities disproportionately impacted by HIV • Providers and administrators from different funding streams Include how the plan will influence, leverage, and coordinate funding streams including but not limited to HAB and CDC funding.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
b. Monitoring 3. Describe the process for monitoring progress on the Integrated Plan goals and objectives. Include how the jurisdiction will: • Coordinate different collaborators. • Use different funding streams to implement plan goals. • Collaborate/coordinate monitoring of multiple different plans (e.g., city-only, state-only) to avoid duplication of effort and potential gaps in service provision. • Coordinate activities and timelines.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.

Note: Recipients will be asked to provide updates to both CDC and HRSA as part of routine monitoring of all awards.			
c. Evaluation 4. Describe performance measures and methodology used to evaluate progress on goals and objectives. Include how often the jurisdiction: • Conducts analysis of the performance measures • Presents data to the planning group.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
d. Improvement 5. Describe how the jurisdiction will: • Continue to use data. • Use community input to make revisions and improvements to the plan. • How revision decisions will be made and how often.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
e. Reporting and Dissemination 6. Describe the process for informing collaborators, including people with HIV, about progress made to the plan. (implementation, monitoring, evaluation and improvements).	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.

f. Updates to Other Strategic Plans to Meet Requirements If using portions of another local strategic plan to satisfy this requirement, please describe: - Steps the jurisdiction has already taken to: - Implement - Monitor - Evaluate - Improve - Report/disseminate plan activities. - Describe Achievements/challenges in implementing: - Strategies to resolve challenges. - Plan to replicate successes. - Revisions made based on work completed.	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
Section VII: Letters of Concurrence Provide letters of concurrence or concurrence with reservation. Each letter should specify how the planning body was involved in the Integrated Plan development. Include a letter of concurrence for each planning body in the state/territory or jurisdiction. Please note, a letter of concurrence is required from Planning Councils regardless of the type of plan submitted. See <i>Appendix 6</i> for a sample Letter of Concurrence.			
Requirements	New/existing Materials	Title/File Name of materials	Page(s) for this section
1. CDC Prevention Program Planning Body Chair(s) or Representative(s) Required letter of concurrence	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
2. RWHAP Part A Planning Council/Planning Body(s) Chair(s) or Representative(s) Required letter of concurrence	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
3. RWHAP Part B Planning Body Chair or Representative Required letter of concurrence unless City-Only Plan is submitted	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
4. Integrated Planning Body Optional letter of concurrence	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.

5. EHE Planning Body Optional letter of concurrence	Choose an item.	Click or tap here to enter text.	Click or tap here to enter text.
---	-----------------	----------------------------------	----------------------------------

Appendix 2

Examples of Workplan Components

Note: *A workplan template is available on TargetHIV under the Integrated HIV/AIDS Planning & Technical Assistance Center (IHAP TAC) as a part of the Integrated Plan Toolkit.*

Diagnose (EXAMPLE)

Goal 1: Diagnose all people with HIV as early as possible.

Objective: To increase the number of HIV tests conducted by XX% within the jurisdiction by 2031.

Key Activities/Strategies:

- 1) Increase capacity of health care delivery systems to offer routine testing in XX ERs, acute care settings, etc.
- 2) Plan and develop a wide dissemination of self-testing kits through system partners across the jurisdiction to improve access for testing.

Responsible Parties: RWHAP Part A recipient, RWHAP Part B recipient, EHE recipient, CDC recipient

Key Partners: Health departments, community-based organizations, FQHCs, correctional facilities, school-based clinics, people and communities disproportionately impacted by HIV, STI/sexually transmitted disease clinics, women's health services/prenatal services providers, hospitals, etc.

Performance Measures:

- # of HIV tests
- # of newly identified persons with HIV

Progress towards national HIV goals: Increase the number of people who know their HIV diagnosis by XX% to prevent new HIV infections.

Treat (EXAMPLE)

Goal 1: Treat HIV timely and effectively.

Objective: To engage and provide access to care for XX people with HIV by 2028.

Key Activities/Strategies:

- 1) Identify and address mental health barriers for people who have never engaged in care or who have fallen out of care by partnering with mental health providers
- 2) Develop and implement at least one effective, evidence-based, or evidence-informed interventions that improve retention in care

Responsible Parties: RWHAP Part A recipient, RWHAP Part B recipient, EHE recipient

Key Partners: FQHCs, medical care providers, hospitals, people and communities disproportionately impacted by HIV, community-based organizations, mental health providers, various professional health care associations, etc.

Performance Measures:

- # of newly identified persons with HIV linked to care within 30 days
- # of persons with HIV identified as not in care linked to care within 30 days

Progress towards national HIV goals: Increase the number of people receiving care by XX% to improve HIV-related health outcomes.

Prevent (EXAMPLE)

Goal 1: Prevent new HIV transmissions.

Objective: To increase access to PrEP by X% for people and communities disproportionately impacted by HIV by 2031.

Key Activities/Strategies:

- 1) Increase number of providers trained each year by X% to prescribe PrEP
- 2) Increase PrEP prescriptions among people and communities disproportionately impacted by HIV to reduce health disparities

Responsible Parties: RWHAP Part A recipient, RWHAP Part B recipient, EHE recipient, CDC recipient

Key Partners: Community-based organizations, people and communities disproportionately impacted by HIV, FQHCs, STI/sexually transmitted disease clinics, hospitals, private providers, social service providers, primary care providers, etc.

Performance Measures:

- # of providers trained
- # of prescriptions for PrEP

Progress towards national HIV goals: Reduce HIV-related disparities

Respond (EXAMPLE)

Goal 1: Respond quickly to potential HIV clusters and/or outbreaks.

Objective: To develop a Cluster Detection and Response (CDR) Plan that can be implemented effectively by 2028.

Key Activities/Strategies:

- 1) Identify and engage all key collaborators in the plan development process, including people and communities disproportionately impacted by HIV
- 2) Convene existing communities of practice to share outbreak best response practices and known gaps to guide development and key strategies in the plan

Responsible Parties: CDC Recipient

Key Partners: Community members, community-based organizations, HIV care providers, FQHCs, correctional facilities, hospitals, social services providers, people with HIV, health departments, public health professionals, etc.

Performance Measures: Completion of CDR plan

Progress towards national HIV goals: Achieve integrated and coordinated efforts that address the HIV epidemic

Appendix 3

Examples of Key Collaborators and Community Members

Community engagement is a key requirement of the Integrated Planning Guidance. Community engagement involves the collaboration of key collaborators and broad-based communities who work together to identify strategies to increase coordination of HIV programs throughout the state, local health jurisdictions, or tribal areas. Each community should select collaborators including people and communities disproportionately impacted by HIV and can best help align resources and set goals that promote HIV prevention and health outcomes. This should include not only traditional collaborators but engagement with new partners and non-traditional organizations. While the Integrated Plan submission should be done in collaboration with identified Integrated Planning body(s), community engagement may also include assessment processes (e.g., focus groups) that take place outside of or in conjunction with the Integrated HIV Care and Prevention body(s) and to inform the Integrated Plan submission.

Please Note: Persons or groups with a “*” must be included in the planning process to meet HRSA and/or CDC’s legislative or programmatic requirements.

Key Collaborators to Consider for Planning Group Membership

- Health department staff*
- Community- based organizations serving populations affected by HIV as well as HIV services providers*
- People with HIV, including members of a Federally recognized Indian tribe as represented in the population, and individuals co-infected with hepatitis B or C*
- People and communities disproportionately impacted by HIV
- Behavioral or social scientists
- Epidemiologists
- HIV clinical care providers including (RWHAP Parts C and D) *
- STD clinics and programs
- Non-elected community leaders including faith community members and business/labor representatives*
- Community health care center representatives including FQHCs*
- Substance use treatment providers*
- Hospital planning agencies and health care planning agencies*
- Intervention specialists
- Jurisdictions with CDC- funded local education agencies/academic institutions (strongly encouraged to participate).
- Mental health providers*
- Individuals (or representatives) with an HIV diagnosis during a period of incarceration (within the last three years) at a federal, state, or local correctional facility*
- Representatives from state or local law enforcement and/or correctional facilities
- Social services providers including housing and homeless services representatives*
- Local, regional, and school-based clinics; healthcare facilities; clinicians; and other medical providers

- Medicaid/Medicare partners
- Area Agencies on Aging and other aging oriented organizations

Examples of Key Collaborators to Consider for Community Engagement

- Existing community advisory boards
- Community members resulting from new outreach efforts
- Community members that represent the demographics of the local epidemic (e.g., race, ethnicity, sex, age, etc.)
- Community members unaligned or unaffiliated with agencies currently funded through HRSA and/or CDC
- STD clinics and programs
- Other key informants
- City, county, tribal, and other state public health department partners
- Local, regional clinics, and school-based healthcare facilities; clinicians; and other medical providers
- Medicaid/Medicare partners and private payors
- Correctional facilities, juvenile justice, local law enforcement and related service providers
- Community- and faith-based organizations, including civic and social groups
- Professional associations
- Local businesses
- Local academic institutions
- Area Agencies on Aging and other aging oriented organizations
- Other key informants

Examples of Community Engagement Activities

- Focus groups or interviews
- Town hall meetings
- Topic-focused community discussions
- Community advisory group or ad hoc committees or panels
- Collaboration building meetings with new partners
- Public planning body(s) meetings or increased membership
- Meetings between state and local health departments
- Social media events

Appendix 4

Suggested Data Sources

Suggested Data Sources:

- Behavioral surveillance data, including databases such as National HIV Behavioral Surveillance System (NHBS), Youth Risk Behavioral Surveillance System (YRBSS), Behavioral Risk Factor Surveillance System (BRFSS) (e.g., patterns of, or deterrents to, HIV testing, substance use and needle sharing, healthcare-seeking behavior, and adherence to prescribed antiretroviral therapies)
- HIV surveillance data, including clinical data (e.g., CD4 and viral load results) and HIV cluster detection and response data. HIV Surveillance Report, Supplemental Reports, and Data Tables
- STI surveillance data
- HIV testing program data (e.g., data from Early Identification of Individuals with HIV/AIDS for RWHAP Parts A and B Grantees; CDC HIV testing data)
- NCHHSTP AtlasPlus (HIV, STD, Hepatitis, TB, and Social Determinants): https://www.cdc.gov/nchhstp/about/atlasplus.html?CDC_AAref_Val=https://www.cdc.gov/nchhstp/atlas/index.htm?s_cid=ss_AtlasPlusUpdate001
- Medical Monitoring Project: https://www.cdc.gov/hiv-data/mmp/?CDC_AAref_Val=https://www.cdc.gov/hiv/statistics/systems/mmp/index.html
- AHEAD: America's HIV Epidemic Analysis Dashboard: <https://ahead.hiv.gov/>
- Other relevant demographic data (i.e., Hepatitis B or C surveillance, tuberculosis surveillance, and substance use data)
- Qualitative data (e.g., observations, interviews, discussion groups, focus groups, and analysis of social networks)
- Vital statistics data (e.g., state office of vital statistics, National Death Index, Social Security Death Master File)
- Other Federal Data Sources (e.g., Medicaid Data, HOPWA Data, VA Data)
- Local Data Sources (e.g., Department of Corrections, Behavioral Health services data including information on substance use and mental health services)
- Other Relevant Program Data: (e.g. Community Health Center program data).

Appendix 6

Sample Letter of Concurrence or Concurrence with Reservations between Planning Body and State or Local Health Department or Funded Agency

Dear (Name):

The [insert name of Planning Body, e.g. planning council, advisory council, HIV planning group, planning body] [insert ***concurs or concurs with reservations***] with the following submission by the [insert name of State/Local Health Department/ Funded Agency] in response to the guidance set forth for health departments and HIV planning groups funded by the CDC's Division of HIV Prevention (DHP) and HRSA's HIV/AIDS Bureau (HAB) for the development of an Integrated HIV Prevention and Care Plan, including the Statewide Coordinated Statement of Need (SCSN) for calendar year (CY) 2027-2031.

The planning body (e.g. planning council, advisory council, HIV planning group, planning body) has reviewed the Integrated HIV Prevention and Care Plan submission to the CDC and HRSA to verify that it describes how programmatic activities and resources are being allocated to the most disproportionately affected people and communities and geographical areas with high rates of HIV. The planning body [insert ***concurs or concurs with reservations***] that the Integrated HIV Prevention and Care Plan submission fulfills the requirements put forth by the CDC's Notice of Funding Opportunity for Integrated HIV Surveillance and Prevention Programs for Health Departments and the Ryan White HIV/AIDS Program legislation and program guidance.

[Insert the process used by the planning body to provide input or review the jurisdiction's plan.]

[If applicable, insert how jurisdictions with directly funded states and cities plan to coordinate their HIV Planning process.]

The signature(s) below confirms the [insert ***concurrence or concurrence with reservations***] of the planning body with the Integrated HIV Prevention and Care Plan.

EXHIBIT N

NATIONAL HIV/AIDS STRATEGY

for the **United States**
2022–2025

Acknowledgments: The National HIV/AIDS Strategy (NHAS or Strategy) was developed by the White House Office of National AIDS Policy (ONAP) in collaboration with federal partners and with input from the HIV community across the country. Interested parties and organizations throughout the federal government and those engaged in work in many different communities have helped shape the goals, objectives, and strategies in the Strategy. ONAP extends the gratitude and appreciation of the White House to everyone who made thoughtful recommendations and recommitted to the Strategy’s vision and goals. ONAP also offers thanks to the team at the Office of Infectious Disease and HIV/AIDS Policy in the U.S. Department of Health and Human Services for its many contributions to developing the Strategy.

Language used in the National HIV/AIDS Strategy: The Strategy honors the lived experiences and choices of all people, regardless of age, sex, gender identity, sexual orientation, race, ethnicity, religion, disability, geographic location, or socioeconomic circumstance. To reflect this, authors made a concerted effort to use inclusive and person-first language throughout the strategy. Evidence-based, contemporary terminology is also used to convey respect and to reduce stigma faced by communities and populations disproportionately impacted by HIV. This approach is intended to reflect the administration’s vision for a collective, inclusive, and respectful national response. Despite these efforts, in certain instances, for example to accurately convey scientific meaning, specific terminology or language may be unintentionally offensive or stigmatizing to some individuals or populations.

Additional information regarding the Strategy and associated activities may be accessed at the [White House website](#).

Suggested citation: The White House. 2021. *National HIV/AIDS Strategy for the United States 2022–2025*. Washington, DC.

The National HIV/AIDS Strategy is not a budget document and does not imply approval for any specific action under Executive Order 12866 or the Paperwork Reduction Act. The Strategy will inform the Federal budget and regulatory development processes within the context of the goals articulated in the President’s Budget. All activities included in the Strategy are subject to budgetary constraints and other approvals, including the weighing of priorities and available resources by the Administration in formulating its annual budget and by Congress in legislating appropriations.

VISION ★ ★ ★ ★ ★

The United States will be a place where new HIV infections are prevented, every person knows their status, and every person with HIV has high-quality care and treatment, lives free from stigma and discrimination, and can achieve their full potential for health and well-being across the lifespan.

This vision includes all people, regardless of age, sex, gender identity, sexual orientation, race, ethnicity, religion, disability, geographic location, or socioeconomic circumstance.

EXECUTIVE SUMMARY

Building on lessons learned and progress made in the past 40 years, the United States now has the opportunity to end the HIV epidemic. This opportunity has been made possible by tireless advocacy, determined research, and dedicated delivery of diagnostic, prevention, care, treatment, and supportive services.

The nation's annual new HIV infections have declined from their peak in the mid-1980s, and people with HIV in care and treatment are living longer, healthier lives. In 2019, the estimated number of new HIV infections was 34,800 and 1.2 million people were living with HIV in the United States. However, not all groups have experienced decreases in HIV infections or improvements in health outcomes. Centers for Disease Control and Prevention data show that new HIV infections fell 8% from 2015 to 2019, after a period of general stability in new infections in the United States. This trend represents a hopeful sign of progress. But gains remain uneven, illuminating opportunities for geographic- and population-focused efforts to make more effective use of the powerful HIV prevention, care, and treatment tools now available.

This National HIV/AIDS Strategy (the Strategy), the nation's third national HIV strategy, updates the HIV National Strategic Plan (2021). The Strategy sets forth bold targets for ending the HIV epidemic in the United States by 2030, including a 75% reduction in new HIV infections by 2025 and a 90% reduction by 2030. For interested parties and organizations across the nation, the Strategy articulates goals, objectives, and strategies to prevent new infections, treat people with HIV to improve health outcomes, reduce HIV-related disparities, and better integrate and coordinate the efforts of all partners to achieve the bold targets for ending the epidemic. The Strategy also establishes evidence-based indicators to measure progress, with quantitative targets for each indicator, and designates priority populations.

The Strategy establishes the following vision:

The United States will be a place where new HIV infections are prevented, every person knows their status, and every person with HIV has high-quality care and treatment, lives free from stigma and discrimination, and can achieve their full potential for health and well-being across the lifespan.

This vision includes all people, regardless of age, sex, gender identity, sexual orientation, race, ethnicity, religion, disability, geographic location, or socioeconomic circumstance.

The vision, goals, objectives, and other components of the Strategy were developed and approved by a dedicated Steering Committee, composed of subject matter experts from across the federal government, with input from numerous and varied interested parties and organizations in the field. The Strategy is designed to be accessible to and useful for a broad audience, including people working in public health, health care, government, community-based organizations, research, private industry, and academia. It serves as a roadmap for all sectors of society to guide development of policies, services, programs, initiatives, and other actions to achieve the nation's goal of ending the HIV epidemic by 2030.

The Strategy is designed to facilitate a whole-of-society national response to the HIV epidemic in the United States that accelerates efforts to end the HIV epidemic in the United States by 2030 while supporting people with HIV and reducing HIV-associated morbidity and mortality. While not every objective or strategy will speak to or be actionable by all readers, the intent is that individuals and organizations from all sectors of society can find opportunities

where they can support necessary scale-up, expansion, and refinement efforts. All communities, regardless of HIV prevalence, are vital to ending the HIV epidemic in this country and private- and public-sector partners must work together with community-based, faith-focused, and advocacy organizations; governmental public health; mental health and substance use disorder treatment services; the criminal justice system; and providers of housing, food and nutrition, education, and employment services because we all have a role in reducing new HIV infections, improving outcomes and quality of life for people with HIV, and eliminating HIV disparities.

Interwoven throughout the Strategy are approaches to address the individual, community, and structural factors and inequities that contribute to the spread of HIV, such as stigma and social determinants of health. The Strategy highlights opportunities to integrate HIV prevention, care, and treatment into prevention and treatment for sexually transmitted infections, viral hepatitis, mental health and substance use disorders, and other public health efforts by leveraging capacity and infrastructure across the domains and breaking down operational and funding silos. A recurring theme is the need to bring to scale innovative solutions and data-driven approaches to address the ongoing and emerging challenges to HIV prevention, care, and treatment, including expanding the types of community and clinical sites that address HIV to help reach and engage people in need of services; supporting retention in HIV prevention and care services; continuing research into development of better prevention tools, therapeutics, and vaccines; and understanding how to make best use of available tools in real-world settings. Throughout this document, the term “care” is used as an umbrella term meant to encompass holistic services including treatment and supportive services.

To ensure implementation and accountability, a Federal Implementation Plan that documents the specific actions that federal partners will take to achieve the Strategy’s goals and objectives will be developed in early 2022. Progress toward meeting the Strategy’s goals will be monitored and reported annually.

The Strategy and the [*Ending the HIV Epidemic in the U.S.*](#) (EHE) initiative are closely aligned and complementary, with EHE serving as a leading component of the work by the U.S. Department of Health and Human Services (HHS), in collaboration with local, state, tribal, federal, and community partners, to achieve the Strategy’s goals. The EHE initiative focuses on scaling up four strategies in the communities most affected by HIV. The Strategy covers the entire country, has a broader focus across federal departments and agencies beyond HHS and all sectors of society, and addresses the integration of several key components that are vital to our collective work, including stigma, discrimination, and social determinants of health.

NHAS AT-A-GLANCE

This At-A-Glance section briefly summarizes the Goals, Objectives, and Strategies that are discussed in detail in the narrative that follows.

Goal 1: Prevent New HIV Infections

1.1 Increase awareness of HIV

- 1.1.1 Develop and implement campaigns, interventions, and resources to provide education about comprehensive sexual health; HIV risks; options for prevention, testing, care, and treatment; and HIV-related stigma reduction.
- 1.1.2 Increase knowledge of HIV among people, communities, and the health workforce in geographic areas disproportionately affected.
- 1.1.3 Integrate HIV messaging into existing campaigns and other activities pertaining to other parts of the syndemic, such as STIs, viral hepatitis, and substance use and mental health disorders, as well as in primary care and general wellness, and as part of annual reproductive health visits and wellness visits.

1.2 Increase knowledge of HIV status

- 1.2.1 Test all people for HIV according to the most current USPSTF recommendations and CDC guidelines.
- 1.2.2 Develop new and expand implementation of effective, evidence-based, or evidence-informed models for HIV testing that improve convenience and access.
- 1.2.3 Incorporate a status-neutral approach to HIV testing, offering linkage to prevention services for people who test negative and immediate linkage to HIV care and treatment for those who test positive.
- 1.2.4 Provide partner services to people diagnosed with HIV or other STIs and their sexual and/or syringe-sharing partners.

1.3 Expand and improve implementation of safe, effective prevention interventions, including treatment as prevention, PrEP, PEP, and SSPs, and develop new options

- 1.3.1 Engage people who experience risk for HIV in traditional public health and health care delivery systems, as well as in nontraditional community settings.
- 1.3.2 Scale up treatment as prevention (i.e., U=U) by diagnosing all people with HIV, as early as possible, and engaging them in care and treatment to achieve and maintain viral suppression.
- 1.3.3 Make HIV prevention services, including condoms, PrEP, PEP, and SSPs, easier to access and support continued use.
- 1.3.4 Implement culturally competent and linguistically appropriate models and other innovative approaches for delivering HIV prevention services.
- 1.3.5 Support research into the development and evaluation of new HIV prevention modalities and interventions for preventing HIV transmissions in priority populations.

- 1.3.6 Expand implementation research to successfully adapt evidence-based interventions to local environments to maximize potential for uptake and sustainability.

1.4 Increase the diversity and capacity of health care delivery systems, community health, public health, and the health workforce to prevent and diagnose HIV

- 1.4.1 Provide resources, incentives, training, and technical assistance to expand workforce and systems capacity to provide or link clients to culturally competent, linguistically appropriate, and accessible HIV testing, prevention, and supportive services especially in areas with shortages that are geographic, population, or facility based.
- 1.4.2 Increase the diversity of the workforce of providers who deliver HIV prevention, testing, and supportive services.
- 1.4.3 Increase the inclusion of paraprofessionals on prevention teams by advancing training, certification, supervision, financing, and team-based care service delivery.
- 1.4.4 Include comprehensive sexual health and substance use prevention and treatment information in curricula of medical and other health workforce education and training programs.

Goal 2: Improve HIV-Related Health Outcomes of People with HIV

2.1 Link people to care immediately after diagnosis and provide low-barrier access to HIV treatment

- 2.1.1 Provide same-day or rapid (within 7 days) start of antiretroviral therapy for persons who are able to take it; increase linkage to HIV health care within 30 days for all persons who test positive for HIV.
- 2.1.2 Increase the number of schools providing on-site sexual health services through school-based health centers and school nurses, and linkages to HIV testing and medical care through youth-friendly providers in the community.

2.2 Identify, engage, or reengage people with HIV who are not in care or not virally suppressed

- 2.2.1 Expand uptake of data-to-care models using data sharing agreements, integration and use of surveillance, clinical services, pharmacy, and social/support services data to identify and engage people not in care or not virally suppressed.
- 2.2.2 Identify and address barriers for people who have never engaged in care or who have fallen out of care.

2.3 Increase retention in care and adherence to HIV treatment to achieve and maintain long-term viral suppression and provide integrative HIV services for HIV-associated comorbidities, coinfections, and complications, including STIs

- 2.3.1 Support the transition of health care systems, organizations, and patients/clients to become more health literate in the provision of HIV prevention, care, and treatment services.
- 2.3.2 Develop and implement effective, evidence-based, or evidence-informed interventions and supportive services that improve retention in care.
- 2.3.3 Expand implementation research to successfully adapt effective evidence-based interventions, such as HIV telehealth, patient and peer navigators, accessible pharmacy services, community health workers, and others, to local environments to facilitate uptake and retention to priority populations.
- 2.3.4 Support ongoing clinical, behavioral, and other research to support retention in care, medication adherence, and durable viral suppression.

2.4 Increase the capacity of the public health, health care delivery systems, and health care workforce to effectively identify, diagnose, and provide holistic care and treatment for people with HIV

- 2.4.1 Provide resources, value-based and other incentives, training, and technical assistance to expand workforce and systems capacity to provide or link clients to culturally competent and linguistically appropriate care, treatment, and supportive services especially in areas with shortages that are geographic, population, or facility based.
- 2.4.2 Increase the diversity of the workforce of providers who deliver HIV care and supportive services.
- 2.4.3 Increase inclusion of paraprofessionals on teams by advancing training, certification, supervision, reimbursement, and team functioning to assist with screening/management of HIV, STIs, viral hepatitis, and mental and substance use disorders and other behavioral health conditions.

2.5 Expand capacity to provide whole-person care to older adults with HIV and long-term survivors

- 2.5.1 Identify, implement, and evaluate models of care that meet the needs of people with HIV who are aging and ensure quality of care across services.
- 2.5.2 Identify and implement best practices related to addressing psychosocial and behavioral health needs of older people with HIV and long-term survivors including substance use treatment, mental health treatment, and programs designed to decrease social isolation.
- 2.5.3 Increase HIV awareness, capability, and collaboration of service providers to support older people with HIV, including in settings such as aging services, housing for older adults, substance use treatment, and disability and other medical services.
- 2.5.4 Promote research, cross-agency collaborations, and sharing of research discoveries that address specific aging-related conditions in people with HIV, and other comorbidities and coinfections that can impact people with HIV of all ages.
- 2.5.5 Develop and optimize collaborative multi-agency and multi-sectoral approaches and strategies to address emergent and evolving challenges facing people living with HIV at various life stages to support healthy aging with HIV.

2.6 Advance the development of next-generation HIV therapies and accelerate research for HIV cure

- 2.6.1 Promote research and encourage public-private partnerships to accelerate new therapies to achieve sustained viral suppression and to address drug toxicity, viral resistance, adherence, and retention in care and stigma associated with ART use.
- 2.6.2 Increase investment in innovative basic and clinical research to inform and accelerate a research agenda to discover how to sustain viral suppression, achieve ART-free remission, reduce and eliminate viral reservoirs, and achieve HIV cure.

Goal 3: Reduce HIV-Related Disparities and Health Inequities

3.1 Reduce HIV-related stigma and discrimination

- 3.1.1 Strengthen enforcement of civil rights laws (including language access services and disability rights), promote reform of state HIV criminalization laws, and assist states in protecting people with HIV from violence, retaliation, and discrimination associated with HIV status, homophobia, transphobia, xenophobia, racism, substance use, and sexism.
- 3.1.2 Ensure that health care professionals and front-line staff complete education and training on stigma, discrimination, and unrecognized bias toward populations with or who experience risk for HIV, including LGBTQI+ people, immigrants, people who use drugs, and people involved in sex work.
- 3.1.3 Support communities in efforts to address misconceptions and reduce HIV-related stigma and other stigmas that negatively affect HIV outcomes.
- 3.1.4 Ensure resources are focused on the communities and populations where the need is greatest, especially Black, Latino, and American Indian/Alaska Native and other people of color, particularly those who are also gay and bisexual men, transgender people, people who use substances, sex workers, and immigrants.
- 3.1.5 Create funding opportunities that specifically address social and structural drivers of health as they relate to Black, Latino, and American Indian/Alaska Native and other people of color.

3.2 Reduce disparities in new HIV infections, in knowledge of status, and along the HIV care continuum

- 3.2.1 Increase awareness of HIV-related disparities through data collection, analysis, and dissemination of findings.
- 3.2.2 Develop new and scale up effective, evidence-based or evidence-informed interventions to improve health outcomes among priority populations and other populations or geographic areas experiencing disparities.

3.3 Engage, employ, and provide public leadership opportunities at all levels for people with or who experience risk for HIV

- 3.3.1 Create and promote public leadership opportunities for people with or who experience risk for HIV.
- 3.3.2 Work with communities to reframe HIV services and HIV-related messaging so that they do not stigmatize people or behaviors.

3.4 Address social and structural determinants of health and co-occurring conditions that impede access to HIV services and exacerbate HIV-related disparities

- 3.4.1 Develop whole-person systems of care and wellness that address co-occurring conditions for people with or who experience risk for HIV.
- 3.4.2 Adopt policies that reduce cost, payment, coverage, and/or access barriers to improve the delivery and receipt of services for people with or who experience risk for HIV.
- 3.4.3 Improve screening and linkage to services for people with or who experience risk for HIV who are diagnosed with and/or are receiving services for co-occurring conditions.

- 3.4.4 Develop and implement effective, evidence-based and evidence-informed interventions that address social and structural determinants of health among people with or who experience risk for HIV including lack of continuous health care coverage, HIV-related stigma and discrimination in public health and health care systems, medical mistrust, inadequate housing and transportation, food insecurity, unemployment, low health literacy, and involvement with the justice system.
- 3.4.5 Increase the number of schools that have implemented LGBTQ-supportive policies and practices, including (1) having a Gay/Straight Alliance (GSA), Gender Sexuality Alliance, or similar clubs, (2) identifying safe spaces, (3) adopting policies expressly prohibiting discrimination and harassment based on sexual orientation or gender identity, (4) encouraging staff to attend professional development, (5) facilitating access to out-of-school health service providers, (6) facilitating access to out-of-school social and psychological service providers, and (7) providing LGBTQ-relevant curricula or supplementary materials.
- 3.4.6 Develop new and scale up effective, evidence-based or evidence-informed interventions that address intersecting factors of HIV, homelessness or housing instability, mental health and violence, substance use, and gender especially among cis- and transgender women and gay and bisexual men.

3.5 Train and expand a diverse HIV workforce by further developing and promoting opportunities to support the next generation of HIV providers including health care workers, researchers, and community partners, particularly from underrepresented populations

- 3.5.1 Promote the expansion of existing programs and initiatives designed to increase the numbers of non-White research and health professionals.
- 3.5.2 Increase support for the implementation of mentoring programs for individuals from diverse cultural backgrounds to expand the pool of HIV research and health professionals.
- 3.5.3 Encourage the implementation of effective recruitment of community partners through community-based participatory research and social networking approaches.

3.6 Advance HIV-related communications to achieve improved messaging and uptake, as well as to address misinformation and health care mistrust

- 3.6.1 Develop and test strategies to promote accurate creation, dissemination, and uptake of information and to counter associated misinformation and disinformation.
- 3.6.2 Increase diversity and cultural competence in health communication research, training, and policy.
- 3.6.3 Expand community engagement in health communication initiatives and research.
- 3.6.4 Include critical analysis and health communication skills in HIV programs to provide participants with the tools to seek and identify accurate health information and to advocate for themselves and their communities.
- 3.6.5 Expand effective communication strategies between providers and consumers to build trust, optimize collaborative decision-making, and promote success of evidence-based prevention and treatment strategies.

Goal 4: Achieve Integrated, Coordinated Efforts That Address the HIV Epidemic among All Partners and Interested Parties

4.1 Integrate programs to address the syndemic of HIV, STIs, viral hepatitis, and substance use and mental health disorders in the context of social and structural/institutional factors including stigma, discrimination, and violence

- 4.1.1 Integrate HIV awareness and services into outreach and services for issues that intersect with HIV such as intimate partner violence, homelessness or housing instability, STIs, viral hepatitis, and substance use and mental health disorders.
- 4.1.2 Implement a no-wrong-door approach to screening and linkage to services for HIV, STIs, viral hepatitis, and substance use and mental health disorders across programs.
- 4.1.3 Identify and address funding, policy, data, workforce capacity, and programmatic barriers to effectively address the syndemic.
- 4.1.4 Coordinate and align strategic planning efforts on HIV, STIs, viral hepatitis, substance use disorders, and mental health care across national, state, and local partners.
- 4.1.5 Enhance the ability of the HIV workforce to provide naloxone and educate people on the existence of fentanyl in the drug supply to prevent overdose and deaths and facilitate linkage to substance use disorder treatment and harm reduction programs.

4.2 Increase coordination among and sharing of best practices from HIV programs across all levels of government (federal, state, tribal, local, and territorial) and with public and private health care payers, faith-based and community-based organizations, the private sector, academic partners, and the community

- 4.2.1 Focus resources including evidence-based and evidence-informed interventions in the geographic areas and priority populations disproportionately affected by HIV.
- 4.2.2 Enhance collaboration among local, state, tribal, territorial, national, and federal partners and the community to address policy and structural barriers that contribute to persistent HIV-related disparities and implement policies that foster improved health outcomes.
- 4.2.3 Coordinate across partners to quickly detect and respond to HIV outbreaks.
- 4.2.4 Support collaborations between community-based organizations, public health organizations, education agencies and schools, housing providers, and health care delivery systems to provide linkage to and delivery of HIV testing, prevention, care, and treatment services as well as supportive services.

4.3 Enhance the quality, accessibility, sharing, and uses of data, including HIV prevention and care continua data and social determinants of health data

- 4.3.1 Promote the collection, electronic sharing, and use of HIV risk, prevention, and care and treatment data using interoperable data standards, including data from electronic health records, in accordance with applicable law.
- 4.3.2 Use interoperable health information technology, including application programming interfaces (APIs), clinical decision support tools, electronic health records and health IT products certified by the Office of the National Coordinator's Health IT Certification Program, and health information exchange networks, to improve HIV prevention efforts and care outcomes.

- 4.3.3 Encourage and support patient access to and use of their individual health information, including use of their patient-generated health information and use of consumer health technologies in a secure and privacy supportive manner.

4.4 Foster private-public-community partnerships to identify and scale up best practices and accelerate HIV advances

- 4.4.1 Adopt approaches that incentivize the scale up of effective interventions among academic centers, health departments, community-based organizations, allied health professionals, people with HIV and their advocates, the private sector, and other partners.
- 4.4.2 Expand opportunities and mechanisms for information sharing and peer technical assistance within and across jurisdictions to move effective interventions into practice more swiftly.
- 4.4.3 Develop and optimize collaborative multi-agency and multi-sectoral approaches and strategies to address emergent and evolving challenges facing persons of all ages living with HIV.

4.5 Improve mechanisms to measure, monitor, evaluate, and use the information to report progress and course correct as needed in order to achieve the Strategy's goals

- 4.5.1 Streamline and harmonize reporting and data systems to reduce burden and improve the timeliness, availability, and usefulness of data.
- 4.5.2 Monitor, review, evaluate, and regularly communicate progress on the National HIV/AIDS Strategy.
- 4.5.3 Ensure that the National HIV/AIDS Strategy's goals and priorities are included in cross-sector federal funding requirements.
- 4.5.4 Strengthen monitoring and accountability for adherence to requirements, targets, and goals by funded partners.
- 4.5.5 Identify and address barriers and challenges that hinder achievement of goals by funded partners and other interested parties.

INDICATORS AT-A-GLANCE

- Indicator 1:** Increase knowledge of status to 95% from a 2017 baseline of 85.8%.
- Indicator 2:** Reduce new HIV infections by 75% from a 2017 baseline of 37,000.
- Indicator 3:** Reduce new HIV diagnoses by 75% from a 2017 baseline of 38,351.
- Indicator 4:** Increase PrEP coverage to 50% from a 2017 baseline of 13.2%.
- Indicator 5:** Increase linkage to care within 1 month of diagnosis to 95% from a 2017 baseline of 77.8%.
- Indicator 6:** Increase viral suppression among people with diagnosed HIV to 95% from a 2017 baseline of 63.1%.
 - Indicator 6a:** Increase viral suppression among MSM diagnosed with HIV to 95% from a 2017 baseline of 66.1%.
 - Indicator 6b:** Increase viral suppression among Black MSM diagnosed with HIV to 95% from a 2017 baseline of 58.4%.
 - Indicator 6c:** Increase viral suppression among Latino MSM diagnosed with HIV to 95% from a 2017 baseline of 64.9%.
 - Indicator 6d:** Increase viral suppression among American Indian/Alaska Native MSM diagnosed with HIV to 95% from a 2017 baseline of 67.3%.
 - Indicator 6e:** Increase viral suppression among Black women diagnosed with HIV to 95% from a 2017 baseline of 59.3%.
 - Indicator 6f:** Increase viral suppression among transgender women in HIV medical care to 95% from a 2017 baseline of 80.5%.
 - Indicator 6g:** Increase viral suppression among people who inject drugs diagnosed with HIV to 95% from a 2017 baseline of 54.9%.
 - Indicator 6h:** Increase viral suppression among youth aged 13-24 diagnosed with HIV to 95% from a 2017 baseline of 57.1%.
- Indicator 7:** Decrease stigma among people with diagnosed HIV by 50% from a 2018 baseline median score of 31.2 on a 10-item questionnaire.
- Indicator 8:** Reduce homelessness among people with diagnosed HIV by 50% from a 2017 baseline of 9.1%.
- Indicator 9:** Increase the median percentage of secondary schools that implement at least 4 out of 7 LGBTQ-supportive policies and practices to 65% from a 2018 baseline of 59.8%.

In addition, quality of life for people with HIV was designated as the subject for a developmental indicator, meaning that data sources, measures, and targets will be identified and progress monitored thereafter.

INTRODUCTION

HIV EPIDEMIC: PROGRESS TO DATE

After nearly 40 years of tireless advocacy, determined research, and dedicated delivery of diagnostic, prevention, care, treatment, and supportive services, the United States now has the opportunity to end the HIV epidemic. Since it was first discovered in 1981, HIV has affected the lives of millions of people across the nation. Today, through the ongoing commitment of interested parties and organizations from many sectors, as well as landmark biomedical and scientific research advances, the nation has many effective HIV diagnostics, prevention strategies, and improved care and treatment models. New laboratory and epidemiological approaches enable us to identify where HIV is spreading most rapidly and to respond swiftly to stop the further spread of new HIV transmissions.

Over the past decade, the HIV response in the United States has been guided by the National HIV/AIDS Strategy (NHAS or Strategy), first released in 2010 and updated in 2015. The Strategy has changed the way that Americans talk about HIV, prioritize and coordinate resources, and deliver prevention and care services along with other clinical and nonclinical services that support people with or who experience risk for HIV. It has also led to increased collaboration among federal agencies; people with or who experience risk for HIV; state, local, tribal, and territorial governments; health care providers; researchers; faith communities; and many other community partners. Since the release of those first national strategies, several important achievements have bolstered the nation's HIV response:

- **Population-level viral suppression has increased.** After the NHAS was released, the Centers for Disease Control and Prevention (CDC) published its first national estimates of the share of all people with HIV who have achieved viral suppression, finding that only about one in four people with HIV (27.9%) in the United States was virally suppressed in 2010.¹ By 2019, however, viral suppression rates in the United States had doubled to 57%.² Although still too low, these rates represent real progress.
- **HIV diagnoses have declined, especially in key groups.** HIV diagnosis rates were relatively stable for many years prior to the release of the NHAS. CDC data suggest that annual new diagnoses declined by 14.3% from 2010 (42,938) when the Strategy was released to 2019 (36,337).^{3, 4} Large declines occurred in some groups, including women. Deaths declined by 7.6% from 2010 (16,726) to 2019 (15,463).^{3, 4}
- **Outcome disparities within the Ryan White HIV/AIDS Program have decreased.** Nearly 9 in 10 clients of the Health Resources and Services Administration's (HRSA's) Ryan White HIV/AIDS Program (RWHAP) were virally suppressed in 2019, and the program continues to show progress at reducing disparities across groups.⁵ From 2010 to 2019, the gap between male and female clients decreased from nearly 5 percentage points to <1 percentage point. Similarly, the difference between viral suppression rates in Black clients and White clients was 13 percentage points in 2010 but 7 percentage points in 2019.^{5, 6}
- **Policy changes ensure that federal money follows the epidemic.** Earlier in the epidemic, federal HIV resources to states and local governments were either allocated via a discretionary manner or via a formula that relied on cumulative AIDS cases, skewing resources toward early epicenters of the epidemic and not reflecting the current burden of HIV across the country. Prior to release of the Strategy, Congress changed the formulas used by the RWHAP to be based on living HIV/AIDS cases. The Strategy's call for federal money to follow the epidemic spurred further action. In fiscal year 2012, CDC changed the formula for its major HIV prevention program for state and local health departments to be based on living HIV/AIDS cases, and, in 2016, Congress modernized the law that authorized the Housing Opportunities for Persons With AIDS (HOPWA) program to be based on living HIV/AIDS cases.
- **The advent of pre-exposure prophylaxis (PrEP) has increased options for HIV prevention.** The first randomized controlled trial of PrEP reported results in 2010, and the U.S. Food and Drug Administration (FDA) approved the first PrEP medication in 2012. Several federal actions embraced this new biomedical

tool as an important part of comprehensive HIV prevention: for example, CDC issued interim and then final prescriber guidance; the expansion of PrEP access was a central component of the 2015 update to the NHAS; and the *Ending the HIV Epidemic in the U.S.* (EHE) initiative further sought to remove barriers to PrEP uptake, including through the establishment of the Ready, Set, PrEP program, which makes PrEP available at no cost to individuals without prescription drug coverage. Although uptake remains too low and disparities are large, the adoption of new medical technologies often takes decades, and the goal is to expedite widespread adoption of PrEP for people who can benefit from it.

- **Health insurance coverage rates for people with HIV have increased to match the general population.** In 2018, just 1 in 10 (11%) nonelderly people with HIV were uninsured, a rate on par with that of the general population (10%).⁷ An estimated 42% of the adult population with HIV is covered by Medicaid, compared to 13% of the overall adult population.⁸ Medicaid is the largest source of insurance coverage for people with HIV, covering a broad range of services from inpatient and outpatient care, to prescription medications, to preventive services.⁹
- **Strategic investments by the National Institutes of Health (NIH) in research have advanced efforts toward new prevention tools, next-generation therapies, a vaccine, and a cure.** NIH discovery science has been newly complemented by a suite of NIH implementation science projects designed to meet EHE initiative goals through improved use of proven HIV strategies.
- **States, cities, tribes, and local communities have developed their own HIV strategies.** These strategies (e.g., plans to end the HIV epidemic or achieve zero new infections) aligned with the NHAS and resulted in increased coordination across government agencies, nongovernmental organizations, and the private sector.
- **Interested parties and organizations have enhanced the focus on supports and support services such as housing and employment, which play key roles in enabling economic self-sufficiency and improving health outcomes.** With the effectiveness of early antiretroviral treatment (ART), many people with HIV can (and do) participate in the country's workforce. Employment is associated with improved HIV health outcomes, notably testing, linkage to care, and adherence to medication.¹⁰ Coordination and collaboration at all levels of government and across the public and private sectors have led to an increased awareness of these supports. Moreover, the COVID-19 pandemic has led communities across the nation to employ new strategies in providing support services, improving access to food, housing, and employment services.
- **The *Ending the HIV Epidemic in the U.S.* initiative was launched in 2019.** This bold plan aims to end the HIV epidemic in the United States by 2030. EHE is the operational plan developed by agencies across the U.S. Department of Health and Human Services (HHS) to pursue that goal. The initiative leverages critical scientific advances in HIV prevention, diagnosis, treatment, and outbreak response by coordinating the highly successful programs, resources, and infrastructure of many HHS agencies and offices. The initiative is focused on areas where data show the highest numbers of new HIV infections, providing 57 geographic focus areas with a rapid infusion of additional resources, expertise, and technology to develop and implement locally tailored EHE plans.
- **President Biden issued an Executive Order on preventing and combating discrimination on the basis of gender identity or sexual orientation.** This Executive Order aims to prevent and combat discrimination on the basis of gender identity or sexual orientation, and to fully enforce Title VII and other laws that prohibit discrimination on the basis of gender identity or sexual orientation.

HIV IN THE UNITED STATES TODAY

HIV persists as a serious public health challenge in the United States. An estimated 1.2 million people in the United States had HIV at the end of 2019, the most recent year for which this information is available.¹¹ National HIV prevention and care efforts have taken the nation from a peak of 130,000 HIV infections annually in the mid-1980s¹² to approximately 34,800 in 2019.¹⁰ Although HIV infection rates have decreased in the United States, new infections continue in every U.S. state with 34,800 new infections occurring in 2019.

HOPEFUL SIGNS OF PROGRESS EXIST.

The nation has seen hopeful signs of progress in recent years, but not everyone is benefiting equally from advances in HIV prevention and treatment. The latest CDC data show that new HIV infections declined by 8% from 2015 to 2019, after a period of general stability in new infections in the United States (see Figure 1). Much of this progress was due to larger declines among young gay and bisexual men in recent years.¹³

Figure 1. Annual HIV infections in the United States, 2015–2019

Despite this progress, important disparities persist. During this period, Black, Latino, and White gay and bisexual men and Black heterosexual women bore the greatest burden of new HIV infections.¹¹ (See Figure 2.)

Figure 2. New HIV infections by most impacted populations, United States, 2015 vs. 2019¹¹

EFFECTIVE TREATMENT AND PREVENTION ARE NOT ADEQUATELY REACHING PEOPLE WHO COULD BENEFIT MOST.

Although HIV remains a threat in every part of the United States, certain populations—and parts of the country—bear most of the burden, signaling where HIV prevention, care, and treatment efforts must be focused.

HIV by Population

Black and Latino communities are disproportionately affected by HIV compared to other racial/ethnic groups (see Table 1).

Table 1. Proportion of People with HIV by Race/Ethnicity Compared to Proportion of U.S. Population, 2019

Race/Ethnicity	% of People with HIV, 2019 ¹¹	% of U.S. Population, 2019 ¹⁴
Black/African American	40.3%	13.4%
White	28.5%	60.1%
Hispanic/Latino	24.7%	18.5%
Asian	1.5%	5.9%
American Indian/Alaska Native	0.3%	1.3%
Native Hawaiian and Other Pacific Islander	0.09%	0.2%

The disproportionate impact of HIV among Black and Latino communities is also evident in incidence (new infections). (See Figure 3.)

The latest incidence estimates indicate that effective **prevention and treatment are not adequately reaching people who could benefit most.**

Figure 3. HIV incidence by race/ethnicity, 2019¹¹

In all regions of the United States, gay and bisexual men are the most disproportionately affected group. They account for about 66% of new HIV infections each year, even though they account for only 2% of the population, with the highest burden among Black and Latino gay and bisexual men and young men.^{11, 15} In 2019, 26% of new HIV infections were among Black gay and bisexual men, 23% among Latino gay and bisexual men, and 45% among gay and bisexual men under the age of 35.

Disparities persist among women. Black women are disproportionately affected compared to women of other races/ethnicities. Although annual HIV infections remained stable among Black women from 2015 to 2019, the rate of new HIV infections among Black women was 11 times that of White women and 4 times that of Latina women.¹¹

Over 1 million people identify as transgender in the United States.¹⁶ Adult and adolescent transgender people composed 2% (669) of new HIV diagnoses in the United States and dependent areas in 2019. Most of those new HIV diagnoses were among Black/African American people. Compared to all adults and adolescents with diagnosed HIV in 2019, transgender women had almost equal viral suppression rates, while transgender men had higher viral suppression rates.^{2, 17, 18}

In 2019, youth aged 13–24 years composed 21% of the 36,398 new HIV diagnoses in the United States. Youth with HIV are the least likely of any age group to be retained in care and have a suppressed viral load.³ However, in a national survey of students in grades 9–12 in the United States, significantly fewer students reported being tested for HIV in 2019 (9.4%) than in 2009 (12.4%). In addition, trends over the past 10 years (from 2009 to 2019) indicate significant decreases in the percentage of sexually active high school students who used condoms during last sexual intercourse (61.1% vs. 54.3%), and only 8.6% of sexually active students reported being tested for sexually transmitted infections (STIs) during the past year.¹⁹ This despite the fact that almost half of the 26 million new STIs were estimated to occur in youth ages 15–24 in the United States in 2018.

In 2019, 7% of new HIV infections in the United States were among people who inject drugs (PWID). Men who inject drugs accounted for 4% of new HIV infections, and women who inject drugs accounted for 3%. Long-term declining trends in HIV incidence among people who inject drugs have stalled. For example, from 2015 to 2019, the number of new HIV infections remained stable among people who inject drugs.¹¹ Localized outbreaks have contributed to this trend. People who inject drugs are at high risk for acquiring hepatitis C virus infection, and, in fact, 62–80% of people who inject drugs and have HIV experience coinfection with HIV and hepatitis C.

HIV by Geography

Most of the nation's HIV diagnoses are concentrated in certain geographic areas, that is, urban areas and southern states. In 2016 and 2017, more than half of new HIV diagnoses were concentrated in geographic hotspots across the United States: 48 counties plus Washington, DC, and San Juan, Puerto Rico.⁴ Seven states also have a substantial number of HIV diagnoses in rural areas.²⁰ These 57 jurisdictions are prioritized for the EHE initiative. Southern states account for 38% of the U.S. population but bear the highest burden of HIV infection with 53% of annual HIV infections, 46% of people with HIV, and 52% of people with undiagnosed infections.¹¹ (See Figure 4.)

Figure 4. 57 jurisdictions prioritized in the *Ending the HIV Epidemic* initiative

This current landscape of HIV prevention, care, and treatment presents several opportunities and challenges that shape this 5-year Strategy.

OPPORTUNITIES

More tools than ever before are available to end the HIV epidemic in the United States. People who initiate ART soon after diagnosis and remain adherent can live long, healthy lives.²¹ In addition, people with HIV who take ART and achieve and maintain an undetectable viral load have effectively no risk of transmitting HIV through sex.²²⁻²⁵ Thanks to a robust toolbox that includes syringe services programs (SSPs), PrEP, and post-exposure prophylaxis (PEP), and treatment as prevention, an individual's risk of acquiring HIV is significantly lower than ever (see Figure 5).

Figure 5. HIV prevention and treatment toolkits. Source: Eisinger et al.²⁶ Published by Oxford University Press for the Infectious Diseases Society of America 2019. This work is written by (a) U.S. Government employee(s) and is in the public domain in the U.S. Image modified with permission of authors.

To realize the full potential of these tools, several opportunities exist to expand the capacity of existing public health infrastructure, health care systems, and the health care and social service workforce. Engaging the diverse communities of people with and affected by HIV in planning for and delivery of HIV prevention and care services is essential. Further, expanding partnerships and training among traditional settings and parties, as well as identifying and working with nontraditional partners that are likely to engage people with or who experience risk for HIV, will better leverage the capacities of more interested parties and organizations to facilitate access to HIV diagnostics, prevention, care, treatment, and supportive services.

Importantly, the availability and use of data from a variety of sources, along with national, state, tribal, territorial, and local (and even clinic-level) indicators and targets, can help guide decision-making, service planning, and resource allocation.

Along with better use of data, ensuring that community-driven planning and decision-making include more diverse voices, expertise, and experiences can enhance how programs and services are tailored, implemented, and assessed to reach the populations that need them.

During the lifespan of this Strategy, other long-acting therapeutics and other simplified HIV drug regimens may become available. The overall value, potential impact, and cost-effectiveness of each new HIV testing, prevention, care, or treatment intervention must be demonstrated. Policy and program development should occur in parallel with the review and approval process for any new prevention or treatment options, such as long-acting injectable or implantable medications. These efforts should incorporate formative research and conversations with all relevant interested parties and organizations, especially patients, providers, and payers to identify challenges and opportunities to prevent gaps between the approval, implementation, and uptake stages.

Ongoing HIV research will facilitate progress toward HIV prevention and treatment, addressing of comorbid health conditions, and better understanding and addressing of HIV disparities and inequities, while advancing novel approaches toward long-term HIV remission and the ultimate goal of an HIV cure. Incorporating a strong implementation science framework in that research will support successful adaption and utilization of effective interventions that are acceptable to target communities.

These opportunities and developments, among others, will continue to transform and help guide the nation's approach to HIV through 2025.

BIOMEDICAL HIV PREVENTION TOOLS

PrEP is medicine that people who experience risk for HIV take to prevent getting HIV from sex or injection drug use.

PEP is HIV medicine used in emergency cases for people who have possibly been exposed to HIV. People must start taking the pill within 72 hours of exposure.

Treatment as Prevention is a highly effective prevention method in which people with HIV take HIV medication daily as prescribed and get and keep an undetectable viral load. As a result, they have effectively no risk of sexually transmitting HIV to their HIV-negative partners. This is often referred to as U=U or "undetectable = untransmittable."

CHALLENGES

Although the United States is making significant progress in improving HIV outcomes, significant challenges remain. Gaps in the HIV care continuum (see Figure 6) are driving HIV transmission. By ensuring that everyone with HIV is aware of their status, receives the treatment they need, and achieves and maintains viral suppression—key steps in the HIV care continuum—we can preserve the health of people with HIV, improve the quality of their lives, and drive down new HIV infections.

Figure 6. Prevalence-based HIV care continuum, United States, 2019²

The most recent data available (2019) show the following:

- Less than one-half (39%) of the U.S. population has ever been tested for HIV.²⁷ Of people with HIV, an estimated 158,500 (13%) were unaware of their status,¹¹ meaning they are not receiving the care they need to stay healthy and prevent transmission to others. The number unaware is especially high in the South, likely contributing to the high burden of HIV in the region.
- One in three people with HIV (34%) is not receiving needed HIV care.²
- Only 57% of people with HIV were virally suppressed, meaning that 43% are not receiving the benefits of HIV treatment.²

These gaps in the care continuum are challenges to be addressed because, according to a CDC transmission model based on 2016 data, approximately 80% of new HIV infections were transmitted from the nearly 40% of people with HIV who either do not know they have HIV or who received a diagnosis but are not receiving regular care (see Table 2).²⁸

Table 2. HIV Transmissions in the United States, 2016

% of People with HIV	Status of Care	Accounted for X% of New Transmissions ^a
15%	Didn't know they had HIV	38%
23%	Knew they had HIV but weren't in care	43%
11%	In care but not virally suppressed	20%
51%	Taking HIV medicine and virally suppressed	0%

^a Total does not equal 100% because of rounding. Source: CDC.²⁹

In addition to these gaps in HIV diagnoses, care, and treatment, there are HIV prevention challenges. Only 23% of the approximately 1.2 million people indicated for PrEP are receiving it; in other words, about 3 in 4 people who could benefit from PrEP are not receiving it.³⁰ Further, significant disparities in PrEP coverage persist based on race/ethnicity, sex at birth, and age.^{31, 32} Among those who initiate PrEP, daily pill adherence and long-term maintenance can be a challenge.^{33, 34}

Although anyone can acquire HIV, the epidemic disproportionately affects specific populations, communities, and geographic areas across the United States. These disparities exist among gay, bisexual, and other men who have sex with men (MSM), especially Black, Latino,* and American Indian/Alaska Native men. They also exist among Black women, transgender women, youth (particularly gay and bisexual young men and transgender youth), and people who inject drugs. These gaps remain particularly troublesome not only among disproportionately affected populations, but also in some rural areas and the South. In 2019, it was estimated that more than one-half of new HIV infections occurred in the South.¹¹

Inequities in the social determinants of health are significant drivers and contributors to health disparities and highlight the need to focus not only on HIV prevention and care efforts, but also on the ways that programs, practices, and policies affect communities of color and other populations that experience HIV disparities.

Persons from racial and ethnic minority groups are more likely to be uninsured compared to non-Hispanic Whites,³⁵ limiting their access to health care. Barriers to health care access include lack of transportation and childcare, inability to take time off work, experiences with housing instability or homelessness, communication and language barriers, racism, discrimination, and lack of trust in health care providers.

*For this Strategy, Black is defined as African American or Black, and Latino is defined as Latino or Hispanic.

Sexual and gender minorities also face health disparities.³⁶⁻⁴⁰ Barriers to health care include stigma, discrimination, medical mistrust, safety, and lack of access to affirming mental health care.⁴¹ Sexual and gender minorities face greater health challenges than heterosexual and cisgender people due in part to inequities such as stigma and discrimination.³⁷ Sexual and gender minority populations have lower levels of health insurance and access to regular health care compared to heterosexual/cisgender people.^{42, 43}

Another threat to achieving national HIV prevention and care goals is the increase in drug use resulting from both the nation's opioid crisis and resurgent availability and use of methamphetamine and other stimulants among gay men and others who experience higher risk for HIV. Increases in drug use are linked to rising rates, and clusters, of several infectious diseases including hepatitis A, hepatitis B, hepatitis C, and HIV,⁴⁴ which threaten the progress to date to reduce HIV transmission, particularly among people who inject drugs. Recognizing this threat, in 2016 CDC identified 220 counties in 26 states that are vulnerable to HIV and viral hepatitis because of the opioid epidemic.⁴⁵ Many of those counties have taken steps to implement harm reduction services and strengthen their capacity to detect and respond to a potential outbreak. Half of the vulnerable counties were in the Appalachian region, where—along with other areas of the country—there have been multiple recent clusters and outbreaks of new HIV infections among people who inject drugs. Tailored technical assistance and support is needed to help these communities address the syndemic of HIV and hepatitis C virus fueled by substance use disorders. A particular focus should be on supporting them in resolving the local and state structural and systemic issues that get in the way of implementing evidence-based harm reduction and other services for the prevention of HIV and other infectious diseases and making best use of all available substance use disorder and infectious disease funding.

Using drugs or alcohol may lead to sexual behaviors (e.g., having sex without a condom, having multiple partners) that increase the risk of getting or transmitting HIV. In a recent large study of HIV-negative sexual and gender minorities who have sex with men, of whom a substantial proportion used crystal methamphetamine (crystal meth), this highly addictive drug emerged as the dominant risk factor associated with HIV seroconversion, with persistent methamphetamine users accounting for one-third of all observed HIV seroconversions in the study.⁴⁶ Further, a 2018 analysis of the National Notifiable Diseases Surveillance System found substantial overlap in reported substance use and sexual risk behaviors among primary and secondary syphilis cases.⁴⁷ For people with HIV, substance use can hasten disease progression and negatively affect care retention and treatment adherence.⁴⁸

Rising rates of STIs also threaten efforts to reduce new HIV infections.⁴⁹ STIs are associated with a higher risk of transmitting or acquiring HIV.⁵⁰ A recent modeling analysis estimated that 7% of HIV infections were attributed to chlamydia, gonorrhea, syphilis, and trichomoniasis.^{51, 52} Siloed program delivery leads to missed opportunities to screen, link, and provide navigation, care management, and treatment for people with HIV, STIs, viral hepatitis, and substance use and/or mental health disorders.

HIV, STIs, VIRAL HEPATITIS, AND SUBSTANCE USE DISORDERS—A HOLISTIC APPROACH TO THE SYNDEMIC

A syndemic is a set of linked health conditions—such as HIV, viral hepatitis, STIs, and alcohol and substance use and mental health disorders—that adversely interact with one another and contribute to an excess burden of disease in a population. Addressing a syndemic can be challenging because it requires the implementation of integrated and sometimes simultaneous prevention, screening, diagnosis, and treatment efforts, as well as the rapid application of new scientific advances. To be successful, these efforts must go beyond disease-specific responses to identifying and

Stigma is an attitude of disapproval and discontent toward a person or group because of the presence of an attribute perceived as undesirable.

Discrimination is often a consequence of stigma, occurring when unfair and often unlawful actions are taken against people based on their belonging to a particular stigmatized group.

addressing root causes, with greater disease risk and poorer health outcomes often closely tied to employment, stable housing, access to health care and food, and other social determinants of health.

A holistic approach to addressing the syndemic of HIV, viral hepatitis, STIs, and substance use and mental health disorders can only be effective if we also continue to explore the connection between mental health, experience of violence and other types of traumas, substance use, and infectious diseases. Past and present trauma, including experience of violence, homo- and transphobia, discrimination, and racism, contribute to the excess burden of disease in many communities at risk for or diagnosed with these health conditions. This burden challenges our collective efforts to provide prevention and care services because models of trauma-informed care are often not fully developed within many health care settings. In addition, ready access to substance use and mental health care, or health care in general, is lacking in many communities, exacerbating existing health disparities in communities of color.

A **syndemic** is a set of linked health problems that interact synergistically and contribute to excess burden of disease in a population.

Social determinants of health and stigma also play a significant role in this syndemic.

The syndemic does not just appear in adulthood; the inter-relationship between sexual health, trauma, mental health, and substance use may have precursors in early childhood and coalesce in adolescence. Adverse childhood experiences have substantial effects on health and well-being through adolescence and into adulthood. In adolescence, sexual risk, substance use, experience of violence, and mental health problems co-occur and represent significant risk for STIs and HIV, particularly among sexual minority youth. The opportunity exists, however, to adopt trauma-informed approaches and bolster the coordination, capacity, and delivery of services to populations with and experiencing risk for these linked conditions.

To help drive a coordinated response to the syndemic, the Strategy complements the Viral Hepatitis National Strategic Plan (Viral Hepatitis Plan) and the Sexually Transmitted Infections National Strategic Plan (STI Plan), both released in early 2021. These plans mutually recognize that both the specific health conditions and the syndemic itself present opportunities to conduct relevant research and analyses, develop evidence-based interventions and policy options, and allocate resources to respond efficiently and effectively. The Strategy aligns with the Administration's statement of first-year drug control priorities and will also align with the comprehensive 2022 National Drug Control Strategy being developed by the White House Office of National Drug Control Policy.

COVID-19 and the Syndemic

This Strategy is being released during the unprecedented COVID-19 pandemic. Since early 2020, SARS-CoV-2, the coronavirus that causes COVID-19 disease, has spread rapidly across the globe, causing more than 200 million confirmed cases worldwide and claiming the lives of more than 4 million individuals to date. The pandemic has caused great uncertainty, including for people with and who experience risk for HIV, STIs, viral hepatitis, and substance use and mental health disorders.

In the United States, the pandemic has exacerbated existing challenges in public health and health care systems, exposing longstanding and pervasive structural inequities. Many clinical and public health services focused on people with or who experience risk for HIV, viral hepatitis, STIs, and substance use and mental health disorders have been forced to reduce hours or close temporarily, with staff redeployed to address the public health emergency. These actions have particularly affected populations who are already disproportionately affected by these health conditions and who are most vulnerable to the economic and societal consequences of the pandemic, including loss of employment and insurance, the necessity to work in unsafe environments, housing and food insecurity, cutbacks to public transportation, lack of access to credible health information in multiple languages, and obstacles to practicing safe social distancing. Faced with these challenges, many individuals have not received necessary medical care or related services. Implementation of the Strategy should consider the potential long-term effects caused by these circumstances.

The Strategy accounts for the many lifesaving program innovations and policy changes that were developed to counteract the curtailment of in-person visits and other challenges posed by the COVID-19 pandemic. Examples include the use of telephone- and video-based telehealth visits to ensure that people who experience risk for HIV can access PrEP and that people with HIV can access ongoing care and treatment; exploration and implementation of tele-harm reduction approaches to substance use disorder treatment and HIV treatment; distribution of HIV self-tests and home specimen collection kits; multi-month dispensation of ART; condom delivery; and modification of policies to support mail order, home delivery, or curbside pick-up of medication. Further, community-based programs expanded their roles to ensure the safety of health care workers, clients, and community members by distributing timely and accurate information about COVID-19 testing and vaccinations; facilitating interactions with public health authorities; and serving as testing and vaccination sites.

These innovations in HIV prevention and care delivery prove that the nation can innovate and adapt to ensure that access to HIV prevention and treatment services continues uninterrupted—even in the presence of unprecedented circumstances. Although their outcomes must be studied, many of these innovations may prove worth sustaining as effective tools in our work to achieve our national HIV goals. Our tasks ahead are to carefully determine how to preserve these innovations over the long term for people who can benefit from them, adapt these innovations to achieve success with other populations, and leverage resources to deliver these innovations to larger audiences.

NATIONAL HIV/AIDS STRATEGY 2022–2025

This Strategy, updated for 2022–2025, builds on the lessons learned and progress of previous iterations and seeks to leverage opportunities and address the challenges that remain. It provides a national roadmap for continuing the coordinated response to HIV and puts the country on the path to end the HIV epidemic in the United States by 2030. The Strategy is guided by this vision statement:

The United States will be a place where new HIV infections are prevented, every person knows their status, and every person with HIV has high-quality care and treatment, lives free from stigma and discrimination, and can achieve their full potential for health and well-being across the lifespan.

This vision includes all people, regardless of age, sex, gender identity, sexual orientation, race, ethnicity, religion, disability, geographic location, or socioeconomic circumstance.

OVERVIEW

This Strategy includes the following:

- Four goals to achieve this vision, specific objectives for each goal, and strategies for each objective.
- Priority populations, identified by national-level data as being disproportionately affected by HIV, to help focus stakeholder efforts and resource allocation.
- Nine core indicators, one disparities indicator stratified for each priority population with quantitative targets to track progress toward achieving national HIV goals, and one developmental indicator to be established.

OBJECTIVES AND STRATEGIES

The Strategy sets forth four goals, objectives for each goal, and strategies for each objective (see Table 3 for definitions). These objectives and strategies are designed to guide federal partners as well as nonfederal parties in achieving the Strategy’s vision and goals. The objectives provide direction for the attainment of each goal. The strategies recommend approaches to achieve the objectives. Numerous objectives and strategies could fit under more than one goal. However, each one has been placed under the goal with which it most closely aligns.

Table 3. Definitions of Elements of the Strategy

National HIV/AIDS Strategy	Federal Implementation Plan
Goals: Broad aspirations that enable a plan’s vision to be realized Objectives: Changes, outcomes, and impact a plan is trying to achieve Strategies: Choices about how best to accomplish objectives	Action Steps: Specific activities that will be performed to implement the strategies and achieve the goals of the plan Progress Reports: Reports on progress, successes, and challenges

^a Adapted from the HHS Office of the Assistant Secretary for Planning and Evaluation.

The Strategy’s objectives and strategies are intended to be implemented by a broad mix of interested parties and organizations at all levels and across many sectors, both public and private. They also serve as a tool to foster a shared focus, enhance coordination of efforts across agencies and programs, and identify areas of synergy and new opportunities to sharpen collective efforts. The strategies are intended to be scalable by implementer type and size of population to be served.

INDICATORS

The Strategy adopts bold targets for ending the HIV epidemic in the United States by 2030, calling for a 75% reduction in new HIV infections by 2025 and a 90% reduction by 2030. The Strategy’s goals, objectives, and strategies focus on achieving national targets set for 2025, setting the stage to ultimately end the HIV epidemic by 2030. As such, the Strategy’s vision, goals, objectives, strategies, indicators, and quantitative targets align with the EHE initiative, which complements and will serve as one of many important implementation elements of the Strategy (see Box 1).

The Strategy includes indicators for measuring progress and quantitative targets for each indicator. There are nine core indicators, one of which is stratified to measure progress in addressing HIV disparities in the priority populations (i.e., disparities indicators). In addition, one key issue, quality of life for people with HIV, was designated as the subject for a “developmental indicator,” meaning that data sources, measures, and targets will be identified, and progress monitored thereafter. The Strategy’s indicators and quantitative targets also align with *Healthy People 2030*. A detailed discussion of the indicators, including methodology, and specifications is found in Appendix A.

BOX 1 THE NATIONAL HIV/AIDS STRATEGY AND THE *ENDING THE HIV EPIDEMIC IN THE U.S.* INITIATIVE

The Strategy and *Ending the HIV Epidemic in the U.S.* (EHE) initiative are complementary, with EHE serving as a leading component of the work by the U.S. Department of Health and Human Services (HHS), in collaboration with federal, state, tribal, territorial, and local partners, to end the HIV epidemic in the United States by 2030. Both the Strategy and the EHE initiative aim to reduce new HIV transmissions in the United States by 75% by 2025 and by 90% by 2030, which would mean fewer than 3,000 new HIV infections per year.

EHE efforts focus on 57 priority jurisdictions, including 48 counties, Washington, DC, and San Juan, Puerto Rico, where greater than 50% of new HIV diagnoses occurred in 2016 and 2017, as well as 7 states with a disproportionate occurrence of HIV in rural areas. With additional funding appropriated by Congress, HHS is providing the 57 geographic focus areas with an infusion of additional resources, expertise, and technology to develop and implement locally tailored EHE plans. Those plans, developed and being implemented with significant community involvement, focus on four pillars:

- Diagnose all people with HIV as early as possible.
- Treat people with HIV rapidly and effectively to reach sustained viral suppression.
- Prevent new HIV transmissions by using proven interventions, including preexposure prophylaxis (PrEP) and syringe services programs (SSPs).
- Respond quickly to potential HIV outbreaks to get prevention and treatment services to people who need them.

The scope of the Strategy extends to agencies beyond HHS and encompasses the entire nation. The Strategy presents a holistic approach to engaging a broad range of interested parties and organizations across many sectors of society to not only end the HIV epidemic by 2030, but also address other components of the syndemic, stigma, discrimination, and social determinants of health.

PRIORITY POPULATIONS

Although HIV affects people from all social, economic, and racial and ethnic groups, and from all parts of the United States, it disproportionately affects certain populations. The disproportionate prevalence of HIV in specific populations increases the risk for HIV transmission with each sexual or injection drug use encounter within those populations. In addition, a range of social, economic, and demographic factors—such as stigma, discrimination, socioeconomic status, income, education, age, and geographic region—affect people’s risk for HIV or their ability to access or remain engaged in prevention or care services.

To focus effort and resources for the greatest impact, the Strategy uses national-level HIV surveillance data to identify populations disproportionately affected by HIV. The following factors were considered: (1) incidence of new HIV infections and trends; (2) prevalence of HIV; (3) HIV diagnoses; (4) outcomes along the HIV care continuum; and (5) potential impact of other major public health threats (e.g., opioid epidemic). Based upon this analysis, the Strategy prioritizes efforts to reduce disparities and improve HIV outcomes among

- gay, bisexual, and other men who have sex with men, in particular Black, Latino, and American Indian/Alaska Native men;

- Black women;
- transgender women;
- youth aged 13–24 years; and
- people who inject drugs.

Focusing efforts on these five priority populations will reduce the HIV-related disparities they experience, which is essential if the nation is to succeed on the path toward ending the HIV epidemic by 2030.

To drive action and measure progress toward reducing health inequities and disparities among the priority populations, the Strategy uses viral suppression, stratified by population, as an indicator. Viral suppression was selected as the disparities indicator because increasing and maintaining viral suppression among priority populations will improve health outcomes, reduce HIV-related deaths, and prevent new HIV transmissions. Monitoring progress on these disparities indicators also helps ensure that the nation is making progress with all populations, leaving no groups behind.

This Strategy acknowledges that other populations with unique circumstances warrant specific attention, such as sex workers, immigrants, older adults, people experiencing housing instability or homelessness, individuals with disabilities, and justice-involved individuals. For example, the risk of HIV among people who exchange sex for money, drugs, food, or shelter is high; however, little data exist for this population. The illegal—and often criminalized—nature of exchange sex complicates the collection of population-wide data on HIV risk among this population. Nevertheless, the high prevalence of HIV and STIs among people who participate in exchange sex warrants attention. Sex work is largely performed by transgender women, cisgender women, and men who have sex with men, and is also heavily concentrated among Black and African Americans. The convergence of gender, poverty, and racial and ethnic discrimination as social determinants of health within exchange sex must be examined further to fully understand the HIV epidemic.

Similarly, some non-U.S.-born people with or experiencing risk for HIV face unique challenges when accessing prevention, care, and treatment services. Discrimination, lack of culturally and linguistically competent service providers, and fear of interacting with health care systems and other authorities are often barriers to accessing needed services.

People involved in the justice system face a confusing/disparate system of prevention and care services, often for short time periods. These individuals experience a disproportionately high risk of HIV, as well as risk factors associated with under-utilization of prevention and treatment options, including substance use, mental health issues, and poor access to care.⁵³ Improving HIV prevention and management among justice-involved people requires innovative approaches to integrating care. HIV programs must work with state and local facilities to ensure that care services are provided throughout the justice system, particularly to people upon release back to their communities; pre- and post-transition planning is critical to decreasing barriers to care.

More than one-half of people diagnosed with HIV in the United States today are over age 50. Although an indicator of the success of modern HIV treatment, this statistic signals the need to tailor services to individuals within this population not only to continue their engagement in care and viral suppression but also to address the comorbidities and psycho-social needs often associated with aging.

Evidence suggests that some people with disabilities may experience higher risk of acquiring HIV than people who are not disabled. Some of the factors associated with this risk include poverty, vulnerability to sexual violence and abuse, limited access to education and health care, and social marginalization. Some people with disabilities may experience barriers to accessing the HIV prevention, testing, or care and treatment services they need.

People with HIV often have other disabilities, and people with disabilities can be at higher risk for acquiring HIV than the general population. Adopting syndemic approaches that place HIV in the context of multiply marginalized

communities and that seek to comprehensively leverage a variety of health care, social services, and other community supports to improve overall community health offers an important opportunity to strengthen health care outcomes and improve the quality of life.

Local partners and interested parties should use local surveillance and program data on HIV—as well as on STIs, viral hepatitis, and social determinants of health—to identify the populations most affected in their communities and to understand the outcomes for each population along the continuums of HIV prevention and care. Each state, tribe, community, program, or clinic will make its own assessment of relevant priority populations so that programs and services can be tailored and focused accordingly. In some jurisdictions, local surveillance and program data may indicate that additional populations not mentioned here are experiencing persistent HIV disparities that require focus from local efforts.

In addition, some partners and organizations may work with specific populations or communities in a limited area with data that vary somewhat from the national data. For example, on a federal level, agencies such as the Indian Health Service, CDC’s Division of Adolescent and School Health, Department of Veterans Affairs, Federal Bureau of Prisons, and Administration for Community Living serve distinct populations with or who experience risk for HIV. Likewise, state, tribal, territorial, and local jurisdictions, as well as schools and other institutions, may serve distinct populations. For these and other interested parties, efforts should be guided by an assessment of health disparities within their purview and/or jurisdiction to determine how best to focus available resources to achieve results with the greatest impact.

IMPLEMENTATION

A separate NHAS Federal Implementation Plan will be developed in early 2022 and will detail federal partners’ plans and activities to implement the strategies set forth in this document. During development of that plan, the federal partners involved will explore opportunities to engage other federal departments or agencies that could expand services or that administer programs or support delivery of services that address social determinants of health and reduce health disparities and, as such, could make vital contributions to national efforts to end the HIV epidemic.

GOAL 1: PREVENT NEW HIV INFECTIONS

THE OPPORTUNITY

The most effective ways to reduce new HIV infections are to ensure timely diagnosis and engagement in care and treatment for people with HIV so that they achieve and maintain viral suppression and therefore cannot transmit the virus; target prevention resources to the places with the largest disease burden and the populations experiencing greatest risk; and ensure that the most effective prevention strategies are prioritized and widely implemented. An array of HIV prevention options, for use in combination or on their own, is available to people with or experiencing risk for HIV.

- **HIV treatment as prevention.** Evidence has definitively shown that people with HIV who achieve and maintain an undetectable viral load by taking HIV medication as directed will not sexually transmit the virus to an HIV-negative partner.
- **HIV testing and engagement in care.** Nearly 40% of people with HIV are unaware of their status or are diagnosed but not receiving care. In 2016, people unaware or not receiving care accounted for nearly 80% of new HIV infections in the United States.²⁸
- **PrEP.** Because of the 2019 USPSTF recommendation that clinicians offer PrEP with effective ART to persons who are at high risk of HIV acquisition, as of January 2021 HHS requires most insurance plans to cover PrEP without copay or cost-sharing as a result of the preventive care provisions of the ACA. Implementation guidance issued in July 2021 clarified that this coverage also includes a range of clinical services as part of PrEP clinical care.^{54, 55} In addition, in 2019 FDA approved a second PrEP drug for people assigned male at birth. A generic version of the original drug became available, increasing options for people who wish to use PrEP. Researchers are investigating a variety of non-vaccine HIV prevention products including long-acting injectable antiretrovirals, long-acting oral pills, vaginal rings, vaginal and rectal gels, and more. If found safe and effective and approved by FDA, these products would further expand the options in the prevention toolbox.
- **SSPs, medication for treatment of opioid use disorder, and other harm reduction services.** Nearly 30 years of research shows that comprehensive SSPs are safe, effective, and cost-saving; do not increase illegal drug use or crime; and play an important role in reducing the transmission of HIV, viral hepatitis, and other infections.⁵⁶ FDA has approved several different medications to treat alcohol and opioid use disorders. Certain medications for opioid use disorder relieve the withdrawal symptoms and psychological cravings resulting from opioid dependence. Research also shows that these medications and certain behavioral therapies can contribute to lowering a person's risk of contracting HIV or hepatitis C by reducing the potential for relapse. Appropriations language from Congress permits the use of funds from HHS, under certain circumstances, to support SSPs with the exception that funds may not be used to purchase needles or syringes. [Multi-agency guidance](#) was issued on this opportunity, and in 2020 CDC published a [technical package](#) on effective strategies and approaches for planning, design, and implementation of SSPs. The White

GOAL 1: PREVENT NEW HIV INFECTIONS

Objectives

- 1.1 Increase awareness of HIV
- 1.2 Increase knowledge of HIV status
- 1.3 Expand and improve implementation of safe, effective prevention interventions, including treatment as prevention, PrEP, PEP, and SSPs, and develop new options
- 1.4 Increase the diversity and capacity of health care delivery systems, community health, public health, and the health workforce to prevent and diagnose HIV

House Office of National Drug Control Policy also included several actions related to increasing access to SSPs in its first-year policy priorities, including authorizing the use of federal funds to purchase syringes and other supplies.⁵⁷ In addition, in October 2021, the HHS released the new HHS Overdose Prevention Strategy in which evidence-based harm reduction services, including SSPs, are prioritized as a key target area of action.⁵⁸

- **PEP, condoms, and other effective prevention interventions.** PEP is a short course of HIV medicines taken very soon after a possible exposure to HIV to prevent the virus from taking hold in the body. PEP should be used only in emergency situations and must be started within 72 hours after a recent possible exposure to HIV. Correct condom use remains one of the most effective methods to reduce the risk of HIV transmission during sexual activity. The CDC and USPSTF recommend intensive behavioral counseling on ways to prevent STIs (including HIV) in all adolescents and adults at increased risk for STIs.

In addition, a range of HIV prevention or multipurpose prevention products are under development or regulatory review, which could result in even more HIV prevention tools becoming available within the 5-year span of this Strategy.

CHALLENGES

The following challenges hinder efforts to reduce new infections:

- HIV awareness remains too low.^{59, 60}
- HIV testing and diagnosis opportunities are being missed (see Box 2).⁶¹
- STIs are surging in the United States (see Box 3).⁶²
- A significant number of people with HIV are unaware of their status or are diagnosed in the later stages of their HIV disease.^{3, 11}
- Retention in HIV care is suboptimal.²
- Uptake of PrEP is too low.^{30, 63, 64}
- There are a range of policy, legal, and resource barriers that limit full implementation of SSPs, especially in the most needed areas.^{65, 66}

BOX 2 MISSED OPPORTUNITIES FOR HIV DIAGNOSIS

Substantial numbers of people who are diagnosed with HIV and who had experienced high risk for HIV experienced missed opportunities for earlier diagnosis. For example, in one study, approximately one-half of newly diagnosed gay and bisexual men and people who inject drugs had been unaware of their infection until diagnosed during the study. They reported not being offered HIV testing by any health care provider despite having seen one within the past year.⁶¹ Further, a retrospective study at an urban adolescent HIV clinic found that many youth recently diagnosed with HIV had prior primary and acute care encounters within the health care system but did not receive an HIV test.⁶⁷

Other studies have highlighted missed opportunities by setting. For example, STI clinic patients experience increased risk for HIV, yet data from nine STI clinics across the United States revealed that three-quarters of STI clinic patients were not tested for HIV despite visiting the clinic within the past year.⁶⁸

BOX 2 MISSED OPPORTUNITIES FOR HIV DIAGNOSIS (CONTINUED)

Similarly, more than two-thirds of missed opportunities for HIV diagnoses in a Louisiana health care system occurred at health care visits outside the primary care setting, including inpatient care, specialty care clinics, surgical specialties, ob-gyn visits, and emergency care facilities.⁶⁹ In addition, an infectious disease practice in New Jersey found that hospital emergency departments and subspecialty clinics were the two most common settings for missed testing opportunities, with between 37% and 45% of patients presenting with a new HIV diagnosis with an encounter in the institution in the year prior.⁷⁰ Dental facilities present another opportunity to provide point-of-care HIV screening and testing.⁷¹ Pharmacies and retail clinics represent a vast, largely untapped potential for the delivery of HIV testing in settings that are more accessible and, for some people, less stigmatizing than traditional settings.⁷² Finally, the Centers for Disease Control and Prevention recommends that HIV screening be provided upon entry into and before release from correctional settings and that voluntary (opt-out) HIV testing be offered periodically during incarceration.⁷³ Studies have shown that opportunities for HIV diagnosis and linking HIV-positive individuals with justice system involvement to community care after release are being missed in the majority of prison systems and jails.^{74, 75}

COVID-19 testing and vaccinations also present an opportunity to diagnose people who are unaware of their HIV status. One hospital in an urban setting saw a “considerable increase in acute HIV diagnoses” when it linked HIV screening with COVID testing in emergency departments.⁷⁶

Missed opportunities for HIV testing result in diagnosis delays, disease progression, and lack of access to HIV care and treatment. They also prolong the time a person is unaware of their infection, increasing the potential for HIV transmission. For care and treatment to effectively reduce HIV incidence, improved testing coverage and frequency are needed to ensure that a large proportion of cases are diagnosed and treated soon after infection occurs.

BOX 3 OPPORTUNITIES FOR ENHANCED HIV PREVENTION SERVICES IN STI SPECIALTY CLINICS

STI specialty clinics have been an important health care setting for people who may not otherwise have access to health care services, including those who are uninsured, and for people seeking low-barrier (e.g., nontraditional hours, walk-in or express appointments, low or no cost), expert, and confidential services. STI clinics serve people who may not be engaged in HIV prevention programs or the primary health care system for their STI and HIV prevention, care, and treatment.⁷⁷⁻⁷⁹ As such, they are suitable settings to (1) reach people who could benefit from HIV pre-exposure prophylaxis (PrEP) and nonoccupational post-exposure prophylaxis (PEP), including people diagnosed with an STI; and (2) identify people with HIV who are either unaware of their status or are not virally suppressed and could benefit from linkage to or reengagement in care.⁸⁰

An evaluation of HIV testing events funded by the Centers for Disease Control and Prevention provided further evidence of STI clinics' important role in identifying people who experience increased risk for HIV. In 2019, STI clinics provided almost one-third of all CDC-funded HIV tests conducted among health care settings, and approximately 20% of all newly identified HIV-positive persons were diagnosed in STI clinics.⁸¹

SUMMARY OF OBJECTIVES

The following objectives are critical to achieving the goal of preventing new HIV infections:

- 1.1 Increase awareness of HIV
- 1.2 Increase knowledge of HIV status
- 1.3 Expand and improve implementation of safe, effective prevention interventions, including treatment as prevention, PrEP, PEP, and SSPs, and develop new options
- 1.4 Increase the diversity and capacity of health care delivery systems, community health, public health, and the health workforce to prevent and diagnose HIV

OBJECTIVES AND STRATEGIES

Objective 1.1 Increase awareness of HIV

Nearly four decades into the HIV epidemic, too many people still lack essential information about HIV or hold misconceptions about the virus, including how it is prevented and transmitted. The resulting misperception of self-risk and perpetuation of HIV-related stigma and discrimination can deter people from learning their status, accessing prevention services, seeking or remaining in care, or supporting people who need diagnostic, prevention, care, or treatment services.

More must be done to increase HIV awareness among everyone, but especially among people, communities, and the health workforce where HIV is most heavily concentrated. Messaging must be clear, specific, consistent, and [culturally and linguistically appropriate](#) and must reflect today's scientific knowledge of HIV disease progression, its impact on community and individual health, the importance of early and sustained HIV treatment, and the health and prevention benefits of viral suppression. Once developed, the messaging should be broadly and persistently disseminated as educational campaigns using both traditional and social media delivered by trusted community members and community influencers.

School-based health programs that include sexual health education and connect youth to services serve to create safer and more supportive school environments, particularly for LGBTQI+ youth.⁸² These environments help prevent HIV among adolescents by providing students with the knowledge and skills to help them be healthy and avoid HIV. Comprehensive school-based health programs ensure that students can access the services they need, and promote protective factors, such as school connectedness, that have long-term impact on risk for HIV. HIV prevention implemented in schools includes curricula that are medically accurate, developmentally appropriate, affirming, culturally relevant, accessible, and universally designed with content and skills that target key behavioral outcomes and promote healthy sexual development. Efforts to improve the safety and supportiveness of school environments include the provision of policies and practices that support LGBTQI+ students as well as activities that increase school connectedness and parent engagement.

Suitable primary prevention approaches focused on youth should be age-appropriate, linguistically and culturally informed, community-centered, accessible and universally designed, inclusive, stigma-reducing, and grounded in science and medicine. According to the American Academy of Pediatrics, developmentally appropriate and evidence-based education about human sexuality and sexual reproduction provided over time by pediatricians, schools, other professionals, and parents is important to help children and adolescents make informed, positive, and safe choices about healthy relationships, responsible sexual activity, and their reproductive health.⁸³ Similar recommendations were presented in a 2021 report issued by the National Academies of Sciences, Engineering, and Medicine, which called for the adoption of a holistic sexual health paradigm, among other actions, to reduce STIs.⁸⁴ School-based programs that use strategies to increase sexual health education, connect youth to needed services, and increase the safety and supportiveness of school environments have been demonstrated to reduce sexual risk behavior, experience of sexual violence, and substance use.⁸³ Primary prevention should be a part of comprehensive sexual education, particularly for youth, including delayed initiation of sexual activity for those who are not yet sexually active, and non-judgmental and affirming information about safer sexual activity for those who are sexually active.

These efforts must engage organizations and people who shape and influence knowledge, attitudes, beliefs, and behaviors, particularly among populations that experience risk of HIV, as well as leverage digital strategies and new technologies to reach the highest number of people at relevant access points.

Strategies

- 1.1.1 Develop and implement campaigns, interventions, and resources to provide education about comprehensive sexual health; HIV risks; options for prevention, testing, care, and treatment; and HIV-related stigma reduction.
- 1.1.2 Increase knowledge of HIV among people, communities, and the health workforce in geographic areas disproportionately affected.
- 1.1.3 Integrate HIV messaging into existing campaigns and other activities pertaining to other parts of the syndemic, such as STIs, viral hepatitis, and substance use and mental health disorders, as well as in primary care and general wellness, and as part of annual reproductive health visits and wellness visits.

Objective 1.2 Increase knowledge of HIV status

In addition to general knowledge about HIV, it is important for people with HIV to receive a diagnosis (also known as knowledge of HIV status), which would allow them to take control of their health. Full implementation of CDC and USPSTF screening and testing guidelines is critical to increasing knowledge of status (see Box 4). Innovative models and approaches that expand access to and availability of testing in various settings such as routine opt-out testing in clinical settings, testing in retail pharmacies, self-testing, testing in correctional facilities, mobile testing, and self-testing offered via social networks are required. Early detection coupled with prompt linkage to care and immediate initiation of treatment is also critical and can lead to improved individual and community

health outcomes. The U.S. Department of Veteran Affairs (VA) provides an innovative solution in which pharmacists developed a clinical dashboard that lists patients needing action, including a shared electronic medical record to span HIV, STI, viral hepatitis, and PrEP needs of VA patients. The dashboard enables staff to access quality improvement data, benchmarks against other comorbidities, and comparative analysis by year for improvement purposes.

BOX 4 HIV TESTING RECOMMENDATIONS

U.S. Preventive Services Task Force (USPSTF) Recommendation (2019)—USPSTF recommends that clinicians screen for HIV in adolescents and adults aged 15–65 years. Younger adolescents and older adults who experience increased risk of infection should also be screened. USPSTF also recommends that clinicians screen for HIV infection in all pregnant women, including those who present in labor or at delivery with unknown HIV status. [Read the recommendation.](#)

Centers for Disease Control and Prevention (CDC) Recommendations (2006)—CDC recommends that everyone aged 13–64 years get tested for HIV at least once as part of routine health care. For those with specific risk factors, CDC recommends testing at least annually. [Read the recommendations.](#)

Expansion of the status-neutral approach to HIV care allows for ongoing engagement in HIV prevention, care, and treatment regardless of a person’s HIV status (see Box 5). Embracing a status-neutral approach helps improve care and service provision and eliminates structural HIV and other intersecting stigma by meeting people where they are, offering a “whole person” approach to care, and putting the needs of the person ahead of their HIV status. By embedding HIV prevention and care into routine care, this approach advances health equity by integrating HIV prevention and care with strategies that address social determinants of health and barriers to accessing and remaining engaged in care. HIV testing serves as the entry point to services—the pathway to prevention and treatment. In addition, people are assessed for and engaged in continuous care and supportive services if needed to improve health and prevent new infections (see Figure 7). Health care providers and public health partners play critical roles in a status-neutral approach.

Strategies

- 1.2.1 Test all people for HIV according to the most current USPSTF recommendations and CDC guidelines.
- 1.2.2 Develop new and expand implementation of effective, evidence-based or evidence-informed models for HIV testing that improve convenience and access.
- 1.2.3 Incorporate a status-neutral approach to HIV testing, offering linkage to prevention services for people who test negative and immediate linkage to HIV care and treatment for those who test positive.
- 1.2.4 Provide partner services to people diagnosed with HIV or other STIs and their sexual and/or syringe-sharing partners.

BOX 5 STATUS-NEUTRAL APPROACH TO HIV SERVICES

Adoption of a status-neutral approach to HIV services—in which HIV testing serves as an entry point to services regardless of positive or negative result—can improve testing as well as prevention and care outcomes.

Status-Neutral HIV Prevention and Care

Follow CDC guidelines to test people for HIV. Regardless of HIV status, quality care is the foundation of HIV prevention and effective treatment. Both pathways provide people with the tools they need to stay healthy and stop HIV.

Figure 7. CDC's HIV status-neutral approach to HIV services

People who receive a negative HIV test result are offered powerful tools that prevent HIV, which may include pre-exposure prophylaxis (PrEP) and information about access to condoms and sexual health and harm reduction services. The prevention pathway emphasizes a consistent return to HIV testing and facilitates seamless entry to treatment for people who later receive a positive test result.

People who receive a positive HIV test result should be quickly engaged in HIV primary care and prescribed effective treatment to help them achieve and maintain an undetectable viral load and to tend to their other non-HIV-related health care. An undetectable viral load essentially eliminates the risk of sexual HIV transmission and enables people with HIV to live long, healthy lives.

Objective 1.3 Expand and improve implementation of safe, effective prevention interventions, including treatment as prevention, PrEP, PEP, and SSPs, and develop new options

Today, a range of highly effective prevention methods are available for use in combination or on their own. However, they do not yet reach everyone who needs them. Scaling up combinations of scientifically proven, cost-effective interventions targeted to the right populations in the right geographic areas is key to preventing new HIV infections. Especially important is scaling up highly effective, biomedical interventions: treatment as prevention (U=U), PrEP, and PEP, along with other highly effective prevention interventions including delayed initiation of sexual

activity, correct and consistent condom usage, HIV and viral hepatitis testing, STI testing and treatment, SSPs and harm reduction services, universal HIV testing and linkage to care in primary care settings, and behavioral health services.⁸⁵⁻⁸⁹

These interventions must be available to people who need them in a variety of traditional health care and public health settings as well as nontraditional settings. Public health and health care systems can better meet the HIV prevention needs of the people they serve by developing or adopting culturally competent, linguistically appropriate, and accessible approaches and policies for service design and delivery. Examples of interventions include models that allow for low-barrier access to prevention and supportive services such as expanded service hours, drop-in appointments, telehealth, peer navigators, community health workers, and co-located service delivery.⁹⁰

Schools can offer on-site sexual health services through their own health care infrastructure, such as school-based health centers and school nurses, or can establish referral systems to community partners to provide services, such as periodic, school-wide HIV and STI screening events or mobile clinics. In addition, treatment for alcohol use disorder, other substance use disorders, and mental health conditions can also reduce HIV.⁹¹

Policy and other systemic changes can support the expansion or improvement of these prevention interventions and can often be cost-neutral or cost-saving, as resources are realigned and services are provided at focused hours and delivery is tailored to people seeking assistance.⁹² For example, structural barriers such as state or local laws or policies may require review and revision to facilitate expanded access to HIV prevention services, such as permitting SSPs, working with law enforcement to strengthen training on harm reduction as an effective public health intervention, or expanding prescribing authority and reimbursement of services for PrEP and PEP to pharmacists and other providers.

Ongoing implementation research on how best to use new and existing HIV prevention tools is needed, as is continued research into new tools that make HIV prevention more convenient and accessible. Research must pursue biomedical interventions that simplify implementation, such as long-acting, extended-release tools that can protect against HIV infection without daily pills, as well as non-systemic tools that expand user options such as lubricant- or douche-based microbicides or multi-purpose tools that might protect women from both HIV and pregnancy. Research is needed to identify strategies to most effectively integrate such tools into HIV prevention services when they become available. Other prevention tools also warrant further investigation, including antibody-mediated protection strategies, effective vaccines, and behavioral and social-structural interventions.

Strategies

- 1.3.1 Engage people who experience risk for HIV in traditional public health and health care delivery systems, as well as in nontraditional community settings.
- 1.3.2 Scale up treatment as prevention (i.e. U=U) by diagnosing all people with HIV, as early as possible, and engaging them in care and treatment to achieve and maintain viral suppression.
- 1.3.3 Make HIV prevention services, including condoms, PrEP, PEP, and SSPs, easier to access and support continued use.
- 1.3.4 Implement culturally competent and linguistically appropriate models and other innovative approaches for delivering HIV prevention services.
- 1.3.5 Support research into the development and evaluation of new HIV prevention modalities and interventions for preventing HIV transmissions in priority populations.
- 1.3.6 Expand implementation research to successfully adapt evidence-based interventions to local environments to maximize potential for uptake and sustainability.

Objective 1.4 Increase the diversity and capacity of health care delivery systems, community health, public health, and the health workforce to prevent and diagnose HIV

Expanding awareness, access, uptake, and adherence to effective HIV prevention interventions and improving availability of HIV testing for people with undiagnosed infection or ongoing risk of acquisition are actions that fall largely under the purview of the health care and public health systems. Therefore, steps must be taken to strengthen and expand capacity to ensure that these services are more commonly available in clinical and nonclinical settings including primary care, health centers, community-based organizations, emergency departments, pharmacies (see Box 6), Title X family planning sites, STI specialty clinics (see Box 3), substance use disorder treatment facilities, correctional settings, home- and community-based services, and other settings.

One step involves training all staff, ranging from those performing administrative duties to those delivering direct care, on trauma-informed care, cultural competency, stigma and discrimination, and unrecognized bias. Health care services that are respectful of and responsive to the health beliefs, practices, and cultural, developmental, and linguistic needs of diverse patients can also help bring about positive health outcomes.⁹³ Another step involves providing resources, incentives, training, and technical assistance to organizations to expand workforce and systems capacity especially in areas with limited availability of prevention and other health care and supportive services.⁹⁴ Available mechanisms to increase the number of HIV providers include health professions training grants, the National Health Service Corps Scholarship and Loan Repayment Programs, financial incentives to compensate providers for HIV care management, and program coordination so that providers who are not HIV specialists are adequately equipped to provide prevention services to high-risk populations and link patients who test positive to HIV clinical care providers.

These efforts must seek to expand the number, variety, diversity, and distribution of health care providers who routinely provide HIV testing, prevention counseling, and linkage to specialty care. A recent study showed that a low proportion of primary care providers were familiar with PEP and PrEP.⁹⁵ In some settings, these efforts require addressing the “purview paradox,” a contradiction in which primary care physicians and HIV specialists sometimes consider PrEP to be beyond their purview.⁹⁶ Thus, HIV prevention and testing must become the purview of providers of all types who care for patients who may experience risk. Further, health care providers in high HIV prevalence jurisdictions must understand the relationship of epidemiological context and HIV acquisition. In these jurisdictions, providers may be encouraged to offer universal opt-out HIV testing and integrate PrEP screening as a part of routine care for all clients.

The nation’s more than 13,500 health center service delivery sites span every U.S. state, U.S. territory, and the District of Columbia, and serve 1 in 11 people across the country. In 2020, health centers logged nearly 2.5 million visits for HIV tests and provided more than 389,000 people with access to PrEP.⁹⁷ Further strengthening and supporting the capacity of health centers to respond to the needs of individuals experiencing risk for HIV or living with HIV, including creating affirming and welcoming environments and providing HIV services with integrated behavioral health and family support models, is a promising approach to increasing availability of high-quality HIV prevention and care services for those who need them.

BOX 6 PHARMACISTS' ROLES IN HIV PREVENTION AND CARE

Pharmacists' knowledge and accessibility in nearly every urban and rural community can be leveraged as part of a comprehensive HIV prevention and care strategy to expand access to care and improve population health. As trusted health care professionals, pharmacists develop a strong rapport with patients and may be the key to addressing current disparities in PrEP-prescribing patterns as well as serving as an essential liaison between patients and other members of the multidisciplinary care team.⁹⁸ Pharmacists and community pharmacies can also be utilized to expand rapid, point-of-care HIV testing in communities.⁷² In addition, studies have shown that engaging pharmacists as key players in a care team can increase retention in care and adherence to ART and maintain viral suppression.⁹⁹⁻¹⁰¹

Strategies

- 1.4.1 Provide resources, incentives, training, and technical assistance to expand workforce and systems capacity to provide or link clients to culturally competent, linguistically appropriate, and accessible HIV testing, prevention, and supportive services especially in areas with shortages that are geographic, population, or facility based.
- 1.4.2 Increase the diversity of the workforce of providers who deliver HIV prevention, testing, and supportive services.
- 1.4.3 Increase the inclusion of paraprofessionals on prevention teams by advancing training, certification, supervision, financing, and team-based care service delivery.
- 1.4.4 Include comprehensive sexual health and substance use prevention and treatment information in curricula of medical and other health workforce education and training programs.

Indicators of Progress

Working together to pursue these objectives, the nation can achieve the following targets by 2025:

- Indicator 1** Increase knowledge of status to 95% from a 2017 baseline of 85.8%.
- Indicator 2** Reduce new HIV infections by 75% from a 2017 baseline of 37,000.
- Indicator 3** Reduce new HIV diagnoses by 75% from a 2017 baseline of 38,351.
- Indicator 4** Increase PrEP coverage to 50% from a 2017 baseline of 13.2%.

GOAL 2: IMPROVE HIV-RELATED HEALTH OUTCOMES OF PEOPLE WITH HIV

THE OPPORTUNITY

Starting and staying on HIV treatment as soon as possible following HIV diagnosis is necessary for all people with HIV to improve health outcomes and to prevent HIV transmissions.¹⁰²⁻¹⁰⁴ People who start HIV treatment early and remain adherent to antiretroviral medications can live a normal lifespan. Improving the health of people with HIV requires continued focus on the HIV continuum of care to identify gaps and disparities at each step of the continuum to target resources and interventions (see Figure 8). Increasing access to comprehensive health care through expansion of Medicaid programs, counseling about private insurance through the Affordable Care Act and the American Rescue Plan, and implementing programs to support maintaining insurance such as co-pay and premium assistance through the RWHAP will increase access.

Figure 8. The HIV care continuum outlines the steps that people with HIV take from diagnosis to achieving and maintaining viral suppression. Source: HIV.gov.¹⁰⁵

One common gap is the lack of understanding about the personal and public health benefits of entering treatment immediately and achieving and maintaining viral suppression. Increasing HIV education and available treatment along with strengthening relationships between patients and providers can play an even larger part in supporting people with HIV to begin, or reengage in, care and treatment and improve long-term health outcomes. Developing and expanding partnerships between providers of HIV specialty care and other providers (such as primary care and other health care providers as well as community organizations, health departments, community-based substance use and harm reduction programs, jails and prisons, and others) can leverage existing resources, allowing for seamless transitions between each step of the continuum from diagnosis to achieving and maintaining viral suppression. In addition, government, academic, and pharmaceutical industry research has provided simpler, more easily tolerated therapies than the initial generation of effective antiretroviral therapies. Continued advances such as long-acting injectables could result in the introduction of new HIV treatments during the course of this 5-year plan. These new options could help address challenges with adherence to a daily pill regimen.

Several approaches exist to support treatment initiation and adherence as well as retention in care across the continuum, including:

- **Rapid start programs.** Programs focusing on the immediate (ideally same day or within 7 days after diagnosis) initiation of ART have demonstrated success and are expanding in communities across the nation. Such “rapid start” or “red carpet” programs require structural or other changes to improve linkage to care, care coordination, patient navigation, adequate staffing, specialized services, and clinical provider evaluation.
- **Evidence-based strategies.** Every year evidence-informed best practices are added to the compendia of recommended interventions designed to improve treatment adherence and retention in care. Although interventions are often not a one-size-fits-all approach, health departments, clinics, and community organizations have additional tools to implement and receive a wide range of adaptations that have worked in different settings, in different population sizes, and for specific populations. Increasing the use of evidence-based strategies and best practices, coupled with community input, to reengage people who have fallen out of care, and people never in care, is necessary.
- **Health literacy.** Limited health literacy is associated with poorer health outcomes.¹⁰⁶ At all levels, further effort is needed to construct organizations, institutions, systems, and a workforce that embrace and implement the concepts and principles of health literacy. Efforts to create more health-literate public and private health systems at the federal, state, tribal, territorial, and local levels will help patients understand the health care system and the importance of HIV prevention, care, and treatment, and the benefits of viral suppression. Patient education is a necessary aspect of people-centered care, but it requires systems and providers to end the use of jargon, take the time to educate and explain in plain language, alter websites and brochures, proactively counter medical misinformation, use social media differently, and consider other culturally appropriate and accessible ways to deliver key information. Understanding HIV, the importance of treatment, and the risks of transmission to others can also lead to less stigma and shame, which in turn can lead to increased interactions with the health system and positive health outcomes.¹⁰⁷ Efforts to increase health literacy can also aid in addressing the mistrust of the medical system prevalent among many minority groups because of the historical systemic racism in many health care settings.
- **Comprehensive array of clinical and support services.** Current systems of HIV care and treatment have produced tremendous results, and the nation has more providers treating people with HIV than ever before. Today, people with HIV who are on treatment are living longer and healthier lives, and more than one-half of the people with HIV in the United States are over age 50. Researchers and clinicians are identifying and providing services to address the comorbidities experienced by people aging with HIV as well as people with HIV across the entire lifespan whose health can be impacted by noncommunicable comorbidities or coinfections. Other key

GOAL 2: IMPROVE HIV-RELATED HEALTH OUTCOMES OF PEOPLE WITH HIV

Objectives

- 2.1 Link people to care immediately after diagnosis and provide low-barrier access to HIV treatment
- 2.2 Identify, engage, or reengage people with HIV who are not in care or not virally suppressed
- 2.3 Increase retention in care and adherence to HIV treatment to achieve and maintain long-term viral suppression and provide integrative HIV services for HIV-associated comorbidities, coinfections, and complications, including STIs
- 2.4 Increase the capacity of the public health, health care delivery systems, and health care workforce to effectively identify, diagnose, and provide holistic care and treatment for people with HIV
- 2.5 Expand capacity to provide whole-person care to older adults with HIV and long-term survivors
- 2.6 Advance the development of next-generation HIV therapies and accelerate research for HIV cure

population groups, such as youth, transgender people, people with substance use disorders, justice-involved people, people with disabilities, or people experiencing homelessness, require different combinations of tailored services to help improve their health outcomes.¹⁰⁸ Work continues to scale up evidence-based and evidence-informed programs that provide enhanced case and care management for people with HIV specific to their comorbidities or co-occurring conditions such as homelessness, food insecurity, and lack of employment.

- **Capacity of the health care delivery system.** As providers engage and reengage people in care and implement rapid start models, the number of people in care will increase. However, workforce needs may not be able to keep pace. The existing highly skilled and dedicated workforce, combined with a growing number of federally funded health centers of all types treating people with HIV, are key to ensuring positive health outcomes. There is an opportunity to examine ways to restructure staff and clinic workflows, implement technological solutions, enhance quality improvement programs, consolidate paperwork requirements, and examine task sharing to create new efficiencies and revamp the ability to use peers in key places along the HIV care continuum. Continuing to find innovative ways to encourage clinical and nonclinical providers to specialize in HIV care and treatment and engaging primary care providers in care and treatment of HIV, viral hepatitis, and STIs will remain important.
- **Meaningful involvement of people with HIV in program design and implementation.** People with HIV are central to the response to the epidemic and must be included in all elements of programming and service delivery to achieve the Strategy's goals. People with HIV must be included in program design and implementation, quality improvement initiatives, and campaigns; engaged as peers in prevention and care services; employed in HIV service delivery organizations; and involved in large-scale structural and policy initiatives. COVID-19 has presented opportunities for engaging people with HIV and communities in new and different ways, and program implementers must continue to create mechanisms for the meaningful engagement of interested individuals.

CHALLENGES

The following challenges hinder efforts to improve HIV-related health outcomes:

- Health care capacity and workforce shortages exist in critical geographic areas, particularly in the Southern United States.
- Services to address intersecting conditions of mental health, substance use disorders, homelessness or housing instability, and incarceration are limited and/or fragmented.
- HIV-related stigma, other forms of stigma associated with people with HIV, and discrimination continue to impede optimal health outcomes for people with HIV.
- There is a need for new and innovative health care delivery strategies and therapeutics to better support and retain people most vulnerable to not adhering to or dropping out of care.
- There is a lack of ongoing, diverse, meaningful, and engaged community input in some HIV programs and services.
- Medical mistrust and medical misinformation must be addressed.
- Lack of Medicaid expansion, particularly in Southern states disproportionately affected by HIV, limits access to HIV prevention and care services for many who need them.

SUMMARY OF OBJECTIVES

A concerted national effort to engage people with HIV in care is essential to achieving the Strategy's vision. The following steps are critical to achieving success:

- 2.1 Link people to care immediately after diagnosis and provide low-barrier access to HIV treatment.
- 2.2 Identify, engage, or reengage people with HIV who are not in care or not virally suppressed.

- 2.3 Increase retention in care and adherence to HIV treatment to achieve and maintain long-term viral suppression and provide integrative HIV services for HIV-associated comorbidities, coinfections, and complications, including STIs.
- 2.4 Increase the capacity of the public health, health care delivery systems, and health care workforce to effectively identify, diagnose, and provide holistic care and treatment for people with HIV.
- 2.5 Expand capacity to provide whole-person care to older adults with HIV and long-term survivors.
- 2.6 Advance the development of next-generation HIV therapies and accelerate research for HIV cure.

OBJECTIVES AND STRATEGIES

Objective 2.1 Link people to care immediately after diagnosis and provide low-barrier access to HIV treatment

Achieving improved health outcomes for people with HIV begins with ensuring that they are promptly linked to effective HIV care and treatment upon diagnosis. Linkage to HIV care and treatment immediately or as early as possible following HIV diagnosis leads to faster time to viral suppression, increased rates of retention in care and ongoing viral suppression, and reduction in transmission risk.¹⁰⁹⁻¹¹¹ Programs must continue to build capacity and shrink the amount of time between diagnosis and linkage to care so that immediate linkage to care becomes the standard across the United States, allowing people to begin receiving care and treatment within hours or days of their diagnosis no matter where they live. This effort may require that some clinics and health departments work to reduce facility-based, government-based, workforce, or administrative barriers to initiating care and treatment. Red carpet and warm-handoff programs provide low-barrier access by linking newly diagnosed people to care and treatment services, often within the same day.^{112, 113} For example, these programs, which often integrate robust navigation services, may schedule medical appointments on behalf of the patient, drive newly diagnosed people who lack transportation from an HIV testing site to a trusted clinic, or help people who need assistance complete required forms and paperwork.

Strategies

- 2.1.1 Provide same-day or rapid (within 7 days) start of antiretroviral therapy for persons who are able to take it; increase linkage to HIV health care within 30 days for all persons who test positive for HIV.
- 2.1.2 Increase the number of schools providing on-site sexual health services through school-based health centers and school nurses, and linkages to HIV testing and medical care through youth-friendly providers in the community.

Objective 2.2 Identify, engage, or reengage people with HIV who are not in care or not virally suppressed

Although improvements have been made over time, only 58% of people with diagnosed HIV were retained in care in 2019² and 81% of people with diagnosed HIV were rapidly linked to care within 1 month of diagnosis. In addition, 23% of people with HIV who are not receiving care account for 43% of new infections.²⁸ This population often needs highly tailored approaches to identify, conduct outreach, ascertain barriers to care, and create individualized care plans to facilitate entry into care, followed by navigation and other services to support retention in care, such as short- or long-term housing assistance, benefits counseling across the social services spectrum, and employment counseling. New solutions must be identified to engage and reengage populations that, to date, systems have been unsuccessful in reaching and retaining in care. Feedback and evaluations of services from people with HIV are critical to understanding and improving how services are received by those who need them the most. Attention should also be paid to eligibility and other requirements placed on people seeking care such as eligibility processes and duplicative paperwork requests.

Data-to-care models based on solid, interwoven data points, and other evidence-based interventions focused on finding people not in care and people who are not yet virally suppressed, are proven strategies to reengage people over the long term.¹¹⁴ Disparate data systems must first be linked to identify people who have tested HIV positive but do not have recent indicators of quality care, people who have fallen out of care, people in care who lack timely prescription refills, and people in care who have not achieved or maintained viral suppression. Entering into formal data sharing agreements ensures that the uses of the data, responsibilities, and protections are clearly delineated for all parties. Such agreements are needed among state public health surveillance systems, state and local health departments, tribes, tribal organizations, urban Indian organizations, the RWHAP, federally funded health centers of all types, community-based organizations, STI specialty clinics, HOPWA programs, Medicaid, Departments of Corrections, pharmacies and pharmacy benefits managers, and other components of the health system serving people with HIV in a geographic area. A goal of data sharing agreements is to reduce administrative burden on providers as well as individuals, thereby avoiding redundant intakes, increasing efficiency, and preparing providers to work alongside clients to develop comprehensive treatment plans without delay.

Strategies

- 2.2.1 Expand uptake of data-to-care models using data sharing agreements, integration and use of surveillance, clinical services, pharmacy, and social/support services data to identify and engage people not in care or not virally suppressed.
- 2.2.2 Identify and address barriers for people who have never engaged in care or who have fallen out of care.

Objective 2.3 Increase retention in care and adherence to HIV treatment to achieve and maintain long-term viral suppression and provide integrative HIV services for HIV-associated comorbidities, coinfections, and complications, including STIs

People with HIV need ongoing support to stay in care and adhere to ART to achieve and maintain viral suppression.¹¹⁵ Approaches to increase retention in care include higher levels of personal contact with a patient navigator or community health worker to ensure care receipt; reminders about appointments and calls to discuss why appointments were missed; patient navigation services designed to help patients identify, apply for, and receive necessary services to bolster medical care; medical case management; financial incentives; and low-threshold care including walk-in appointments and on-site pharmacies.^{116, 117} Among adherence interventions are those designed to ensure the efficiency of receiving and taking medications such as 90-day prescriptions, options for medication pick-up or receipt by mail, use of technology such as medication reminder apps, and adherence counseling. Other interventions must address common barriers to adherence and retention, such as providing co-located treatment for HIV and mental health and substance use disorders.

Ongoing research in a variety of disciplines is also needed to improve care retention, medication adherence, and sustained viral suppression. Research topics include next-generation therapeutics that are longer-acting, less toxic, and have fewer side effects and complications, as well as behavioral and social sciences to better understand and address barriers to treatment uptake and adherence, as well as disparities. Biomedical, behavioral, and implementation research approaches can be combined to increase viral suppression, reduce HIV transmission, and improve health for all affected populations. Basic, translational, and clinical research can increase understanding of HIV-related comorbidities, coinfections, and complications, which can interfere with retention, adherence, or viral suppression.

New and differentiated models of care, especially those that integrate HIV prevention, care, and supportive services, alongside broader structural interventions, must be tailored and implemented for priority populations. Many populations such as youth transitioning from pediatric to adult care, people without consistent and stable housing, and people released from correctional facilities need well-coordinated interventions that span systems, providers, and payers and address structural, medical, behavioral, and support service concerns.

Strategies

- 2.3.1 Support the transition of health care systems, organizations, and patients/clients to become more health literate in the provision of HIV prevention, care, and treatment services.
- 2.3.2 Develop and implement effective, evidence-based or evidence-informed interventions and supportive services that improve retention in care.
- 2.3.3 Expand implementation research to successfully adapt effective evidence-based interventions, such as HIV telehealth, patient and peer navigators, accessible pharmacy services, community health workers, and others, to local environments to facilitate uptake and retention to priority populations.
- 2.3.4 Support ongoing clinical, behavioral, and other research to support retention in care, medication adherence, and durable viral suppression.

Objective 2.4 Increase the capacity of the public health, health care delivery systems, and health care workforce to effectively identify, diagnose, and provide holistic care and treatment for people with HIV

Increasing viral suppression requires expanded capacity of public health, health care and support service delivery systems, and the health workforce to be flexible and responsive to the needs of people with HIV. COVID-19 has strained HIV care and prevention systems and has highlighted gaps within our nation's response. Federal and state programs focused on HIV should work to identify opportunities to expand the HIV workforce, including partnerships with medical colleges, particularly Historically Black Colleges and Universities, and incentives for clinicians to provide HIV and related services. Increasing the diversity of providers offering HIV prevention and care services is one important capacity-building approach. In addition, publicly funded organizations can increase the diversity of their workforce and provide training to ensure culturally competent care and knowledge of best practices for caring for people from diverse backgrounds.¹¹⁸ Health care and support systems can also take advantage of different types of health professionals such as nurses, advanced practice providers, pharmacists, and behavioral health specialists to ensure that any workforce shortages can be addressed. Innovative staffing models can also build capacity to better meet the needs of people with HIV including the use of community health workers, linkage to care and reengagement specialist teams, task sharing, integrated care teams, and use of peer mentors.¹¹⁹ Organizations should also work to ensure that their staff represents the populations served, including hiring pathways for people with HIV and providing opportunities for leadership and leadership development. In addition, sustained continuous quality improvement programs must be utilized to ensure that up-to-date and high-quality care is being provided by integrated and diverse care teams.

In addition to the RWHAP, patient-centered medical homes and health homes create opportunities to address medical and support service needs of people with HIV through coordinated, team-based, and accessible programs including co-location of mental health, substance use, geriatric, reproductive, and other related health care services. Similar to HIV prevention, expanding care and treatment capacity must also include delivery of additional resources, incentives, training, and technical assistance to existing systems as well as development of new systems in areas with limited availability. For example, establishing new partnerships and advancing telehealth arrangements to expand access to professionals with specialized backgrounds should be explored to increase access to services in geographically underserved areas, as well as expanding broadband access, so that those in underserved and rural areas may have equitable access to telehealth arrangements. The design of programs to reach and engage people out of care, people never in care, and people who are challenged to stay in care may require novel approaches, services, and partnerships to address issues of trauma, poverty, and associated conditions that are obstacles to care. The creation and implementation of new programs should involve input and feedback from people with HIV because they have unique knowledge to share. Systems should also offer low-threshold capacity-building resources to organizations and retail health clinics led and staffed by local members of the priority populations to enhance their

ability to apply for and receive grants and foundation funds to increase the number of services being provided in and by affected communities.

In addition, to address the unique needs of people aging with HIV and long-term survivors, federal and state programs and community-based organizations must conduct analyses to identify gaps in service delivery for this population so that programs can be implemented to address shortfalls. This analysis should include federal programs such as Medicare and the RWHAP to ensure adequacy of care and support services, benefits, and policies.

Strategies

- 2.4.1 Provide resources, value-based and other incentives, training, and technical assistance to expand workforce and systems capacity to provide or link clients to culturally competent and linguistically appropriate care, treatment, and supportive services especially in areas with shortages that are geographic, population, or facility based.
- 2.4.2 Increase the diversity of the workforce of providers who deliver HIV care and supportive services.
- 2.4.3 Increase inclusion of paraprofessionals on teams by advancing training, certification, supervision, reimbursement, and team functioning to assist with screening/management of HIV, STIs, viral hepatitis, and mental and substance use disorders and other behavioral health conditions.

Objective 2.5: Expand capacity to provide whole-person care to older adults with HIV and long-term survivors

More than one-half (52%) of people in the United States with diagnosed HIV were aged 50 and older in 2019.³ Of the more than 500,000 clients served by the RWHAP in 2019, 46.8% were aged 50 years and older—an increase from 31.6% in 2010. Of clients aged 50 years and older receiving RWHAP HIV medical care, 90.9% were virally suppressed, which was slightly higher than the national RWHAP average (88.1%).¹²⁰ The proportion of older adults with HIV is expected to continue to rise because of the effectiveness of ART, as well as new diagnoses within this age group, which accounts for approximately 17% of all diagnosed HIV in the United States.

People aging with HIV, many of whom are long-term survivors, have unique mental health and physical health needs.¹²¹ Although people with HIV over age 50 have the highest viral suppression rates and the lowest incidence rates of any age group, the effects of aging, chronic inflammation, frailty, and distinctive behavioral health issues can compound the care and support service needs for this population.

Although modern antiretroviral therapies increase the life expectancy of people living with HIV, many challenges and opportunities for the treatment of HIV and HIV-associated comorbidities, coinfections, and complications across the lifespan persist. Even when long-term viral suppression is achieved, people living with HIV over age 50 are more likely than their peers without HIV to experience age-related complications such as cardiovascular disease, lung disease, infection-related and non-infection-related cancers, neurocognitive and neuropsychiatric disorders, osteopenia/osteoporosis, liver cirrhosis, and renal disease. In addition, people living with HIV infection may suffer from multiple morbidities, polypharmacy, declining physical and cognitive function, alterations in body composition, social isolation, and increased caregiver burden.

Older adults with HIV and long-term survivors of HIV often experience social isolation, loneliness, and a lack of social support, as well as HIV- and age-related stigma. These issues may prevent them from seeking or staying in care and can contribute to poor mental and physical health. The U.S. HIV care and treatment system must adapt to ensure that people aging with HIV can receive whole-person care that addresses their HIV- and aging-related health needs, along with support services such as mental health, transportation, housing, food and nutrition, and benefits counseling, among many others. Relatedly, our nation's programs designed to serve older adults—including Medicare, Medicaid, and programs supported through the HHS Administration for Community Living including

State Units on Aging, Area Agencies on Aging, and other community-based organizations and social service providers—must be prepared to meet the needs of people with HIV. Partnerships between HIV care providers and community-based organizations can greatly enhance the ability of people aging with HIV to maintain independence and experience improved quality of life (see Box 8 for a discussion of HIV Prevention and Care Across the Lifespan).

Strategies

- 2.5.1 Identify, implement, and evaluate models of care that meet the needs of people with HIV who are aging and ensure quality of care across services.
- 2.5.2 Identify and implement best practices related to addressing psychosocial and behavioral health needs of older people with HIV and long-term survivors including substance use treatment, mental health treatment, and programs designed to decrease social isolation.
- 2.5.3 Increase HIV awareness, capability, and collaboration of service providers to support older people with HIV, including in settings such as aging services, housing for older adults, substance use treatment, and disability and other medical services.
- 2.5.4 Promote research, cross-agency collaborations and sharing of research discoveries that address specific aging-related conditions in people with HIV, and other comorbidities and coinfections that can impact people with HIV of all ages.
- 2.5.5 Develop and optimize collaborative multi-agency and multi-sectoral approaches and strategies to address emergent and evolving challenges facing people living with HIV at various life stages to support healthy aging with HIV.

Objective 2.6: Advance the development of next-generation HIV therapies and accelerate research for HIV cure

Research and programmatic implementation of varied HIV therapeutic modalities that meet the needs of diverse communities of people with HIV is critical to reduce onward transmission and to achieve complete virus remission, eradication, and HIV cure. Collaboration must exist on a global scale, as much of the research on these new therapies is being done in highest incidence settings.

Novel ART classes and drugs that target the HIV lifecycle are in various stages of preclinical and clinical development and are under investigation in clinical trials. Next-generation therapeutics research includes basic and clinical studies to optimize efficient delivery of therapies and interventions that address drug toxicity, viral resistance, adherence, and retention in care and stigma associated with ART use.

Numerous novel diagnostic and delivery systems are similarly being developed and tested, including subcutaneous, intravenous, topical, implantable, and long-acting oral formulations. New delivery systems and technologies will improve adherence to drug regimens and reduce the burden on health systems.

Research toward safer, effective, and long-lasting therapeutics that successfully achieve viremic control in the absence of ART or completely eradicate the HIV infection (cure) must continue, and must seek a better understanding of the viral reservoir dynamics, persistent viral replication consequences, and the host immune system clearance capacity to remove residual infection.

In parallel to research efforts, safe, long-acting, more efficacious regimes must be rapidly approved and implemented to meet the needs of communities of people with HIV. Achieving these goals will benefit from robust public-private partnerships both in basic and clinical research as well as in implementation planning and delivery to ensure community involvement and advocacy.

Strategies

- 2.6.1 Promote research and encourage public-private partnerships to accelerate new therapies to achieve sustained viral suppression and to address drug toxicity, viral resistance, adherence, and retention in care and stigma associated with ART use.
- 2.6.2 Increase investment in innovative basic and clinical research to inform and accelerate a research agenda to discover how to sustain viral suppression, achieve ART-free remission, reduce and eliminate viral reservoirs, and achieve HIV cure.

INDICATORS OF PROGRESS

Working together to pursue these objectives, the nation can achieve the following targets by 2025:

- Indicator 5** Increase linkage to care within 1 month of diagnosis to 95% from a 2017 baseline of 77.8%.
- Indicator 6** Increase viral suppression among people with diagnosed HIV to 95% from a 2017 baseline of 63.1%.

GOAL 3: REDUCE HIV-RELATED DISPARITIES AND HEALTH INEQUITIES

THE OPPORTUNITY

Advances in HIV prevention, testing, care, treatment, and supportive services have led to significant declines in new HIV transmissions and deaths. They also make it possible for the nation to envision ending the HIV epidemic. However, realizing this vision requires that every person across the United States with or who experiences risk for HIV has access to high-quality and culturally competent prevention, diagnostic, care, treatment, and supportive services that are non-stigmatizing, non-discriminatory, inclusive, and responsive to their needs. Further, issues such as discrimination and systemic racism that contribute to differences in the quality of and access to health care and other necessities such as housing and behavioral and substance use services, and lead to ongoing disparities among racial, ethnic, and sexual and gender minority populations, must be addressed.

The Strategy recognizes racism as a serious public health threat that directly affects the well-being of millions of Americans. Racism is not only the discrimination against one group based on the color of their skin or their race or ethnicity, but also the structural barriers that impact racial and ethnic groups differently to influence where a person lives, where they work, where they play, and where they gather as a community. Over generations, these structural inequities have resulted in racial and ethnic health disparities that are severe, far-reaching, and unacceptable.¹²² Across the country, federal, state, and local leaders are declaring racism to be a public health crisis, an important step in the movement toward equity.¹²⁰ This recognition comes with the need for a more equitable HIV response that focuses on populations with the greatest need.

Reducing these disparities entails focusing on the needs of disproportionately affected populations, supporting racial justice, combating HIV-related stigma and discrimination, providing leadership and employment opportunities for people with or who experience risk for HIV, and addressing social determinants of health and co-occurring conditions to reduce health inequities and disparities. Therefore, the Strategy fully recognizes that the national HIV goals can only be achieved through collaborative efforts at the federal, state, tribal, territorial, and local levels that focus on reducing HIV-related disparities and by ongoing commitment to understand and address the central factors that create HIV inequities.

In recent years, the nation and individual states have made progress in the area of HIV-related disparities. For example:

- **The RWHAP significantly reduced viral suppression disparities among client populations**, particularly women, transgender people, youth, Blacks, and people with unstable housing. Overall, 88% of clients receiving medical care in the RWHAP were virally suppressed in 2019.⁵ From 2010 to 2019, the gap between male and female clients decreased from nearly 5 percentage points to <1 percentage point. In addition, the gap between male and transgender clients decreased from 9 percentage points to 5 percentage points. Similarly, the disparity between viral suppression rates in Black clients and White clients was 13 percentage points in 2010 but 7 percentage points in 2019.^{5, 6} HRSA and its RWHAP recipients have continued to use these data to drive programs and decision-making.
- **Disparities in rates of new infections declined in some populations.** From 2015 to 2019 the United States saw reductions of disparities in the rates of new HIV infections among gay and bisexual men, Black gay and bisexual men, and Black women.¹¹
- **Since 2014, at least nine states (CA, CO, IA, IL, MI, MO, NV, NC, VA) have modernized or repealed their HIV criminal exposure laws.** Changes have included removing HIV prevention issues from the criminal code and including them instead under disease control regulations, requiring intent to transmit or actual HIV transmission, or providing for defenses for taking measures to prevent transmission.

CHALLENGES

The following challenges hinder efforts to reduce HIV-related disparities and health inequities:

- Disparities in HIV prevalence persist.¹²⁴
- The South bears a disproportionate HIV burden.
- Disparities are also evident in the proportion of people with HIV with viral suppression.²
- Significant disparities exist in PrEP uptake by age, race, sex at birth, and geographic location.^{11, 63, 64}

Research to better understand and address such disparities and inequalities—including through community-based participatory research methods—can help improve HIV testing and engagement and retention in prevention and care services and can enhance the health and well-being of people with or who experience risk for HIV in underserved and marginalized communities.

Also important is consideration of and appropriate and proportional response to HIV among groups that represent a small share of both the population and of HIV infections. Although it is vital to focus national efforts in communities with the highest burden, HIV prevention, care, and treatment must continue to be supported in localities with concentrations of groups such as Asian Americans and Pacific Islanders and American Indians/Alaska Natives, and informed by the best available data.

A Focus on Health Inequities

Certain racial and ethnic minority groups have higher rates of HIV incidence, prevalence, poor health outcomes (lower viral suppression), and mortality, compared to non-Hispanic Whites.¹²⁵ Health disparities can stem from inequities in the social determinants of health and highlight the need to focus on not only HIV prevention and care efforts, but also how programs, practices, and policies affect racial and ethnic minority communities. Persons from racial and ethnic minority groups are more likely to be uninsured compared to non-Hispanic Whites,¹²⁶ limiting their access to health care. Sexual and gender minorities also face health inequities. Sexual and gender minorities have lower levels of health insurance and access to regular health care compared to their heterosexual counterparts.^{37, 38} Barriers to health care access include lack of transportation and childcare, inability to take time off from work, communication and language barriers, racism, discrimination, and lack of trust in health care providers.¹²⁷ Further, CDC's 2019 Youth Risk Behavior Survey data show that substantial health disparities exist among an estimated 2.6 million sexual minority students, placing them at risk for negative health outcomes, including HIV infection.

The Strategy recognizes the importance of addressing social determinants of health to improve health outcomes for racial, ethnic, and sexual and gender minority groups. By working to establish policies and programs that positively

GOAL 3: REDUCE HIV-RELATED DISPARITIES AND HEALTH INEQUITIES

Objectives

- 3.1 Reduce HIV-related stigma and discrimination
- 3.2 Reduce disparities in new HIV infections, in knowledge of status, and along the HIV care continuum
- 3.3 Engage, employ, and provide public leadership opportunities at all levels for people with or who experience risk for HIV
- 3.4 Address social and structural determinants of health and co-occurring conditions that impede access to HIV services and exacerbate HIV-related disparities
- 3.5 Train and expand a diverse HIV workforce by further developing and promoting opportunities to support the next generation of HIV providers including health care workers, researchers, and community partners, particularly from underrepresented populations
- 3.6 Advance HIV-related communications to achieve improved messaging and uptake, as well as to address misinformation and health care mistrust

influence social and economic conditions and by supporting changes in individual behavior, health can be improved and sustained, and disparities reduced. Improving the conditions in which we live, learn, work, play, age, and worship and the quality of our relationships will create a healthier population, society, and workforce.¹²⁸ Application of a “health in all policies” strategy, a cross-sector collaborative approach to integrating health into policies and programs to close the health gaps,¹²⁹⁻¹³⁰ can be implemented across all areas and levels of government and in the community to foster achievement of these aims.

SUMMARY OF OBJECTIVES

The following objectives are critical to reducing HIV-related disparities and health inequities:

- 3.1 Reduce HIV-related stigma and discrimination
- 3.2 Reduce disparities in new HIV infections, in knowledge of status, and along the HIV care continuum
- 3.3 Engage, employ, and provide public leadership opportunities at all levels for people with or who experience risk for HIV
- 3.4 Address social and structural determinants of health and co-occurring conditions that impede access to HIV services and exacerbate HIV-related disparities
- 3.5 Train and expand a diverse HIV workforce by further developing and promoting opportunities to support the next generation of HIV providers including healthcare workers, researchers, and community partners, particularly from underrepresented populations
- 3.6 Advance HIV-related communications to achieve improved messaging and uptake, as well as to address misinformation and health care mistrust

OBJECTIVES AND STRATEGIES

Objective 3.1 Reduce HIV-related stigma and discrimination

Many people with HIV experience stigma and discrimination because of their HIV status. Stigma is an attitude of disapproval and discontent toward a person or group because of the presence of an attribute perceived as undesirable. Discrimination is often a consequence of stigma, occurring when unfair and often unlawful actions are taken against people based on their belonging to a particular stigmatized group. HIV stigma and discrimination can pose complex barriers for people with or who experience risk for HIV, preventing them from seeking prevention tools, learning their HIV status, and accessing medical care, treatment, and supportive services. Interested parties and organizations from all sectors of society, including government, faith communities, businesses, schools, and others, must work to combat stigma and discrimination in order to reduce new transmissions and improve health outcomes for people with HIV.

Ending the HIV epidemic requires addressing structural barriers to HIV prevention and care. HIV-specific criminal laws perpetuate HIV-related stigma, and discrimination can also deter individuals from getting tested. Some of these laws criminalize behavior that pose low or no risk for transmitting HIV and apply regardless of actual HIV transmission. These outdated laws do not reflect our current understanding of HIV and should be repealed or updated. At least nine states have done so since 2014. Such efforts must ensure that criminal laws and policies regarding HIV transmission are based on the latest scientific evidence and reflect effective public health strategies, and that legislators, prosecutors, and law enforcement officials have an accurate understanding of HIV transmission risks (see Box 7).

Discriminatory practices cause stress and play a role in the health outcomes of minorities.¹³¹ Public health and health care systems should be respectful of and responsive to the health beliefs, practices, accessibility needs, and cultural and language needs of diverse patients.¹³² At the community level, interested parties and advocates should

be equipped with knowledge and tools to address misconceptions and change norms that are associated with HIV-related stigma and discrimination. At the individual level, multiple approaches to address interpersonal and internalized stigma should be available to people with or who experience risk for HIV as well as their family, friends, health care providers, and others.

HIV-related stigma and discrimination and their effects on people with or who experience risk for HIV should not be viewed in a silo. Stigma and discrimination come in different forms and are often complicated when people also experience stigma and discrimination related to—among other identities or experiences—race and ethnicity, sexual orientation or sexual behavior, other STIs, gender identity, substance use, mental health, homelessness, socioeconomic circumstance, justice involvement, immigration status, age, disability, or sex work.^{108, 133} Additional research, innovative solutions, and replication of global efforts, such as those from the President’s Emergency Program for Emergency AIDS Relief (PEPFAR), to address the drivers, facilitators, and manifestations of stigma are needed.¹³⁴ These solutions should be integrated into the delivery of services that are responsive and sensitive to the unique needs of populations that face intersectional stigmas and intersectional discrimination.

Strategies

- 3.1.1 Strengthen enforcement of civil rights laws (including language access services and disability rights), promote reform of state HIV criminalization laws, and assist states in protecting people with HIV from violence, retaliation, and discrimination associated with HIV status, homophobia, transphobia, xenophobia, racism, substance use, and sexism.
- 3.1.2 Ensure that health care professionals and front-line staff complete education and training on stigma, discrimination, and unrecognized bias toward populations with or who experience risk for HIV, including LGBTQI+ people, immigrants, people who use drugs, and people involved in sex work.
- 3.1.3 Support communities in efforts to address misconceptions and reduce HIV-related stigma and other stigmas that negatively affect HIV outcomes.
- 3.1.4 Ensure resources are focused on the communities and populations where the need is greatest, especially Black, Latino, and American Indian/Alaska Native and other people of color, particularly those who are also gay and bisexual men, transgender people, people who use substances, sex workers, and immigrants.
- 3.1.5 Create funding opportunities that specifically address social and structural drivers of health as they relate to Black, Latino, and American Indian/Alaska Native and other people of color.

BOX 7 STATE HIV CRIMINALIZATION LAWS

During the early years of the HIV epidemic, many states implemented HIV-specific criminal exposure laws to discourage behavior that they believed might lead to transmission, promote safer sex practices, and, in some cases, receive funds to support HIV prevention activities. These laws were passed at a time when very little was known about HIV, including how it was transmitted and how best to prevent or treat it. For example, many were enacted before the advent of pre-exposure prophylaxis (PrEP), which reduces the risk of acquiring HIV sexually by 99% when taken daily, or the availability of antiretroviral therapy (ART), which—when taken as prescribed—helps an individual with HIV achieve and maintain a suppressed viral load so that they have effectively no risk of transmitting HIV to sexual partners. As such, many of these state laws criminalize [behavior that cannot transmit HIV](#) and apply regardless of actual transmission.

BOX 7 STATE HIV CRIMINALIZATION LAWS (CONTINUED)

Criminalization of potential HIV exposure is largely a matter of state law, with some federal legislation addressing criminalization in discrete areas, such as blood donation and sex work. In 2021, CDC assessed state laws and grouped them into four categories:

1. HIV-specific laws that criminalize or control behaviors that can potentially expose another person to HIV.
2. STI, communicable, contagious, infectious disease laws that criminalize or control behaviors that can potentially expose another person to STIs/communicable/infectious disease, perhaps including HIV.
3. Sentence enhancement laws specific to HIV or STI that do not criminalize a behavior but increase the sentence length when a person with HIV commits certain crimes.
4. No specific criminalization laws.

Figure 9. State criminal HIV exposure laws, as of 2021

As shown in Figure 9, these laws vary as to what behaviors are criminalized or what behaviors result in additional penalties. Several states criminalize one or more behaviors that pose a low or negligible risk for HIV transmission. Only 9 of the 35 states with HIV criminalization laws account for HIV prevention measures that reduce transmission risk, such as condom use and ART.

BOX 7 STATE HIV CRIMINALIZATION LAWS (CONTINUED)

Since 2014, at least nine states have modernized or repealed their HIV criminal laws: California, Colorado, Illinois, Iowa, Michigan, Missouri, Nevada, North Carolina, and Virginia. Changes have included removing HIV prevention issues from the criminal code and including them under disease control regulations, requiring intent to transmit or actual HIV transmission, or providing defenses for taking measures to prevent transmission such as viral suppression or being noninfectious, condom use, and partner PrEP use.

After more than 30 years of HIV research and significant biomedical advancements to treat and prevent HIV transmission, many state laws are still outdated and do not reflect our current understanding of HIV. In many cases, this same standard is not applied to other treatable diseases. Further, these laws have not increased disclosure and may discourage HIV testing, increase stigma against people with HIV, and exacerbate disparities. To end the HIV epidemic, public health, criminal justice, and legislative systems must work together to ensure that laws protect the community, are evidence-based and just, and support public health efforts. When a law meant to protect the public is not working as intended, is unjust, and may be hurting efforts to keep communities healthy, common solutions must be found to better meet public health and public safety goals. States should repeal or update these outdated laws and practices.

Source: CDC^{135, 136}

Objective 3.2 Reduce disparities in new HIV infections, in knowledge of status, and along the HIV care continuum

Monitoring of progress toward HIV targets should identify, raise awareness of, and inform appropriately tailored interventions to respond to ongoing and emerging disparities among various populations and in geographic areas. With improved mechanisms to measure, monitor, and report data in a timely manner and enhanced quality, accessibility, sharing, and use of data (see Goal 4), governments and organizations can more quickly identify disparities and direct resources appropriately.

When disparities are identified, tailored interventions must be developed in partnership with the affected populations. Specific populations may have unique or specialized needs and face challenges that require more tailored approaches based on sociodemographic, geographic, cultural, and other characteristics that may be associated with HIV risk or health-promoting behaviors.

Strategies

- 3.2.1 Increase awareness of HIV-related disparities through data collection, analysis, and dissemination of findings.
- 3.2.2 Develop new and scale up effective, evidence-based or evidence-informed interventions to improve health outcomes among priority populations and other populations or geographic areas experiencing disparities.

Objective 3.3 Engage, employ, and provide public leadership opportunities at all levels for people with or who experience risk for HIV

Achieving the goals of this Strategy and ending the HIV epidemic demand a whole-of-society effort that must include and elevate the diverse voices and experiences of people with or who experience risk for HIV, as well as

their partners, families, and communities. Jurisdictions and organizations must meaningfully engage and employ people with or who experience risk for HIV in the development, implementation, monitoring, and assessment of policies, programs, and services. This includes creating opportunities for employment and advancement, as well as fair compensation, wherever possible, particularly for individuals from the priority populations identified in this Strategy. Their experiences and expertise can inform efforts to remove barriers that hinder access to needed information or services and to design services that meet unique needs as well as enhance cultural competency. Governments and other institutions working to meaningfully engage people with or who experience risk for HIV must develop partnerships with networks of people with or who experience risk for HIV and other organizations that engage and serve populations most affected by HIV in each community, thereby identifying ways to optimize messages and services and to combat stigma and discrimination. This includes meaningful engagement of Black, Latinx, American Indian/Alaska Native, and other people of color communities—especially people with or experiencing risk for HIV, people who inject drugs, people with a history of justice involvement, immigrants, sex workers, transgender people, and gay and bisexual men—in HIV planning, service delivery, program monitoring/assessment, research, and policymaking.

Strategies

- 3.3.1 Create and promote public leadership opportunities for people with or who experience risk for HIV.
- 3.3.2 Work with communities to reframe HIV services and HIV-related messaging so that they do not stigmatize people or behaviors.

Objective 3.4 Address social and structural determinants of health and co-occurring conditions that impede access to HIV services and exacerbate HIV-related disparities

Addressing social determinants of health and co-occurring conditions, such as noncommunicable comorbidities and coinfections, is essential to reducing HIV-related health disparities and inequities. For many people with or who experience risk for HIV, addressing basic and immediate needs, such as safety and/or shelter, takes precedence over HIV testing, prevention, care, or treatment. Lack of continuous health insurance coverage, inability to pay for care and treatment, inadequate housing, food insecurity, under- and unemployment, medical mistrust, provider misconceptions and bias, low health literacy, language barriers, and involvement in the justice system all act as barriers to improved HIV outcomes.

In other cases, people may be interested in HIV services, but shortages of a skilled and competent workforce or lack of nearby HIV services hinder their ability to access them. These limitations are made worse by inadequate infrastructure, including limited or no broadband internet services and lack of public transportation.⁹⁴ Structural barriers such as laws or policies can also impede the availability of or access to HIV services. For example, support for the legalization or expansion of SSPs is needed in many jurisdictions, particularly in areas with a significant population of people who inject drugs.

Ending the HIV epidemic requires recognition of the need for interventions and pooled resources to address upstream factors often rooted in racism and other social and structural barriers.¹³⁷ Programs could destigmatize HIV services, increase service utilization, address social determinants of health, and improve health outcomes by integrating them in multi-disease, community-based testing, care, and treatment models.¹³⁸ Ultimately, the success of biomedical and behavioral interventions may be directly impacted by whether structural interventions are effectively integrated to support them. Such integration supports person-centered care that considers all of the patient's needs and lived experiences, including those separate from HIV that vary across the lifespan (see Box 8). Integration also includes establishing additional opportunities to engage in partnerships that make it possible to address clients' unmet needs, maximize reach, and promote efficiency and sustainability.

BOX 8

ADDRESSING HIV PREVENTION AND CARE ACROSS THE LIFESPAN

Responsive services that recognize and support variable and episodic needs across the lifespan are necessary to best support people with or who experience risk for HIV.

Much progress has been achieved in preventing perinatal transmission of HIV in the United States; only 65 HIV infections were attributed to perinatal transmission in 2018.¹³⁹ Although rare, perinatal transmission of HIV still occurs in the United States but disproportionately impacts Black children.¹³⁹ Limited antiretroviral therapy (ART) formulations for infants and children make HIV management in these age groups challenging. Questions remain about the impact of HIV and ART exposure in utero, as well as HIV infection and long-term ART on the growing and developing child. While early treatment reduces morbidity and mortality from HIV, whether very early ART can ameliorate complications of HIV and preserve neurodevelopment, optimal cognitive functioning, and mental health in children with HIV is unclear. Preventing mother-to-child transmission requires intensive case management and coordination across many systems and payors.

Youth experience worse HIV outcomes on status awareness, pre-exposure prophylaxis uptake, and health outcomes. Children and young adults with HIV need tailored and often more intensive medical and support services to support them as they grow and become young adults. Schools play an important role in the primary prevention of HIV in youth by offering comprehensive sexual health education and on-site sexual health services through school-based health centers and school nurses, or in collaboration with community partners that provide services, such as periodic, school-wide HIV and STI screening events or mobile clinics. Schools that cannot provide direct sexual health services can establish integrated referral systems that link students to youth-friendly providers in the community. There is a need for both primary prevention approaches and HIV care models that are tailored to groups of youth at disproportionate risk of HIV, including young gay, bisexual, and other men who have sex with men and people who inject drugs.

Across the lifespan, individuals with HIV will also experience a spectrum of non-HIV-specific needs, which may require coordination across various health and social services systems, such as sexual and reproductive health or transition-related care for transgender individuals, in order to ensure affirming whole-person care.

Similarly, tailored approaches are required to meet the HIV prevention, testing, and care needs of older adults. Older Americans are more likely than younger Americans to be diagnosed with HIV infection late in the course of their disease, meaning they get a late start to treatment and possibly experience more damage to their immune system. Thanks to effective HIV care and treatment, people with HIV who are diagnosed early in their infection, and who get and stay on ART, can keep the virus suppressed and live long and healthy lives. Therefore, the number of older adults with HIV is growing; more than one-half of people with diagnosed HIV in the United States were aged 50 and older in 2018.¹²⁵

Older people with HIV, especially long-term survivors, face different health and psychosocial issues than their younger counterparts and thus require appropriately tailored HIV care and treatment services. These unique needs include screening for, assessment of, and treatment of HIV-associated, non-AIDS conditions as well as age-associated diseases for which people with HIV experience increased risk, and addressing social challenges such as social isolation or depression faced by many people aging with HIV and especially those who are long-term survivors of the disease. As this population continues to age, it will be necessary to research, develop, and implement effective interventions, and adapt and appropriately fund systems of care, with attention to comorbidities related to aging.

**BOX 8****ADDRESSING HIV PREVENTION AND CARE ACROSS THE LIFESPAN
(CONTINUED)**

HIV systems of care must incorporate and form partnerships with service providers for older adults, including local Area Agencies on Aging and housing for older adults, to ensure that older people with HIV can also access social services as well as qualified mental health and substance use services that are provided by people experienced in elder care and HIV. Ensuring that agencies focused on elder services can provide age-friendly, affirming care to LGBTQI+ individuals and those with HIV is imperative as the population in need of those services continues to grow.

There is a clear need for both primary prevention approaches and HIV care models tailored to different life stages. Cross-agency efforts are needed to develop, adapt, and implement treatments and interventions specific for the different life stages in order to improve and sustain HIV health outcomes.

Sources: Mandsager et al.⁶, McNeil and Rowe¹⁴⁰

Strategies

- 3.4.1 Develop whole-person systems of care and wellness that address co-occurring conditions for people with or who experience risk for HIV.
- 3.4.2 Adopt policies and laws that reduce cost, payment, coverage, and/or access barriers to improve the delivery and receipt of services for people with or who experience risk for HIV.
- 3.4.3 Improve screening and linkage to services for people with or who experience risk for HIV who are diagnosed with and/or are receiving services for co-occurring conditions.
- 3.4.4 Develop and implement effective, evidence-based and evidence-informed interventions that address social and structural determinants of health among people with or who experience risk for HIV including lack of continuous health care coverage, HIV-related stigma and discrimination in public health and health care systems, medical mistrust, inadequate housing and transportation, food insecurity, unemployment, low health literacy, and involvement with the justice system.
- 3.4.5 Increase the number of schools that have implemented LGBTQ-supportive policies and practices, including (1) having a Gay/Straight Alliance (GSA), Gender Sexuality Alliance, or similar clubs, (2) identifying safe spaces, (3) adopting policies expressly prohibiting discrimination and harassment based on sexual orientation or gender identity, (4) encouraging staff to attend professional development, (5) facilitating access to out-of-school health service providers, (6) facilitating access to out-of-school social and psychological service providers, and (7) providing LGBTQ-relevant curricula or supplementary materials.
- 3.4.6 Develop new and scale up effective, evidence-based or evidence-informed interventions that address intersecting factors of HIV, homelessness or housing instability, mental health and violence, substance use, and gender especially among cis- and transgender women and gay and bisexual men.

Objective 3.5: Train and expand a diverse HIV workforce by further developing and promoting opportunities to support the next generation of HIV providers including healthcare workers, researchers, and community partners, particularly from underrepresented populations

Continuous building of a diverse HIV workforce is critical to achieve HIV epidemic control. Supporting and promoting equity and diversity is fundamentally important to adequately and effectively advance research and

enhance innovation. Diversity, inclusion, and community representation are key to achieving creative problem-solving perspectives, and to ensuring the comprehensive cultural spectrum necessary to understand epidemic dynamics.

Multiple obstacles, including the lack of opportunity for minority institutions and communities, paucity of adequate mentorship, and resource limitations, impede achieving equity and diversity in the health workforce. Such structural barriers create challenges at all levels of the workforce development ladder, from recruitment to education, promotion, and retention of HIV providers including researchers, community health workers, and other health care providers.

Together with the development of a diverse health workforce, research that effectively reduces and eliminates health disparities in HIV will require the participation of all sectors of the community. Inclusion of all sectors is fundamental to better understand current needs and develop effective actions to mitigate existing gaps in HIV research and service delivery.

A multipronged approach will be necessary to achieve the interrelated goals of a more diverse and appropriately trained research and health workforce and improved community engagement. Successful approaches should address both individual factors and social factors and involve funding agencies, academic institutions, professional societies, and peer collaboration.

Strategies

- 3.5.1 Promote the expansion of existing programs and initiatives designed to increase the numbers of non-White research and health professionals.
- 3.5.2 Increase support for the implementation of mentoring programs for individuals from diverse cultural backgrounds to expand the pool of HIV research and health professionals.
- 3.5.3 Encourage the implementation of effective recruitment of community partners through community-based participatory research and social networking approaches.

Objective 3.6: Advance HIV-related communications to achieve improved messaging and uptake, as well as address misinformation and health care mistrust

Accurate and accessible health communication is essential to ending the HIV epidemic. Communication science provides the tools and strategies for developing communications tailored to the needs of people with HIV and experiencing risk for HIV. Effective HIV communication science involves best practice principles applied to communicator choice and the design, content, tone, and timing of messages. Communications must be responsive to life contexts, community circumstances and feedback, and changes over time.

The U.S. Surgeon General’s “Advisory on Building a Healthy Information Environment” states that the nation has the power to build a healthier information reality.¹⁴¹ Such an environment improves health by enabling informed decision-making and bolsters trust. Dissemination of accurate and accessible health information has been pivotal in the success of HIV prevention and treatment strategies. HIV health communication plays a significant role in decreasing transmission, increasing treatment, and reducing stigma.

Health communication science is a key to understanding and addressing inaccurate health information, whether unintentional misinformation or deliberate and strategic disinformation. Increased investment in new communication implementation research will improve HIV-related health communication strategies and decrease vulnerability to misinformation and disinformation. Addressing communication challenges requires a sustained whole-of-government approach and engagement with multi-sector partnerships and communities.

Strategies

- 3.6.1 Develop and test strategies to promote accurate creation, dissemination, and uptake of information and to counter associated misinformation and disinformation.
- 3.6.2 Increase diversity and cultural competence in health communication research, training, and policy.
- 3.6.3 Expand community engagement in health communication initiatives and research.
- 3.6.4 Include critical analysis and health communication skills in HIV programs to provide participants with the tools to seek and identify accurate health information and to advocate for themselves and their communities.
- 3.6.5 Expand effective communication strategies between providers and consumers to build trust, optimize collaborative decision-making, and promote success of evidence-based prevention and treatment strategies.

INDICATORS OF PROGRESS

Working together to pursue these objectives, the nation can achieve the following targets by 2025:

Indicator 7 Decrease stigma among people with diagnosed HIV by 50% from a 2018 baseline median score of 31.2 on a 10-item questionnaire.

Indicator 8 Reduce homelessness among people with diagnosed HIV by 50% from a 2017 baseline of 9.1%.

Indicator 9 Increase the median percentage of secondary schools that implement at least 4 out of 7 LGBTQ-supportive policies and practices to 65% from a 2018 baseline of 59.8%

In addition to these indicators, the Strategy identifies a disparities indicator to measure progress toward reducing significant HIV-related disparities. Core indicator 6 on viral suppression serves as this disparities indicator and is stratified by each of the priority populations identified in the Strategy:

Indicator 6a Increase viral suppression among MSM diagnosed with HIV to 95% from a 2017 baseline of 66.1%.

Indicator 6b Increase viral suppression among Black MSM diagnosed with HIV to 95% from a 2017 baseline of 58.4%.

Indicator 6c Increase viral suppression among Latino MSM diagnosed with HIV to 95% from a 2017 baseline of 64.9%.

Indicator 6d Increase viral suppression among American Indian/Alaska Native MSM diagnosed with HIV to 95% from a 2017 baseline of 67.3%.

Indicator 6e Increase viral suppression among Black women diagnosed with HIV to 95% from a 2017 baseline of 59.3%.

Indicator 6f Increase viral suppression among transgender women in HIV medical care to 95% from a 2017 baseline of 80.5%.

Indicator 6g Increase viral suppression among people who inject drugs diagnosed with HIV to 95% from a 2017 baseline of 54.9%.

Indicator 6h Increase viral suppression among youth aged 13–24 diagnosed with HIV to 95% from a 2017 baseline of 57.1%.

GOAL 4: ACHIEVE INTEGRATED, COORDINATED EFFORTS THAT ADDRESS THE HIV EPIDEMIC AMONG ALL PARTNERS AND INTERESTED PARTIES

THE OPPORTUNITY

Since the NHAS was first published in 2010, it has inspired all sectors of society—including government agencies, nongovernmental organizations, and the private sector—to better coordinate the nation’s response to the HIV epidemic. This iteration of the Strategy continues to recognize the importance of more integrated, coordinated efforts.

Even greater coordination is possible and essential to ending the HIV epidemic in America. Opportunities include partnerships to meet unmet needs, maximize reach, share best practices to overcoming common challenges, leverage available data, use new and evolving technologies, and promote efficiency and sustainability. Greater integration of services is crucial to meeting the nation’s HIV testing, prevention, care, treatment, and supportive service needs, especially for people living in under-resourced areas and/or who are not effectively reached and engaged by existing programs and services.

It is also essential to address the syndemic of HIV, STIs, viral hepatitis, and alcohol and substance use and mental health disorders. Collaborative efforts cannot be a one-way street, only benefiting the goals of HIV programs; rather, they should address how HIV programs can facilitate the attainment of other programs’ goals that contribute to the overall health and well-being of the populations served.

Activities that exemplify improved integration and coordination of efforts include the following:

- **CDC and HRSA’s joint guidance to health departments and planning groups about single, multi-year Integrated HIV Prevention and Care Plans.** In June 2021, CDC and HRSA issued Integrated Plan Guidance for CY 2022–2026, which intends to accelerate progress toward meeting national goals while allowing each jurisdiction to design an HIV services delivery system that reflects local vision, values, and needs. This guidance built on the first such guidance issued in 2015;¹⁴² reduced duplicative planning and reporting for grantees; streamlined the work of health department staff and HIV planning groups; and promoted improved collaboration and coordination in the use of data to inform HIV prevention and care program planning, resource allocation, evaluation, and continuous quality improvement.
- **Integration of CDC funding for health department HIV surveillance and prevention.** In 2018, CDC renewed and strengthened its flagship funding program to support HIV surveillance and prevention efforts led by state, territorial, and local health departments with 5-year funding awards that integrated HIV surveillance and prevention programs for the first time. Integration helps health departments plan and execute more efficient, coordinated, and data-driven prevention efforts.
- **Pilot programs that have demonstrated the effectiveness of collaborative data-to-care (D2C) approaches.** Using HIV surveillance and other data to improve continuity of HIV care, these CDC-supported pilot programs integrated data from public health and health care delivery to identify people with an HIV diagnosis who were not engaged in medical care and facilitated linkage to care. The pilots demonstrated effectiveness in achieving their goal of increasing the number of people with HIV who are reengaged in care and virally suppressed.¹⁴³
- **Integration of data across programs to improve design and delivery of services.** HRSA and the Department of Housing and Urban Development collaborated to better coordinate HIV care and housing services for people with HIV through data integration and to ultimately improve health outcomes along the HIV care continuum.¹⁴⁴

- **HRSA, NIH, and CDC Implementation Science**

Workgroup. In 2018 the HRSA HIV/AIDS Bureau began a close collaboration with the CDC Division of HIV/AIDS Prevention and the National Institutes of Health's National Institute of Mental Health to create a platform for dialogue across federal agencies working to apply implementation science in HIV, establishing the Federal Implementation Science Workgroup. The resulting funding opportunity announcements seek to strengthen research/service delivery collaborations between NIH investigators and implementers such as sites funded by CDC, HRSA, the Indian Health Service (IHS), the Substance Abuse and Mental Health Services Administration (SAMHSA), and other providers of HIV prevention and care services. Applicants develop creative, locally defined, and culturally sensitive concepts that align with the EHE jurisdictional plans.¹⁴⁵

- **A growing awareness of the need to better integrate services for populations vulnerable to multiple health concerns.**

For example, a 2019 National Academies of Sciences, Engineering, and Medicine workshop highlighted the importance of addressing infectious diseases as part of an improved, comprehensive opioid response and noted that separately administered substance use disorder treatment and infectious disease services often inhibit comprehensive care.¹⁴⁶ In addition, in 2020 SAMHSA published [Prevention and Treatment of HIV Among People Living with Substance Use and/or Mental Disorders](#), a guide that addresses the co-occurrence of HIV and mental illness and/or substance use disorders and reviews effective programs and practices to prevent HIV and, for people with HIV, to increase linkage and retention in care in order to improve health outcomes.

- **Use of new HIV surveillance techniques.** CDC has supported several jurisdictions to detect possible HIV infection clusters more quickly and then coordinate swift responses across programs to deliver needed prevention and treatment services to people who need them. As work continues to expand the ability to identify and quickly respond to new HIV infections, health departments and communities must work together to collectively address the consent, privacy, and data use concerns.

- **Provisions in the 21st Century Cures Act on the interoperability of health information.** These provisions, including those related to social determinants of health, put the patient at the center of care and promote secure health information exchange to enable improved coordination, targeting of resources, and research that can support achieving the Strategy's goals. In March 2020, the Office of the National Coordinator for Health IT (ONC) issued a final rule to implement key interoperability provisions of the 21st Century Cures Act, including promoting patient access to their electronic health information, supporting provider needs, advancing innovation, and addressing industry-wide information blocking practices.¹⁴⁷

GOAL 4: ACHIEVE INTEGRATED, COORDINATED EFFORTS THAT ADDRESS THE HIV EPIDEMIC AMONG ALL PARTNERS AND INTERESTED PARTIES

Objectives

- 4.1 Integrate programs to address the syndemic of HIV, STIs, viral hepatitis, and substance use and mental health disorders in the context of social and structural/institutional factors including stigma, discrimination, and violence
- 4.2 Increase coordination among and sharing of best practices from HIV programs across all levels of government (federal, state, tribal, local, and territorial) and with public and private health care payers, faith-based and community-based organizations, the private sector, academic partners, and the community
- 4.3 Enhance the quality, accessibility, sharing, and uses of data, including HIV prevention and care continua data and social determinants of health data
- 4.4 Foster private-public-community partnerships to identify and scale up best practices and accelerate HIV advances
- 4.5 Improve mechanisms to measure, monitor, evaluate, and use the information to report progress and course correct as needed in order to achieve the Strategy's goals

- **Partnerships with Medicaid programs.** Through these partnerships, several state HIV programs have been able to implement performance measures that reward providers who have increased the numbers of patients who have achieved and maintained viral suppression.
- **Enhanced efforts to integrate services and disciplines in health care delivery.** In recent years, greater emphasis has been placed on integrating behavioral health (mental health and substance use disorder) services and primary care and vice versa. Expanding availability of medications for treatment for substance use disorders in primary care settings is one example. Similarly, to serve the growing population of people with HIV over age 50, more clinics are adopting a geriatric multidisciplinary approach to health care, addressing the domains of medical problems, cognitive and functional abilities, psychiatric disorders, and social circumstances.¹⁴⁸
- **Updating the United States Core Data for Interoperability (USCDI) as a Foundation for Interoperability.** In July 2021, ONC released version 2 of the USCDI. The update expands the standardized set of health data classes and elements for nationwide, interoperable health information exchange. The new data elements support efforts to advance health equity by addressing sexual orientation, gender identity, and social determinants of health.¹⁴⁹

THE CHALLENGES

The following challenges hinder efforts to achieve more integrated and coordinated efforts that address the HIV epidemic among all partners and interested parties:

- Rising rates of substance use have resulted in concurrent infectious diseases epidemics.
- Coordination at the federal, state, and local levels has not expanded to include other necessary government, community-based, and civic partners.
- Data sharing and integration is not timely across programs.
- Local HIV plans are not adequately supported.
- The COVID-19 pandemic continues to divert resources.
- Legislation, budget allocations, and payment systems are not aligned with models of integrated care.

SUMMARY OF OBJECTIVES

The following objectives are critical to achieving integrated, coordinated efforts that address the HIV epidemic among all partners and interested parties:

- 4.1 Integrate programs to address the syndemic of HIV, STIs, viral hepatitis, and substance use and mental health disorders in the context of social and structural/institutional factors including stigma, discrimination, and violence.
- 4.2 Increase coordination among and sharing of best practices from HIV programs across all levels of government (federal, state, tribal, local, and territorial) and with public and private health care payers, faith-based and community-based organizations, the private sector, academic partners, and the community.
- 4.3 Enhance the quality, accessibility, sharing, and use of data, including HIV prevention and care continuum data and social determinants of health data.
- 4.4 Foster private-public-community partnerships to identify and scale up best practices and accelerate HIV advances.
- 4.5 Improve mechanisms to measure, monitor, evaluate, and use the information to report progress and course correct as needed in order to achieve the Strategy's goals.

OBJECTIVES AND STRATEGIES

Objective 4.1 Integrate programs to address the syndemic of HIV, STIs, viral hepatitis, and substance use and mental health disorders in the context of social and structural/institutional factors including stigma, discrimination, and violence

The syndemic of HIV, STIs, viral hepatitis, substance use and mental health disorders in the United States highlights overlapping risk factors as well as associations with social determinants of health such as poverty, lack of health insurance, housing instability, and other related inequities. An effective response to the syndemic requires integration of programs to enable increased flexibility in utilization of allocated resources; better coordinated policy and program planning, development, and delivery; and rapid adjustment to new data or scientific advances. For such integration to occur, major shifts in policy, systems, and societal norms and attitudes must occur, and the willingness to explore new and nontraditional approaches and strategies must increase.

A National Academies report recommends that the syndemic be addressed via integrated medical services in place of often siloed services.¹⁴⁶ Opportunities are missed every day to test people for multiple infections and to scale up HIV services in settings where people who experience risk receive other services. For example, in 2019 among health care settings and non-health-care settings, only 34% of CDC-funded HIV tests had at least one STI or hepatitis C test conducted concurrently.¹⁵⁰ These missed opportunities translate directly into lost time and resources and may result in harm to people who remain undiagnosed, untreated, and at risk of severe outcomes or of transmitting the infection to others. A reciprocal, integrated approach in responses to infectious diseases, the opioid crisis, and substance use and mental health disorders that puts patients first through a status-neutral and no-wrong-door approach will maximize their ability to access services that meet their health needs. In addition, creating a system that focuses on a whole-health approach and one that considers a myriad of needs can lead to enhanced life experiences for people living with HIV. For example, HIV testing programs can identify opportunities to screen for other STIs, viral hepatitis, substance use, and intimate partner violence. Similarly, STI, substance use disorder treatment, and viral hepatitis programs can integrate HIV testing and linkage to relevant HIV prevention or care services, as appropriate.

Strategies

- 4.1.1 Integrate HIV awareness and services into outreach and services for issues that intersect with HIV such as intimate partner violence, homelessness or housing instability, STIs, viral hepatitis, and substance use and mental health disorders.
- 4.1.2 Implement a no-wrong-door approach to screening and linkage to services for HIV, STIs, viral hepatitis, and substance use and mental health disorders across programs.
- 4.1.3 Identify and address funding, policy, data, workforce capacity, and programmatic barriers to effectively address the syndemic.
- 4.1.4 Coordinate and align strategic planning efforts on HIV, STIs, viral hepatitis, substance use disorders, and mental health care across national, state, tribal, territorial, and local partners.
- 4.1.5 Enhance the ability of the HIV workforce to provide naloxone and educate people on the existence of fentanyl in the drug supply to prevent overdose and deaths and facilitate linkage to substance use disorder treatment and harm reduction programs.

Objective 4.2 Increase coordination among and sharing of best practices from HIV programs across all levels of government (federal, state, tribal, local, and territorial) and with public and private health care payers, faith-based and community-based organizations, the private sector, academic partners, and the community

Ending the HIV epidemic requires a whole-of-society approach. Increasing coordination across all sectors of society enables better delivery of services and resources to people with or who experience risk for HIV. Likewise,

establishing trusted partnerships enables coalitions to develop, implement, and regularly evaluate and update policies and programs that address the social, economic, and political environments that shape and constrain individual, community, and societal outcomes.

Increased coordination at the federal level includes expanding the partners engaged in the nation's HIV response. This effort includes leveraging existing programs whose primary purpose may not be HIV services, but that could provide supportive services such as employment training or nutrition assistance to people with or who experience risk for HIV. Such coordination helps to ensure that resources are allocated according to current burden of disease and that the most effective prevention and care strategies are tailored to local community needs to achieve maximal results.

Better coordination involves fostering strong linkages among community-based organizations, health departments, other public programs and services, education agencies, pharmacies, health care providers and systems, and community leaders. Collaboration with community partners is particularly important to developing locally relevant plans for providing testing, prevention, care, treatment, and supportive services, including those that engage people not yet reached by existing programs and services. Collaboration also involves engaging and building capacity and competencies among partners and communities that are interested in providing HIV services but may not have had the opportunity or resources to do so. Expanded and strengthened partnerships can better equip communities to respond swiftly and effectively to identified outbreaks of HIV, STIs, and/or viral hepatitis. Greater involvement by our nation's technology and other business communities can boost efforts to provide accurate information, reach key populations, and develop innovative tools.

Attention must also be focused on service delivery and payment methods. Fee-for-service and other payment models do not adequately support integrated, comprehensive health care delivery models, such as behavioral health and medical care integration, patient-centered medical homes, services provided by pharmacists in nontraditional roles, integration with support services, oral health care, and care coordination. Grant funding to support pilots or demonstrations of such integrated models is limited and time-bound. Scaling up and sustaining these effective care delivery models require evolutions in public and private payer systems.

Strategies

- 4.2.1 Focus resources including evidence-based and evidence-informed interventions in the geographic areas and priority populations disproportionately affected by HIV.
- 4.2.2 Enhance collaboration among local, state, tribal, territorial, national, and federal partners and the community to address policy and structural barriers that contribute to persistent HIV-related disparities and implement policies that foster improved health outcomes.
- 4.2.3 Coordinate across partners to quickly detect and respond to HIV outbreaks.
- 4.2.4 Support collaborations between community-based organizations, public health organizations, education agencies and schools, housing providers, and health care delivery systems to provide linkage to and delivery of HIV testing, prevention, care, and treatment services as well as supportive services.

Objective 4.3 Enhance the quality, accessibility, sharing, and uses of data, including HIV prevention and care continua data and social determinants of health data

High-quality data are essential to increasing coordination, integration, and seamless delivery of services that are required to end the HIV epidemic. The appropriate collection and use of data can inform efforts to focus prevention and testing services on populations that need them most, can help ensure that people newly diagnosed with HIV are promptly linked to care, and can facilitate retention in effective HIV care. However, jurisdictions need resources, guidance, and support to strengthen HIV surveillance systems and activities, in accordance with applicable law, to

obtain the data needed to improve our response to the HIV epidemic, including viral load reporting and disparities data to ensure that populations or communities are not being left behind.

Appropriate use of secure electronic health information exchange can help to engage and retain or reengage people in care and to facilitate transitions across care and community settings. Further, sharing of treatment and outcome data can drive the science needed to develop new and better treatments, approaches to retention in care, and prevention interventions. Better use of data on social determinants of health can optimize prevention and testing efforts for groups experiencing greater risk of acquiring HIV, engage and retain people with HIV in care, support adherence to treatment, and inform ongoing research efforts to develop better treatment and prevention. Use of modeling and other analytical approaches may yield novel insights and inform planning.

Strategies

- 4.3.1 Promote the collection, electronic sharing, and use of HIV risk, prevention, and care and treatment data using interoperable data standards, including data from electronic health records, in accordance with applicable law.
- 4.3.2 Use interoperable health information technology, including application programming interfaces (APIs), clinical decision support tools, electronic health records and health IT products certified by the Office of the National Coordinator's Health IT Certification Program, and health information exchange networks to improve HIV prevention efforts and care outcomes.
- 4.3.3 Encourage and support patient access to and use of their individual health information, including use of their patient-generated health information and use of consumer health technologies in a secure and privacy-supportive manner.

Objective 4.4 Foster private-public-community partnerships to identify and scale up best practices and accelerate HIV advances

Effective private-public-community partnerships are necessary to enhance responses to critical implementation challenges. Partnerships should ensure local relevance and emphasize the leadership role of community members, academic investigators, public health departments and other collaborators through intentional involvement in all stages of research, from conceptualization of the research question to dissemination of results.

There is growing interest in developing closer partnerships among the private sector to increase the appropriate application of evidence in policy and practice. Private-sector resources and approaches that integrate multidisciplinary HIV prevention and treatment service delivery in different settings can reach communities in ways that government cannot. Emphasis on cross-disciplinary collaboration and input by allied health and community service providers as partners with the private sector in HIV research, prevention, and care will optimize program acceptability, uptake, and rollout; improve outcomes; and maximize the impact of translation of research results.

The response to the HIV epidemic has generated significant scientific advances and best practices. Implementation science provides a framework to identify factors that facilitate application of relevant and effective public health interventions and services. Community-centric implementation research is one important approach to rapidly and effectively translate new discoveries into practice at the local level, with fidelity. Effective partnerships can achieve an impact at the population level, to efficiently disseminate evidence-based interventions at scale through culturally appropriate public health initiatives and clinical practice (see Box 9).

There is a need to develop more opportunities and mechanisms for timely information sharing and peer technical assistance to support replication of best practices and use of lessons learned to address common barriers within and across jurisdictions. Activities supporting replication and scale-up of proven interventions should address infrastructure needs and include intentional sustainability planning to ensure continuity of care and services across all participating service settings.

Strategies

- 4.4.1 Adopt approaches that incentivize the scale up of effective interventions among academic centers, health departments, community-based organizations, allied health professionals, people with HIV and their advocates, the private sector, and other partners.
- 4.4.2 Expand opportunities and mechanisms for information sharing and peer technical assistance within and across jurisdictions to move effective interventions into practice more swiftly.
- 4.4.3 Develop and optimize collaborative multi-agency and multi-sectoral approaches and strategies to address emergent and evolving challenges facing people of all ages living with HIV.

BOX 9

LEVERAGING TECHNOLOGY INNOVATIONS TO IMPROVE HIV PREVENTION AND TREATMENT

Technological innovations have rapidly altered many aspects of life in the past decade. Many Americans have transformed their digital toolbox to include systems such as Zoom or FaceTime, email, and other applications to stay informed on their health and connected to health care systems. These innovations prove the potential to leverage technology in the HIV response.

Telehealth has proven to be a reliable resource for reaching populations experiencing risk or who are living with HIV and can address many of the factors identified as barriers to retention in HIV care. Telehealth can also broaden access to pre-exposure prophylaxis (PrEP), HIV care and treatment, and mental health and substance use treatment in rural areas, which often face workforce shortages and transportation challenges.¹⁵¹ Refining and sustaining telehealth services that were implemented in response to the COVID-19 pandemic will allow organizations to use these technological advances to improve the HIV response.

Expanded use of the internet and social media can help people involved in HIV prevention and treatment use mobile devices, websites, and applications as hubs for HIV information and collaboration to ensure that scientifically and medically accurate information is prioritized, and misinformation is combated. At the same time, these websites and applications can also make accessing information on HIV prevention, testing, and treatment more accessible and discrete. Wearable technology such as smartwatches can use health applications to provide real-time insights on an individual's health status and empower people to personalize and monitor their own health data. Electronic health records strengthen the HIV care continuum by providing accurate and timely information. Electronic health records can also use clinical decision support tools to help improve screening by identifying patients for whom an HIV test or PrEP might be recommended or facilitating reengagement in HIV care for those who may have left but present for other health care services elsewhere. Further advancements in the use of technology to improve HIV care could also be used to streamline patient pathways including enhanced remote patient monitoring techniques and other engagement opportunities made available through emerging fields such as digital therapeutics and at-home testing. Policymakers, clinicians, and private-sector partners must collaborate to uncover solutions and further innovation to leverage technology in the HIV response and improve patient engagement.

Objective 4.5 Improve mechanisms to measure, monitor, evaluate, and use the information to report progress and course correct as needed in order to achieve the Strategy's goals

There is a continued need to streamline and harmonize data reporting to reduce reporting burden and produce more regular, timely, and useful data. Support is also needed to adopt new analytic methods and approaches to

increase the timeliness of data, enhance the ability to characterize the burden of HIV across the nation, and use that information to allocate resources to achieve the greatest impact. In addition, complementary data sources such as health care payer databases, surveys, and linkages to electronic health records are necessary to ensure that robust information that can guide decision-making.

Timely data will improve accountability among federally funded organizations as they set and make progress toward measurable goals and targets aligned with this Strategy. Data for the indicators at the local, state, and national levels should be regularly and publicly reported and reviewed to identify successful efforts, indicate challenges, and facilitate ongoing dialogue about ways to continue moving forward. Such reporting and review require a monitoring plan that evaluates the implementation of the Strategy. A system of regular public reporting will help to sustain public attention and support at the national level. Organizations that struggle to engage new parties and organizations or fall short of expected outcomes should receive intensive capacity-building assistance and other supportive measures as a condition of continued funding. The nation can thus direct its funds to entities and initiatives that demonstrate the highest level of performance and accountability for high-impact HIV prevention.

Strategies

- 4.5.1 Streamline and harmonize reporting and data systems to reduce burden and improve the timeliness, availability, and usefulness of data.
- 4.5.2 Monitor, review, evaluate, and regularly communicate progress on the National HIV/AIDS Strategy.
- 4.5.3 Ensure that the National HIV/AIDS Strategy's goals and priorities are included in cross-sector federal funding requirements.
- 4.5.4 Strengthen monitoring and accountability for adherence to requirements, targets, and goals by funded partners.
- 4.5.5 Identify and address barriers and challenges that hinder achievement of goals by funded partners and other interested parties.

IMPLEMENTATION AND ACCOUNTABILITY

FEDERAL PARTNERS

The Strategy provides a framework for ending the HIV epidemic in the United States. Development of the Strategy was a collaborative process led by the White House that engaged federal partners across multiple departments and agencies with input from a diverse range of interested parties and organizations from across the nation.

Federal partners will collaborate to develop an implementation plan to pursue the Strategy goals, objectives, and strategies. The NHAS Federal Implementation Plan will set forth federal partners' commitments to policies, initiatives, and activities to meet the goals of the Strategy and will be published for transparency and accountability.

As part of their ongoing commitment to reduce HIV in this nation, federal partners have committed to serve on a Strategy implementation working group. This working group will collaborate to address HIV in an integrated fashion by including other infectious diseases as components of the syndemic. The working group will meet regularly to coordinate activities across agencies and departments, apply lessons learned from epidemiological data and research findings, monitor progress toward the indicator targets, course correct as needed, and report on national progress. As scientific, medical, and public health advances and challenges emerge, new and innovative policies will be developed to complement the existing Strategy.

NONFEDERAL PARTNERS

Addressing HIV is not solely a federal activity. Success depends on coordinated action by state, tribal, territorial, and local governments; community-based organizations and faith-based organizations; health plans and payers, health care providers, and other health-related organizations; private-sector partners; the criminal justice system; universities, schools, education agencies, and other venues for educational activities; researchers; families; and patients and their partners. Its success also depends on a holistic approach to the various parts of the syndemic, including STIs, viral hepatitis, substance use and mental health disorders, stigma and discrimination, and social and structural determinants of health.

Each community and stakeholder brings a unique perspective and plays a critical role in preventing and responding to HIV. Over the past several years many states and localities have engaged in community-wide efforts to develop their own plans to end the HIV epidemic. Interested parties and organizations are encouraged to use this Strategy to engage with others and build or update their own roadmap to reduce HIV and end the HIV epidemic among the populations and communities they serve. Interested parties and organizations should consider adopting the vision and goals of this Strategy; pursuing the objectives and implementing the strategies relevant to their role(s), populations served, and community circumstances; and identifying opportunities to adopt and use the Strategy's indicators and targets to measure their own progress. In doing so, communities and interested parties and organizations can also apply other evidence-based strategies that are appropriate for responding to HIV in their area and use all available data to identify where their resources and effort will have the most impact. A data-driven strategy will help interested parties and organizations focus efforts and efficiently and effectively use available resources. Integrating HIV testing, prevention, care, and treatment efforts with other components of the syndemic is also strongly encouraged.

APPENDIX A: PROCESS FOR DEVELOPING THE STRATEGY

On June 5, 2021, the Biden-Harris administration re-established the Office of National AIDS Policy (ONAP) within the White House. After discussions with staff of the White House Domestic Policy Council, it was agreed that the HIV National Strategic Plan (HIV Plan) released in January 2021 provided a strong foundation for ending the HIV epidemic but required updates to reflect Administration priorities, the latest data and research, and community feedback specific to the HIV Plan.

ONAP consulted with the federal department and agency representatives who served on the interagency Steering Committee that developed the HIV Plan (see Table A.1) to obtain recommendations to fulfill this mandate. In addition, ONAP received feedback from a variety of parties from the HIV community that could strengthen the Strategy to end the HIV epidemic by 2030. ONAP reviewed, considered, and integrated much from these various inputs into this Strategy, with support from the White House Office of National Drug Control Policy and the Office of Infectious Disease and HIV/AIDS Policy (OIDP), within the Office of the Assistant Secretary for Health at the Department of Health and Human Services (HHS). Drafts were refined through successive rounds of review by the Steering Committee, Domestic Policy Council, inter-departmental clearance, and the White House.

Table A.1. Composition of NHAS Federal Steering Committee

Federal Departments and Agencies	HHS Agencies/Offices	
• Department of Agriculture • Department of Defense • Department of Education • Department of Justice • Equal Employment Opportunity Commission • Department of Health and Human Services • Department of Housing and Urban Development • Department of Labor • Department of Veterans Affairs	• Administration for Community Living • Agency for Healthcare Research and Quality • Centers for Disease Control and Prevention • Centers for Medicare & Medicaid Services • Food and Drug Administration • Health Resources and Services Administration • Indian Health Service	• National Institutes of Health • Office for Civil Rights • Office of the Assistant Secretary for Health • Office of the National Coordinator for Health Information Technology • Substance Abuse and Mental Health Services Administration

IDENTIFICATION OF PRIORITY POPULATIONS BASED ON NATIONAL-LEVEL DATA

ONAP maintained in this Strategy the priority populations designated in the HIV National Strategic Plan. Priority populations are disproportionately affected populations, which are defined as groups of people with a higher burden of disease than others. HIV testing, prevention, care, and treatment interventions and resources can be delivered to priority populations for the greatest impact. An Indicators Subcommittee of the Steering Committee that developed

the HIV National Strategic Plan reviewed national HIV surveillance data available in 2020 to identify priority populations. In developing this Strategy, ONAP reviewed the most recent data and determined that it continued to support the designation of the identified priority populations.

Table A.2. Priority Populations and Summary National-Level Data, Calendar Year 2019 (unless otherwise indicated)

Gay, Bisexual, and Other Men Who Have Sex with Men (MSM)

- Gay, bisexual, and other men who have sex with men are the population most affected by HIV in the United States. At the end of 2019, an estimated 1,189,700 people had HIV in the United States. Of those, 692,900 (58%) were gay and bisexual men.¹¹
- In 2019, adult and adolescent gay and bisexual men represented 66% (23,100) of the 34,800 new HIV infections in the United States.¹¹
- The incidence of many STIs in gay, bisexual, and other men who have sex with men—including primary and secondary syphilis and antimicrobial-resistant gonorrhea—is greater than that reported in women and men who have sex with women only.¹⁵² Having another STI can greatly increase the chance of getting or transmitting HIV. Of new HIV infections among men who have sex with men, 10% are estimated to be attributable to gonorrhea and chlamydia, equating to 2,600 HIV infections each year.⁵¹

Black MSM

- Black gay, bisexual, and other men who have sex with men are more affected by HIV than any other group in the United States.
- In 2019, Black gay and bisexual men accounted for 26% (8,900) of the 34,800 new HIV infections and 39% of the 23,100 new infections among all gay and bisexual men in the United States.¹¹
- Of the 36,337 new HIV diagnoses among adolescents and adults ≥13 years in the United States and dependent areas in 2019, 25% were among Black gay and bisexual men.³
- From 2015 to 2019, HIV infections remained stable among Black gay and bisexual men overall. By age group, the annual number of new HIV infections declined in Black gay and bisexual men aged 13–24, while the number of new infections remained stable among all other age groups of Black gay and bisexual men.¹¹ In 2019 the largest percentage of new HIV infections among Black/African American gay and bisexual men was among those aged 25–34 years (46%), followed by those aged 13–24 years (33%).¹¹
- Along the HIV care continuum, compared to all people with diagnosed HIV in 41 states and the District of Columbia, Black gay and bisexual men have lower viral suppression rates.⁷ (See Figure A.1.)

Latino MSM

- Latino gay, bisexual, and other men who have sex with men are heavily affected by HIV. In 2019, adult and adolescent Latino gay and bisexual men comprised 23% (7,900) of the 34,800 new HIV infections in the United States and 34% of 23,100 new HIV infections among all gay and bisexual men in the United States.¹¹
- Of the 36,337 new HIV diagnoses among adolescents and adults ≥13 years in the United States and dependent areas in 2019, 22% were among Latino gay and bisexual men.³
- From 2015 to 2019, the annual number of new HIV infections declined in Hispanic/Latino gay and bisexual men aged 13–24, while the number of new infections remained stable among all other age groups of Hispanic/Latino gay and bisexual men.¹¹ In 2019 the largest percentage of HIV infections among Hispanic/Latino gay and bisexual men was among those aged 25–34 years (44%), followed by those aged 13–24 years (23%).¹¹

American Indian/Alaska Native MSM

- American Indian/Alaska Native men who have sex with men are disproportionately affected by HIV. In 2019, 62% (126/209) of diagnoses among adolescents and adults ≥13 years occurring among American Indian/Alaska Native people were among men who have sex with men.³
- HIV diagnoses among American Indian/Alaska Native gay and bisexual men increased 15% between 2015–2019, while diagnoses among gay and bisexual men of other races/ethnicities were either stable or declined.¹²⁵

Black Women

- Although data show a 22% decrease in new HIV infections among Black women between 2010 and 2019, among all women in the United States, Black women account for the largest share of 6,400 new HIV infections (3,400 or 53%) in 2019.^{4, 11}
- The rate of new HIV infections among Black women (18.9 per 100,000) is nearly 11 times as high as the rate among White women (1.8 per 100,000) and nearly 4 times as high as the rate among Latinas (4.9 per 100,000).¹¹

Transgender Women

- A 2019 systematic review and meta-analysis found that an estimated 14% of transgender women have HIV.¹⁴
- By race/ethnicity, an estimated 44% of Black transgender women, 26% of Latina transgender women, and 7% of White transgender women have HIV.^{2, 3, 153}
- Among the 3 million HIV testing events reported to CDC in 2017, the percentage of transgender people who received a new HIV diagnosis was three times the national average.¹⁵⁴

Youth Aged 13–24 Years

- In 2019, youth aged 13–24 years accounted for 21% (7,200) of the 34,800 new HIV infections in the United States and dependent areas. Most new HIV diagnoses among youth were among young gay and bisexual men.
- Only 9% of high school students have been tested for HIV and therefore do not know their HIV status. Among male students who had sexual contact with other males, only 15% have ever been tested for HIV.¹⁵⁵
- In 2019, youth with diagnosed HIV were also the least likely of any age group to be linked to care within 1 month of diagnosis (79%).² Further, compared to all people with HIV, youth have the lowest rates of viral suppression. For every 100 youth with HIV, 45 received some HIV care, 33 were retained in care, and 35 were virally suppressed.²
- People aged 15–24 years account for approximately 50% of the 20 million new STIs in the United States each year, yet approximately 25% of the sexually active population.¹⁵² Having another STI can greatly increase the chance of getting or transmitting HIV.

People Who Inject Drugs (PWID)

- People who inject drugs are at high risk for getting HIV and/or HCV if they use and share needles, syringes, or other drug injection equipment that someone with HIV has used.
- New HIV infections among people who inject drugs have increased 8.7% in recent years (from 2,300 infections in 2015 to 2,500 infections in 2019) in the United States and dependent areas.¹¹
- Although HIV incidence among people who inject drugs has declined substantially over many years, the ongoing use of opioids and other frequently injected substances including cocaine and methamphetamine are threatening this HIV prevention success. HIV diagnoses among people who inject drugs increased by 11% nationally from 2016 to 2018, with more pronounced increases among adults younger than age 40 and non-Hispanic White adults.¹²⁵ Injection drug use has contributed to multiple recent clusters and outbreaks of new HIV infections among people who inject drugs.¹⁵⁶
- Among people with HIV who inject drugs, 62–81% were also living with hepatitis C.¹⁵⁷ People with HIV also living with hepatitis B or hepatitis C have higher liver-related morbidity and mortality, and higher overall mortality than patients only living with hepatitis B or hepatitis C.¹⁵⁸⁻¹⁶⁰

Figure A.1 depicts the subpopulations (defined by race, ethnicity, and gender) with the most new HIV diagnoses in 2019.

Figure A.1. New HIV diagnoses in the United States and dependent areas for the most-affected subpopulations, 2019

Notes: Black refers to people having origins in any of the Black racial groups of Africa. African American is a term often used for Americans of African descent with ancestry in North America. Hispanics/Latinos can be of any race. Subpopulations representing 2.0% or less of all people who received an HIV diagnosis in 2018 are not represented in this chart. Source: Centers for Disease Control and Prevention.¹⁶¹

The Strategy recognizes the importance of providing HIV services to all populations with or who experience risk for HIV. Therefore, even though they were not designated as priority populations, the Strategy discusses the importance of addressing the unique needs of other groups, such as long-term survivors and older people with HIV or people experiencing unstable housing or homelessness.

INDICATORS TO MEASURE PROGRESS FOR THE NATIONAL HIV/AIDS STRATEGY

The Strategy includes 9 core indicators to monitor annual progress toward achieving Goals 1, 2, and 3. In addition, one of the core indicators is stratified by each of the priority populations to measure progress toward reducing disparities.

For each indicator, baseline measurements (2017) and targets for 2025 are provided. Indicators 1–6 are aligned with the EHE initiative and *Healthy People 2030* objectives. Alignment of the indicators between the HIV Plan and EHE allows for consistency and reduced burden on local and state health departments that report data as well as on federal partners who monitor and report on progress in measuring and reporting results across the indicators.

The methods for measuring progress and specifications for each of the indicators is detailed below.

METHODS

CDC's National Center for Health Statistics describes the “percent of targeted change achieved,” which quantifies progress for *Healthy People 2020* indicators that are moving toward their targets. The methods are described in full by Talih and Huang¹⁶² and may be used for measuring progress in *Healthy People 2030*. To align methods for measuring progress across HHS, the percentage of targeted change achieved method is adapted for use to measure national progress annually for the National HIV/AIDS Strategy.

METHODS

The “percent of targeted change achieved” used in *Healthy People 2020* is the difference between the baseline and the midcourse value as a percent of the targeted change between the baseline value and the *Healthy People 2020* target. To adapt for use in the National HIV/AIDS Strategy, annual results and National HIV/AIDS Strategy targets are used. This method also provides a way to compare percent of targeted change achieved by National HIV/AIDS Strategy indicator and highlights areas on which to focus. The formula is as follows:

$$\text{Percent of targeted change achieved} = \frac{\text{Annual result} - \text{Baseline result} \times 100}{2025 \text{ target} - \text{Baseline result}}$$

The magnitude of change for percent of targeted change achieved may be evaluated using statistical significance testing for indicators that are estimated.

An *example* using hypothetical data is provided below to illustrate the calculations for the percent of targeted change achieved for linkage to care within 1 month and viral suppression.

Table A.3. Hypothetical Data for Linkage to Care and Viral Suppression Calculations

Indicator	2017	2023	2025 Target
Linkage to Care within 1 Month	78.4%	82.3%	95%
Viral Suppression	54.4%	65.5%	95%

Percent of targeted change achieved for *linkage to care within 1 month*:

$$= \frac{82.3\% - 78.4\%}{95\% - 78.4\%} = \frac{3.9}{16.6} = 23.5\%$$

Achieving the 95% target for linkage to care within 1 month is 100% of the targeted change needed by 2025.

Interpretation: By 2023, almost one-quarter or 23.5% of the targeted change has occurred for linkage to care within 1 month.

Percent of targeted change achieved for *viral suppression*:

$$= \frac{65.5\% - 54.4\%}{95\% - 54.4\%} = \frac{11.1}{40.6} = 27.3\%$$

Achieving the 95% target for viral suppression is 100% of the targeted change needed by 2025. *Interpretation:* By 2023, a little more than one-quarter or 27.3% of the targeted change has occurred for viral suppression.

Indicators that met or exceeded their targets

When the desired direction is increase, an indicator has met or exceeded the target if the annual result is greater than or equal to the 2025 target.

$$\text{Annual result} \geq 2025 \text{ target}$$

When the desired direction is a decrease, an indicator has met or exceeded the target if the annual result is less than or equal to the 2025 target or the 2030 target.

$$\text{Annual result} \leq 2025 \text{ target}$$

Statistical significance is not factored into the determination of the target met or exceeded status.

Indicators moving toward their targets

For indicators that had not already met or exceeded their targets at baseline and are *moving toward* their 2025 targets, the percent of targeted change achieved measures the extent of movement toward the target. The formula is the same as that presented above and is calculated by:

$$\text{Percent of targeted change achieved} = \frac{\text{Annual result} - \text{Baseline result} \times 100}{2025 \text{ target} - \text{Baseline result}}$$

When the desired direction is an increase (i.e., increase to 95%), an indicator is *moving toward* its target when the most recent *annual result is higher than the baseline value but less than the 2025 target*.

Baseline result < Annual result < 2025 target

When the desired direction is a decrease (i.e., decrease by 75%), an indicator is *moving toward* its target when the most recent *annual result is less than the baseline value but greater than the 2025 target*.

Baseline result > Annual result > 2025 target

Indicators moving away from their targets

For indicators that had not already met or exceeded their targets at baseline and are moving away from their 2025 targets, the percent of targeted change achieved measures the extent of movement away from the target and is calculated by:

$$\text{Magnitude of percent change from baseline} = \frac{|\text{Annual result} - \text{Baseline result}| \times 100}{\text{Baseline result}}$$

The absolute value of the percent change from baseline is used to measure movement in this instance. When indicator results are moving away from the 2025 targets, the indicator results will need to make up the deficit from the baseline (i.e., get back to baseline value). Additional work would be needed to see desired targeted change once the baseline value is regained.

INDICATOR SPECIFICATIONS FOR THE NATIONAL HIV/AIDS STRATEGY

Indicator 1: Increase knowledge of status

- Definition:
 - ◊ Numerator: Number of persons aged ≥13 years living with diagnosed HIV at end of a measurement year.
 - ◊ Denominator: Estimated number of persons aged ≥13 years living with diagnosed or undiagnosed HIV at the end of a measurement year.
- Baseline year: 2017
- Baseline result: 85.8%
- Target: By 2025, increase to 95%.
- Data source: National HIV Surveillance System (NHSS).¹¹ NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.
- Data availability: Data are published annually.

Indicator 2: Reduce new HIV infections

- Definition: Incidence is the estimated number of new HIV infections among persons aged ≥ 13 years that occurred in the measurement year and includes diagnosed and undiagnosed infections.
- Baseline year: 2017
- Baseline result: 37,000
- Targets: By 2025, reduce incidence by 75% from baseline. By 2030, reduce incidence by 90% from baseline.
- Data source: National HIV Surveillance System (NHSS).¹¹ NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.
- Data availability: Data are published annually.

Indicator 3: Reduce new HIV diagnoses

- Definition: Number of persons ≥ 13 years who have received laboratory or clinical confirmation of HIV in a measurement year.
- Baseline year: 2017
- Baseline result: 38,351
- Targets: By 2025, reduce diagnoses by 75% from baseline. By 2030, reduce diagnoses by 90% from baseline.
- Data source: National HIV Surveillance System (NHSS). NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.³
- Data availability: Data are published annually. Preliminary data are also available quarterly.
- Notes: Provisional annual data (annual data with ≥ 12 months of reporting delay) will be used to measure progress.

Indicator 4: Increase PrEP coverage

- Definition:
 - ◊ Numerator: Number of persons ≥ 16 years who were classified as having been prescribed PrEP in a measurement year.
 - ◊ Denominator: Estimated number of persons with indications for PrEP in a measurement year.
- Baseline year: 2017
- Baseline result: 13.2%
- Target: By 2025, increase to 50%.
 - ◊ Numerator: IQVIA Real-World Longitudinal Prescriptions database
 - ◊ Denominator: Uses three data sources:
 1. The American Community Survey from U.S. Census is used to estimate the number of men who have sex with men (MSM) in a jurisdiction.¹⁶³
 2. Behavioral data from the National Health and Nutrition Examination Survey (NHANES) are used to estimate the proportion of HIV-negative MSM with indications for PrEP.¹⁶⁴
 3. The National HIV Surveillance System (NHSS) diagnoses data are used.² The number of HIV-negative MSM with indications for PrEP are multiplied by the ratio of percentage of HIV diagnoses during the specified year attributed to persons who inject drugs (PWID) and heterosexual transmission risk groups compared to the percentage among MSM. The estimated number of persons with indications

for PrEP in the three major transmission risk groups (MSM, heterosexuals, PWID) in each jurisdiction are then summed to yield national estimates.

- Data availability: Data are published annually. Preliminary data are also available quarterly.
- Note: Prescriptions for PrEP or having indications for PrEP are not reportable conditions and therefore are not reported through the National HIV Surveillance System. Annual data will be used to measure progress.

Indicator 5: Increase linkage to care

- Definition:
 - ◊ Numerator: Number of persons aged ≥ 13 years with HIV diagnosed in a measurement year and who had ≥ 1 viral load (VL) or CD4 test ≤ 1 month after HIV diagnosis.
 - ◊ Denominator: Number of persons aged ≥ 13 years with HIV infection diagnosed during a measurement year.
- Baseline year: 2017
- Baseline result: 77.8%
- Target: By 2025, increase to 95%.
- Data source: National HIV Surveillance System (NHSS). NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.²
- Data availability: Data are published annually. Preliminary data are also available quarterly.
- Notes: Data are reported for jurisdictions with complete laboratory reporting of CD4 and viral load test results to CDC. The number of jurisdictions may vary each year. Provisional annual data (annual data with ≥ 12 months of reporting delay) will be used to measure progress.

Indicator 6: Increase viral suppression

- Definition:
 - ◊ Numerator: Number of persons aged ≥ 13 years living with diagnosed HIV and have a viral load test result < 200 copies/mL at the most recent viral load test during a measurement year.
 - ◊ Denominator: Number of persons aged ≥ 13 years living with diagnosed HIV by the end of the year prior to the measurement year and alive at the end of the measurement year.
- Example: Denominator for 2019 viral suppression is the number of persons aged ≥ 13 years living with diagnosed HIV by the end of 2018 and alive at the end of 2019.
- Baseline year: 2017
- Baseline result: 63.1%
- Target: By 2025, increase to 95%.
- Data source: National HIV Surveillance System (NHSS). NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.²
- Data availability: Data are published annually.
- Note: Data are reported for jurisdictions with complete laboratory reporting of CD4 and viral load test results to CDC and with complete death ascertainment. The number of jurisdictions may vary each year.

Indicator 7: Decrease stigma

- Definition: The median score of a 10-item stigma scale, ranging from 0 (no stigma) to 100 (high stigma), measured among persons aged > 18 years living with diagnosed HIV infection living in the United States and Puerto Rico.

- Note: The stigma scale was revised for the 2018 data collection cycle and includes three questions with a 12-month reference period to allow participants to provide experiences in a defined and more recent period of time for one domain of stigma (personalized stigma).
- Baseline year: 2018
- Baseline result: 31.2 median score
- Target: By 2025, decrease by 50%.
- Data source: Medical Monitoring Project (MMP). MMP is a cross-sectional, nationally representative, complex sample survey that assesses the behavioral and clinical characteristics of adults with diagnosed HIV infection in the United States. MMP also provides information on behaviors and clinical outcomes affecting the risk of HIV transmission, morbidity, and mortality. In 2015, MMP sampling and weighting methods were revised to include all adults with diagnosed HIV infection regardless of HIV care status.
- Data availability: Data are published annually.

Indicator 8: Reduce homelessness

- Definition:
 - ◊ Numerator: Number of persons aged ≥ 18 years living with diagnosed HIV in a measurement year and report having been homeless during the 12 months prior to interview. Homelessness is defined as living on the street, living in a shelter, living in a single-room-occupancy hotel, or living in a car.
 - ◊ Denominator: A sample of persons aged ≥ 18 years living with diagnosed HIV in a measurement year, as documented in the medical record.
- Baseline year: 2017
- Baseline result: 9.1%
- Target: By 2025, reduce by 50%.
- Data source: Medical Monitoring Project (MMP). MMP is a cross-sectional, nationally representative, complex sample survey that assesses the behavioral and clinical characteristics of adults with diagnosed HIV infection in the United States. MMP also provides information on behaviors and clinical outcomes affecting the risk of HIV transmission, morbidity, and mortality. In 2015, MMP sampling and weighting methods were revised to include all adults with diagnosed HIV infection regardless of HIV care status.
- Data availability: Data are published annually.

Indicator 9: Increase LGBTQ-supportive school policies and practices

- Definition: This indicator is the median percentage of secondary schools that are implementing at least four of seven school policies and practices that are known to improve health outcomes for both LGBTQ youth and all students: (1) having a Gay/Straight Alliance (GSA) or similar club, (2) identifying safe spaces, (3) prohibiting harassment based on sexual orientation or gender identity, (4) encouraging staff to attend professional development; (5) facilitating access to out-of-school health service providers, (6) facilitating access to out-of-school social and psychological service providers, and (7) providing LGBTQ-relevant curricula or supplementary materials.
- Baseline year: 2018
- Baseline result: 59.8%
- Targets: By 2025, increase the median percentage of secondary schools that are implementing at least four of seven LGBTQ-supportive policies and practices to 65% from a 2018 baseline of 59.8%. By 2030, increase the median percentage of secondary schools to 68.7%.

- Data source: CDC School Health Profiles. The School Health Profiles is a system of surveys assessing school health policies and practices in states, large urban school districts, and territories.
- Data availability: Data are published bi-annually.

Disparities Indicators

To monitor our progress in addressing HIV disparities, the viral suppression indicator is monitored for the following priority populations.

MSM

- Definition:
 - ◊ Numerator: Number of persons with male-to-male sexual contact (MSM) aged ≥ 13 years living with diagnosed HIV and have a viral load test result < 200 copies/mL at the most recent viral load test during a measurement year.
 - ◊ Denominator: Number of persons with male-to-male sexual contact (MSM) aged ≥ 13 years living with diagnosed HIV by the end of the year prior to the measurement year and alive at the end of the measurement year.
- Baseline year: 2017
- Baseline result: 66.1%
- Target: By 2025, increase to 95%.
- Data source: National HIV Surveillance System (NHSS).² NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.
- Data availability: Data are published annually.
- Note: Data are reported for jurisdictions with complete laboratory reporting of CD4 and viral load test results and with complete death ascertainment. The number of jurisdictions may vary each year.

Black/African American MSM

- Definition:
 - ◊ Numerator: Number of Black/African American persons with male-to-male sexual contact (MSM) aged ≥ 13 years living with diagnosed HIV and have a viral load test result < 200 copies/mL at the most recent viral load test during a measurement year.
 - ◊ Denominator: Number of Black/African American persons with male-to-male sexual contact (MSM) aged ≥ 13 years living with diagnosed HIV by the end of the year prior to the measurement year and alive at the end of the measurement year.
- Baseline year: 2017
- Baseline result: 58.4%
- Target: By 2025, increase to 95%.
- Data availability: Data are published annually.
- Data source: National HIV Surveillance System (NHSS).² NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.
- Note: Data are reported for jurisdictions with complete laboratory reporting of CD4 and viral load test results and with complete death ascertainment. The number of jurisdictions may vary each year.

Hispanic/Latino MSM

- Definition:
 - ◊ Numerator: Number of Hispanic/Latino persons with male-to-male sexual contact (MSM) aged ≥ 13 years living with diagnosed HIV and have a viral load test result < 200 copies/mL at the most recent viral load test during a measurement year.
 - ◊ Denominator: Number of Hispanic/Latino persons with male-to-male sexual contact (MSM) aged ≥ 13 years living with diagnosed HIV by the end of the year prior to the measurement year and alive at the end of the measurement year.
- Baseline year: 2017
- Baseline result: 64.9%
- Target: By 2025, increase to 95%.
- Data source: National HIV Surveillance System (NHSS).² NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.
- Data availability: Data are published annually.
- Note: Data are reported for jurisdictions with complete laboratory reporting of CD4 and viral load test results and with complete death ascertainment. The number of jurisdictions may vary each year.

American Indian/Alaska Native MSM

- Definition:
 - ◊ Numerator: Number of American Indian/Alaska Native persons with male-to-male sexual contact (MSM) aged ≥ 13 years living with diagnosed HIV and have a viral load test result < 200 copies/mL at the most recent viral load test during a measurement year.
 - ◊ Denominator: Number of American Indian/Alaska Native persons with male-to-male sexual contact (MSM) aged ≥ 13 years living with diagnosed HIV by the end of the year prior to the measurement year and alive at the end of the measurement year.
- Baseline year: 2017
- Baseline result: 67.3%
- Target: By 2025, increase to 95%.
- Data source: National HIV Surveillance System (NHSS).² NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.
- Data availability: Data are published annually.
- Note: Data are reported for jurisdictions with complete laboratory reporting of CD4 and viral load test results and with complete death ascertainment. The number of jurisdictions may vary each year.

Black Women

- Definition:
 - ◊ Numerator: Number of Black/African American females aged ≥ 13 years living with diagnosed HIV and have a viral load test result < 200 copies/mL at the most recent viral load test during a measurement year.
 - ◊ Denominator: Number of Black/African American females aged ≥ 13 years living with diagnosed HIV by the end of the year prior to the measurement year and alive at the end of the measurement year.
- Baseline year: 2017
- Baseline result: 59.3%

- Target: By 2025, increase to 95%.
- Data source: National HIV Surveillance System (NHSS).² NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.
- Data availability: Data are published annually.
- Note: Data are reported for jurisdictions with complete laboratory reporting of CD4 and viral load test results and with complete death ascertainment. The number of jurisdictions may vary each year.

Transgender Women in HIV Medical Care

- Definition:
 - ◊ Numerator: Number of transgender women living with HIV ≥ 13 years who received from a Ryan White HIV/AIDS Provider at least one outpatient ambulatory health care (OAHC) visit and had at least one viral load test during the measurement year who was virally suppressed. Viral suppression was defined as the most recently reported HIV test result of < 200 copies/mL.
 - ◊ Denominator: Number of transgender women living with HIV ≥ 13 years who received from a Ryan White HIV/AIDS Provider at least one outpatient ambulatory health care (OAHC) visit and had at least one viral load test during the measurement year.
- Baseline year: 2017
- Baseline result: 80.5%
- Target: By 2025, increase to 95%.
- Data source: Ryan White HIV/AIDS Program Services Report⁵
- Data availability: Data are published annually.

People Who Inject Drugs (PWID)

- Definition:
 - ◊ Numerator: Number of persons who inject drugs aged ≥ 13 years living with diagnosed HIV and have a viral load test result < 200 copies/mL at the most recent viral load test during a measurement year.
 - ◊ Denominator: Number of persons who inject drugs aged ≥ 13 years living with diagnosed HIV by the end of the year prior to the measurement year and alive at the end of the measurement year.
- Baseline year: 2017
- Baseline result: 54.9%
- Target: By 2025, increase to 95%.
- Data source: National HIV Surveillance System (NHSS).² NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.
- Data availability: Data are published annually.
- Note: Data are reported for jurisdictions with complete laboratory reporting of CD4 and viral load test results and with complete death ascertainment. The number of jurisdictions may vary each year.

Youth 13–24 years

- Definition:
 - ◊ Numerator: Number of persons aged 13–24 years living with diagnosed HIV and have a viral load test result < 200 copies/mL at the most recent viral load test during a measurement year.
 - ◊ Denominator: Number of persons aged 13–24 years living with diagnosed HIV by the end of the year prior to the measurement year and alive at the end of the measurement year.

- Baseline year: 2017
- Baseline result: 54.9%
- Target: By 2025, increase to 95%.
- Data source: National HIV Surveillance System (NHSS).² NHSS is the primary source for monitoring trends in HIV in the United States. It is the data source for incidence, diagnoses, and other HIV care continuum data.
- Note: Data are reported for jurisdictions with complete laboratory reporting of CD4 and viral load test results and with complete death ascertainment. The number of jurisdictions may vary each year.

Developmental Indicator—Quality of life for people with HIV

In addition, one key issue, quality of life for people with HIV, was designated as the subject for a “developmental indicator,” meaning that data sources, measures, and targets will be identified, and progress monitored thereafter. Potential data sources and measures exist for this indicator, but further work must be done to assess them and craft the specifications for this developmental indicator. Working with parties and organizations, the federal government will develop an indicator.

APPENDIX B: ACRONYMS

AIDS	acquired immune deficiency syndrome
ART	antiretroviral therapy
CDC	Centers for Disease Control and Prevention (HHS)
COVID-19	coronavirus disease 2019
EHE	Ending the HIV Epidemic in the U.S.
FDA	Food and Drug Administration (HHS)
HHS	U.S. Department of Health and Human Services
HIV	human immunodeficiency virus
HOPWA	Housing Opportunities for Persons With AIDS
HRSA	Health Resources and Services Administration (HHS)
IHS	Indian Health Service (HHS)
MSM	men who have sex with men
NHAS	National HIV/AIDS Strategy
NIH	National Institutes of Health
OASH	Office of the Assistant Secretary for Health (HHS)
OIDP	Office of Infectious Disease and HIV/AIDS Policy (HHS)
ONAP	Office of National AIDS Policy (White House)
PEP	post-exposure prophylaxis
PrEP	pre-exposure prophylaxis
PWID	people who inject drugs
RWHAP	Ryan White HIV/AIDS Program (HRSA)
SAMHSA	Substance Abuse and Mental Health Services Administration (HHS)
SARS-CoV-2	severe acute respiratory syndrome coronavirus 2
SSP	syringe services program
STI	sexually transmitted infection
U=U	Undetectable = Untransmittable
USPSTF	U.S. Preventative Services Task Force

Executive Order 14183 of January 27, 2025

Prioritizing Military Excellence and Readiness

By the authority vested in me as President by the Constitution and the laws of the United States of America, and as Commander in Chief of the Armed Forces of the United States, and to ensure the readiness and effectiveness of our Armed Forces, it is hereby ordered:

Section 1. Purpose. The United States military has a clear mission: to protect the American people and our homeland as the world's most lethal and effective fighting force. Success in this existential mission requires a singular focus on developing the requisite warrior ethos, and the pursuit of military excellence cannot be diluted to accommodate political agendas or other ideologies harmful to unit cohesion.

Recently, however, the Armed Forces have been afflicted with radical gender ideology to appease activists unconcerned with the requirements of military service like physical and mental health, selflessness, and unit cohesion. Longstanding Department of Defense (DoD) policy (DoD Instruction (DoDI) 6130.03) provides that it is the policy of the DoD to ensure that service members are "[f]ree of medical conditions or physical defects that may reasonably be expected to require excessive time lost from duty for necessary treatment or hospitalization." As a result, many mental and physical health conditions are incompatible with active duty, from conditions that require substantial medication or medical treatment to bipolar and related disorders, eating disorders, suicidality, and prior psychiatric hospitalization.

Consistent with the military mission and longstanding DoD policy, expressing a false "gender identity" divergent from an individual's sex cannot satisfy the rigorous standards necessary for military service. Beyond the hormonal and surgical medical interventions involved, adoption of a gender identity inconsistent with an individual's sex conflicts with a soldier's commitment to an honorable, truthful, and disciplined lifestyle, even in one's personal life. A man's assertion that he is a woman, and his requirement that others honor this falsehood, is not consistent with the humility and selflessness required of a service member.

For the sake of our Nation and the patriotic Americans who volunteer to serve it, military service must be reserved for those mentally and physically fit for duty. The Armed Forces must adhere to high mental and physical health standards to ensure our military can deploy, fight, and win, including in austere conditions and without the benefit of routine medical treatment or special provisions.

Sec. 2. Policy. It is the policy of the United States Government to establish high standards for troop readiness, lethality, cohesion, honesty, humility, uniformity, and integrity. This policy is inconsistent with the medical, surgical, and mental health constraints on individuals with gender dysphoria. This policy is also inconsistent with shifting pronoun usage or use of pronouns that inaccurately reflect an individual's sex.

Sec. 3. Definitions. The definitions in the Executive Order of January 20, 2025 (Defending Women from Gender Ideology Extremism and Restoring Biological Truth to the Federal Government) shall apply to this order.

Sec. 4. Implementation. (a) Within 60 days of the date of this order, the Secretary of Defense (Secretary) shall update DoDI 6130.03 Volume 1 (Medical Standards for Military Service: Appointment, Enlistment, or Induction

(May 6, 2018), Incorporating Change 5 of May 28, 2024) and DoDI 6130.03 Volume 2 (Medical Standards for Military Service: Retention (September 4, 2020), Incorporating Change 1 of June 6, 2022) to reflect the purpose and policy of this Order.

(b) The Secretary shall promptly issue directives for DoD to end invented and identification-based pronoun usage to best achieve the policy outlined in section 2 of this order.

(c) Within 30 days of the date of this order, the Secretary shall:

(i) identify all additional steps and issue guidance necessary to fully implement this order; and

(ii) submit to the President through the Assistant to the President for National Security Affairs a report that summarizes these steps.

(d) Absent extraordinary operational necessity, the Armed Forces shall neither allow males to use or share sleeping, changing, or bathing facilities designated for females, nor allow females to use or share sleeping, changing, or bathing facilities designated for males.

(e) Within 30 days of the issuance of the respective updates, directives, and guidance under subsections (a), (b), and (c) of this section, the Secretary of Homeland Security shall, with respect to the Coast Guard, issue updates, directives, and guidance consistent with the updates, directives, and guidance issued under subsections (a), (b), and (c) of this section.

Sec. 5. *Implementing the Revocation of Executive Order 14004.* (a) Pursuant to the Executive Order of January 20, 2025 (Initial Rescissions of Harmful Executive Orders and Actions), Executive Order 14004 of January 25, 2021 (Enabling All Qualified Americans To Serve Their Country in Uniform), has been revoked. Accordingly, all policies, directives, and guidance issued pursuant to Executive Order 14004 shall be rescinded to the extent inconsistent with the provisions of this order.

(b) The Secretary and, with respect to the Coast Guard, the Secretary of Homeland Security, shall take all necessary steps to implement the revocations described in subsection (a) of this section and ensure that all military departments and services fully comply with the provisions of this order.

Sec. 6. *Severability.* If any provision of this order, or the application of any provision to any person or circumstance, is held to be invalid, the remainder of this order and the application of its provisions to any other persons or circumstances shall not be affected thereby.

Sec. 7. *General Provisions.* (a) Nothing in this order shall be construed to impair or otherwise affect:

(i) the authority granted by law to an executive department or agency, or the head thereof; or

(ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

A handwritten signature in black ink, appearing to be a stylized representation of a name, possibly "Donald Trump", written in a cursive, somewhat jagged style.

Presidential Documents

Executive Order 14187 of January 28, 2025

Protecting Children From Chemical and Surgical Mutilation

By the authority vested in me as President by the Constitution and the laws of the United States of America, it is hereby ordered:

Section 1. *Policy and Purpose.* Across the country today, medical professionals are maiming and sterilizing a growing number of impressionable children under the radical and false claim that adults can change a child's sex through a series of irreversible medical interventions. This dangerous trend will be a stain on our Nation's history, and it must end.

Countless children soon regret that they have been mutilated and begin to grasp the horrifying tragedy that they will never be able to conceive children of their own or nurture their children through breastfeeding. Moreover, these vulnerable youths' medical bills may rise throughout their lifetimes, as they are often trapped with lifelong medical complications, a losing war with their own bodies, and, tragically, sterilization.

Accordingly, it is the policy of the United States that it will not fund, sponsor, promote, assist, or support the so-called "transition" of a child from one sex to another, and it will rigorously enforce all laws that prohibit or limit these destructive and life-altering procedures.

Sec. 2. *Definitions.* For the purposes of this order:

(a) The term "child" or "children" means an individual or individuals under 19 years of age.

(b) The term "pediatric" means relating to the medical care of a child.

(c) The phrase "chemical and surgical mutilation" means the use of puberty blockers, including GnRH agonists and other interventions, to delay the onset or progression of normally timed puberty in an individual who does not identify as his or her sex; the use of sex hormones, such as androgen blockers, estrogen, progesterone, or testosterone, to align an individual's physical appearance with an identity that differs from his or her sex; and surgical procedures that attempt to transform an individual's physical appearance to align with an identity that differs from his or her sex or that attempt to alter or remove an individual's sexual organs to minimize or destroy their natural biological functions. This phrase sometimes is referred to as "gender affirming care."

Sec. 3. *Ending Reliance on Junk Science.* (a) The blatant harm done to children by chemical and surgical mutilation cloaks itself in medical necessity, spurred by guidance from the World Professional Association for Transgender Health (WPATH), which lacks scientific integrity. In light of the scientific concerns with the WPATH guidance:

(i) agencies shall rescind or amend all policies that rely on WPATH guidance, including WPATH's "Standards of Care Version 8"; and

(ii) within 90 days of the date of this order, the Secretary of Health and Human Services (HHS) shall publish a review of the existing literature on best practices for promoting the health of children who assert gender dysphoria, rapid-onset gender dysphoria, or other identity-based confusion.

(b) The Secretary of HHS, as appropriate and consistent with applicable law, shall use all available methods to increase the quality of data to guide practices for improving the health of minors with gender dysphoria, rapid-onset gender dysphoria, or other identity-based confusion, or who otherwise seek chemical or surgical mutilation.

Sec. 4. *Defunding Chemical and Surgical Mutilation.* The head of each executive department or agency (agency) that provides research or education grants to medical institutions, including medical schools and hospitals, shall, consistent with applicable law and in coordination with the Director of the Office of Management and Budget, immediately take appropriate steps to ensure that institutions receiving Federal research or education grants end the chemical and surgical mutilation of children.

Sec. 5. *Additional Directives to the Secretary of HHS.* (a) The Secretary of HHS shall, consistent with applicable law, take all appropriate actions to end the chemical and surgical mutilation of children, including regulatory and sub-regulatory actions, which may involve the following laws, programs, issues, or documents:

- (i) Medicare or Medicaid conditions of participation or conditions for coverage;
- (ii) clinical-abuse or inappropriate-use assessments relevant to State Medicaid programs;
- (iii) mandatory drug use reviews;
- (iv) section 1557 of the Patient Protection and Affordable Care Act;
- (v) quality, safety, and oversight memoranda;
- (vi) essential health benefits requirements; and
- (vii) the Eleventh Revision of the International Classification of Diseases and other federally funded manuals, including the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition.

(b) The Secretary of HHS shall promptly withdraw HHS's March 2, 2022, guidance document titled "HHS Notice and Guidance on Gender Affirming Care, Civil Rights and Patient Privacy" and, in consultation with the Attorney General, issue new guidance protecting whistleblowers who take action related to ensuring compliance with this order.

Sec. 6. *TRICARE.* The Department of Defense provides health insurance, through TRICARE, to nearly 2 million individuals under the age of 18. As appropriate and consistent with applicable law, the Secretary of Defense shall commence a rulemaking or sub-regulatory action to exclude chemical and surgical mutilation of children from TRICARE coverage and amend the TRICARE provider handbook to exclude chemical and surgical mutilation of children.

Sec. 7. *Requirements for Insurance Carriers.* The Director of the Office of Personnel Management, as appropriate and consistent with applicable law, shall:

- (a) include provisions in the Federal Employee Health Benefits (FEHB) and Postal Service Health Benefits (PSHB) programs call letter for the 2026 Plan Year specifying that eligible carriers, including the Foreign Service Benefit Plan, will exclude coverage for pediatric transgender surgeries or hormone treatments; and
- (b) negotiate to obtain appropriate corresponding reductions in FEHB and PSHB premiums.

Sec. 8. *Directives to the Department of Justice.* The Attorney General shall:

- (a) review Department of Justice enforcement of section 116 of title 18, United States Code, and prioritize enforcement of protections against female genital mutilation;
- (b) convene States' Attorneys General and other law enforcement officers to coordinate the enforcement of laws against female genital mutilation across all American States and Territories;
- (c) prioritize investigations and take appropriate action to end deception of consumers, fraud, and violations of the Food, Drug, and Cosmetic Act by any entity that may be misleading the public about long-term side effects of chemical and surgical mutilation;

(d) in consultation with the Congress, work to draft, propose, and promote legislation to enact a private right of action for children and the parents of children whose healthy body parts have been damaged by medical professionals practicing chemical and surgical mutilation, which should include a lengthy statute of limitations; and

(e) prioritize investigations and take appropriate action to end child-abusive practices by so-called sanctuary States that facilitate stripping custody from parents who support the healthy development of their own children, including by considering the application of the Parental Kidnaping Prevention Act and recognized constitutional rights.

Sec. 9. *Enforcing Adequate Progress.* Within 60 days of the date of this order, the heads of agencies with responsibilities under this order shall submit a single, combined report to the Assistant to the President for Domestic Policy, detailing progress in implementing this order and a timeline for future action. The Assistant to the President for Domestic Policy shall regularly convene the heads of agencies with responsibilities under this order (or their designees) to coordinate and prepare for this submission.

Sec. 10. *Severability.* If any provision of this order, or the application of any provision to any person or circumstances, is held to be invalid, the remainder of this order and the application of any of its other provisions to any other persons or circumstances shall not be affected thereby.

Sec. 11. *General Provisions.* (a) Nothing in this order shall be construed to impair or otherwise affect:

(i) the authority granted by law to an executive department or agency, or the head thereof; or

(ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

THE WHITE HOUSE,

Presidential Documents

Executive Order 14190 of January 29, 2025

Ending Radical Indoctrination in K–12 Schooling

By the authority vested in me as President by the Constitution and the laws of the United States of America, it is hereby ordered:

Section 1. Purpose and Policy. Parents trust America’s schools to provide their children with a rigorous education and to instill a patriotic admiration for our incredible Nation and the values for which we stand.

In recent years, however, parents have witnessed schools indoctrinate their children in radical, anti-American ideologies while deliberately blocking parental oversight. Such an environment operates as an echo chamber, in which students are forced to accept these ideologies without question or critical examination. In many cases, innocent children are compelled to adopt identities as either victims or oppressors solely based on their skin color and other immutable characteristics. In other instances, young men and women are made to question whether they were born in the wrong body and whether to view their parents and their reality as enemies to be blamed. These practices not only erode critical thinking but also sow division, confusion, and distrust, which undermine the very foundations of personal identity and family unity.

Imprinting anti-American, subversive, harmful, and false ideologies on our Nation’s children not only violates longstanding anti-discrimination civil rights law in many cases, but usurps basic parental authority. For example, steering students toward surgical and chemical mutilation without parental consent or involvement or allowing males access to private spaces designated for females may contravene Federal laws that protect parental rights, including the Family Educational Rights and Privacy Act (FERPA) and the Protection of Pupil Rights Amendment (PPRA), and sex-based equality and opportunity, including Title IX of the Education Amendments of 1972 (Title IX). Similarly, demanding acquiescence to “White Privilege” or “unconscious bias,” actually promotes racial discrimination and undermines national unity.

My Administration will enforce the law to ensure that recipients of Federal funds providing K–12 education comply with all applicable laws prohibiting discrimination in various contexts and protecting parental rights, including Title VI of the Civil Rights Act of 1964 (Title VI), 42 U.S.C. 2000d *et seq.*; Title IX, 20 U.S.C. 1681 *et seq.*; FERPA, 20 U.S.C. 1232g; and the PPRA, 20 U.S.C. 1232h.

Sec. 2. Definitions. As used herein:

(a) The definitions in the Executive Order “Defending Women from Gender Ideology Extremism and Restoring Biological Truth to the Federal Government” (January 20, 2025) shall apply to this order.

(b) “Discriminatory equity ideology” means an ideology that treats individuals as members of preferred or disfavored groups, rather than as individuals, and minimizes agency, merit, and capability in favor of immoral generalizations, including that:

(i) Members of one race, color, sex, or national origin are morally or inherently superior to members of another race, color, sex, or national origin;

(ii) An individual, by virtue of the individual’s race, color, sex, or national origin, is inherently racist, sexist, or oppressive, whether consciously or unconsciously;

(iii) An individual's moral character or status as privileged, oppressing, or oppressed is primarily determined by the individual's race, color, sex, or national origin;

(iv) Members of one race, color, sex, or national origin cannot and should not attempt to treat others without respect to their race, color, sex, or national origin;

(v) An individual, by virtue of the individual's race, color, sex, or national origin, bears responsibility for, should feel guilt, anguish, or other forms of psychological distress because of, should be discriminated against, blamed, or stereotyped for, or should receive adverse treatment because of actions committed in the past by other members of the same race, color, sex, or national origin, in which the individual played no part;

(vi) An individual, by virtue of the individual's race, color, sex, or national origin, should be discriminated against or receive adverse treatment to achieve diversity, equity, or inclusion;

(vii) Virtues such as merit, excellence, hard work, fairness, neutrality, objectivity, and racial colorblindness are racist or sexist or were created by members of a particular race, color, sex, or national origin to oppress members of another race, color, sex, or national origin; or

(viii) the United States is fundamentally racist, sexist, or otherwise discriminatory.

(c) "Educational service agency" (ESA) has the meaning given in 20 U.S.C. 1401(5), and the terms "elementary school," "local educational agency" (LEA), "secondary school," and "state educational agency" (SEA) have the meanings given in 34 CFR 77.1(c).

(d) "Patriotic education" means a presentation of the history of America grounded in:

(i) an accurate, honest, unifying, inspiring, and ennobling characterization of America's founding and foundational principles;

(ii) a clear examination of how the United States has admirably grown closer to its noble principles throughout its history;

(iii) the concept that commitment to America's aspirations is beneficial and justified; and

(iv) the concept that celebration of America's greatness and history is proper.

(e) "Social transition" means the process of adopting a "gender identity" or "gender marker" that differs from a person's sex. This process can include psychological or psychiatric counseling or treatment by a school counselor or other provider; modifying a person's name (e.g., "Jane" to "James") or pronouns (e.g., "him" to "her"); calling a child "nonbinary"; use of intimate facilities and accommodations such as bathrooms or locker rooms specifically designated for persons of the opposite sex; and participating in school athletic competitions or other extracurricular activities specifically designated for persons of the opposite sex. "Social transition" does not include chemical or surgical mutilation.

Sec. 3. *Ending Indoctrination Strategy.* (a) Within 90 days of the date of this order, to advise the President in formulating future policy, the Secretary of Education, the Secretary of Defense, and the Secretary of Health and Human Services, in consultation with the Attorney General, shall provide an Ending Indoctrination Strategy to the President, through the Assistant to the President for Domestic Policy, containing recommendations and a plan for:

(i) eliminating Federal funding or support for illegal and discriminatory treatment and indoctrination in K–12 schools, including based on gender ideology and discriminatory equity ideology; and

(ii) protecting parental rights, pursuant to FERPA, 20 U.S.C. 1232g, and the PPRA, 20 U.S.C. 1232h, with respect to any K–12 policies or conduct implicated by the purpose and policy of this order.

(b) The Ending Indoctrination Strategy submitted under subsection (a) of this section shall contain a summary and analysis of the following:

(i) All Federal funding sources and streams, including grants or contracts, that directly or indirectly support or subsidize the instruction, advancement, or promotion of gender ideology or discriminatory equity ideology:

(A) in K–12 curriculum, instruction, programs, or activities; or

(B) in K–12 teacher education, certification, licensing, employment, or training;

(ii) Each agency’s process to prevent or rescind Federal funds, to the maximum extent consistent with applicable law, from being used by an ESA, SEA, LEA, elementary school, or secondary school to directly or indirectly support or subsidize the instruction, advancement, or promotion of gender ideology or discriminatory equity ideology in:

(A) K–12 curriculum, instruction, programs, or activities; or

(B) K–12 teacher certification, licensing, employment, or training;

(iii) Each agency’s process to prevent or rescind Federal funds, to the maximum extent consistent with applicable law, from being used by an ESA, SEA, LEA, elementary school, or secondary school to directly or indirectly support or subsidize the social transition of a minor student, including through school staff or teachers or through deliberately concealing the minor’s social transition from the minor’s parents.

(iv) Each agency’s process to prevent or rescind Federal funds, to the maximum extent consistent with applicable law, from being used by an ESA, SEA, LEA, elementary school, or secondary school to directly or indirectly support or subsidize:

(A) interference with a parent’s Federal statutory right to information regarding school curriculum, records, physical examinations, surveys, and other matters under the PPRA or FERPA; or

(B) a violation of Title VI or Title IX; and

(v) A summary and analysis of all relevant agency enforcement tools to advance the policies of this order.

(c) The Attorney General shall coordinate with State attorneys general and local district attorneys in their efforts to enforce the law and file appropriate actions against K–12 teachers and school officials who violate the law by:

(i) sexually exploiting minors;

(ii) unlawfully practicing medicine by offering diagnoses and treatment without the requisite license; or

(iii) otherwise unlawfully facilitating the social transition of a minor student.

(d) The Assistant to the President for Domestic Policy shall regularly convene the heads of the agencies tasked with submitting the Ending Indoctrination Strategy under subsection (a) of this section to confer regarding their findings, areas for additional investigation, the modification or implementation of their respective recommendations, and such other policy initiatives or matters as the President may direct.

Sec. 4. Reestablishing the President’s Advisory 1776 Commission and Promoting Patriotic Education. (a) The President’s Advisory 1776 Commission (“1776 Commission”), which was created by Executive Order 13958 of November 2, 2020, to promote patriotic education, but was terminated by President Biden in Executive Order 13985 of January 20, 2021, is hereby reestablished. The purpose of the 1776 Commission is to promote patriotic education and advance the purposes stated in section 1 of Executive Order 13958, as well as to advise and promote the work of the White House Task Force on Celebrating America’s 250th Birthday (“Task Force 250”) and the United States Semiquincentennial Commission in their efforts to

provide a grand celebration worthy of the momentous occasion of the 250th anniversary of American Independence on July 4, 2026.

(b) Within 120 days of the date of this order, the Secretary of Education shall establish the 1776 Commission in the Department of Education.

(c) The 1776 Commission shall be composed of not more than 20 members, who shall be appointed by the President for a term of 2 years. The 1776 Commission shall be made up of individuals from outside the Federal Government with relevant experience or subject-matter expertise.

(d) The 1776 Commission shall have a Chair or Co-Chairs, at the President's discretion, and a Vice Chair, who shall be designated by the President from among the Commission's members. An Executive Director, designated by the Secretary of Education in consultation with the Assistant to the President for Domestic Policy, shall coordinate the work of the 1776 Commission. The Chair (or Co-Chairs) and Vice Chair shall work with the Executive Director to convene regular meetings of the 1776 Commission, determine its agenda, and direct its work, consistent with this order.

(e) The 1776 Commission shall:

(i) facilitate the development and implementation of a "Presidential 1776 Award" to recognize student knowledge of the American founding, including knowledge about the Founders, the Declaration of Independence, the Constitutional Convention, and the great soldiers and battles of the American Revolutionary War;

(ii) in coordination with the White House Office of Public Liaison, coordinate bi-weekly lectures regarding the 250th anniversary of American Independence that are grounded in patriotic education principles, which shall be broadcast to the Nation throughout calendar year 2026;

(iii) upon request, advise executive departments and agencies regarding their efforts to ensure patriotic education is appropriately provided to the public at national parks, battlefields, monuments, museums, installations, landmarks, cemeteries, and other places important to the American founding and American history, as appropriate and consistent with applicable law;

(iv) upon request, offer advice and recommendations to, and support the work of Task Force 250 and the United States Semiquincentennial Commission regarding their plans to celebrate the 250th anniversary of American Independence; and

(v) facilitate, advise upon, and promote private and civic activities nationwide to increase public knowledge of and support patriotic education surrounding the 250th anniversary of American Independence, as appropriate and consistent with applicable law.

(f) The Department of Education shall provide funding and administrative support for the 1776 Commission, to the extent permitted by law and subject to the availability of appropriations.

(g) Members of the 1776 Commission shall serve without compensation but, as approved by the Department of Education, shall be reimbursed for travel expenses, including per diem in lieu of subsistence, as authorized by law for persons serving intermittently in the Government service (5 U.S.C. 5701–5707).

(h) Insofar as chapter 10 of title 5, United States Code (commonly known as the Federal Advisory Committee Act), may apply to the 1776 Commission, any functions of the President under that Act, except that of reporting to the Congress, shall be performed by the Secretary of Education, in accordance with the guidelines issued by the Administrator of General Services.

(i) The 1776 Commission shall terminate 2 years from the date of this order, unless extended by the President.

Sec. 5. Additional Patriotic Education Measures. (a) All relevant agencies shall monitor compliance with section 111(b) of title I of Division J of

Public Law 108–447, which provides that “[e]ach educational institution that receives Federal funds for a fiscal year shall hold an educational program on the United States Constitution on September 17 of such year for the students served by the educational institution,” including by verifying compliance with each educational institution that receives Federal funds. All relevant agencies shall take action, as appropriate, to enhance compliance with that law.

(b) All relevant agencies shall prioritize Federal resources, consistent with applicable law, to promote patriotic education, including through the following programs:

(i) the Department of Education’s American History and Civics Academies and American History and Civics Education-National Activities programs;

(ii) the Department of Defense’s National Defense Education Program and Pilot Program on Enhanced Civics Education; and

(iii) the Department of State’s Bureau of Educational and Cultural Affairs and Fulbright, U.S. Speaker, and International Visitor Leadership programs, as well as the American Spaces network.

Sec. 6. General Provisions. (a) Nothing in this order shall be construed to impair or otherwise affect:

(i) the authority granted by law to an executive department or agency, or the head thereof; or

(ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

THE WHITE HOUSE,

Presidential Documents

Executive Order 14201 of February 5, 2025

Keeping Men Out of Women's Sports

By the authority vested in me as President by the Constitution and the laws of the United States of America, and to protect opportunities for women and girls to compete in safe and fair sports, it is hereby ordered:

Section 1. *Policy and Purpose.* In recent years, many educational institutions and athletic associations have allowed men to compete in women's sports. This is demeaning, unfair, and dangerous to women and girls, and denies women and girls the equal opportunity to participate and excel in competitive sports.

Moreover, under Title IX of the Education Amendments Act of 1972 (Title IX), educational institutions receiving Federal funds cannot deny women an equal opportunity to participate in sports. As some Federal courts have recognized, "ignoring fundamental biological truths between the two sexes deprives women and girls of meaningful access to educational facilities." *Tennessee v. Cardona*, 24-cv-00072 at 73 (E.D. Ky. 2024). See also *Kansas v. U.S. Dept. of Education*, 24-cv-04041 at 23 (D. Kan. 2024) (highlighting "Congress' goals of protecting biological women in education").

Therefore, it is the policy of the United States to rescind all funds from educational programs that deprive women and girls of fair athletic opportunities, which results in the endangerment, humiliation, and silencing of women and girls and deprives them of privacy. It shall also be the policy of the United States to oppose male competitive participation in women's sports more broadly, as a matter of safety, fairness, dignity, and truth.

Sec. 2. *Definitions.* The definitions in Executive Order 14168 of January 20, 2025 (Defending Women from Gender Ideology Extremism and Restoring Biological Truth to the Federal Government), shall apply to this order.

Sec. 3. *Preserving Women's Sports in Education.* (a) In furtherance of the purposes of Title IX, the Secretary of Education shall promptly:

(i) in coordination with the Attorney General, continue to comply with the vacatur of the rule entitled "Nondiscrimination on the Basis of Sex in Education Programs or Activities Receiving Federal Financial Assistance" of April 29, 2024, 89 FR 33474, see *Tennessee v. Cardona*, 24-cv-00072 at 13-15 (E.D. Ky. 2025), and take other appropriate action to ensure this regulation does not have effect;

(ii) take all appropriate action to affirmatively protect all-female athletic opportunities and all-female locker rooms and thereby provide the equal opportunity guaranteed by Title IX of the Education Amendments Act of 1972, including enforcement actions described in subsection (iii); to bring regulations and policy guidance into line with the Congress' existing demand for "equal athletic opportunity for members of both sexes" by clearly specifying and clarifying that women's sports are reserved for women; and the resolution of pending litigation consistent with this policy; and

(iii) prioritize Title IX enforcement actions against educational institutions (including athletic associations composed of or governed by such institutions) that deny female students an equal opportunity to participate in sports and athletic events by requiring them, in the women's category, to compete with or against or to appear unclothed before males.

(b) All executive departments and agencies (agencies) shall review grants to educational programs and, where appropriate, rescind funding to programs that fail to comply with the policy established in this order.

(c) The Department of Justice shall provide all necessary resources, in accordance with law, to relevant agencies to ensure expeditious enforcement of the policy established in this order.

Sec. 4. *Preserving Fairness and Safety in Women's Sports.* Many sport-specific governing bodies have no official position or requirements regarding trans-identifying athletes. Others allow men to compete in women's categories if these men reduce the testosterone in their bodies below certain levels or provide documentation of "sincerely held" gender identity. These policies are unfair to female athletes and do not protect female safety. To address these concerns, it is hereby ordered:

(a) The Assistant to the President for Domestic Policy shall, within 60 days of the date of this order:

(i) convene representatives of major athletic organizations and governing bodies, and female athletes harmed by such policies, to promote policies that are fair and safe, in the best interests of female athletes, and consistent with the requirements of Title IX, as applicable; and

(ii) convene State Attorneys General to identify best practices in defining and enforcing equal opportunities for women to participate in sports and educate them about stories of women and girls who have been harmed by male participation in women's sports.

(b) The Secretary of State, including through the Bureau of Educational and Cultural Affairs' Sports Diplomacy Division and the Representative of the United States of America to the United Nations, shall:

(i) rescind support for and participation in people-to-people sports exchanges or other sports programs within which the relevant female sports category is based on identity and not sex; and

(ii) promote, including at the United Nations, international rules and norms governing sports competition to protect a sex-based female sports category, and, at the discretion of the Secretary of State, convene international athletic organizations and governing bodies, and female athletes harmed by policies that allow male participation in women's sports, to promote sporting policies that are fair, safe, and in furtherance of the best interests of female athletes.

(c) The Secretary of State and the Secretary of Homeland Security shall review and adjust, as needed, policies permitting admission to the United States of males seeking to participate in women's sports, and shall issue guidance with an objective of preventing such entry to the extent permitted by law, including pursuant to section 212(a)(6)(C)(i) of the Immigration and Nationality Act (8 U.S.C. 1182(a)(6)(C)(i)).

(d) The Secretary of State shall use all appropriate and available measures to see that the International Olympic Committee amends the standards governing Olympic sporting events to promote fairness, safety, and the best interests of female athletes by ensuring that eligibility for participation in women's sporting events is determined according to sex and not gender identity or testosterone reduction.

Sec. 5. *General Provisions.* (a) Nothing in this order shall be construed to impair or otherwise affect:

(i) the authority granted by law to an executive department or agency, or the head thereof; or

(ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party

against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

(d) If any provision of this order, or the application of any provision to any person or circumstance, is held to be invalid, the remainder of this order and the application of its provisions to any other persons or circumstances shall not be affected thereby.

Supreme Court Bolsters President Trump's Push to Eliminate Transgender Insanity

The White House

June 30, 2026

Today, the Supreme Court affirmed President Donald J. Trump's longstanding commitment to protect women and girls, ruling that states may reserve female athletic competition for biological females.

The Court's decision is a landmark victory for common sense, biological reality, and for the millions of women and girls who deserve a level playing field. By upholding laws protecting female athletic competition, the Court confirmed that states may preserve the fairness, safety, and equal opportunities that Title IX was enacted to guarantee.

This ruling is the latest affirmation of President Trump's efforts to restore biological reality throughout the federal government and protect the rights of women and girls. Since returning to office, President Trump has taken a series of decisive actions to advance those goals, including:

- Barring men from competing in women's sports, resulting in athletic organizations such as the NCAA, International Olympic Committee, and World Athletics Council realigning their policies with biological reality.
- Cracking down on athletic organizations that refuse to comply with President Trump's commonsense Executive Order by launching Title IX investigations across the country, including four in the past week alone.
- Restoring biological reality as the official policy of the federal government by recognizing that there are only two immutable sexes: male and female.
- Restoring biological sex as the sole markers for official federal documents, including passports.
- Banning federal funding, sponsorship, and promotion of child gender mutilation in more than 40 hospitals and health systems across the country stopping and mutilation programs.

Click to listen

- Ordering the Department of Health and Human Services to perform a comprehensive review of best practices for children and adolescents, ultimately confirming the complete absence of scientific evidence supporting child gender mutilation.
- Terminating federal support for “gender ideology” and “equity” curricula, forcing states to halt the indoctrination of children with woke ideology or risk losing federal funding.
- Cutting billions of dollars in federal funding for the proliferation of radical gender ideology.
- Prioritizing military readiness over radical gender ideology by requiring troops to serve according to their biological sex, and barring so-called transgender individuals from military service.
- Ending all funding for sex change surgeries at the Department of War and Department of Veterans Affairs.
- Eliminating radical gender ideology from U.S. service academies and training programs.
- Protecting women’s spaces, including bathrooms, locker rooms, and shelters.

President Trump and his entire Administration will continue safeguarding women’s sports, shielding children from radical gender ideology, and restoring biological truth throughout the federal government, just as he promised on the campaign trail.

President Trump Ended Democrats' "Transgender for Everybody" Insanity

The White House

March 31, 2026

Two years ago today, the Biden Administration desecrated Easter Sunday with a “transgender” message that elevated radical leftist ideology over faith, family, and biological truth. This Easter season, the Trump Administration is celebrating a decisive victory: the swift and unrelenting dismantling of subversive, woke policies that endangered children, eroded women’s rights, assaulted common sense, and dragged America toward moral and cultural decline.

Under President Trump, the era of government-sanctioned delusion is over:

- President Trump declared it the official policy of the U.S. Government that there are only two immutable sexes: male and female.
- President Trump banned federal funding, sponsorship, or promotion of the chemical and surgical mutilation of minors — protecting children from irreversible harm and directing agencies to defund institutions engaged in these practices.
 - As a result, more than three dozen health systems across the country — including Kaiser Permanente, Children’s Hospital Los Angeles, Children’s Minnesota, Denver Health, Lurie Children’s Hospital of Chicago, Stanford Medicine, NYU Langone, and many others — announced they are stopping or suspending child mutilation programs.
- The Trump Administration ended the un-American indoctrination of schoolchildren by terminating federal support for “gender ideology” and “equity” curricula — enforcing parental rights and putting states on notice to remove such content or lose funding.
- President Trump ended the unfair, demeaning practice of forcing women to compete against biological men in sports — which resulted in both the NCAA and the International Olympic Committee, as well as multiple state high school athletics associations, to realign with biological reality.

Click to listen

- The Department of War reinstated standards requiring service members to serve according to their biological sex, banned transgender individuals from military service where it conflicts with readiness and cohesion, and prohibited taxpayer funds for sex change procedures — restoring the military’s focus on excellence, not ideology.
- The Department of Health and Human Services conducted a comprehensive review of so-called “gender-affirming care” and confirmed the lack of medical or scientific evidence supporting its irreversible effects on minors.
- The Trump Administration — including across the Department of War and the Department of Veterans Affairs — ceased all funding for sex change surgeries and related procedures.
- President Trump eliminated radical gender ideology from U.S. service academies and training programs.
- President Trump directed enforcement to protect single-sex spaces designed for women and girls — including bathrooms, locker rooms, and shelters — based on biological sex.
- The Trump Administration axed billions of dollars in grants that had been used by states to perpetuate radical gender ideology and related propaganda.
- The Trump Administration ended the practice of allowing gender self-identification on federal documents — including passports — restoring biological sex as the sole basis for official records.

These bold actions have shattered years of Democrat extremism, rescued a generation of children from irreversible harm, restored biological truth, and reclaimed America’s commitment to fairness, science, and sanity.

In the Trump Administration, truth, strength, and moral clarity are once again guiding our nation forward.

Proclamation 10911 of April 3, 2025

National Child Abuse Prevention Month, 2025

By the President of the United States of America

A Proclamation

America's children are the foundation of our families, the heirs of our freedom, and the stewards of our national promise. This National Child Abuse Prevention Month, we commit to empowering every child in America to lead a fulfilling life of dignity and love—and we pledge to bring every abuser, predator, and evildoer who threatens the health and safety of our children to swift justice.

As citizens, each of us is entrusted with the sacred responsibility of caring for the most vulnerable among us, especially children uniquely at risk of trauma and abuse. My Administration recognizes that the most powerful safeguard against child abuse is a stable family with loving parents, and that there is no substitute for a strong mother and father. For this reason, I am working every day to fortify our families and embolden our Nation's children to live their lives full of happiness, health, and success that they so dearly deserve. I call on every American to take steps to prevent child abuse and neglect before it occurs. By doing so, we can reduce the risk of depression, suicide, substance abuse, and developmental challenges in our youth.

Sadly, one of the most prevalent forms of child abuse facing our country today is the sinister threat of gender ideology. Proponents of the gender ideology movement are outrageously indoctrinating our children with the devastating lie that they are trapped in the wrong body—and that the only way they can be truly happy is to alter their sex with hormone therapy, puberty blockers, and sexual mutilation surgery. The evil and backwards lies of gender insanity are robbing our children of their happiness, health, and freedom, while imposing unimaginable heartbreak on parents and families. As I stated during my Joint Address to the Congress last month, my message to every American child is simple: you are perfect exactly the way God made you.

As President, I proudly signed Executive Order 14187 prohibiting public schools from indoctrinating our children with transgender ideology, while also taking action to cut off all taxpayer funding to any institution that engages in the sexual mutilation of our youth. To further protect our children, I have taken historic action to secure our southern border and end child trafficking—and am working diligently to make our young people healthy again.

This National Child Abuse Prevention Month, we pledge to stop the atrocity of child abuse in all its forms. We affirm that every perpetrator who inflicts violence on our children will be punished to the fullest extent of the law. Above all, we vow to give our children the tools they need to fully embrace God's gift of life, and to carry that radiant torch of American Liberty generations into the future.

NOW, THEREFORE, I, DONALD J. TRUMP, President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States, do hereby proclaim April 2025 as National Child Abuse Prevention Month. I call upon all Americans to invest in the lives of our Nation's children, to be aware of their safety and well-

being, and to support efforts that promote their psychological, physical, and emotional development.

IN WITNESS WHEREOF, I have hereunto set my hand this third day of April, in the year of our Lord two thousand twenty-five, and of the Independence of the United States of America the two hundred and forty-ninth.

A handwritten signature in black ink, appearing to be a stylized name, possibly "Donald Trump", written in a cursive script.

The Director

UNITED STATES OFFICE OF PERSONNEL MANAGEMENT
Washington, DC 20415

MEMORANDUM

TO: Heads and Acting Heads of Departments and Agencies

FROM: Charles Ezell, Acting Director, U.S. Office of Personnel Management

DATE: January 29, 2025

RE: Initial Guidance Regarding President Trump's Executive Order *Defending Women*.

Pursuant to its authority under 5 U.S.C. § 1103(a)(1) and (a)(5), the U.S. Office of Personnel Management (OPM) is providing the following initial guidance to agencies regarding the President's Executive Order entitled *Defending Women from Gender Ideology Extremism and Restoring Biological Truth to the Federal Government (Defending Women)*.

Steps to End Federal Funding of Gender Ideology: In light of *Defending Women*, each agency should take prompt actions to end all agency programs that use taxpayer money to promote or reflect gender ideology as defined in Section 2(f) of *Defending Women*. Specifically, agency heads should take the following steps:

1. No later than **5:00 p.m. EST on Friday, January 31, 2025**
 - a. Send an email to all agency employees announcing that the agency will be complying with *Defending Women* and this guidance.
 - b. Review all agency programs, contracts, and grants, and terminate any that promote or inculcate gender ideology.
 - c. Review all agency position descriptions and send a notification to all employees whose position description involves inculcating or promoting gender ideology that they are being placed on paid administrative leave effective immediately as the agency takes steps to close/end all initiatives, offices, and programs that inculcate or promote gender ideology.
 - d. Take down all outward facing media (websites, social media accounts, etc.) that inculcate or promote gender ideology.
 - e. Review agency email systems such as Outlook and turn off features that prompt users for their pronouns.

- f. Withdraw any final or pending documents, directives, orders, regulations, materials, forms, communications, statements, and plans that inculcate or promote gender ideology.
 - g. Cancel any trainings that inculcate or promote gender ideology or have done so in the past.
 - h. Disband or cancel any employee resource groups or special emphasis programs that inculcate or promote gender ideology or have done so in the past.
 - i. Review all agency forms that require entry of an individual's sex and ensure that all list male or female only, and not gender identity. Remove requests for "gender" and substitute requests for "sex."
 - j. Ensure that all applicable agency policies and documents, including forms, use the term "sex" and not "gender."
 - k. Ensure that intimate spaces designated for women, girls, or females (or for men, boys, or males) are designated by biological sex and not gender identity.
2. No later than **12:00 p.m. EST on Friday, February 7, 2025**, report to OPM on all steps taken to implement this guidance, including:
- a. a complete list of actions taken in response to this guidance and *Defending Women*; and
 - b. any agency plans to fully comply with this guidance and *Defending Women*.

Please contact OPM at defendingwomen@opm.gov if you have any questions regarding this guidance. Please send any reports requested by this guidance to defendingwomen@opm.gov.

M-25-13

MEMORANDUM FOR HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES

FROM: Matthew J. Vaeth, Acting Director, Office of Management and Budget 

SUBJECT: Temporary Pause of Agency Grant, Loan, and Other Financial Assistance Programs

The American people elected Donald J. Trump to be President of the United States and gave him a mandate to increase the impact of every federal taxpayer dollar. In Fiscal Year 2024, of the nearly \$10 trillion that the Federal Government spent, more than \$3 trillion was Federal financial assistance, such as grants and loans. Career and political appointees in the Executive Branch have a duty to align Federal spending and action with the will of the American people as expressed through Presidential priorities. Financial assistance should be dedicated to advancing Administration priorities, focusing taxpayer dollars to advance a stronger and safer America, eliminating the financial burden of inflation for citizens, unleashing American energy and manufacturing, ending “wokeness” and the weaponization of government, promoting efficiency in government, and Making America Healthy Again. The use of Federal resources to advance Marxist equity, transgenderism, and green new deal social engineering policies is a waste of taxpayer dollars that does not improve the day-to-day lives of those we serve.

This memorandum requires Federal agencies to identify and review all Federal financial assistance¹ programs and supporting activities consistent with the President’s policies and requirements.² For example, during the initial days of his Administration, President Donald J. Trump issued a series of executive orders to protect the American people and safeguard valuable taxpayer resources, including *Protecting the American People Against Invasion* (Jan. 20, 2025), *Reevaluating and Realigning United States Foreign Aid* (Jan. 20, 2025), *Putting America First in International Environmental Agreements* (Jan. 20, 2025), *Unleashing American Energy* (Jan. 20, 2025), *Ending Radical and Wasteful Government DEI Programs and Preferencing* (Jan. 20,

¹ 2 CFR 200.1 defines Federal financial assistance to mean “[a]ssistance that recipients or subrecipients receive or administer” in various forms, but this term does not include assistance provided directly to individuals. For the purposes of this memorandum, Federal financial assistance includes: (i) all forms of assistance listed in paragraphs (1) and (2) of the definition of this term at 2 CFR 200.1; and (ii) assistance received or administered by recipients or subrecipients of any type except for assistance received directly by individuals.

² Nothing in this memo should be construed to impact Medicare or Social Security benefits.

2025), *Defending Women from Gender Ideology Extremism and Restoring Biological Truth to the Federal Government* (Jan. 20, 2025), and *Enforcing the Hyde Amendment* (Jan. 24, 2025). These executive orders ensure that Federal funds are used to support hardworking American families.

To implement these orders, each agency must complete a comprehensive analysis of all of their Federal financial assistance programs to identify programs, projects, and activities that may be implicated by any of the President's executive orders. In the interim, to the extent permissible under applicable law, Federal agencies **must temporarily pause** all activities related to obligation or disbursement of all Federal financial assistance, and other relevant agency activities that may be implicated by the executive orders, including, but not limited to, financial assistance for foreign aid, nongovernmental organizations, DEI, woke gender ideology, and the green new deal.

This temporary pause will provide the Administration time to review agency programs and determine the best uses of the funding for those programs consistent with the law and the President's priorities. The temporary pause will become effective on January 28, 2025, at 5:00 PM. Even before completing their comprehensive analysis, Federal agencies must immediately identify any legally mandated actions or deadlines for assistance programs arising while the pause remains in effect. Federal agencies must report this information to OMB along with an analysis of the requirement. OMB also directs Federal agencies to pause all activities associated with open NOFOs, such as conducting merit review panels.

No later than February 10, 2025, agencies shall submit to OMB detailed information on any programs, projects or activities subject to this pause. Each agency must pause: (i) issuance of new awards; (ii) disbursement of Federal funds under all open awards; and (iii) other relevant agency actions that may be implicated by the executive orders, to the extent permissible by law, until OMB has reviewed and provided guidance to your agency with respect to the information submitted.

OMB may grant exceptions allowing Federal agencies to issue new awards or take other actions on a case-by-case basis. To the extent required by law, Federal agencies may continue taking certain administrative actions, such as closeout of Federal awards (2 CFR 200.344), or recording obligations expressly required by law.

Additionally, agencies must, for each Federal financial assistance program: (i) assign responsibility and oversight to a senior political appointee to ensure Federal financial assistance conforms to Administration priorities; (ii) review currently pending Federal financial assistance announcements to ensure Administration priorities are addressed, and, subject to program statutory authority, modify unpublished Federal financial assistance announcements, withdraw any announcements already published, and, to the extent permissible by law, cancel awards already awarded that are in conflict with Administration priorities, and; (iii) ensure adequate oversight of Federal financial assistance programs and initiate investigations when warranted to identify underperforming recipients, and address identified issues up to and including cancellation of awards.

Directive on NIH Priorities

Agency: National Institutes of Health

Office of the Director

Action: Directive

FOR FURTHER INFORMATION CONTACT:

National Institutes of Health

Office of the Director

EFFECTIVE DATE: February 21, 2025

Restoring Scientific Integrity and Protecting the Public Investment in NIH Awards

The National Institutes of Health (NIH) is the largest public funder of biomedical and behavioral research in the world. The public trusts NIH with substantial funds to foster creative discoveries that will improve health and prevent disease in this Country. Accordingly, NIH is committed to promoting only the highest level of scientific integrity, public accountability, and social responsibility in the programs it funds. And NIH promises to prioritize the funding of projects that will generate a high return on the public's investment, so that taxpayer dollars are not going to waste. Every dollar should be used to make Americans live longer, healthier lives.

This mission requires NIH to ensure that it is not supporting low-value and off-mission research programs, including but not limited to studies based on diversity, equity, and inclusion (DEI) and gender identity. While this description of NIH's mission is consistent with recent Executive Orders issued by the President, I issue this directive based on my expertise and experience; consistent with NIH's own obligation to pursue effective, fiscally prudent research; and pursuant to NIH authorities that exist independently of, and precede, those Executive Orders.

Research programs based primarily on artificial and non-scientific categories, including amorphous equity objectives, are antithetical to the scientific inquiry, do nothing to expand our knowledge of living systems, provide low returns on investment, and ultimately do not enhance health, lengthen life, or reduce illness. Worse, DEI studies are often used to support unlawful discrimination on the basis of race and other protected characteristics, which harms the health of Americans. Therefore, it is the policy of NIH not to prioritize such research programs.

Likewise, research programs based on gender identity are often unscientific, have little identifiable return on investment, and do nothing to enhance the health of many Americans. Many such studies ignore, rather than seriously examine, biological realities. It is the policy of NIH not to prioritize these research programs either.

For these reasons and pursuant to, among other authorities, 42 U.S.C. § 282(b) and 45 C.F.R. Part 75 (45 C.F.R. §§ 75.207, 75.210, 75.371–373),¹ the Director of NIH hereby directs:

NIH personnel shall conduct an internal review of all contract solicitations and notices of funding opportunities; applications pending Type 1 and Type 2 awards; existing awards; cooperative agreements; and other transactions. Such review shall be aimed at ensuring NIH grants, contracts, cooperative agreements, and other transactions do not fund or support low-value and off-mission research activities or projects – including DEI and gender identity research activities and programs. NIH personnel should also ensure grants, contracts, cooperative agreements, and other transactions are free from fraud, abuse, and duplication, and are being implemented consistent with federal law.

This Directive shall be implemented by all relevant NIH personnel, including but not limited to those in the Office of Extramural Research, Office of Intramural Research, and the Division of Program Coordination, Planning, and Strategic Initiatives. Grants, contracts, cooperative agreements, and other transactions deemed inconsistent with NIH's mission may, where permitted by applicable law, be subject to funding restrictions, terminated or partially terminated, paused, and/or not continued or renewed, in compliance with all procedural requirements.

Notwithstanding this Directive, and consistent with any court orders that may apply, no open award disbursements may be paused in reliance upon Office of Management and Budget Memorandum M-25-13 or any Executive Order underlying that Memorandum. Previous instructions ordering the immediate release of such funds remain in effect. Also, consistent with any court orders that may apply, this Directive does not instruct personnel to condition or withhold federal funding pursuant to Section 4 of Executive Order 14,187 (Protecting Children from Chemical and Surgical Mutilation) based on the fact that a healthcare entity or health professional provides care or treatment.

Dated: February 21, 2025

Matthew J. Memoli, M.D.
Acting Director of NIH

¹ To be clear, these citations are illustrative, not exhaustive. Further explanation of the range of statutory and regulatory authorities that support actions taken pursuant to this Directive will be issued as appropriate.

EXHIBIT AA

A stylized, low-poly illustration of five diverse people standing and sitting on a set of stairs. The background is a textured blue. The people are rendered in various colors: a man in a yellow shirt and blue pants, a woman in a blue dress, a man in a red shirt and tan pants, a man in a green sweater and tan pants, and a woman in a red shirt and blue pants.

Dedication

A Guide to Primary Care of People with HIV/AIDS is dedicated to all the men and women working in the Ryan White CARE Act programs. Their commitment and dedication to serving people living with HIV and AIDS makes these programs possible.

Acknowledgments

Helen Schietinger managed the development and production of the guide. Joan Holloway oversaw its conception and execution.

Cover design and layout was done by Laura Spofford.

Design and layout of the book was done by Patrice Lincoln.

Frances Porcher and Helen Schietinger copyedited the text, and Bill Todd created the index.

Chapter 1:

Primary Care as Chronic Care

1*John G. Bartlett, MD**Laura W. Cheever, MD, ScM**Michael P. Johnson, MD, MPH**Douglas S. Paauw, MD, FACP*

What is a primary care approach to the treatment of HIV/AIDS, and why is it important?

People with HIV/AIDS can live longer, healthier lives because of advances in treatment of HIV infection. However, longer lives are associated with increased prevalence of 1) adverse effects of HIV infection, 2) adverse effects of the drugs used to treat HIV, and 3) concurrent medical conditions that would occur in the absence of HIV. These long-term complications have put HIV infection in the realm of chronic diseases rather than of infectious diseases, which usually respond to short-term clinical interventions.

Effective management of chronic diseases in the primary care setting requires the coordination of interventions that occur at the level of the clinical services, the community supports for those clinical services, and the individual patient. While clinical services begin in the primary care clinic, community supports are needed, and the patient must be engaged to enhance self-management. The coordinated interventions together contribute to the desired clinical outcomes. The Chronic Care Model, which is used in the design and quality improvement activities of clinical services, conceptualizes how these factors impact the clinical outcome of chronic disease management (see Figure 1-1).

What is the purpose of this guide?

This book addresses several important aspects of HIV/AIDS care and treatment in a concise, accessible format; it is not meant to be a comprehensive reference book. Recommended references and citations are provided for the reader to be able to access in-depth information on topics that are particularly important and/or controversial. Appropriate use of antiretroviral drugs, treatment of opportunistic infections, symptom management, treatment of concurrent medical conditions, and other specific interventions to treat HIV disease and its complications are addressed.

The format of this guide is designed to provide practical information for the common questions that arise in the care of patients with HIV infection. Recognizing the broader array of best practices that contribute to effective clinical outcomes among patients with a complex array of service needs, the authors also address patient evaluation, adherence, mental health, substance abuse, overall clinic management, and other factors that lead to improved patient outcomes according to the Chronic Care Model. Last, because the authors recognize the challenges of maintaining clinical practices in the face of rapidly changing and ever more complex treatment interventions, a chapter on sources for updated and in-depth clinical information is provided. Pediatric HIV/AIDS treatment is not addressed in this book.

Figure 1-1. The Chronic Care Model

Source: Adapted from Wagner EH. Chronic disease management: What will it take to improve care for chronic illness? *Effective Clinical Practice*. 1998;1:2-4. Reprinted with permission. The Chronic Care Model was developed by Ed Wagner, MD, MPH, Director of the MacColl Institute for Healthcare Innovation, Group Health Cooperative of Puget Sound, and colleagues with support from The Robert Wood Johnson Foundation. Further details can be found at www.ihl.org.

Who is the target audience?

The target audience is providers of primary medical care, such as physicians, physician assistants, and nurse practitioners, who are taking care of a small but perhaps an increasing number of HIV-infected persons but who are not experts in HIV care. Parts of this book will also be useful for nurses, counselors, pharmacists, and others seeking specific, concise information about the treatment of HIV-infected persons. Last, specific chapters on clinic management and quality improvement are relevant for those responsible for the administration of clinical sites treating patients with HIV/AIDS. Clinicians with small numbers of patients with HIV/AIDS are encouraged to seek appropriate expert consultation when complex clinical situations arise. Provider expertise in HIV care is essential in many treatment decisions. In fact, patient outcome is correlated with the number of patients with HIV a provider has treated. For more information, see Suggested Resources in Chapter 18 on Keeping Up-to-Date: Sources of Information for the Practicing Clinician.

What is the purpose of the pocket guide contained within the book?

The guide is a pocket-sized quick reference that provides a summary of all Federal guidelines dealing with HIV, including antiretroviral therapy (ART), prevention of opportunistic infections (OIs), management of class adverse reactions, treatment of tuberculosis (TB) and hepatitis C (HCV), laboratory testing, prevention after occupational exposure, and HIV management in pregnancy. It is presented in a format that is intended for point-of-care decision making: it can be carried in the clinic and at the bedside to rapidly access needed information for patient treatment.

The pocket guide will be updated more frequently than the book to meet rapid changes in HIV medication options and recommendations.

How will the book keep pace with the rapidly changing field of HIV/AIDS treatment?

The book details principles and major recommendations for the treatment of persons with HIV/AIDS that will remain, for the most part, relevant for the coming 2 or 3 years. However, the field of HIV treatment is very fluid, and specific drugs and drug combinations evolve rapidly. For this reason, such information has been consolidated in the pocket guide, which will be revised, with updates available in the on-line version on the HIV/AIDS Bureau (HAB) website. Revisions of the pocket guide will include new drugs, new treatment guidelines, and new side effects as well as new drug interactions. In addition to the pocket guide, information on other useful websites is provided to help with keeping up-to-date.

KEY POINTS

HIV is now a chronic disease requiring ongoing primary care management.

The chronic care model uses coordinated interventions at the clinic, community, and individual levels.

A Guide to Primary Care of People with HIV/AIDS is for primary care providers who are taking care of a small number of patients with HIV but who are not experts in HIV care.

The Pocket Guide provides easy reference to rapidly changing treatment guidelines for point-of-care decision making.

Chapter 2:**Approach to the Patient**

John V. L. Sheffield, MD
Gloria A. Casale, MD, MSPH

BASIC ELEMENTS OF CARE
STIGMA AND DISCRIMINATION
CONFIDENTIALITY AND DISCLOSURE
PATIENT EDUCATION
RISK ASSESSMENT AND COUNSELING
KEY POINTS
SUGGESTED RESOURCES

2**BASIC ELEMENTS OF CARE****What are the special challenges of caring for patients with HIV/AIDS?**

Providers need to be mindful of several special issues:

- Patients infected with HIV face a complex array of medical, psychological, and social challenges. A strong provider-patient relationship, the assistance of a multidisciplinary care team, and frequent office visits are usually required to provide excellent care.
- The stigma associated with HIV/AIDS places a major psychological burden on patients. Confidentiality is critical, as is a careful assessment of each patient's emotional support system.
- Ethnic minorities are over-represented among people with HIV. Efforts to understand and acknowledge the beliefs of patients from a variety of cultural backgrounds are necessary to establish trust between providers and patients.
- Providers play a key role in the public health system's HIV prevention strategy. Disease reporting, partner notification, and risk assessment are important aspects of care.
- Many patients have inaccurate AIDS information that can heighten their anxiety, sabotaging treatment adherence and appropriate prevention behaviors. They need assurance that HIV is a treatable disease and that with successful treatment, patients may live indefinitely. They also need to hear explicitly that HIV is transmitted through sexual contact, intravenous drug use, and blood contact (perinatal or other) and how they can prevent transmission to others.

What are the important components of good HIV care?

The elements that ensure good care for people with HIV/AIDS include mechanisms for coordination and communication of care:

- Clinics must offer a nonjudgmental and supportive environment because of the sensitive nature of issues that must be discussed.

- A multidisciplinary approach, utilizing the special skills of nurses, pharmacists, nutritionists, social workers, and case managers is highly desirable to help physicians address patients' needs regarding housing, medical insurance, emotional support, financial benefits, substance abuse counseling, and legal issues.
- Providers and other clinic staff should be prepared to conduct appropriate interventions and make timely referrals to community resources and institutions.
- The primary provider should coordinate care, with close communication among providers across disciplines.
- Individual office visits should be long enough to allow a thorough evaluation.
- Providers must be able to see patients frequently for good continuity of care, and clinic scheduling should be flexible so that patients with acute problems can be seen quickly.
- A range of medical resources, including providers with subspecialties and laboratory expertise, must be in place (see Chapter 16: Clinic Management).
- Patient education is a vital aspect of care that begins during the initial evaluation and continues throughout the course of care (see section on Patient Education below).

What steps can providers take to enhance care?

Providing comprehensive care for patients infected with HIV requires a lot of time, attention to detail, and a strong patient-provider relationship. Specifically, the provider should do the following:

- Discuss issues in a straightforward fashion to foster trust and openness.
- Be realistic about the seriousness of HIV disease and yet, to instill hope, be optimistic about the potential to restore health and to provide comfort. Give accurate information regarding prognosis and the real hope that antiretrovirals provide.
- Encourage patients to learn all they can about their condition and take an active role in decisions regarding their care.

- Anticipate that significant time will be required for patient education (see section on Patient Education below).
- Explicitly outline clinic operations and expectations for provider-patient communication.
- Plan to see patients often and communicate regularly between visits to answer questions, assess treatment effectiveness, and manage side effects.
- Arrange to see patients with acute problems quickly.

How can providers help patients with HIV/AIDS cope with the emotional issues they face?

Patients coming to terms with HIV infection often experience a range of emotions, including anger, fear, shock, disbelief, sadness, and depression. Loss is a major issue for patients with HIV disease because health, employment, income, relationships with friends, lovers, and family, and hope may all be threatened. Many patients feel overwhelmed, and providers need to recognize that a patient's emotional state affects the ability to solve problems and attend to important medical or social issues. Even patients who seem to be adjusting reasonably well can find it difficult to keep all of the appointments that are scheduled as they initiate care. Providers can do the following:

- Assess each patient's emotional state and the availability of friends and family for emotional support. Patients may feel hesitant about seeking emotional support, and some will need counseling to help them decide whether to disclose their diagnosis to friends, family, or employers.
- Deliver important information in easily understood terms and in small amounts. Reassess patient understanding of crucial information at subsequent visits, and repeat important information as necessary.
- Screen for anxiety, depression (including suicidal ideation), and substance use.
- Refer patients to community resources for crisis counseling, support groups, and, if appropriate, psychiatric treatment to help them achieve emotional stability (see also Chapter 14: Mental Health Disorders).
- Assign a case manager who can help reduce anxiety about keeping life in order.

STIGMA AND DISCRIMINATION

Why is stigma associated with HIV/AIDS?

Stigma is founded on fear and misinformation. Theodore de Bruyn has observed that stigma is associated with HIV/AIDS because "it is a life-

threatening disease; people are afraid of contracting HIV; it is associated with behaviors that are considered deviant; a belief that HIV/AIDS has been contracted due to unacceptable lifestyle choices; and, some believe it is the result of a moral fault which deserves punishment" (de Bruyn, Theodore. Paper prepared for the Canadian HIV/AIDS Legal Network. 1999).

Stigma can adversely affect how patients are perceived by others and how they view themselves. The stigma associated with HIV/AIDS is such that individuals known to be or suspected of being infected with HIV may be excluded from community activities and suffer isolation or abandonment. Some patients may feel ambivalent about seeking medical care if by doing so they risk disclosing their condition. Others may have learned from experience to expect rejection and are therefore untrusting of all care providers. It is essential for providers to be supportive of patients dealing with the burden of stigma.

How can providers support patients facing the stigma of fear of contagion?

The clinic must be inviting, and *all* staff members must model behavior in this area. For example, gloves should be worn only as appropriate during physical exams and as consistent with universal precautions. There should not be separate facilities or procedures for HIV-infected patients. Patients and their families are often unaware that routine household contact with a person with HIV poses no risk of contagion. They should be educated about this but also taught what to do in situations that do pose risk, such as bleeding.

How can providers support patients who face stigma associated with being gay, lesbian, bisexual, or transgender?

Demonstrating respect and providing excellent care to patients with various cultural backgrounds, beliefs, and sexual orientations define professionalism. Providers should approach patients in an open and nonjudgmental fashion and be familiar with medical management issues unique to these populations, such as STD screening for men who have sex with men (MSM) and high-dose hormonal treatment for transgender male-to-female patients. Clinic staff members must also be respectful and supportive; having staff who are familiar with gay and lesbian culture is a natural way to create a welcoming environment. Providers and social workers should be aware of community agencies with resources available to people who are gay, lesbian, or transgender. In addition, providers and clinic staff should be aware of special legal issues that affect these populations. For

example, designating a durable power of attorney for medical decision making can be particularly important in states that do not recognize same-gender partners as legal next of kin.

What other special cultural issues affect patients infected with HIV?

Minorities are disproportionately affected by HIV, and many people of color with HIV disease have major socioeconomic problems such as poverty, homelessness, lack of medical insurance, lack of acculturation, and undocumented immigration status. All of these can make accessing health care difficult and attending to health problems less of a priority. A patient's cultural background influences health beliefs and behaviors, and the effectiveness of provider-patient communication may affect compliance with therapy. In addition, prior adverse experiences may make some patients distrustful of medical care. For all of these reasons, providers should do the following:

- Carefully explore what each patient believes about his or her health, what would be appropriate treatment, and who should be involved in medical decision making.
- Use professional interpreters to help overcome language barriers.
- Use case managers to help overcome social barriers.

CONFIDENTIALITY AND DISCLOSURE

Why is confidentiality especially important for patients with HIV disease?

Confidentiality of medical information is always mandatory, but the stakes are particularly high for patients infected with HIV, who risk losing medical insurance, employment, or the support of friends or family if the wrong individuals learn of their diagnosis. Unfortunately, fear and ignorance persist regarding HIV transmission; people with HIV disease may be shunned because of the incorrect belief that HIV can be transmitted via casual contact. Although people with HIV disease are protected against discrimination under provisions of the Americans with Disabilities Act, discrimination can be difficult to prove, and there are strict time limits after which charges of discrimination can no longer be made.

What steps should providers take to protect patient confidentiality?

By adhering to the newly implemented Health Insurance Portability and Accountability Act (HIPAA) regulations, providers are protecting patient confidentiality. Personnel policies should reinforce measures such as requiring that papers and computer screens containing patient identifying information not be left unattended and documenting whether phone messages can be left for the patient, and if they can, with whom.

How can providers help patients decide whom to disclose their HIV status to?

Patients with a support network function better than those who are isolated. However, patients' fear of disclosure is often well founded, and providers must find a balance between accepting patients' unwillingness to disclose and the need to develop support networks. Patients may find support groups or individual psychotherapy sessions beneficial in deciding to whom and when to disclose.

The sex and needle-sharing partners of people with HIV need to be informed about their possible exposure to HIV. The local health department should be able to either assist patients in making these disclosures or provide anonymous partner notification for them.

What public health role do providers play in the HIV epidemic?

Primary care providers must also consider their public health role in curbing the spread of HIV. The nationwide increase in the incidence of syphilis and gonorrhea, especially among MSM, suggests that the advent of potent antiretroviral therapy has resulted in relaxed adherence to safer sex recommendations. All patients with a diagnosis of AIDS and, in many states, those with a positive HIV test must be reported to the State health department. Laws vary by state regarding reporting requirements and subsequent notification of potentially exposed individuals, but the name of the source contact is never divulged to the person being notified. Providers should become familiar with the laws of their jurisdiction by contacting their health departments. (The Association of State and Territorial Health Officers provides links to all State health departments at: <http://www.astho.org>.) Providers are required to do the following:

- Inform patients whose positive HIV or AIDS status must be reported to the State health department, tell them if partner notification is required, and explain what they should expect regarding efforts that must be made by the patient, provider, or health department to notify sex partners or individuals who may have been exposed to HIV through their needle sharing. Assure them that the patient's name is always kept confidential, and is never given to potentially exposed individuals by the Health Department.
- Carefully assess patients' risk-taking behaviors, educate them regarding HIV transmission, and perform STD screening (see question on STD screening in this chapter).
- Provide counseling to encourage safer sexual practices (see section on Risk Assessment and Counseling below) and make referrals to drug rehabilitation or needle exchange centers (see Chapter 13: Management of Substance Abuse).

The recently released Federal guidelines on prevention for persons living with HIV, which contain recommendations for providers, are listed in the Suggested Resources below. (See also Chapter 4: Prevention of HIV in the Clinical Care Setting.)

PATIENT EDUCATION

What does patient education involve?

The provider should assess the patient's understanding of HIV disease and begin patient education at the initial evaluation. To make sound decisions regarding treatment, the patient must understand certain medical information, including:

- The critical role of the patient in his or her own care
- Natural history of HIV disease and consequences of immune system destruction
- How HIV is transmitted
- The meaning of the viral load and CD4 count
- The beneficial impact of antiretroviral drugs
- Early signs and symptoms of opportunistic illnesses
- The role of prophylactic agents

What should patients understand before beginning antiretroviral therapy?

Before initiating antiretroviral therapy, patients must be fully aware of:

- The importance of adhering completely to the treatment regimen
- The possibility of drug resistance and loss of treatment options
- The proper timing of pills and coordinating pill-taking with meals
- Possible side effects and long-term drug toxicities
- The option to stop treatment at any time

In addition, patients should express a commitment to adhere to treatment before providers initiate any form of treatment. (For more on adherence, see Chapter 7: Adherence.)

How should providers incorporate patient education into care?

Patient education is so important that entire clinic visits are often devoted to a discussion of key concepts. Providers should use easily understood language and confirm the patient's understanding of medical terms and concepts. During these discussions, it is helpful for providers to be flexible, acknowledging that uncertainties exist regarding optimal medical management of HIV disease.

Because patient education is time-consuming, many HIV specialty clinics utilize staff other than the primary care provider, such as nurses and nurse practitioners who specialize in HIV clinical care, physician's assistants, pharmacists, and trained peer educators. This interdisciplinary team approach can supplement the limited time primary care providers often have with patients.

What information resources are available for patients?

Clinics can provide patient education materials and make referrals to social workers, nutritionists, pharmacists, and financial advisers who serve as first-line sources of information about medical issues and social services available in the community. At the regional level, community-based HIV/AIDS organizations and county and State public health departments offer information about medical care and facilitate access to legal aid, financial assistance, low-income housing, support groups, and other social services. At the national level, many organizations provide comprehensive information about HIV/AIDS. Table 2-1 lists recommended resources to which providers can refer patients for information and support.

RISK ASSESSMENT AND COUNSELING

What risk-taking behaviors should be reviewed with patients?

Patients infected with HIV who practice unsafe sex or inject drugs can infect others, be reinfected themselves with new HIV strains, or contract STDs, viral hepatitis, or other infections. Abuse of alcohol or illicit drugs is directly harmful and may affect adherence to a complicated medical regimen. Accordingly, providers need a detailed understanding of their patients' risk-taking behaviors to guide patient education and counseling efforts and to assess the advisability of initiating antiretroviral treatment.

Table 2-2 lists specific risk-taking behaviors to review with patients. See also Chapter 4: Prevention of HIV in the Clinical Care Setting and Chapter 13: Management of Substance Abuse.

Table 2-2. Risk-Taking Behaviors to Review with Patients Infected with HIV

Sexual Practices

Number and gender of partners

Specific sexual practices

Frequency

Condom use

HIV status of partners and disclosure of patient's HIV status

Anonymous partners

Association with drug use

Prior STDs

Genital ulcer disease

Drugs

Substances used

Routes of administration

Tolerance and history of withdrawal

History of drug treatment

How should one ask about risk-taking behaviors?

Explaining the rationale for reviewing risk-taking behaviors, informing patients that such a review is routine, and asking for a patient's permission to discuss these topics is a good way to initiate the conversation.

Projecting comfort with the subject material and proceeding in a poised, professional, nonjudgmental, and supportive fashion will engender trust and help patients feel safe enough to discuss their behavior. With regard to sexual behavior, asking "Do you have sex with men, women, or both?" indicates the provider's openness to all sexual orientations. Making a comment that many men who have sex with men, particularly in certain cultures, do not self-identify as gay assures patients that discussing their behavior will not cause the provider to categorize them without their consent. Providers should also explore factors associated with sexual abstinence.

At the same time, it is important for providers to be realistic. Wanting a satisfying sex life is a reasonable desire; the goal is to minimize risk associated with sex. Similarly, changing addictive behavior is extremely difficult and often requires several attempts. Discussing realistic goals will enhance a provider's credibility and minimize a patient's resistance to discussing these subjects. The goal of this initial survey is to learn what patients are doing, not to draw battle lines.

What are effective counseling strategies to help patients decrease their risk taking?

When discussing risk-taking behaviors, a key first goal is to assess a patient's state of preparedness for change. Some patients with newly diagnosed HIV come to care motivated to make healthy lifestyle changes. For these individuals, an enhanced understanding of the risks associated with certain behaviors in conjunction with a provider's strong recommendation to modify behavior may suffice. Providers should also be prepared to offer appropriate medications (e.g., to assist with smoking cessation) or referrals for drug and alcohol abuse counseling. For patients with complicating factors such as severe mental illness, substance abuse, domestic violence, or sexual abuse, referral and close linkages with specialty care are essential.

What if a patient is not prepared to make lifestyle changes?

Providers should deliver a clear, unequivocal message regarding the risks to patients and others associated with unsafe sex and ongoing drug use and advise patients of ways, such as safer sexual practices and needle exchange programs, to reduce risk. It should be kept in mind, however, that pushing patients unprepared for behavioral change may lead to animosity and resistance and that direct advice alone is unlikely to result in immediate or sustained behavioral change. For example, advice to stop smoking generally results in 12-month success rates of 5% -

10%. For patients unprepared to alter their risk-taking behavior, a longer-term strategy is required, and a nonconfrontational approach such as motivational interviewing is recommended (see Table 2-3).

When working with a patient over time to support behavioral change, it is crucial for the provider to be a consistent source of support, hope, and optimism. By acknowledging positive efforts even when initial attempts to modify behavior fail, by continuing to offer encouragement, and by supporting even small progress, the provider can help bolster a patient's resolve and sense of control over his or her actions.

Table 2-3. Motivational Interviewing

Basic Steps:

- Seek to understand the patient's experience through careful and reflective listening.
- Help the patient voice his or her own reasons for change.
- Recognize and accept resistance to change.
- Affirm the patient's ability to control his or her own actions.

In this patient-centered approach, the provider seeks an accurate understanding of the patient's unique experience with certain behaviors. The interviewer listens carefully to the patient's thoughts about his or her behavior, monitors readiness for change, clarifies what the patient believes to be obstacles to change, identifies the patient's own self-motivational statements, and selectively reinforces these expressions of desire, intent, and ability to change. In this manner, the provider yields the role of "expert" and offers affirmation and support for the patient's ability to control his or her own behavior.

Principles to Remember:

- For most people, motivation for change must come from within. Direct persuasion does not often result in sustained behavioral change.
- It is the patient's task to articulate resolve and ambivalence.
- When patients voice resistance to change, it is preferable to recognize and accept a lack of readiness than to press for immediate change. Timing is important.
- Patients must understand that resolutions to change often slip, and failure should not become a reason to avoid contact with the provider.

KEY POINTS

Caring for patients with HIV/AIDS requires a strong provider-patient relationship, a multidisciplinary care team, and frequent office visits.

Stigma and discrimination must be addressed through strong confidentiality protections, emotional support, and cultural sensitivity.

Patient education about the disease process, treatment, and community resources is a vital component of care.

The primary care provider plays a key role in risk assessment and counseling for all patients with HIV.

INITIAL EVALUATION
ONGOING CARE
KEY POINTS
SUGGESTED RESOURCES

3

INITIAL EVALUATION

What are the goals of the initial evaluation?

The goals will depend to a large extent on why the patient is being seen by the primary care provider, which may be because of symptoms, the need for evaluation after a positive HIV test, referral, for a consultation, etc. The initial evaluation should be tailored to the patient's specific need, but the following are the usual goals of the initial evaluation:

- Evaluate HIV-related complaints that require immediate intervention
- Establish a strong patient-provider relationship with clear lines of communication
- Initiate a complete medical database (Table 3-1)
- Assess the patient's understanding of HIV disease
- Identify health needs for current medical problems, including those associated with mental health, substance abuse, hepatitis, and hypertension
- Assess the need for social and psychological intervention
- Assess the need for consultants for medical, social, or psychiatric care
- Describe HIV disease in lay terms, including natural history, laboratory tests (CD4 cell count and viral load), complications, treatment, and outcome
- Describe methods of transmission and of prevention

This is a large menu, and there may need to be several "first visits."

What are the important aspects of the initial evaluation in patients with symptoms?

It is critical to learn quickly if the patient has any HIV-related complications that indicate advanced disease and may require rapid intervention. The most common presentations related to earlier HIV disease are thrush, weight loss, skin lesions of Kaposi's sarcoma, *Pneumocystis carinii* pneumonia (PCP), and fever. Patients with HIV can also have medical conditions that stem from other causes, such as headaches, upper respiratory infections (URI), gastroesophageal reflux disease (GERD), hypertension, diabetes, or heart disease. Distinction between these and conditions that are HIV-related may be obvious, but when not, the best laboratory test is a CD4 cell count, which represents the barometer of immune function with HIV infection. Nearly all HIV-related complications occur when the CD4 cell count is $< 200/\text{mm}^3$. It may take 2-3 days for the laboratory to report the CD4 cell count, but clues to late-stage disease include evidence of chronic illness with weight loss and/or fever, and/or a total lymphocyte count of $< 1,000/\text{mL}$ which is readily available from a stat complete blood count (WBC x % lymphocytes). Late-stage HIV also is an indication of some urgency to initiate antiretroviral therapy. Some patients present with late complications such as PCP, cryptococcal meningitis, toxoplasmosis, or cytomegalovirus (CMV) retinitis. When these are in the differential diagnosis, the workup may require hospitalization, consultation, extensive testing, and frequent followup by telephone or clinic visit. These are medical emergencies – all are ultimately lethal and all are treatable.

Table 3-1. Initial History and Physical Examination: Key Areas for Patients with HIV/AIDS

History	
Emotional reaction to HIV diagnosis	Availability of friends and family for support
HIV-specific information	First known positive HIV test Documentation of positive HIV test Possible timing and risk factors for HIV infection Opportunistic illnesses Prior CD4 counts, viral load measurements, and resistance tests Prior antiretroviral therapy and side effects Understanding of HIV disease Transmission, natural history of immune-response destruction and opportunistic infections, significance of CD4 counts and viral load, and antiretroviral therapy
Risk assessment	Risk category Sexual behavior history (see Table 2-2) Current sexual activity History of syphilis and other STDs Substance abuse history Intravenous and other substance abuse Rehabilitation and interest in rehabilitation
Past medical history	Use of alternative medicine Mental health history Reproductive history, including pregnancies since becoming HIV positive, and plans for pregnancy Tuberculosis history History of positive PPD test, TB disease, or treatment of latent TB infection Concurrent medical conditions (diabetes, coronary artery disease, hypertension, etc.) Hospitalizations
Social history	Housing Food sources, 3-day diet history Income, employment, and insurance Emergency contacts Legal issues Living will and durable power of attorney for medical decisions Permanency planning for dependent children
Physical Examination	
Vital signs, weight, height	
Skin	Dermatitis, folliculitis, fungal infections, molluscum, and Kaposi sarcoma
HEENT	Retinal exam (with CD4 < 200/mm ³) Oropharynx: oral hairy leukoplakia, candidiasis, dentition
Lymph nodes	Cervical, axillary, inguinal
Abdomen	Liver and spleen
Neurologic status	Special focus on mental status and sensation
Genital and rectal findings	Discharges, ulcers, and warts

What are important aspects of the initial history in asymptomatic patients?

The encounters should be tailored to the idiosyncrasies of the individual patient's needs supplemented with the collection of some routine information about their HIV and general health status. The patient's most pressing concern may require confirming the diagnosis, addressing denial, dealing with "HIV hysteria," evaluating conditions unrelated to HIV, or evaluating for antiretroviral therapy (ART). For patients with prior medical treatment for HIV infection, the previous records are often critical for efficiency in time and cost. When possible, these should be brought by the patient or sent in advance of the visit. The type of information that is particularly useful is the record of CD4 cell counts and viral loads, HIV-related complications, current and prior medications, including information about tolerance, toxicity, and adherence (see Table 3-1).

What information do patients need to know about HIV?

HIV is a chronic infection, which will be lifelong, and its outcome will depend to a large extent on the patient's understanding of the disease process and management. Parallels with type 1 diabetes are clear. With this in mind, it is very important that the patient have access to information to advance his or her understanding of the disease. Essential knowledge includes:

- **Transmission** Sex, injection drug use, and perinatal transmission are the "big 3" and have accounted for virtually all cases in the United States since blood began being screened in 1985.
- **Natural history** Explain the 5 stages: 1) acute HIV, 2) seroconversion, 3) long period with no symptoms and decreasing CD4 cell count, 4) complications when the CD4 cell count is $< 200/\text{mm}^3$, and 5) lethal outcome. Emphasize that without therapy the average untreated patient survives about 10 years from HIV acquisition to death, but there is a great deal of individual variation.
- **What does the CD4 cell count mean?** This is the cell that becomes infected with HIV, it is also the quarterback of the immune system, and the count is a barometer of immunosuppression. Normal is $> 500/\text{mm}^3$; a count of $< 200/\text{mm}^3$ is the definition of AIDS.
- **What does the viral load mean?** This indicates the amount of HIV in the blood. The average is about 30,000 copies per ml (c/ml), but again there is a great deal of individual variation. When it is high, the CD4 cell count tends to decline rapidly (negative CD4 slope). The goal of therapy is to reduce the viral load to undetectable levels, and with this the CD4 cell count usually increases 100-150 cells/ mm^3 each year.

- **Therapy** Potent antiretroviral therapy (ART, also called highly active antiretroviral therapy, or HAART) has revolutionized the course of this disease. Although a miraculous development, HAART is also terribly demanding for the patient in terms of adherence, and some patients have big problems with side effects that are either short-term (eg, nausea, rash, asthenia) or long-term (eg, fat redistribution, hyperlipidemia, peripheral neuropathy). The benefits clearly outweigh the risks, and HIV is no longer an inevitably progressive disease, but is a chronic condition such as hypertension or diabetes that requires continual observation and care.
- **Cure** No cure yet and unlikely to be with any of the current medications.
- **Prevention** See discussion below.

For more information, see Chapter 2: Approach to the Patient (section on Patient Education, especially Table 2-1, Information Resources for Patients).

How should prevention be addressed?

Prevention needs to be addressed early and frequently, usually at every encounter. Nearly all adults who acquired HIV after 1985 did so by sexual exposure or needle sharing in the context of injection drug use. Patients in HIV clinics now constitute an important source for HIV transmission by the same mechanisms. Health care providers are now considered essential in risk reduction with a 3-part responsibility:

- **Risk behavior screening** Patients need to be screened for risk behaviors. The screening includes a history of sexual practices and a clinical assessment for evidence of sexually transmitted diseases (STDs). The history of sexual practices can be taken before patients are seen by the primary care provider, either by another staff member or by having patients complete questionnaires. A component of the assessment includes evaluation for STDs because having STDs is associated with a 5-fold increase in the risk of transmitting HIV and also indicates high-risk sexual activities. Women under 25 years old should be screened for cervical *Chlamydia trachomatis*, all symptomatic patients should be evaluated for gonococcal and chlamydia infection, and asymptomatic patients should be considered for screening for these pathogens. Screening is now facilitated by the use of urine specimens for nucleic acid amplification tests (NAAT) for both *N. gonorrhoeae* and *C. trachomatis*.
- **Risk reduction counseling** The second component of prevention is risk reduction counseling, which may be done in the office or through referral. It is critical that patients be fully informed about how HIV is and is not transmitted and that they be counseled about how they can reduce the risk of transmitting HIV to others.

- **Partner referral** The third component, partner referral, involves asking patients to identify persons whom they have placed at risk through sexual or drug-using behaviors. These persons are then referred to a “Partner Counseling and Referral Service” (PCRS) without identifying the source of the information. The PCRS provides public health resources for confidentially informing partners that they have been exposed to HIV and need HIV counseling and testing.

For more information on prevention, see Chapter 2: Approach to the Patient (section on Risk Assessment and Counseling), Chapter 4: Prevention of HIV in the Clinical Care Setting, and Chapter 13: Management of Substance Abuse .

What are common patient questions?

Patients have many questions when they are newly diagnosed with HIV.

- **What will happen to me?** Patients need to know the facts of HIV regarding prognosis, but emphasis should be placed on the extraordinary benefits of therapy, which, for many, may mean a normal lifespan.
- **Can HIV be cured?** Not with current drugs (but it can be contained).
- **Will I need to take medicine forever?** Patients who respond well to therapy will probably be able to discontinue treatment periodically, but regularly scheduled treatment interruptions generally result in poor long-term control of HIV.
- **Would alternative medicine help me?** Probably not, but some patients seem to think it does. Patients should be encouraged to report any alternative medicines they are taking because some of them are problematic in combination with ART.
- **Will I give HIV to the people I live with?** Patients can give HIV to anyone they have sex with or share needles with; however, they also need to understand that people who live in the same household without that kind of contact are not at risk. It is probably best for people with HIV to have their own toothbrushes and razors and not to share eating utensils that have not been washed, even though HIV is not generally transmitted that way.
- **Are pets a problem for me?** Pets don’t give or get HIV. Occasionally cats will become the source of *Toxoplasma gondii* or *Bartonella*, but this is rare; patients should wash their hands after handling pets and especially before eating, avoid contact with cat stool to prevent toxoplasmosis, and avoid cat bites and scratches and fleas to avoid bartonellosis.
- **Should I have a special diet?** Nutrition is important, but there is nothing idiosyncratic about the needs of people with HIV (see Table 2-1 in Chapter 2 for nutrition resources). With late-stage disease, it might be smart to avoid ingesting lake water because of *Cryptosporidium parvum*, which is commonly present and can cause chronic disease.

- **Can I travel?** Certain vaccines required for travel to developing countries are best avoided by people with suppressed immune systems, but vaccines rarely interfere with travel. The biggest problem may be access to good health care and the usual conditions such as traveler’s diarrhea that can affect any traveler.
- **What will happen if I am around someone with a cold or some other common infection?** This type of exposure would probably cause nothing more than an ordinary cold. People with HIV infection do not become susceptible to infectious complications until the CD4 cell count is low. Then they become vulnerable to a very specific menu of infectious disease complications that are extremely rare in the general public. The infections that are common, such as upper respiratory infections or gastroenteritis, are generally no worse in a person with advanced HIV disease than in a healthy person.
- **My cousin has a newborn infant that I want to visit. Is this a good idea?** There should be no reservations here and no reason to talk about HIV infection. It’s okay to hold, kiss, and hug the child; patients should just obey the simple rules of hygiene that they would under ordinary circumstances.
- **Who should I tell?** People who have been placed at risk either sexually or through drug use need to know, and either the patient can tell them or health department staff can do it. The reason is that they need to be tested so that if they are infected they do not transmit HIV to others, and they also need to gain access to care, which is critical. Beyond that, patients should be counseled to be very careful who they tell about the diagnosis.
- **Do I need to tell people at work?** Generally no. HIV is not transmitted by HIV-infected workers in the work place. A rare exception is some health care workers who could conceivably transmit HIV infection during surgery. Most institutions have policies about health care workers who perform invasive procedures, and these need to be followed. Otherwise, there are no other circumstances in which anyone needs to know unless the symptoms of HIV interfere with effective performance.

What should be covered in the physical exam?

Everything, but special attention should be paid to scrutiny of the vital signs, enlargement of lymph nodes, skin lesions, enlargement of liver or spleen, and mental status (see Table 3-1).

What are the initial laboratory tests to order?

Standard laboratory testing should be done to stage the HIV disease, determine the general health status, and identify the presence of concurrent conditions, and baseline tests should be done on patients who are candidates for ART (see Table 3-2). In general, the CD4 cell count identifies the need to treat with antiretroviral drugs, and the viral load is the major indicator of therapeutic response.

Table 3-2 Laboratory Testing in HIV Primary Care			
(Revised 10/8)			
Test	Baseline	Repeat	Comment
Confirmation of Positive HIV Status			
Standard HIV serologic test	Either copy of prior lab results or new tests		Make sure there is a confirmed positive result with standard HIV serologic test
HIV Staging			
CBC	Yes	Repeat at 3-6 month intervals	Repeat more often with some drugs or abnormalities
CD4 count	Yes	Repeat at 3-6 month intervals	Evaluates immune status
HIV viral load	Yes	Repeat at 3-month intervals	Prognostic indicator Repeat more frequently with initiation of ART
Health Status Evaluation			
Chemistry panel	Yes	Repeat annually	Repeat more frequently with abnormalities
Pap smear	Yes	Repeat at 6 months and then annually	
PPD	Yes if no history of TB or a prior positive test	Repeat if initial test was negative and patient was exposed, or if CD4 count increased to > 200/mm ³	
Hepatitis screen			
HAV	Optional		Screen once to identify candidates for HAV vaccine
HBsAg			Test if abnormal liver function tests
anti-HBc or anti-HBs	Yes		Identify candidates for HBV vaccine
HCV	Yes		Screen especially if liver disease present
STDs			
VDRL or RPR	Yes	Repeat annually in sexually active patients	Syphilis screen
Urine nucleic acid amplification test (NAAT) for <i>N. gonorrhoeae</i> and <i>C. trachomatis</i>	Consider for sexually active patients	Consider annual testing or more frequently if at high risk	First-catch urine or urethral (male)/cervical (female) specimen
Chest x-ray	Optional		Must do if positive PPD or chest symptoms
<i>Toxoplasma gondii</i> IgG	Yes		Consider repeating if there are typical symptoms and negative prior test
Baseline for HAART			
Fasting glucose	Yes		
Fasting lipids	Yes		

ONGOING CARE

After the initial evaluation is completed, how often do patients need to be seen?

In general, patients with early-stage disease are seen at 3-month intervals to undergo routine medical evaluation and monitoring of CD4 cell count, viral load, and CBC. During the initial evaluation more frequent visits are common because there is so much information to transmit. Visits should also be more frequent when therapy is introduced and when the CD4 cell count is $< 200/\text{mm}^3$ because complications are more likely. It is very important for the primary care provider to thoroughly understand HIV and its complications. In general, the patients are in 4 categories with some overlap: 1) those with a CD4 cell count of $> 200/\text{mm}^3$, whose complaints are rarely due to HIV or its complications, 2) patients with a CD4 cell count of $< 200/\text{mm}^3$, whose new complaints usually reflect an HIV-related complication which is usually both potentially serious and treatable, 3) patients from either group who are receiving ART and other medications, in which case the side effects of the drugs must be considered, and 4) patients with other medical problems, which is actually the rule rather than the exception because of the high frequency of concurrent conditions.

How can one provider take care of all of the problems?

HIV is generally a complex disease in patients with complicated lives, lifestyles, and concurrent conditions. They are best served by a multidisciplinary team with ancillary services for support regarding case management, mental health, substance abuse treatment, transportation, and housing assistance, using the chronic disease model of care. Another model of care emphasizes patient self-management, with the patient as the principal caregiver supported by a well-prepared practice team with a clear division of labor. The patient is linked not only to the provider unit (the clinic) but also to community-based resources and support from the larger health care organization.

What needs to be done in the follow-up evaluations?

Follow-up evaluations are important to document disease trends and response to therapy and to assess high-risk behavior. This includes history, physical exam, and lab tests (see Tables 3-1 and 3-2). In general, the review needs to be tailored to the specific needs of the patient. Sometimes the major issue is a concurrent condition such as hepatitis C, mental illness, or substance abuse requiring resources that are best achieved with a multidisciplinary approach. For patients who are receiving ART and prophylactic drugs to prevent opportunistic infections, heavy emphasis needs to be placed on adherence and drug-related toxicities as discussed in Chapter 7 or on symptoms related to HIV complications as discussed in Chapters 8, 9, and 10. Under all circumstances, it is important to periodically assess the patient's knowledge of HIV since misconceptions are common and patients are often reluctant to ask the questions that bother them most. In virtually all encounters, it is important to emphasize prevention.

In patients at highest risk for STDs (multiple or anonymous partners, sex in conjunction with illicit drug use, patients whose partners participate in these activities, high prevalence of STDs in the area or in the patient population), STD screening is recommended more frequently than annually (see Chapter 4).

KEY POINTS

The focus of the first visit is determined by the patient's most immediate needs.

The initial evaluation is complex and usually requires several visits.

An important aspect of primary care is answering the patient's questions to ensure that he or she understands the HIV disease process and treatment.

While patients with early-stage HIV disease can be seen at 3-month intervals for routine medical evaluation, those receiving ART or with more advanced disease must be seen more frequently.

A multidisciplinary team approach with the patient as primary caregiver is the best approach to care.

Chapter 4:

Prevention of HIV in the Clinical Care Setting

*Michael P. Johnson, MD, MPH**RATIONALE FOR HIV PREVENTION IN PRIMARY CARE**INTERVENTIONS FOR HIV PREVENTION**KEY POINTS**SUGGESTED RESOURCES**REFERENCES***4**

RATIONALE FOR HIV PREVENTION IN PRIMARY CARE

Why is HIV prevention important in the HIV clinical care setting?

*Why rob banks?...**Because that is where the money is!*

There is growing awareness that the majority of people living with HIV are having sex and that active substance abuse, often with needle-sharing behavior, remains common in the setting of HIV infection (see Chapter 13: Management of Substance Abuse). The HIV clinical care setting provides an opportunity to work with patients to reduce their risk of transmitting HIV to others. Studies are under way to measure the effectiveness of comprehensive clinical care in preventing the spread of HIV. Until those results are available, one should assume that interventions to reduce HIV concentrations in the body through antiretroviral therapy (ART) combined with behavioral counseling to reduce high-risk sexual behaviors and, when indicated, drug abuse treatment are important approaches to decreasing the incidence of HIV infection.

Do most primary care providers incorporate HIV prevention into their care?

Experienced providers, and even HIV specialists, often do not conduct screening and assessment of behavioral risk or offer prevention counseling for their HIV-infected patients. The degree to which these are neglected is startling. Nationwide, approximately a third of HIV-infected patients report that their providers have never counseled them about HIV prevention; in some settings as many as three quarters of HIV medical care providers do not ask about sexual behavior and as many as half do not ask about drug use (Marks et al, 2002; Natter et al,

2002). Results of an unpublished study suggest that HIV specialists are less likely than primary care physicians to engage clients in discussions about sexual and drug-using behaviors. Barriers of time, training, and comfort level contribute to this missed opportunity for HIV prevention.

What factors are associated with high-risk behaviors of people living with HIV?

People living with HIV often practice high-risk sexual and drug-using behaviors in association with poor adherence to clinical care in general and to ART regimens in particular (Wilson et al, 2002). This is of particular concern given the risk of viral resistance with poor medication adherence, which may subsequently result in transmission of resistant viral strains to others. Also, both adherence to HIV prevention practices and adherence to medication regimens appear to be related to mental health problems, which are common among people with HIV (Kalichman et al, 2002). In particular, depression and anxiety disorders are common and should be assessed in patients who report continued high-risk sexual and drug-using behaviors. Any of these conditions should alert the provider to probe for problems in the other conditions or behaviors; addressing underlying issues can lead to improvements in several important behaviors.

What behavioral interventions work to prevent people living with HIV from transmitting HIV?

The earliest behavioral interventions provided factual information and generated fear of AIDS to motivate people to reduce high-risk behavior. Most experts now agree that these interventions do not effectively reduce high-risk behaviors of persons at greatest risk for acquiring HIV, and that generating fear of AIDS most likely increases stigmatization of people living with HIV infection.

A number of counseling interventions have been found to be more effective than providing knowledge alone. Among these effective approaches are brief, provider-delivered counseling messages, which can be delivered within the context of a clinical encounter (Kamb et al, 1998; CDC, 2001). Several theoretical behavioral models have been used to guide counseling interventions. Some common elements of these theory-based counseling approaches include:

- Establishing dialogue and rapport with the client and providing ongoing services in an understanding and nonjudgmental manner, often with the support of trained peers to supplement the provider-based counseling
- Understanding and addressing client needs, situations, and pressures for sexual and drug-using behavior (eg, mental health needs), with emphasis on issues that might be perceived by the client as more pressing than HIV prevention (eg, food, housing, employment), and external barriers to the adoption of safer behaviors (eg, domestic violence)
- Addressing the client's high-risk behavior in a step-wise manner, understanding the readiness and motivation for a change in each specific high-risk behavior, and building the client skills for implementing such changes

These elements are the basis for the assessment and counseling recommendations discussed below, which can be implemented in the clinical setting, along with planning and mobilization of supportive services.

What is the role of drug abuse treatment in preventing HIV transmission?

Sharing of drug-injection paraphernalia is directly related to HIV transmission through the transmission of infected blood. Drug and/or alcohol abuse indirectly lead to HIV transmission through the exchange of sex for drugs and enhanced sexual risktaking under the influence of these substances. Drug abuse treatment is an important intervention in the setting of HIV clinical care (see Chapter 13) and should be considered as an important and effective means of HIV prevention among persons with HIV who abuse drugs and/or alcohol.

What is known about the role of antiretroviral therapy in preventing HIV transmission?

Effective ART leads to a decline in plasma viral load, which reduces the risk of maternal-infant HIV transmission. The risk of sexual transmission of HIV is strongly correlated with plasma HIV levels (Quinn, 2000) (see Figure 4-1). There is also a strong correlation between changes in plasma viral load and the HIV

viral load in genital secretions (Ball et al, 1999); however, HIV can be present in genital secretions when plasma HIV is suppressed below the level of detection. While it is highly likely that effective ART leads to a significant reduction in HIV infectivity, from a behavioral standpoint an increase in high-risk sexual behavior because of a sense of lower risk to others has been observed in persons being treated with ART (Dukers, 2001; Scheer, 2001). For this reason, HIV prevention counseling remains important for those on effective ART, and it is particularly important when viral loads rise, eg, due to interruption of therapy and/or emergence of viral resistance.

Figure 4-1. Associations of HIV Plasma Viral Load and Sexual Transmission of HIV

What is the role of nonoccupational postexposure prophylaxis (nPEP) in the prevention of HIV infection?

Nonoccupational postexposure prophylaxis (nPEP) refers to the use of ART to prevent HIV after a significant sexual exposure to HIV (eg, after sexual assault or condom breakage during intercourse between a discordant couple). A complete review of postexposure prophylaxis (PEP) can be found in Chapter 11: Postexposure Prophylaxis. In summary, a 28-day course of ART may be considered for prevention of nonoccupational HIV transmission if therapy is initiated within 72 hours after a significant exposure from a person with known or suspected HIV infection. This approach will be addressed in upcoming US Public Health Service (PHS) guidelines for nPEP (watch the AIDSInfo website listed in Suggested Resources for these guidelines).

INTERVENTIONS FOR HIV PREVENTION

What can the provider do to enhance prevention practice in the clinical setting?

Primary care interventions to assess and reduce the risk that HIV-infected persons will transmit the virus to others can be conducted at the level of 1) medical care, 2) other care (eg, case management, social services), and 3) clinic structure. Ideally, interventions at all 3 levels are combined to maximize the opportunities for HIV prevention, and each clinic will structure its interventions differently according to its configuration and resources. The following recommendations are directed primarily to the medical provider, although there are often other clinic staff members who support and reinforce these risk assessment and counseling interventions. Training can enhance the skills and motivation for providers to integrate these activities into their routine practice (see Suggested Resources and Chapter 18: Keeping Up-to-Date: Sources of Information for the Provider).

How can the provider identify a patient's risk behaviors?

A brief history should be taken at each regularly scheduled clinic visit to identify knowledge of HIV transmission, sexual and drug-using behavior, and symptoms of an STD (eg, urethral or vaginal burning or discharge, dysuria, genital or anal ulcers, inter-menstrual bleeding, or lower abdominal pain in women). History-taking methods include written, audio, and computerized questionnaires and face-to-face interviews, using either structured or open-ended questions (see examples in Table 4-1). Studies suggest that patients may provide more honest and detailed responses to questionnaires not administered face-to-face. Also, physicians trained in discussing sensitive sexual and drug-using issues are likely to perform better than those who are not. Providers should give positive reinforcement to patients when the screening questions indicate no high-risk sexual and drug-using behaviors. Conversely, indications of high-risk behavior should trigger a medical/laboratory evaluation for STDs, behavioral risk assessment and counseling interventions, and referral and contact notification, as indicated. For more detailed discussion, see the section on Risk Assessment and Counseling in Chapter 2: Approach to the Patient as well as the screening questions for drug abuse in Chapter 13: Management of Substance Abuse.

Table 4-1. Examples of Open- and Closed-ended Risk-screening Questions

Open-ended questions

What do you know about HIV transmission?

What, if anything, are you doing that could result in transmitting HIV to another person?

Tell me about any sexual activity since your last clinic visit.

What do you know about the HIV status of each sex partner?

Tell me about condom use during any sexual activity.

Tell me about any drug use or needle sharing since your last clinic visit.

Closed-ended questions

Do you know the facts about how HIV is and is not transmitted?

Have you had sex (vaginal, anal, or oral) with any partner since your last clinic visit?

For each of your partners, do you know if he/she has HIV infection, doesn't have HIV infection, or are you not sure?

Did you use a condom every time, from start to finish of each sexual encounter?

Have you shared drug injection equipment (including needle, syringe, cotton, cooker, water) with anyone?

Note: Symptoms of STDs (eg, urethral or vaginal burning or discharge, dysuria, genital or anal ulcers, inter-menstrual bleeding or lower abdominal pain among women) are asked in a closed-ended format, regardless of behavioral question format.

What medical and laboratory screening should be done?

Symptoms or signs of an STD or known exposure to STDs should prompt immediate physical and laboratory examinations. However, because STDs are often present without symptoms, every patient should be screened for laboratory evidence of syphilis, trichomonads (women only), gonorrhea, and chlamydia at the initial visit and at least annually (see Table 4-2). Some experts also recommend type-specific testing for herpes simplex virus type 2 because of its association with a higher risk of HIV transmission and possible need

for enhanced counseling. More frequent screening for STDs is appropriate with evidence or suspicion of high-risk sexual behavior (eg, sex with a new partner, sexual activity without consistent and correct condom use); however, there are no data to guide the precise frequency. More frequent screening might also be appropriate in asymptomatic men who have sex with men (MSM) and younger women because of a higher STD prevalence among these demographic groups. The local prevalence of these infections might guide frequency of screening. Laboratory screening for drug abuse is addressed in Chapter 13.

Table 4-2. Screening for Sexually Transmitted Diseases

STD	Recommended test
Syphilis	Non-treponemal serologic test (RPR, VDRL)
Gonorrhea	Nucleic acid amplification test (first-catch urine or urethral [male]/cervical [female] specimen) or culture (urethral [male]/cervical [female] specimen)
Chlamydia	Nucleic acid amplification test (first-catch urine or urethral [male]/cervical [female] specimen)
Trichomonas	Wet mount or culture (vaginal secretion)
Herpes simplex virus	Type-specific HSV-2 antibody testing

What behavioral assessment and counseling interventions should the provider implement?

Specific suggestions for assessment and counseling are presented in Table 4-3 and in Chapter 2. Each clinic must decide which aspects of HIV prevention assessment and counseling are best done by the primary provider, by other clinical providers with whom the patient interacts, or some combination of both. Brief interventions by physicians have been found to be effective with other conditions, including smoking cessation, improving dietary behavior, and reduction of alcohol consumption. Thus, while data are limited on the topic of HIV prevention, physicians should provide such counseling until studies suggest alternate and improved approaches.

How can clinic staff other than the primary medical provider enhance HIV prevention practice?

In most medium-sized and larger clinics, staff members other than the primary medical provider are responsible for referral, contact notification, and quality improvement, which can all be used to enhance prevention practice, as discussed below. In addition, specific structural interventions (eg, arranging client flow to ensure interaction with clinic staff who conduct prevention counseling, use of video, written handouts or other educational media, and distribution of condoms) can strengthen the role of other clinic staff in prevention activities.

What role does referral to community resources play in HIV prevention?

Some complex patient issues and conditions fall beyond the scope of a primary care clinic and must be addressed before risky behavior can be reduced or eliminated. These include drug abuse, mental health issues, domestic violence, and assistance with needs such as housing, food, and employment. Each clinic should have established relationships with community resources to address these issues, and staff members should have thorough knowledge of the available services as well as mechanisms in place to ensure that patients can access the services. Finally, followup should be done to be certain that the referrals are utilized and are effective for each patient. It is unlikely that persons at highest risk for transmitting HIV to others can effectively reduce such behavior without access to a comprehensive array of services and supports.

What are key elements of contact notification?

Contact notification is an effective way to identify additional HIV-infected persons through HIV counseling and testing, bring them into care, and provide support to help them avoid transmitting HIV to others. Health departments traditionally conduct contact notification; in some States providers are required by law to report to the health department known sexual or drug-equipment-sharing contacts of persons infected with HIV. The standard method is to inform the patient's contacts that they have been placed at risk and need HIV testing without identifying the source.

Table 4-3. Suggested Counseling Content for Behavioral Risk Reduction

Factual topics about HIV transmission	Suggested content
Relative risk of HIV transmission during sex	Most to least risky activities: receptive anal > receptive vaginal > insertive anal > insertive vaginal > receptive oral > insertive oral
Preventing HIV transmission during sexual activity	Abstinence (safest behavior) Correct condom use (latex or polyurethane condoms, used with water-based, not oil-based, lubricants, used from start to finish of any sexual penetration) Other means of reducing risk
Effect of drug use on sexual decisionmaking	Potential increase in sexual risk behavior following drug and/or alcohol use
Risk of HIV transmission when sharing drug-injection equipment	Highest risk for HIV transmission Risk of other disease transmission for either user Entire works (drug paraphernalia), not only needles, need to be clean
Impact of viral load level on HIV transmission risk	Greatest risk of HIV transmission when viral load is elevated (eg, when antiretroviral therapy is stopped or is ineffective) HIV transmission still possible during effective antiretroviral therapy (eg, there can be HIV in genital secretions even when plasma viral load is undetectable)
Components of assessment and counseling	Suggested content
Motivation for HIV prevention	Risk to self: acquiring non-HIV infectious agent and acquiring drug-resistant HIV strain Risk to others: transmitting HIV
Readiness and capacity for HIV prevention	Patient's belief about his/her desire, intent, and sense of capacity to adopt behaviors that prevent HIV transmission
Barriers to adopting safer sexual and drug-using behaviors	Identification of barriers, such as mental health needs, substance abuse, domestic violence, and other social and economic pressures that might impede the adoption of behaviors to prevent the transmission of HIV
Willingness to accept in-depth counseling and/or referral to overcome barriers to adopting safer behaviors	Identification of history of past efforts to address the issue impeding the adoption of safer behavior Encouragement and offering of assistance for more in-depth support through referral
Development of an HIV prevention plan	Creation of a plan mutually agreeable to patient and provider, written for both the medical record and the client
Discussion of reproductive intentions	Assessment of need for in-depth counseling with HIV-experienced obstetrician to address risks and benefits of conception

How can HIV prevention be made a part of routine clinic practice?

HIV prevention, often neglected as a component of HIV clinical care, is more likely to be a part of routine clinic practice if it is part of the clinical continuous quality improvement activities (see Chapter 17: Quality Improvement). While the most effective indicators for prevention practice in the clinical setting are not known, considerations include medical record documentation of risk assessment history, prevention counseling, medical/laboratory examination for STDs, establishment of a prevention plan, and completion of referrals. There should be regular assessment of whether such tasks are completed and regular feedback to staff members regarding the success rates of completing these interventions. Finally, training interventions should be guided by data from these quality improvement activities (see Chapter 18).

KEY POINTS

The HIV clinical care setting offers an ongoing opportunity to work with patients to reduce their risk of transmitting HIV to others.

Common elements of behavioral interventions to reduce HIV risktaking include establishing rapport with the patient, addressing immediate patient needs (eg, mental health problems, substance abuse, housing), and working in small steps to build motivation and skills for change.

A brief history of patient risk behaviors and HIV prevention counseling should be parts of each patient visit.

Besides HIV prevention counseling, the following are important components of HIV prevention in the clinical setting: contact notification, drug abuse treatment, screening for STDs, decreasing the patient's viral load through ART, and nPEP.

Structural interventions for HIV prevention include making available educational materials and condoms, establishing strong referral relationships with social service and substance abuse services, and incorporating prevention indicators into quality improvement activities.

Chapter 5:

Antiretroviral Therapy

*John G. Bartlett, MD**THE PRINCIPLES OF ANTIRETROVIRAL THERAPY (ART)**WHEN TO START THERAPY**WHAT TO START**WHEN TO CHANGE THERAPY**WHAT TO CHANGE TO**RESISTANCE TESTING**KEY POINTS**SUGGESTED RESOURCES**CASES*

THE PRINCIPLES OF ANTIRETROVIRAL THERAPY (ART)

What are the goals of therapy?

The overall objective of treatment for HIV disease, as with treatment for many other infectious diseases, is to control the putative agent with antimicrobial agents while providing other appropriate therapies for HIV-related complications. The single most important goal of HIV antiretroviral therapy is to reduce the HIV viral load to as low as possible for as long as possible. The 5 other goals of antiretroviral therapy (ART) are to

- Prevent HIV-associated complications
- Avoid the long-term and short-term adverse drug reactions associated with antiretroviral agents
- Prevent HIV transmission
- Avoid HIV resistance
- Preserve HIV treatment options

Does antiretroviral therapy work?

Treatment recommendations have evolved greatly since zidovudine (AZT), a nucleoside, was first tested in 1986. The strategy was revolutionized in 1996-97 with the introduction of protease inhibitors (PIs) and then subsequently non-nucleoside reverse transcriptase inhibitors (NNRTIs). Combined with AZT and other nucleosides (see Table 5-1), the result was potent combination ART (also referred to as highly active antiretroviral therapy, or HAART) that had an immediate and dramatic impact on the prognosis for HIV infection, in fact one of the most impressive changes in any disease since the introduction of penicillin in the 1940s. Within 2 years there was a 60%-80% decrease

in mortality, AIDS rates, and hospitalizations for HIV-associated complications. Nevertheless, this treatment was also associated with some disappointments: there is still no cure for HIV infection, many of the patients given ART develop serious side effects, and

drug resistance causes many patients to eventually have virologic failure so that long-term benefit may be difficult to sustain. Also, adherence has been shown to be critical to treatment success, and the level of adherence required is among the stiffest for the treatment of any disease in medicine.

See Glossary of Antiretroviral Drugs on page viii and the Pocket Guide

WHEN TO START THERAPY

What are the criteria for starting therapy?

The decision to start therapy, like most medical decisions, depends on the risk-to-benefit ratio of treatment. ART is given to control HIV replication and the consequent immune dysfunction, but therapy is also associated with the development of some substantial side effects and the risk of developing resistance that would limit future options. The reduction in CD4 cells is the pivotal event of HIV disease that renders the patient susceptible to the unique opportunistic infections (OIs) and tumors that have come to be known as AIDS-defining diagnoses (see Table 5-2). The patient becomes vulnerable to these diseases when the CD4 cell count decreases from normal levels (500-1500 cells/mm³) to <200 cells/mm³; the association with complications is the rationale for this CD4 cell threshold to be used by CDC to define AIDS.

Virtually all guidelines in the world have reached a consensus that a CD4 cell count of <200/mm³ is an indication for ART. The only question is the CD4 level above which treatment should be started. According to the DHHS Guidelines for the Use of Antiretroviral

Agents in HIV-Infected Adults and Adolescents (available at <http://www.aidsinfo.nih.gov>) the CD4 cell count range of 200-350/mm³ is also an indication for ART, but the decision is tempered by the viral load, the rapidity of the CD4 cell count decline (CD4 cell slope), and patient readiness. The role of viral load in this decision is based on 2 observations: 1) the viral load is an independent predictor of progression and 2) the CD4 decline slope is directly correlated with viral load. The implication is that a high viral load imparts a risk for more rapid progression to AIDS and a more rapid decline in the CD4 cell count. The threshold that appears important in the CD4 cell strata of 200-350 is $\geq 20,000$ copies of virus/mL (c/mL). Some authorities also treat patients with a viral load of 50,000-100,000 c/mL even when the CD4 cell count is $> 350/\text{mm}^3$, but there is no consensus here. It should be emphasized that multiple cohort studies involving thousands of patients clearly indicate that therapy is necessary when the CD4 cell count is $< 200/\text{mm}^3$; some of these studies also show a benefit when the CD4 cell count is 200-350/mm³, but these findings are somewhat inconsistent from study to study.

What patient factors influence this decision?

Patient readiness may be the most important factor in the decision to treat most patients. ART is never an emergency, although the CD4 cell count clearly indicates the magnitude of risk from waiting. Most experienced HIV providers will never start ART on the first patient visit, which is designed for evaluation and the initiation of patient education. The patient must understand not only the risks and benefits of HIV treatment, but also the critical role of adherence to what may be one of the most complicated medical treatment regimens for any disease (see Chapter 7: Adherence to HIV Therapies).

WHAT TO START

How do you suppress HIV replication?

The goal of treatment is to suppress HIV as much as possible for as long as possible. This requires 3-4 drugs in combinations that have been proven to have merit in clinical trials (see Table 5-1).

Do you ever start with 1 or 2 drugs?

No, with a rare exception; some providers treat pregnant women with a CD4 cell count of $> 350/\text{mm}^3$ and a viral load of $< 1,000$ c/mL with zidovudine (AZT) alone. With this exception, all patients should be treated with 3-4 drugs combined in a fashion that has established merit.

Table 5-1. Combination Antiretroviral Therapy

Standard initial regimens

- 2 nucleosides* and a protease inhibitor (PI)** or a ritonavir-boosted PI
- 2 nucleosides* and a non-nucleoside reverse transcriptase inhibitor (NNRTI)***

Classes

- * **Nucleosides:** zidovudine (AZT), didanosine (ddI), zalcitabine (ddC), stavudine (d4T), lamivudine (3TC), emtricitabine (FTC), abacavir (ABC), tenofovir (TDF) (tenofovir is actually a nucleotide rather than a nucleoside)
 - ** **Protease inhibitors (PI):** indinavir (IDV), ritonavir (RTV), nelfinavir (NFV), saquinavir (SQV; 2 formulations – Invirase and Fortovase), amprenavir (APV), fosamprenavir (FPV), lopinavir (LPV; co-formulated with ritonavir as LPV/r), and atazanavir (ATV)
 - *** **Non-nucleoside reverse transcriptase inhibitor (NNRTI):** efavirenz (EFV), nevirapine (NVP), and delavirdine (DLV)
- Fusion inhibitors** (used only for salvage): enfuvirtide (T20)

Table 5-2. When to Start Therapy

Patient status	Recommendation	Comment
Symptomatic HIV/AIDS	Treat	AIDS-defining diagnosis
Asymptomatic with CD4 cell count of $> 350/\text{mm}^3$	Defer therapy	Some authorities treat if viral load is $> 55,000$ c/mL
CD4 cell count of 200-350/mm ³	Treat or defer therapy	Influencing factors include • Patient readiness • CD4 slope (rate of decline) • Viral load ($< 20,000$ c/mL = low risk of progression) • Treatment-associated risks: heart disease, drug interactions
CD4 cell count of $< 200/\text{mm}^3$	Treat	Universally accepted CD4 threshold for initiating treatment in all guidelines

How do you decide on a specific regimen?

The selection of a regimen is based on the experience with completed trials and idiosyncrasies of the specific patients. No single regimen is appropriate for all patients, but virtually all experienced AIDS treaters have a few favorites. Most start with a 3- or 4-drug regimen that includes 1) an NNRTI combined with 2 nucleosides, 2) a PI either alone or boosted with ritonavir (RTV) plus 2 nucleosides, or 3) a 3-nucleoside regimen that includes abacavir (ABC), lamivudine (3TC), and zidovudine (combined as Trizivir). This last regimen has been popular for patients who struggle with complicated medical regimens because it is only 1 pill twice a day; however, the regimen is considered suboptimal compared with the PI- or NNRTI-based regimens.

Is once-a-day therapy possible?

This is now feasible and clearly preferred by some patients. The following drugs may be given once a day: tenofovir (TDF), lamivudine (3TC), emtricitabine (FTC), didanosine (ddI), stavudine (d4T), efavirenz (EFV), atazanavir (ATV), and amprenavir plus ritonavir (APV/r).

Table 5-3. Rationale for Changing Therapy

Problem	Definition	Intervention
Virologic failure	Failure to decrease viral load to <500 c/mL within 16-24 weeks or achieving that goal with subsequent elevation to >500 c/mL with at least 2 measurements Causes: non-adherence, resistance or pharmacologic issues (poor bioavailability, drug interaction, etc.) Consequences: viral replication with progression of immunodeficiency and accumulating resistance mutation	Change drugs, usually based on sensitivity tests
Drug toxicity	Side effects that may be 1) annoying (GI intolerance, asthenia), 2) life-threatening (pancreatitis, lactic acidosis, hypersensitivity, hepatic necrosis), 3) cosmetic (fat redistribution), or 4) pose ill-defined risks (hyperlipidemia)	Substitute a different drug

WHEN TO CHANGE THERAPY**When do you change therapy because of virologic failure?**

The goal of therapy is to reduce the viral load to undetectable levels. The expectation is a reduction by 1 log₁₀ c/mL within 1-4 weeks, a viral load of <500 c/mL at 16-24 weeks, and a viral load of <50 c/mL after 24 weeks. Viral load measurements are subsequently made at 3-month intervals and are expected to remain at <50 c/mL. Temporary increases above this level are sometimes called “blips.” Virologic failure is defined as 2 consecutive viral load counts of >500 c/mL (see Table 5-3).

What causes virologic failure?

There are 2 causes: 1) resistance, meaning that the strain of HIV is resistant to one or more of the drugs in the regimen, and 2) failure of the drug to reach the virus, which may be due to failure of adherence, drug interactions, or drug malabsorption. The most common cause is lack of adequate adherence.

What do you do when the patient has side effects or intolerance to the regimen?

Side effects of antiretroviral agents are common and highly variable in severity and implications. Nausea is particularly common and may become a huge impediment to adherence. Other side effects may be more serious in terms of specific medical consequences, including several that are potentially lethal: pancreatitis due to didanosine (ddI), hypersensitivity due to abacavir (ABC), Stevens-Johnson syndrome due to an NNRTI, nevirapine-associated hepatic necrosis, and lactic acidosis due to nucleosides, especially stavudine (d4T). If the side effect precludes adherence or is regarded as a serious consequence for adherence, the regimen must be changed. It is important to warn patients about common and serious side effects before treatment begins.

Are there other forms of treatment failure?

Immunologic failure, as opposed to virologic failure, is characterized by the failure of the CD4 count to rebound, and clinical failure is characterized by AIDS-defining events (see Table 5-4). Success in treatment is based on viral load response, and this dictates therapy decisions. No one knows what to do with immunologic or clinical failure if there is viral suppression.

Table 5-4. Definitions of Therapeutic Failure

Type	Definition
Virologic failure	Initial therapy: failure to decrease viral load by 1 log ₁₀ c/mL by 1-4 weeks, to <500 c/mL by 8-16 weeks, or to <50 c/mL by 16-24 weeks. Chronic therapy: viral load >400 c/mL with 2 measurements after achieving viral suppression.
Immunologic failure	Failure to increase CD4 to >25-50/mm ³ /year (this is an arbitrary definition; the average increase with viral suppression by the above definition is an increase of 100-150 c/mm ³ /year).
Clinical failure	HIV-related complication, usually an AIDS-defining condition after antiretroviral therapy for ≥3 months.

WHAT TO CHANGE TO

How do you address intolerance or serious side effects?

Assuming virologic control has been achieved, the goal is to find a substitute for the offending agent. In most cases, this is simply a single drug substitution using an agent in the same class with comparable potency. For example, for zidovudine (AZT) intolerance, stavudine (d4T) is commonly substituted. For indinavir-associated nephrolithiasis, the usual tactic is to reduce the dose, increase fluid intake, or substitute another PI for indinavir (IDV).

What is intensification?

Intensification is the addition of a drug, usually a single drug, to enhance antiretroviral activity in a patient who has a good but suboptimal response to therapy. This needs to be done at a time when the viral load has not increased to too high a level; for example, most authorities consider a viral load of > 5,000 c/mL to be an indication for a completely new regimen. Common ploys for intensification are the addition of tenofovir (TDF) or abacavir (ABC), or a boosting of a PI with ritonavir (RTV) if that was not done initially.

How do you deal with virologic failure?

The usual method is to measure HIV resistance. If the strain is sensitive, it is important to closely examine the adherence issue or look for drug interactions or some other reason that the antiretroviral agent does not reach the virus. If the virus is resistant, this information is used to select the next regimen as described below.

RESISTANCE TESTING

What are the tests?

There are 2 types of resistance tests: genotypic and phenotypic. Genotypic resistance measures mutations to the genes that are the target of antiretroviral drugs. These mutational changes predict resistance. Phenotypic resistance measures the activity of various drugs against the patient's virus compared with "wild type" virus (untreated HIV strains). These tests are quite different in method of performance, but there is no consensus regarding their relative merit. Many people use genotypic resistance testing most frequently because it is faster and cheaper. Under any circumstances, interpreting both tests requires substantial expertise. It should be emphasized that the testing is valid only for the drugs that are being given at the time the test is done; drugs discontinued > 2-6 weeks earlier may not be reliably tested because the resistant strains often become "minority species" when drug pressure is removed. Thus, a history of prolonged ART and virologic failure in the past often indicates resistance even if this is not revealed with the current test.

What are the indications and requirements for resistance testing?

The major indication for resistance testing is virologic failure, but testing is also sometimes done prior to initiation of therapy (see Table 5-5). The requirement for testing after virologic failure is an adequate viral load (usually > 1,000 c/mL) to do the test. For patients who have failed therapy it is standard practice to sample while the drugs of interest are being given. Resistance to drugs discontinued > 2-6 weeks before testing may not be expressed in the resistance testing, although this probably differs by individual patient and specific agent and has not been extensively studied.

Table 5-5. Resistance Testing		
Patient status	Recommendation	Comment
Primary HIV infection	Consider testing	There are no studies to show use in this setting alters outcome of therapy, but the viral population is presumed to be relatively homogeneous, giving theoretical reliability to testing.
Chronic infection – treatment-naïve	Consider testing	The concern is that resistant HIV may be archived making the test less reliable. Testing at this stage is best for predicting which agent will not work.
Chronic infection – treatment failure on therapy		
• First failure	Recommended if testing requirements are met	Need viral load of >1000 c/mL to do the test. Patient may need to be receiving the antiretrovirals that failed at the time of the test for resistance to be expressed.
• Multiple failures	Recommended if testing requirements are met	Resistant strains from prior therapy may not be expressed in the majority of strains tested; it is important to select next a regimen based on the current resistance test results, prior resistance tests, and treatment history.

How should you treat someone who has run out of options?

Extensive use of ART over several years combined with virologic failure and resistance leads to limited options for many patients. However, it appears that antiretroviral drugs are still beneficial in these patients because of reduced “fitness” of the virus. The implication is that the antiretroviral drugs force development and persistence of resistant mutations, and these mutated strains have reduced replicative capacity in vitro and presumably in vivo as well. Several studies show that discontinuation of ART is often followed after 4-8 weeks by a significant

increase in viral load and a very rapid decline in the CD4 cell count. Thus, the goal of therapy for heavily treated patients who have few therapeutic options is often to continue these drugs despite virologic failure with the hope of maintaining the CD4 cell count and preventing HIV-related complications. Virologic control would be nice, but may be impossible or unrealistic.

What is therapeutic drug monitoring (TDM)?

TDM is the measurement of serum concentrations of antiretroviral drugs to determine if there are adequate levels to assure antiviral activity or to account for toxicity. Relatively few laboratories offer the test, and interpretation is confounded by limited experience and great variability among laboratories testing the same samples. Nucleosides are not tested because this would require measuring intracellular concentrations. It is usually PIs, which may have marginal levels, and to a lesser extent NNRTIs that are tested. Although TDM is not common in clinical practice at present, many experts feel it may become a standard component of treatment in the future with better standardization and more information about how to use the tests. The anticipated use is in situations in which levels are difficult to predict, as in renal failure, hepatic failure, pregnancy, concurrent use of drugs with possible drug interactions, use of once-a-day PIs with concerns about trough levels, and the monitoring of adherence.

When is structured treatment interruption (STI) indicated?

Although there are 4 reasons to suspend treatment temporarily, pulse therapy appears to be the most promising.

- **Immunization** One rationale for STI, when used with patients who have prolonged virologic control, is to stop therapy to let the virus come back and “immunize” the patient in a fashion analogous to a vaccine. The theory seemed good, but has not proven successful, and most have abandoned this tactic except with the rare patient who was treated very early in the course of the disease.
- **Treatment failure** A rationale for discontinuing treatment when it has failed due to drug resistance is to allow growth of “wild type virus” that is sensitive to antiretroviral agents. The theory, that STI would permit a new round of therapy against sensitive virus, has not proven successful for possibly predictable reasons. In many or most patients, the resistant strains are minority species that quickly become the dominant strains under renewed antiviral pressure.

- **Intermittent therapy** The plan with intermittent therapy is to periodically discontinue treatment on a prearranged schedule, such as 1 week on and 1 week off or 5 days of treatment followed by a weekend off. The theory is that when therapy is discontinued there is usually sustained viral suppression for 10-14 days and treatment is restarted while the virus is still suppressed. This strategy could potentially reduce treatment-associated side effects and cost. Although the initial experience has been limited but promising, the strategy cannot be recommended until more substantial experience is gained.
- **Pulse therapy** With this strategy, therapy is discontinued when the CD4 cell count increases to a level that makes the patient and physician comfortable doing so and is restarted when the CD4 count declines to a worrisome level. Initial experience has generally been that the viral load returns within 2 weeks and the CD4 cell count declines rapidly and then plateaus. Most experts restart therapy when the CD4 cell count reaches $350/\text{mm}^3$, but this strategy has not been systematically studied. Nevertheless, it does appear that there is no penalty in terms of resistance and the period off therapy is often 1-2 years, depending to a large extent on the CD4 cell count at the time treatment is discontinued and on the pre-therapy CD4 nadir. The patient must be warned that viral loads will return to pre-therapy levels, with important implications for risk of HIV transmission to others.

KEY POINTS

The major indicator for the speed of progression in early stage disease is the viral load, which dictates the speed of CD4 cell decline. The major indicator for the risk of HIV-associated complications is the CD4 cell count.

ART is directed toward preventing HIV-associated complications and hospitalizations and improving quality of life and survival.

ART does not cure HIV infection, is expensive, is associated with substantial risks of short-term and long-term toxicity, and requires a level of adherence that is unmatched with any other antimicrobial therapy.

ART is recommended when there are HIV-associated symptoms or when the CD4 count is $< 200\text{-}350/\text{mm}^3$.

The standard of practice for ART is 3 or 4 drugs representing 2 classes.

The major objective of ART is to inhibit HIV as reflected by viral load. Successful antiviral therapy is defined as a viral load of $< 50\text{ c/mL}$ by 16-24 weeks, usually accompanied by an increase in the CD4 cell count of $100\text{-}150/\text{mm}^3/\text{year}$.

Failed therapy is defined as virologic (viral load $> 400\text{ c/mL}$ twice after 24 weeks), immunologic (CD4 count fails to increase by $> 25\text{-}50/\text{mm}^3$ at 6-12 months), or clinical (new AIDS-defining OI after > 3 months of therapy).

Treatment is changed for drug intolerance (substitution) or virologic failure (selection by resistance tests).

The 3 factors that consistently predict outcome are CD4 cell count, patient adherence, and provider experience.

CASES

1.

A 36-year-old woman is asymptomatic and has a CD4 cell count of $210/\text{mm}^3$ and a baseline viral load of $>750,000$ copies/mL. Other laboratory studies are unremarkable. She seeks your advice regarding management.

Question: What can you recommend?

- a. zidovudine (AZT) plus stavudine (d4T) plus efavirenz (EFV)
- b. lamivudine (3TC) plus zidovudine plus nelfinavir (NFV)
- c. Trizivir (AZT + 3TC + ABC) plus lopinavir/ritonavir (LPV/r)
- d. Trizivir
- e. lamivudine plus stavudine plus indinavir (IDV)

Answer:

Virtually all of these are feasible except option a, which combines zidovudine and stavudine, a combination that shows pharmacologic antagonism. The worrisome part of her presentation is that the CD4 cell count is quite low and approaching the threshold of vulnerability to opportunistic infections, and the viral load is very high, which poses substantial challenge to virologic control. The best drugs for baseline high viral load according to currently available data are 2 nucleosides combined with efavirenz or lopinavir/ritonavir. Thus, option c would be the best choice.

2.

A 42-year-old truck driver has HIV infection that was treated in 1999 with efavirenz (EFV), stavudine (d4T), and lamivudine (3TC). He subsequently did well and maintained a viral load of <50 c/mL, and the CD4 cell count increased from 250 to $450/\text{mm}^3$. He feels well, is fully adherent with his regimen by history, and has no complaints except that he is bothered by facial thinning (buccal cheek atrophy).

Question: Which of the following would you recommend?

- a. Discontinue treatment
- b. Change stavudine to abacavir (ABC)
- c. Switch efavirenz to indinavir (IDV) plus ritonavir (RTV)
- d. Switch stavudine to zidovudine
- e. Give zidovudine, lamivudine, and abacavir

Answer:

Discontinuing therapy is an option, although guidelines on when and how to do this are sparse because it has not been extensively studied. Anecdotal information suggests that this patient will have a sustained period with a CD4 cell count above the threshold for initiating treatment by current guidelines of $200\text{--}350/\text{mm}^3$. The best predictor of a prolonged drug-free interval is the baseline CD4 cell count, which in his case is low, but not severely low. The main problem is that the CD4 cell count at $450/\text{mm}^3$ is high, but possibly not high enough. The most likely cause of his change in face appearance is stavudine, but methods to reverse the change are not necessarily clear. If we stop stavudine, face thinning will not progress and some studies suggest there may be reversal after a prolonged period. Since this is important to the patient and this kind of change is relatively easy to make, we should probably do it, so the best answers are to use a potent regimen without stavudine treatment (options a, b, and d).

3.

A 36-year-old woman sees you for evaluation of HIV infection, which she has had since 1985. There have been multiple courses of treatment, including nucleosides in the period 1987 to 1996 and since then nucleosides combined with NNRTIs and PIs. The longest course of treatment was with zidovudine (AZT), lamivudine (3TC), and efavirenz (EFV), which produced a temporary period of virologic control but then failed. Currently she is receiving amprenavir (APV), lopinavir/ritonavir (LPV/r), and tenofovir (TDF). You perform a resistance test, which shows mutations on the reverse transcriptase gene at codons 41, 210, and 215 and mutations on the protease gene at 30 and 82. The conclusion is that HIV is resistant to some NRTIs and PIs. Her current numbers show a CD4 cell count of 87/mm³ and a viral load of 210,000 c/mL.

Question: What would you recommend?

- a. zidovudine plus lamivudine plus tenofovir plus efavirenz
- b. lopinavir/ritonavir plus efavirenz plus tenofovir
- c. AZT/3TC/ABC (Trizivir) plus lopinavir/ritonavir
- d. AZT/3TC/ABC plus tenofovir plus indinavir (IDV) plus ritonavir (RTV)
- e. enfurvirtide (T-20) plus atazanavir plus lamivudine plus tenofovir

Answer:

The tricky part of this question is the need to assume resistance to efavirenz and lamivudine despite the failure to demonstrate the associated mutations: 103 and 184 on the RT gene. This reflects the fact that these drugs were not being given at the time the test was done, but history suggests that resistance to these drugs occurred at the time of failure. The point is that interpretation of resistance tests must take into account both the current pattern and the history of drug exposure in terms of specific agent, duration, and virologic outcome. This patient is running low on options and low on CD4 cells. She does have some PI options, but the most predictable response would probably be a regimen with the fusion inhibitor enfurvirtide (option e).

4.

A 50-year-old secretary has just learned that he has HIV infection with a CD4 cell count of 49/mm³ and viral load of 280,000 c/mm³. He is quite shaken by this information, claims that he has never been able to take pills for anything and wants treatment, but wants it to be as simple as possible.

Question: What would you recommend?

- a. Delay therapy until the patient is ready
- b. AZT/3TC/ABC (Trizivir) plus efavirenz (EFV)
- c. tenofovir (TDF), lamivudine (3TC), plus efavirenz
- d. zidovudine (AZT), lamivudine, amprenavir (APV), and ritonavir (RTV)
- e. AZT/3TC/ABC (Trizivir)
- f. zidovudine plus efavirenz plus indinavir (IDV)

Answer:

This patient needs to be treated rapidly because he is highly vulnerable to major opportunistic infections. We emphasize the need for patient readiness, but this patient does not have much time to get ready. Training will take substantial effort as described in Chapter 7: Adherence to HIV Therapies. We would like potency plus convenience to facilitate adherence. The combination of lamivudine plus tenofovir plus efavirenz (option c) means 4 pills once a day, which could be taken, for example, when he shaves.

5.

A doctor telephones you about a patient who has read about structured treatment interruption for patients who have failed therapy. You are told this patient has extensive experience with antiretroviral treatment for over 10 years, a CD4 cell count of 80-100/mm³, and a viral load that is back to baseline at 420,000 c/mL.

Question: What would you recommend to the physician?

- a. Test resistance while receiving antiretroviral drugs and select the drugs based on the ART history and resistance tests
- b. Discontinue treatment, test the HIV strain at 12 weeks, and treat accordingly
- c. Continue therapy with same drugs
- d. Treat with lopinavir/ritonavir (LPV/r), Trizivir (AZT/3TC/ABC), tenofovir (TDF), and either efavirenz (EFV) or nevirapine (NVP)

Answer:

The experience with STI for virologic failure is that wild-type virus that is less resistant replaces the predominant strain after about 6-11 weeks, but the CD4 cell count drops rapidly during the period off treatment; after new treatment, the more completely resistant pre-STI strain returns. The largest experience indicates only about 10%-15% of these attempts have been judged successful. Therefore, STI for virologic failure has fallen into disfavor. Nevertheless, if you wanted to play long odds, the right time to do the testing is after there has been a sufficient interval for ingrowth of a new, more sensitive strain of HIV making option b the correct option. However, most would prefer option a with expert interpretation of the test results.

6.

Question: Which of the following patients is the best candidate for genotype resistance testing?

- a. A previously untreated pregnant woman with HIV
- b. A chronically infected, previously untreated man with a partner who is currently taking triple therapy with poor control
- c. A woman who has failed her initial treatment with a viral load of 7,000 c/mL after 1 year on indinavir (IDV), ritonavir (RTV), lamivudine (3TC), and stavudine (d4T)
- d. A 40-year-old man with good virologic control, but a need to change therapy because of AZT-induced anemia

Answer:

Recommendations for the use of resistance testing are somewhat arbitrary, but the highest priority according to virtually all guidelines is for patients who have failed treatment for the purpose of identifying the next regimen; therefore, option c is the best answer.

Chapter 6:

Metabolic Complications of Antiretroviral Therapy

*David H. Spach, MD**OVERVIEW**LIPID ABNORMALITIES**LIPODYSTROPHY**LACTIC ACIDOSIS**OTHER METABOLIC COMPLICATIONS**KEY POINTS**SUGGESTED RESOURCES**REFERENCES**CASES*

OVERVIEW

What is meant by metabolic complications of antiretroviral therapy (ART)?

Metabolic complications refers to a group of adverse drug reactions that have been associated with long-term use of antiretroviral drugs, which include:

- Lipid abnormalities
- Lipodystrophy
- Lactic acidosis
- Hyperglycemia
- Decreased bone mineral density

See Glossary of Antiretroviral Drugs on page viii and the Pocket Guide

Each adverse reaction is more commonly associated with a specific class of antiretroviral drugs, and the agents within the class that cause the reactions do so with variable frequencies. In most cases, the pathophysiologic mechanism of the changes is unknown. The classes of drugs associated with each major adverse reaction are listed in Table 6-1.

What metabolic toxicities should you monitor for in patients taking ART?

Recommendations for monitoring patients for ART-related metabolic complications, listed in Table 6-2, are discussed in detail in the sections below.

Table 6-1. Adverse Reactions of Classes of Antiretroviral Drugs

Adverse Reaction	Cause		
	NRTIs*	NNRTIs**	PI***
Lactic acidosis	++	-	-
Lipid changes			
Elevated triglycerides	-	(+)	++
Elevated LDL cholesterol	-	+	++
Insulin resistance	-	-	++
Fat redistribution			
Fat atrophy	+	-	-
Fat accumulation	-	-	++
* NRTIs = Nucleoside and nucleotide reverse transcriptase inhibitors ** NNRTIs = Non-nucleoside reverse transcriptase inhibitors *** PIs = Protease inhibitors (+) = possibly causes adverse reaction + = sometimes causes adverse reaction ++ = frequently causes adverse reaction			

LIPID ABNORMALITIES

What antiretroviral medications adversely affect lipid levels?

Available data suggest that drugs in the protease inhibitor (PI) class have the greatest adverse effect on triglycerides, total cholesterol, and low-density lipoprotein (LDL) cholesterol levels. The mechanism remains unclear. Among the PIs, ritonavir (RTV) and ritonavir-boosted regimens appear to have the greatest impact on triglycerides and total cholesterol levels. Because some patients who receive ritonavir had no significant changes whereas others have dramatic increases, genetic predisposition may play a major role. The PI atazanavir (ATV) does not significantly affect lipid levels. The impact of nucleoside reverse transcriptase inhibitors (NRTIs) and non-nucleoside reverse transcriptase inhibitors (NNRTIs) on lipid levels has not been well defined, but the impact appears much less than changes associated with PIs. In 96-week data from a trial that compared stavudine (d4T) plus lamivudine (3TC) plus efavirenz (EFV) with tenofovir (TDF) plus

lamivudine plus efavirenz, those patients in the stavudine arm had significantly higher cholesterol and triglyceride levels. The NNRTI nevirapine (NVP) has no adverse affect on lipids, and the changes with efavirenz are variable. Patients receiving PIs should undergo regular monitoring of lipid levels (see Table 6-2).

Do antiretroviral drugs cause an increase in cardiovascular disease?

Several isolated case reports initially suggested ART could lead to cardiovascular disease, including death from myocardial infarction, in HIV-infected patients. More recent aggregate data from over 20,000 patients in cohort studies indicate the risk related to ART is low and substantially lower than the risk of smoking (Friss-Moller, et al, 2003). In addition, in a large study that involved more than 36,000 veterans, investigators found the benefit of these drugs far outweighed the risks. Because cardiovascular disease may take 10-15 years to manifest, investigators will need long-term followup of individuals who have received ART to determine the long-term impact.

Table 6-2. Recommendations for Assessment and Monitoring of Metabolic Complications of Antiretroviral Therapy for HIV Infection

Glucose and lipid abnormalities	- The following assessments are recommended before initiation of potent ART, at the time of a switch of therapy, 3 to 6 months after starting or switching therapy, and at least annually during stable therapy: - Fasting glucose (if therapy includes a PI) - Fasting lipid panel (total cholesterol, HDL, and LDL cholesterol [calculated or direct], and triglyceride levels) - A blood glucose level after oral administration of 75 g of glucose may be used to identify impaired glucose tolerance in patients with risk factors for type 2 diabetes mellitus or those with severe body fat changes.
Body fat distribution abnormalities	No specific technique can be recommended at the present time for routine assessment and monitoring of body fat distribution changes.
Lactic acidemia	- Routine measurement of lactic acid levels is not recommended. - Lactic acid levels should be monitored in those receiving NRTIs who have clinical signs or symptoms of lactic acidemia, and in pregnant women receiving NRTIs. - If alternative NRTIs are resumed in those who have interrupted antiretroviral therapy for lactic acidemia, lactate levels should be monitored every 4 weeks for at least 3 months.
Osteopenia, osteoporosis, and osteonecrosis	- Routine screening for osteoporosis or osteonecrosis is not recommended. - Radiographic examination of involved bone is recommended for those with symptoms of bone or joint pain; the contralateral joint should also be assessed.
DEXA = dual-energy x-ray absorptiometry HDL = high-density lipoprotein LDL = low-density lipoprotein NCEP = National Cholesterol Education Program NNRTI = non-nucleoside reverse transcriptase inhibitor NRTI = nucleoside reverse transcriptase inhibitor Source: Schambelan M, Benson CA, Andrew Carr A, et al. Management of metabolic complications associated with antiretroviral therapy for HIV-1 infection: Recommendations of an International AIDS Society-USA Panel. <i>J Acquir Immune defec Syndr</i>. 2002;31:269. Reprinted with permission of Lippincott Williams and Wilkins. http://www.com.	

Should you treat abnormal lipid levels in HIV-infected persons?

Although prospective studies have not clearly defined the long-term adverse cardiovascular effects associated with hyperlipidemia in HIV-infected persons, abnormal lipid levels appear to pose the same long-term risks as have been well established in persons who do not have HIV infection and thus need to be managed appropriately (see Table 6-3). Accordingly, clinicians should address abnormal lipid levels and the individual patient risks, including prior cardiovascular events, smoking, hypertension, diabetes, family history, obesity, and baseline lipid levels. The potential interventions include 1) switching to a regimen less likely to cause abnormal lipids (if possible without sacrificing antiviral effectiveness), 2) implementing dietary changes, 3) using a lipid-lowering agent according to

recommendations in Table 6-4, and 4) addressing other lifestyle habits that affect cardiovascular risk, such as smoking and exercise.

What statins are recommended for treating patients on PIs?

Significant drug interactions may occur with PIs and lipid-lowering statins; for patients on PI-based ART, most experts consider pravastatin and atorvastatin as preferred statins and avoid using lovastatin or simvastatin. Initial therapy should consist of a low dose of either pravastatin (20 mg po qd) or atorvastatin (10 mg po qd), with monitoring of response to therapy and, if required, gradual and cautious increases in doses of the statin. Triglyceride levels in excess of 1000 mg/dL place the patient at risk for developing pancreatitis. Most experts recommend intervening

Table 6-3. Recommendations for Treatment of Metabolic Complications of Antiretroviral Therapy for HIV Infection

Glucose intolerance and diabetes mellitus	• Weight loss for overweight subjects is recommended. • Follow established guidelines for treating diabetes in the general population, with preference given to insulin sensitizing agents such as metformin (except for those with renal disease or history of lactic acidemia) or thiazolidinediones (except for those with preexisting liver disease). • Avoid use of a PI as initial therapy in patients with preexisting glucose intolerance or diabetes mellitus.
Lipid and lipoprotein abnormalities	• Follow NCEP III guidelines for assessment of risk factors for cardiovascular disease, and dietary and lifestyle alterations for lowering cholesterol and triglyceride levels. • Avoid use of PIs, if possible, in those with preexisting cardiovascular risk factors, family history of hyperlipidemia, or elevated lipid levels. • Follow NCEP guideline thresholds for lipid-lowering therapy. • Fibrates are recommended as initial therapy for those with isolated fasting hypertriglyceridemia. • Pravastatin or atorvastatin are preferred statin agents for those with isolated fasting hypercholesterolemia requiring treatment in the setting of PI or other CYP 3A4 inhibitor therapy. • If combination therapy for hypercholesterolemia and hypertriglyceridemia is indicated, therapy should begin with a statin, followed by the addition of a fibrate if there is insufficient response after 3 to 4 months of treatment.
Body fat distribution abnormalities	• No therapies for fat distribution abnormalities in the absence of other metabolic complications can be routinely recommended.
Lactic acidemia	• ART should be withheld for all patients with confirmed lactate levels >10 mmol/L (90 mg/dL) or those with confirmed lactate levels >5 mmol/L (45 mg/dL) who are symptomatic. • No intervention apart from NRTI cessation is recommended. • Restart combination NNRTI and PI therapy after lactate levels return to normal and symptoms resolve.
Osteopenia, osteoporosis, and osteonecrosis	• Surgical resection of involved bone is the only effective therapy for symptomatic osteonecrosis. • If osteoporosis is demonstrated by radiography or regional DEXA scanning, or if a pathological fracture occurs in the setting of osteoporosis, therapy with a bisphosphonate should be considered.

DEXA = dual-energy x-ray absorptiometry
HDL = high-density lipoprotein
LDL = low-density lipoprotein
NCEP = National Cholesterol Education Program
NNRTI = non-nucleoside reverse transcriptase inhibitor
NRTI = nucleoside reverse transcriptase inhibitor

Table 6-4. Summary of National Cholesterol Education Program Treatment Recommendations Based on LDL Cholesterol*

Risk Category	Initiate therapeutic lifestyle changes†	Consider drug therapy	LDL** cholesterol goal	Non-HDL** cholesterol goal
With CHD or CHD** risk equivalent (10-year risk >20%, noncoronary atherosclerotic vascular disease, or type 2 diabetes mellitus)	≥100 mg/dL (≥2.6 mmol/L)	≥130 mg/dL (≥3.4 mmol/L) 100–129 mg/dL (2.6–3.3 mmol/L): therapy optional	<100 mg/dL (<2.6 mmol/L)	<130 mg/dL (<3.4 mmol/L)
2 or more risk factors (10-year risk <20%)‡	≥130 mg/dL (≥3.4 mmol/L)	10-year risk of 10%–20%: ≥130 mg/dL (≥3.4 mmol/L) 10-year risk of <10%: ≥160 mg/dL (≥4.1 mmol/L)	<130 mg/dL (<3.4 mmol/L)	<160 mg/dL (<4.1 mmol/L)
0 or 1 risk factor‡	≥160 mg/dL (≥4.1 mmol/L)	≥190 mg/dL (≥4.9 mmol/L) 160–189 mg/dL (4.1–4.9 mmol/L): therapy optional	<160 mg/dL (<4.1 mmol/L)	<190 mg/dL (<4.9 mmol/L)

* For patients with high triglyceride levels in whom LDL cholesterol cannot be measured, non-HDL cholesterol level (total cholesterol – HDL cholesterol) may be used as an approximation if 30 mg/dL (0.8 mmol/L) is added to the LDL cholesterol threshold. For those with triglyceride levels >200 mg/dL (2.3 mmol/L), the non-HDL cholesterol level is considered a secondary target of therapy and the goals of therapy are as indicated under the heading of non-HDL cholesterol goal.

‡ Risk factors include cigarette smoking; hypertension (blood pressure ≥140/90 mm Hg or taking antihypertension drugs); HDL cholesterol level below 40 mg/dL (1.0 mmol/L); family history of premature CHD (in first-degree male relatives <55 years and first-degree female relatives <65 years); age (>45 years for men and >55 years for women). Risk factor equivalent: diabetes. If HDL cholesterol is over 60 mg/dL (1.6 mmol/L), subtract 1 risk factor from the total.

† Therapeutic lifestyle changes refer to reducing saturated fat and cholesterol intake; enhancing the reduction in LDL cholesterol level by the use of plant stanols/sterols and increased soluble fiber; weight reduction; and increased physical activity.

** CHD, coronary heart disease; HDL, high-density lipoprotein; LDL, low-density lipoprotein; VLDL, very low-density lipoprotein.

when triglyceride levels exceed 500 mg/dL. Although dietary changes can improve triglyceride levels, most patients with PI-associated hypertriglyceridemia will require pharmacologic intervention. Patients with isolated hypertriglyceridemia should receive a fibric acid derivative, either gemfibrozil (600 mg po bid) or fenofibrate (200 mg po qd). For those who have high triglyceride and LDL cholesterol levels, a statin drug should be used first with the plan of adding a fibric acid derivative after 4 months if the response to the statin is suboptimal. Because both the statin drugs and the fibric acid derivatives can cause rhabdomyolysis, caution should be used if these medications are given concurrently. In patients with severe hypertriglyceridemia refractory to a fibric acid derivative, some experts would recommend a trial of adding fish oil supplements to the lipid-lowering regimen.

Does switching ART improve lipid abnormalities?

Although some antiretroviral medications clearly have a greater adverse impact than others on lipids, modifying the regimen in an attempt to improve the lipid profile is sometimes difficult, mainly because of the need to maintain antiretroviral efficacy. Examples of possible changes likely to improve lipid abnormalities include switching a PI to either nevirapine (NVP) or using the alternative PI atazanavir (ATV). Changing from a PI to efavirenz (EFV) has not produced consistent results. Preliminary data from one study has shown that patients who switched from stavudine (d4T) to tenofovir (TDF) had a significant improvement in cholesterol and triglyceride levels. Future work will better determine whether changes from one nucleoside to another will affect lipid levels.

LIPODYSTROPHY

What is lipodystrophy?

Although lipodystrophy was first reported in the mid-1990's, investigators have not agreed on a standardized, objective definition for this disorder. Most researchers and clinicians loosely define lipodystrophy as any significant change in body morphology that does not result from either weight gain or weight loss. The general term lipodystrophy now typically includes 3 subsets of morphologic changes: generalized fat accumulation, focal fat accumulation, and fat atrophy. Fat accumulation most often occurs in the abdominal, breast, or dorsocervical region. Fat atrophy most often occurs as buccal fat pad atrophy (facial wasting) or subcutaneous fat wasting in the buttocks or extremities. Because a standardized definition for lipodystrophy is lacking, the incidence varies depending on the exact criteria investigators use to define lipodystrophy in their specific study. Tests for abnormalities in body fat distribution have included computed tomography (CT) scanning, magnetic resonance imaging (MRI), bioelectrical impedance analysis (BIA), DEXA (dual energy x-ray absorptiometry) scans, and anthropometric measurements. The CT and MRI tests are generally considered the most accurate, but not practical for routine screening purposes, primarily because of their high cost. Anthropometric measurements can estimate visceral adipose tissue and subcutaneous adipose tissue and can easily be performed in the clinic without major costs. Despite the many options available for measuring abnormalities in fat distribution, no technique has shown adequate sensitivity and specificity to recommend performing routinely.

What causes lipodystrophy in HIV-infected persons?

Despite intense investigation, the exact pathogenesis of lipodystrophy remains unclear. Initial reports linked PI use with lipodystrophy, but subsequent reports have identified lipodystrophy in patients who had never received a PI. Several studies have shown that the most important risk factors for development of lipodystrophy are a history of severe immune suppression (nadir CD4 count < 100 cells/mm³), older age, prolonged use of antiretroviral drugs, and highly active antiretroviral therapy. Investigators have found that patients with lipodystrophy often have high insulin levels and evidence of insulin resistance, a finding that suggests insulin resistance is associated with lipodystrophy, but does not prove that insulin resistance causes lipodystrophy. Many clinicians have observed that fat accumulation is more often associated with PI-based therapy, whereas fat wasting has been most closely linked to NRTIs, particularly stavudine (d4T). In 96-week data

from a trial that compared stavudine plus lamivudine (3TC) plus efavirenz (EFV) with tenofovir (TDF) plus lamivudine plus efavirenz, those patients in the stavudine arm had substantially higher rates of lipodystrophy.

Can fat redistribution be reversed?

First, it is important to evaluate the severity of the lipodystrophy, the degree to which the patient is bothered by the body changes, and how strongly the patient wants to try to reverse the lipodystrophy. Although fat redistribution does not appear to directly alter health outcome, many patients experience notable unfavorable changes in their physical appearance that may affect their quality of life. Moreover, these changes in body appearance may broadcast their HIV diagnosis. That lipodystrophy changes thus may even lead some to stop their antiretroviral medications. If lipodystrophy develops, there are 3 treatment options: 1) Switch therapy, meaning a substitution for the implicated drug. This usually involves a substitute for stavudine (d4T) if lipoatrophy has developed or a change to a non-PI-based regimen if fat accumulation has occurred. Initial results with switches showed limited success, and when there was a response it took a long time. More promising results were seen in a recent study in which replacing stavudine (d4T) with abacavir (ABC) or zidovudine (AZT) resulted in significant improvement after 48 weeks in patients with stavudine-induced lipoatrophy (McComsey, et al, 2004). 2) Drug therapy is another option. Metformin, thiazolidinediones, testosterone, other anabolic steroids, and growth hormone have been used with partial success with fat accumulation, but all have drawbacks and do not address the underlying lipoatrophy. 3) The third option is plastic surgery, which may be particularly useful for buccal fat atrophy or dorsothoracic fat accumulations; however, results have been highly variable, and these procedures are usually regarded as cosmetic surgery and not covered by insurance companies.

LACTIC ACIDOSIS

What are ART-related hyperlactatemia and lactic acidosis?

ART-related abnormalities of serum lactate levels (hyperlactatemia) range from asymptomatic hyperlactatemia to symptomatic hyperlactatemia with mild acidosis, to fulminant lactic acidosis, liver failure, and death. In addition, some patients develop hepatic steatosis. The development of fulminant lactic acidosis, although very rare, has clearly emerged as one of the most dreaded adverse effects associated with ART.

What antiretroviral drugs cause hyperlactatemia?

Hyperlactatemia and lactic acidosis result from abnormal mitochondrial toxicity caused by NRTIs that inhibit the critical enzyme mitochondrial DNA polymerase gamma. There is no evidence that NNRTIs or PIs cause mitochondrial toxicity or abnormalities in serum lactate levels. In vitro data and retrospective clinical data show that stavudine (d4T) and didanosine (ddI) are the most likely medications in the NRTI class to cause this complication, especially if used together. Zidovudine poses some risk but significantly less than either stavudine or didanosine. Tenofovir (TDF), abacavir (ABC), emtricitabine (FTC), and lamivudine (3TC) appear to pose the least risk of causing lactic acidosis. Identified risk factors, in addition to the use of NRTIs, include pregnancy, female gender, obesity, or concurrent treatment with ribavirin, hydroxyurea, or metformin.

How do you collect and interpret a serum lactate test?

The normal serum lactate level is < 2 mmol/dL. Proper blood collection and appropriate transport are essential for obtaining an accurate result. The patient should not exercise for 24 hours prior to the test and should be well hydrated, and should rest for at least 5 minutes prior to the blood draw. The blood should be drawn without tourniquet and the patient should be instructed not to clench his or her fist. The sample should be submitted promptly for processing using a pre-chilled fluoride-oxalate tube transported on ice. The specimen should be processed within 4 hours after being drawn.

For interpretation, levels of 2-5 mmol/dL are often associated with no symptoms, levels of 5-10 mmol/dL are usually associated with symptoms that require discontinuation of NRTIs, and levels of > 10 mmol/dL are associated with a fatality of $> 30\%$ and require immediate intervention. Abnormal levels should usually be confirmed.

How do you diagnose lactic acidosis?

Routine monitoring of serum lactate levels in asymptomatic patients is not recommended (see Table 6-2), but obtaining a serum lactate level is critical if hyperlactatemia is suspected (see previous question for correct technique). Patients with mild increases in serum lactate levels generally do not have significant symptoms, and if symptoms are present, they are most likely nonspecific. With more severe increases in serum lactate levels, patients may have marked fatigue,

nausea, anorexia, vomiting, abdominal pain, dyspnea, and hyperventilation. Although a chemistry panel may show a decreased serum bicarbonate level or increased anion gap level, some reports have documented patients with severe lactic acidosis who do not have abnormal serum bicarbonate or increased anion gap measurements. CT scan of the liver may show enlargement and fatty infiltration.

How do you manage severe hyperlactatemia or lactic acidosis?

Patients with severe hyperlactatemia or lactic acidosis should immediately discontinue ART (see Table 6-3). Seriously ill patients may require IV bicarbonate, mechanical ventilation, or dialysis. Most respond to drug withdrawal. Case reports have suggested improvement in lactic acidosis with use of compounds such as riboflavin, thiamine, L-carnitine, or co-enzyme Q, with the benefit hypothetically resulting from improvement in mitochondrial function; however, the use of these agents to prevent hyperlactatemia and lactic acidosis has not been studied. Unfortunately, even after discontinuing ART, recovery from lactic acidosis typically takes about 8 weeks, since regeneration of severely damaged mitochondria is a prolonged process.

Once a lactic acidosis episode is resolved, can a patient resume ART?

For those patients who recover from an episode of lactic acidosis, the optimal management of their subsequent ART remains unclear. For those patients who clearly need ART, the safest option would be to use a regimen that does not contain an NRTI, such as lopinavir plus ritonavir plus efavirenz (LPV/r + EFV), saquinavir plus ritonavir (SQV + RTV), or indinavir plus ritonavir plus efavirenz (IDV + RTV + EFV). Available data suggest tenofovir (TDF), lamivudine (3TC), emtricitabine (FTC), and abacavir (ABC) are the NRTIs least likely to cause severe hyperlactatemia or lactic acidosis. In a report of 17 patients who developed symptomatic hyperlactatemia while receiving stavudine (d4T), the patients were rechallenged with abacavir or zidovudine; none of the 17 had a recurrence of symptomatic hyperlactatemia. Nevertheless, providers should obtain expert consultation and also observe the patient closely when restarting a new regimen that includes one or more NRTIs in any patient with a history of lactic acidosis.

OTHER METABOLIC COMPLICATIONS

Does ART cause hyperglycemia and diabetes?

Although several studies have shown that PIs can have a direct effect on glucose metabolism, predominantly by increasing insulin resistance, it remains unclear whether ART significantly increases the risk for developing diabetes mellitus. Available data would suggest that ART, particularly with PIs, likely causes a slightly increased risk of developing overt diabetes mellitus. Routine monitoring for hyperglycemia is recommended for any patient on a PI-based regimen (see Table 6-3). Studies of patients with hyperglycemia and insulin resistance have consistently shown that switching from a PI to either nevirapine (NVP), efavirenz (EFV), or abacavir (ABC) will significantly improve the hyperglycemia and insulin resistance. Nevertheless, further study is needed to better clarify the risk of a patient's developing diabetes mellitus while taking a PI and the long-term clinical benefit of switching from a PI to a regimen that causes less insulin resistance.

Does ART cause abnormalities in bone density?

Several retrospective reports have suggested that ART may cause decreases in bone mineral density and, rarely, avascular necrosis. Recently, the relationship between ART and decreases in bone mineral density has become very controversial and prospective studies are needed to resolve the issue. From a clinical perspective, avascular necrosis should be suspected when a patient complains of focal bone pain; either CT or MRI can confirm the diagnosis. Avascular necrosis most often involves the femoral or humeral head, can consist of necrosis at a single or multiple sites, does not respond to medical therapy, and typically requires surgical intervention (see Table 6-3). There are no data regarding modifying an ART regimen either to prevent avascular necrosis or to improve the condition once it has already developed.

KEY POINTS

Metabolic complications include the long-term consequences of antiretroviral agents: lactic acidosis (due to NRTIs [nucleosides]), dyslipidemia (usually due to PIs), insulin resistance (usually due to PIs), fat redistribution (usually due to NRTIs and PIs).

All PIs except atazanavir (ATV) are associated with variable increases in the LDL cholesterol and/or triglycerides.

Cardiovascular risks of dyslipidemia associated with PI therapy are assumed to be the same as for persons without HIV infection; they are usually managed with lifestyle changes (smoking cessation, diet modifications, and exercise) and, if necessary, lipid-lowering drugs; if statins are used, pravastatin or atorvastatin are preferred to avoid drug interactions with the PIs.

Patients receiving PIs should have blood lipids and glucose monitored at baseline, at 3-6 months and then at least annually, and more frequently depending on other risks and severity of abnormalities.

ART is associated with fat redistribution, both fat accumulation (abdomen, breasts, dorsocervical) and fat wasting (buccal fat with face thinning, buttocks, and extremities). These changes can result in major unfavorable changes in physical appearance and can have a significant impact on quality of life.

There are no effective treatments for reversing fat redistribution. Discontinuing or switching therapy has moderate effect at best and improvement requires a very long time; with face thinning the best results are with discontinuing stavudine (d4T) early.

Lactic acidosis is a result of mitochondrial toxicity caused by prolonged use of NRTIs, primarily stavudine (d4T), didanosine (ddI) and to a lesser degree zidovudine (AZT).

The usual symptoms of lactic acidosis are fatigue, abdominal pain, nausea, and weight loss; the usual laboratory finding is a serum lactate exceeding 5 mmol/dL. The main treatment is to discontinue the implicated drugs or switch to NRTIs that are less likely to cause this.

Type 2 diabetes is an occasional complication of PI therapy due to insulin resistance. Monitoring should include fasting blood glucose at baseline and at 5-8 months with subsequent measurements depending on risk and prior results.

CASES**1.**

A 36-year-old HIV-infected man has received stavudine (d4T) plus lamivudine (3TC) plus indinavir (IDV) for approximately 4 years. This regimen was his first regimen and before starting therapy his HIV RNA was 59,000 copies/mL and his CD4 count was 34 cells/mm³. His antiviral and immunologic response has been excellent, with HIV RNA levels persistently less than 50 copies/mL and a CD4 count that has increased to 526 cells/mm³. In the past 9 months, however, he has developed hyperlipidemia, hyperglycemia, and body fat changes, most notably enlargement of his abdominal region and facial thinning. He has been very hesitant to change his regimen but now comes into the clinic to discuss this matter again.

Question: If he changes his antiretroviral regimen, will he likely continue to have excellent control of HIV?

Answer:

Since this patient has experienced excellent long-term viral suppression and this was his first regimen, it is highly likely that a switch from a PI to a NNRTI (efavirenz [EFV] or nevirapine [NVP]) would maintain continued viral suppression. Similarly, a change from one NRTI to another would likely have no adverse effect on HIV suppression. In patients who have previously developed resistance and are currently on a salvage regimen, changing a medication because of side effects can pose a much greater risk of not maintaining excellent virologic control.

Question: What improvements would he likely expect if he makes a change?

Answer:

Among the problems this patient has developed as a complication of ART, insulin resistance and hyperlipidemia are the most likely to improve with a regimen change. In particular, several studies have shown switching from a PI to either nevirapine, efavirenz, or abacavir (ABC) typically leads to significant improvement in hyperglycemia and insulin resistance. Improvements in lipids are most likely to occur if the PI is switched to either nevirapine or abacavir. Switching from one PI to the new PI atazanavir (ATV) may provide significant improvement in lipid abnormalities. Unfortunately, changing from a PI to an NNRTI has not produced reliable improvements in lipodystrophy. Changing from stavudine to either abacavir or tenofovir (TDF) may provide some improvement in lipodystrophy for some patients. Although tenofovir causes less lipodystrophy than stavudine, studies that examine the effect of changing stavudine to tenofovir have not been performed.

2.

A 33-year-old woman on stavudine (d4T) plus didanosine (ddI) plus efavirenz (EFV) presents with severe fatigue. No obvious cause for the fatigue is discovered and 1 week later she returns with even worse fatigue. Serum chemistries now are notable for a bicarbonate of 17 mmol/L. A serum lactate level is drawn and a lactate level of 6.3 mmol/L is reported from the laboratory. The patient is not taking any other medications and is not taking any herbal preparations.

Question: Is the serum lactate level of 6.3 mmol/L concerning in this patient?

Answer:

Experts have stratified serum lactate levels based on the risk of developing complications from hyperlactatemia. Those with a serum lactate level of 2.1-5.0 mmol/L are considered to have mild hyperlactatemia, those with a serum lactate level of at least 5 mmol/L have serious hyperlactatemia, and those with a lactate level at least 5 mmol/L plus a bicarbonate level less than 20 mmol/L have lactic acidosis. Accordingly, the patient's serum lactate of 6.3 mmol/L (along with the serum bicarbonate of 17 mmol/L) is extremely concerning and suggests lactic acidosis, a potentially life-threatening problem.

Question: If lactic acidosis is suspected, how should the patient be managed?

Answer:

Because hyperlactatemia and lactic acidosis result from NRTI-induced mitochondrial toxicity, the first step in managing this problem is to immediately discontinue ART. Although several case reports have suggested improvement in lactic acidosis by using compounds such as riboflavin, thiamine, L-carnitine, or co-enzyme Q, supportive care remains the mainstay of therapy. After discontinuing ART, regeneration of severely damaged mitochondrial typically requires prolonged periods, and recovery from lactic acidosis can take several months. Following recovery, the optimal management of subsequent antiretroviral therapy remains unclear. Preliminary reports suggest changing the NRTIs (typically replacing stavudine) can safely be performed, but should be done with expert consultation.

Chapter 7:

Adherence to HIV Therapies

*Laura W. Cheever, MD, ScM**OVERVIEW**ASSESSMENT**INTERVENTIONS**KEY POINTS**SUGGESTED RESOURCES**REFERENCES**CASES*

OVERVIEW

What is meant by medication adherence?

Medication adherence means a patient takes the prescribed dose of prescribed medications on the prescribed schedule, following prescribed dietary instructions. Patient adherence to medical appointments and to behaviors that minimize the risk of transmission of HIV to others correlates strongly with adherence to medications and is an important part of primary care of HIV-infected patients but will not be addressed in this chapter.

Why is medication adherence so important in HIV therapy?

Nonadherence to prescribed therapy is a ubiquitous problem in medicine. In chronic diseases, including asthma, diabetes, and hypertension, only 50 % of patients take their medication as prescribed more than 80 % of the time. The same is true of patients with HIV infection. However, because of the rapid multiplication and mutation rate of HIV and the relatively low potency and short half-life of most antiretrovirals, very high levels of adherence to antiretroviral schedules are necessary to avoid viral resistance. In comparison with patients who are adherent to antiretroviral therapy (ART), nonadherent patients have: 1) Higher mortality (2.5 adjusted relative hazard) (Wood, et al, 2003), 2) Lower increase in CD4 cell count (6 cells/mm³ increase for nonadherent patients versus 83 cells/mm³ increase for adherent patients) (Paterson 2000), and 3) Increased hospital days (12.9 days/1000 days of followup for nonadherent patients versus 2.5 hospital days/1000 days for adherent patients) (Paterson, et al, 2000).

How adherent do patients need to be to avoid viral resistance?

Results of a study of adherence and response to therapy among primarily antiretroviral-experienced patients taking protease inhibitors (PIs) showed that a > 95 % adherence rate was necessary for 78 % of patients to achieve an undetectable viral load (Paterson, 2000); however, some patients with significantly less adherence also had success (see Figure 7-1). Exactly how adherent individual patients need to be is not known and probably depends on several factors, including preexisting antiretroviral resistance, viral load, viral genetic barriers to the development of drug resistance, and drug half-life. Patients should be counseled that the risk of viral resistance increases with nonadherence and that nearly perfect adherence is the goal. Of note, patients with very low levels of adherence may be at decreased risk of developing viral resistance because there is not enough selective pressure (Bangsberg, et al, 2003).

ASSESSMENT

What factors impact adherence?

Many factors contribute to a patient's ability to adhere to medication schedules (Table 7-1). Note that race, education level, and income are generally not predictive of adherence. Providers must remember that factors predicting adherence or nonadherence are only associations and are not absolutely predictive. For example, although patients who use addictive substances are more likely to be nonadherent, some patients with heavy alcohol or drug use are adherent to ART.

Figure 7-1: Adherence Rates Predict Viral Load Response

Source: Adapted from Paterson DL, Swindells S, Mohr J, et al. Adherence to protease inhibitor therapy and outcomes in patients with HIV infection. *Ann Intern Med.* 2000;133:21-30. Copyright American College of Physicians. modified with permission.

7

One of the primary predictors of adherence is “self-efficacy” or patient readiness. Patients who have confidence in their ability to take their medications as instructed (ie, they have good self-efficacy) are much more likely to be compliant than patients who lack this confidence. Among HIV-infected patients, the common comorbidities of substance abuse and untreated mental illness contribute significantly to nonadherence. Because side effects of the medications also are a significant barrier to patient adherence, providers need to vigorously address complaints of side effects.

What is the best way to assess a patient’s adherence?

There is no gold standard for measuring adherence. A provider’s “impression” of a patients’ adherence, without specific assessments, is very unreliable. Mechanisms to measure adherence include assessment of serum drug levels, electronic monitoring of pill bottle openings, pill counts made at clinic visits or at surprise home visits, pharmacy record reviews, and patient responses to questioning. In general these different measures have good correlations to adherence levels, although asking the patient will be more likely to overestimate adherence than objective measures. Computer-assisted questioning of patients will improve self-reporting reliability. Serum drug level assessment provides only information about the most recent dose and is quite costly and not practical in clinical practice..

Table 7-1: Factors that Promote Patients’ Adherence to Medication Regimens

Patient-related factors
Absence of mental illness/depression Absence of substance abuse (alcohol and other drugs of abuse) Perceived ability to take medication as instructed (self-efficacy) Older age Higher literacy Strong social support network Adherence with medical appointments Stable housing Adherence with previous therapies Positive attitude toward efficacy of medication
Medication-related factors
Fewer medications Fewer doses Fewer pills Fewer side effects Lack of dietary restrictions Shorter time on therapy Good “fit” of regimen into patient’s daily routine
Health system-related factors
Trusting relationship with health care provider Patient education: • Patients understand their regimen, including food restrictions • Patients understand the association of adherence and resistance Convenient access to medications and refills

How should providers ask patients about adherence to get the most reliable information?

With appropriate education at the start of ART, a patient should know the importance of adherence. It is important to approach the discussion of adherence at follow-up visits in a nonjudgmental way and “give permission” for missing doses. Also, asking specific questions will yield specific information. An example of an inquiry might be: “Everyone misses doses of their medication some of the time. How many times in the last 3 days/week/month have you missed taking doses of your medicine?” From there, a discussion of the specific events that led to missing doses can lead to problem-solving with the patient to overcome these barriers.

The provider should ask patients to recount exactly when and how they are taking their medications in order to identify any lack of understanding of the regimen itself or of special dietary instructions.

INTERVENTIONS

What can be done to improve adherence?

The most important intervention is making sure patients start medication only when they are “ready.” Providers need to discuss with patients the risks associated with nonadherence that can result from starting medications before they are ready versus waiting while they “prepare.” Preparing can mean entering into substance abuse treatment, finding stable housing, or attending a support group to overcome fears of medication side effects and concerns about confidentiality. Pregnant women and patients with serious complications of HIV infection and very low CD4 counts may not have the luxury of postponing therapy, but for others, being ready to adhere may be critical to the outcome of ART.

Interventions to improve adherence in chronic diseases tend to have, at best, modest effects on adherence. They are most effective if they are multifaceted, ie, they target several aspects of the adherence behavior and are repeated over time. Barriers to adherence differ among patients. Thus, interventions should be tailored to the patient’s specific needs. In addition, barriers to adherence vary over time, so interventions need to vary as well. Interventions can occur at the level of the provider, care team, clinic, and/or pharmacy. Ideally, interventions are occurring throughout the patient’s medical visit and beyond.

The most commonly used interventions address patient readiness using both one-on-one education and support groups. Peer counseling and support are key for many patients to work through concerns related to medication-taking. Making patients partners in the decisionmaking process about when to start and which regimen to use is also important. The regimen should be as simple as possible and should be the one least likely to cause the side effects that the patient fears the most. Substance abuse and mental illness should be treated *before starting* medication whenever possible.

After the patient begins the regimen, close followup and monitoring of adherence is critical, often through frequent clinic visits during the first weeks of therapy even if other medical interventions are not necessary. Providers should ask patients about adherence and

address barriers to adherence at each followup visit. Providers should be open to changing the regimen if a patient has significant problems with it, whether related to side effects or to scheduling. Patients should be encouraged to use pill boxes and incorporate reminder systems as needed. Various kinds of interventions have been used in HIV and other chronic diseases (see Table 7-2).

What is the role of Directly Observed Therapy (DOT) for medication adherence?

Directly observed therapy (DOT) refers to medical staff supervising patients taking each dose of medication. DOT has increased treatment completion and decreased the resistance rates of tuberculosis therapy. Whether it is feasible in HIV therapy is currently under investigation. A majority of ongoing studies are using modified DOT, with only 1 daily dose of medication observed over the first several months of therapy or during the administration of methadone maintenance therapy. The results of these studies will provide valuable information about the long-term patient acceptability, cost, and efficacy of this approach to improve adherence over the long term.

Table 7-2: Interventions That Have Been Used to Support Adherence in HIV and Other Chronic Diseases

Intervention	Comments
The Patient	
Start when patients are ready	For patients with complications of HIV infection, low CD4 cell counts, or pregnancy, the cost-benefit analysis of treatment is different.
Treat substance abuse and depression before initiating ART	If there is no antiretroviral emergency, patients with active substance abuse and depression should have these comorbidities addressed before starting an antiretroviral regimen.
Engage patients in medication tailoring	Discuss with patients in detail how the medications will fit into their daily routine- ie, when (and if) meals are eaten, what patients do on a daily basis that can be linked to dosing times.
Educate (group/individual) regarding: - the regimen - side effects management - consequences of nonadherence	- Patient education is essential -- both group and one-on-one. - Involve caretakers and patient support network in educational efforts. - Patients need to know exactly how to take their medication. A daily calendar with pills on it will help a patient visualize the regimen. - Prior to initiating therapy, patients should know which side effects to expect, what they can do to manage them, and when to call the provider. - Patients need to understand the serious consequences of nonadherence and what to do in the event of a late or missed dose.
Increase support	Patients should enlist the aid of family and friends to promote their adherence. The HIV health care team can provide support through office visits, home visits, and telephone calls, especially in the early days and weeks of ART.
Use skill building exercises	Patients who are concerned about their ability to adhere should use a trial of jellybeans in a pill box to accustom themselves to their pill taking schedule prior to initiating therapy. This may not increase adherence, but it may give patients insight into their adherence and affect their decision to start medications.
Address barriers to adherence	- Have patients consider when medications are likely to be missed and make plans to decrease these events. - Some patients store a few doses in places where they spend a lot of time, such as at the houses of friends and relatives.
Use reminders	- Alarm clocks, in the form of watch alarms, pagers, or pill boxes can decrease missed doses due to simply forgetting. - Patients can place medications in locations where they will notice them at dosing times, such on the breakfast table.
The Regimen	
Simplify as much as possible	- Once or twice-a-day regimens are easiest for patients. - Use as few pills and medications as possible. - Try to use regimens that can be followed without regard to food intake.
Tailor the regimen to the patient's lifestyle (and not the patient's lifestyle to the regimen)	- Ask patients about their daily routine and comfort in taking medications in front of others and at work. - Construct a regimen that works for the patient.
Use pill boxes	- Use of pill boxes allows patients a mechanism for carrying their daily medication. - Pill boxes allow patients to easily recognize when they have missed taking a dose.
Make refills accessible	- Develop policies to allow patients ready access to refills.
The Clinician-Patient Relationship	
Develop a trusting relationship	- Rarely is initiation of antiretroviral regimens required at the first visit. Invest in the doctor-patient relationship prior to initiating therapy.
Ask about adherence	- Providers cannot predict adherence; they must ask patients. - Ask in a nonjudgmental way, with a specific time frame, to get good information. - Give permission for missed doses prior to asking. - Ask repetitively over time.
Use positive reinforcement	Share viral load and CD4 results and reinforce the relationship to adherence.
Listen to the patient	- Individualize therapy based on patient preferences regarding fear of specific side effects or specific medication. - Negotiate the regimen with patients.
System of Care	
Maintain close followup at initiation of regimen	Have telephone, office, or home contact with patients within first few days of therapy to assess for side effects and accurate understanding of regimen.
Develop patient education program	- Consider using nurses, case managers, pharmacists, and peers in patient education. - Have written materials accessible.
Incorporate the adherence message throughout the medical practice	- All staff members need to understand and promote the importance of adherence. - Have pill boxes, alarms, and other adherence aids available to patients.

KEY POINTS

Medication adherence is a significant challenge in all chronic diseases, but is particularly important in ART because of the high levels of adherence that must be maintained to prevent viral resistance.

Patients should not start taking antiretroviral medications until they are ready. Providers should take the time to assess their readiness, conduct interventions to prepare them to begin therapy, and follow them closely once they start.

Interventions to support adherence should be multifaceted and repeated over time. However, interventions have a modest effect on adherence.

CASES

1.

AR is a 37-year-old woman who uses heroin and cocaine daily and has a CD4 count of 300 cells/mm³ and an HIV viral load of 150,000 copies/mL. Since she was diagnosed with HIV infection 10 years ago she has primarily sought care when acutely ill. She comes to clinic for the first time in 6 months because she has decided to start “the cocktail.”

Question: How do you manage this patient?

Answer:

This patient is not engaged in primary care and is using heroin daily. Although she might be able to adhere to therapy, she probably won't. Beginning ART is reasonable given her CD4 cell count and viral load; however nothing makes it critical to start therapy immediately.

The patient did not agree with her physician's assessment that her substance abuse was a barrier to medical care or medication adherence. She agreed to contract with her physician to start ART after she made 5 consecutive clinic visits. After several attempts at consecutive visits, the patient enrolled in a methadone-based substance abuse treatment program. She began to come regularly to clinic, engaged in in-depth medication education, and eventually started ART. She had good adherence, maintaining an undetectable viral load for 18 months before a drug abuse relapse. When she began to miss doses, she stopped all her medications as instructed and did not develop significant resistance.

2.

DP is a 4-year-old with perinatally-acquired HIV infection. He is taken care of by his maternal great-grandmother, who is also caring for 3 other great-grandchildren. He resists taking ART because of the taste, so that it takes his great-grandmother 30-60 minutes to administer each dose when she can get him to take it. Although she has worked closely with the behavior modification team at the pediatric clinic, the situation has not improved. His viral load and CD4 cell count have not changed significantly on therapy.

Question: What do you do to treat this patient?

Answer:

Given the patient's refusal to take medication, the decision was made to place a g-tube for ease of administration. Within 1 month the viral load was undetectable, and the time to administer medications had decreased to less than 10 minutes per dose. The great-grandmother reported a significant improvement in their relationship and in DP's behavior in a number of domains. Although this may seem extreme, this is an example of individualizing the intervention to the barriers that exist for the patient (Shingadia, et al 2000).

Chapter 8:**Symptom Management**

Tara Evans Nysoe, MD
Douglas S. Paauw, MD, FACP

*WORKUP OF SYMPTOMS**MEDICATION-RELATED ISSUES**NAUSEA**PULMONARY SYMPTOMS**FATIGUE**NEUROPATHIC PAIN**DERMATOLOGIC SYMPTOMS**MOUTH LESIONS**WASTING**MYALGIAS**DIARRHEA**HEADACHE**KEY POINTS**SUGGESTED RESOURCES**CASES***WORKUP OF SYMPTOMS****How should you approach the workup of symptoms in patients infected with HIV?**

Symptom evaluation in HIV-infected patients must include knowledge of the CD4 count and viral load as well as close attention to the medication list. An opportunistic disease (OD) is an unlikely cause of symptoms in patients with CD4 cell counts $> 200/\text{mm}^3$. Antiretroviral medications are a common cause of HIV-related symptoms.

MEDICATION-RELATED ISSUES**What are the most common symptoms related to antiretroviral medications?**

Nausea and diarrhea are the two most common symptoms associated with antiretroviral therapy (ART). Pruritus and skin rashes are also common, especially with nonnucleoside drugs. Lower extremity pain due to neuropathy is seen with didanosine (ddI), stavudine (d4T), and zalcitabine (ddC).

What are the common side effects of each of the antiretroviral drugs?

The different classes of drugs have many similar as well as distinct side effects (see Table 8-1).

What symptoms could be due to life-threatening acute drug reactions?

Symptoms of life-threatening acute drug reactions are not to be missed. A patient with myalgias, nausea, vomiting, diarrhea, abdominal pain, fever, rash, malaise, and extreme fatigue who has started taking abacavir (ABC) within the previous 6 weeks is

probably suffering from an abacavir hypersensitivity reaction. In this case, abacavir should be permanently discontinued. The hypersensitivity reaction occurs in up to 5% of patients starting on abacavir and can lead to hypotension and death if the patient is rechallenged with abacavir. If a patient taking one of the “d-drugs” (didanosine [ddI], zalcitabine [ddC], stavudine [d4T], dapsone [for *Pneumocystis pneumonia* prophylaxis]) has rapid onset of nausea/vomiting and constant, severe abdominal pain in the epigastrium or upper quadrants that radiates to the back, drug-induced pancreatitis is possible. Patients taking a nucleoside (NRTI) who have vague symptoms including nausea, vomiting, abdominal pain, weight loss, malaise, fatigue, dyspnea, or fever must have lactic acidosis with hepatic steatosis ruled out. This occurs 5-13 months after initiating therapy and has a 60% fatality rate. Patients taking nevirapine (NVP) who have fatigue, malaise, nausea, vomiting, jaundice, and right-upper-quadrant abdominal pain could have nevirapine-induced hepatitis. Also, up to half the patients taking nevirapine may have a rash; however, if the rash is moist, involves the mucous membranes, or is extensive with an associated fever, Stevens-Johnson syndrome, which also occurs in patients taking trimethoprim-sulfamethoxazole (TMP/sulfa), must be considered. Severe cases of Stevens-Johnson syndrome, including toxic epidermal necrolysis (TEN), are medical emergencies and must be managed as burn cases. For all drug-induced, life-threatening illnesses, immediate discontinuation of the offending drug is the crucial first step in care.

What are the most important drug interactions that occur with antiretroviral medications?

Drug interactions are frequently the cause of symptoms and must be closely watched for. Not only do antiretroviral drugs react with each other, they react with numerous prescribed drugs and recreational drugs (see Tables 4-8 in the Pocket Guide).

Table 8-1. Side Effects of Antiretroviral Drugs

Drug	Side effects
Nucleosides (NRTIs)	
Class effect	Hepatic steatosis/lactic acidosis
abacavir (ABC)	Hypersensitivity reaction (nausea, anorexia, fever, rash, dyspnea, cough)
didanosine (ddI)	Pancreatitis, peripheral neuropathy, nausea, diarrhea
lamivudine (3TC)	Very few side effects
stavudine (d4T)	Peripheral neuropathy, pancreatitis
tenofovir (TDF) (a nucleotide)	Nausea, vomiting, diarrhea
zalcitabine (ddC)	Peripheral neuropathy, mucosal ulcers, pancreatitis
zidovudine (AZT)	Anemia, myopathy, headache, nausea
emtricitabine (FTC)	Nausea, very few side effects
Nonnucleoside reverse transcriptase inhibitors (NNRTIs)	
efavirenz (EFV)	Confusion, insomnia, rash, disturbing dreams
nevirapine (NVP)	Rash (15%), hepatitis
Protease inhibitors (PIs)	
Class effect	Hyperglycemia, hyperlipidemia, lipodystrophy, hepatitis
amprenavir (APV)	Nausea, diarrhea, rash, paraesthesias
atazanavir (ATV)	Elevated bilirubin
fosamprenavir (FAPV)	Diarrhea
indinavir (IDV)	Nausea, renal sludging, renal stones, increased indirect bilirubin
lopinavir+ritonavir (LPV/r or Kaletra)	Nausea, vomiting, diarrhea
nelfinavir (NFV)	Diarrhea common (can be limiting)
ritonavir (RTV)	Nausea, vomiting, circumoral paraesthesias, hepatitis, taste abnormalities
saquinavir (SQV)	Nausea, diarrhea

What natural products are potentially useful in treating the symptoms of patients with HIV?

Some commonly used complementary medicine treatments are listed in Table 8-2. Ginger for the treatment of nausea is probably the most effective of the natural products for symptom management.

Table 8-2. Complementary Medicine Treatment Options for Various Symptoms

Problem	Treatment option	Comments
Nausea	Ginger	Studies have shown possible benefit
Hepatitis	Milk thistle	Inconclusive long-term benefit; may inhibit the p450 system
Migraine prophylaxis	Riboflavin	Randomized controlled trial showed benefit
Immune system dysfunction	Co-enzyme Q	Studies have shown possible benefit in CD4 cell counts but no outcome benefit has been shown

NAUSEA

What are the important causes of nausea in patients with HIV?

The most common cause of nausea in patients with HIV is medication side effects. Many of the antiretroviral drugs can result in prominent nausea. Full dose ritonavir (RTV) probably causes the most severe and frequent symptoms, but nausea can be seen with all of the protease inhibitors (PIs). Zidovudine (AZT) frequently causes nausea when first taken. Didanosine (ddI), stavudine (d4T), and zalcitabine (ddC) can all cause nausea, or nausea may be an early sign of the pancreatitis these drugs can lead to. All classes of antiretroviral drugs can cause hepatitis, which may present as intense nausea and fatigue. Nevirapine (NVP) and PIs are the most likely to do this, but nucleosides can cause life-threatening lactic acidosis in association with hepatic steatosis. Nausea can be a component of abacavir (ABC) hypersensitivity reaction, usually associated with fever, rash, vomiting, and anorexia. The commonly used antibiotics trimethoprim-sulfamethoxazole (for *Pneumocystis pneumonia* [PCP] prophylaxis) and azithromycin or clarithromycin (for *Mycobacterium avium* complex [MAC] prophylaxis) can cause nausea.

Nonmedication causes to consider include viral hepatitis (acute hepatitis A, B, or C). Nausea is a common feature of cryptococcal meningitis; other sources of increased intracranial pressure such as CNS lymphoma or toxoplasmosis can also present with severe nausea and vomiting.

What are the best options for managing nausea?

If nausea is due to medications, stopping the medication or removing an interacting drug is the best option. Symptomatic therapy with prochlorperazine or metoclopramide may help. A natural product option is ginger, at a dose of 2 grams daily (no more than 4 grams/day). Switching the time of the dose of the offending drug to be taken with food may be helpful.

PULMONARY SYMPTOMS

What are the possible causes of cough in an HIV-infected patient?

The CD4 cell count is crucial information in determining the cause of cough. In patients with CD4 cell counts $> 200/\text{mm}^3$, viral upper respiratory infections, bacterial pneumonia (caused by *S. pneumoniae* or *H. influenzae* most commonly), tuberculosis (TB), and sinusitis with post-nasal drip are all important causes of cough. Bacterial bronchitis is more common in patients with HIV than in non-HIV-infected patients. In patients with low CD4 cell counts ($< 200/\text{mm}^3$) *Pneumocystis carinii* pneumonia must be considered. The risk of PCP is markedly diminished if the patient is taking trimethoprim-sulfamethoxazole for PCP prophylaxis. The cough that occurs with PCP is usually dry and persistent and will usually have been present for several weeks before a patient seeks evaluation. Fungal disease due to cryptococcus, histoplasmosis, or coccidioidomycosis is more common with lower CD4 cell counts.

What workup is appropriate?

In patients with CD4 cell counts $> 200/\text{mm}^3$ the history and physical exam should determine what testing to do. If the patient has a cough but no fever or productive sputum, no dyspnea, and a normal pulmonary exam, then chest x-ray is not necessary. A patient at high risk for TB should have an x-ray if there is a prolonged cough ($> 2-3$ weeks) regardless of CD4 cell count. In a patient with a low CD4 cell count ($< 200/\text{mm}^3$) the possibility of PCP is much more likely and an aggressive approach is warranted; a chest x-ray can begin the workup. If it is normal, then consider obtaining oxygen saturation measurements with ambulation. An individual who has oxygen desaturations should have further workup. For evaluation of suspected PCP see Chapter 9, Management of Opportunistic Diseases.

Are patients infected with HIV at increased risk of developing bacterial pneumonia?

Available data clearly suggest that HIV-infected patients have an increased risk of developing bacterial pneumonia. In the 1993 CDC classification system, recurrent pneumonia (2 or more episodes in 1 year) is defined as a category C (AIDS-indicator) condition. Pneumococcal pneumonia is the most common bacterial pneumonia in persons infected with HIV, and it occurs approximately 10 times more frequently than in persons not infected with HIV. In addition, the development of pneumococcal pneumonia can occur early in the course of HIV disease, before other manifestations of immune suppression. HIV-infected persons with pneumococcal pneumonia have clinical signs and symptoms similar to those in HIV-negative individuals, but they have an approximately 20-fold higher risk of developing pneumococcal bacteremia. Treatment of pneumococcal pneumonia is generally the same in persons with and without HIV infection. Several studies have shown that HIV-infected persons have a slightly increased risk of developing pneumonia caused by *Pseudomonas aeruginosa*.

How common is sinus disease in patients with HIV?

Sinus disease is very common in patients with HIV. The lower the CD4 cell count, the more severe and more widespread (number of sinuses involved) sinusitis is. In patients with lower CD4 cell counts, chronic sinusitis and lack of response to therapy are more common. The most common organisms involved are *Streptococcus pneumoniae*, *Streptococcus viridans*, and *Pseudomonas aeruginosa*. Pseudomonal sinus infections are more common in patients with CD4 cell counts of $< 50/\text{mm}^3$. Fungal (*Aspergillus*) and viral (Cytomegalovirus) sinusitis can occur in patients with CD4 cell counts $< 100/\text{mm}^3$. Aggressive treatment of sinus disease with saline irrigation, antihistamine/decongestant combinations and full-dose nasal steroids is appropriate. Antibiotics should be given for the normal duration for episodes of acute sinusitis (3-6 week course). If antibiotic therapy and aggressive irrigation do not resolve the problem, referral to an ENT specialist for drainage procedures and for consideration of sinus surgery is appropriate.

FATIGUE

What are the common causes of chronic fatigue in patients with HIV?

Fatigue can have a large impact on the quality of a patient's life. Common descriptors of fatigue include tiredness, weakness, lack of energy, sleepiness, and exhaustion. Of the many possible causes of chronic fatigue in patients with HIV, the most common is depression. Other psychosocial causes include stress, anxiety, use of recreational substances, sleep disturbances, domestic abuse, and lack of exercise. ODs must be considered as a possible cause of fatigue in patients with low CD4 cell counts. Other disease states such as anemia, hypothyroidism, hypogonadism, adrenal insufficiency, influenza and other non-opportunistic infections, diabetes, liver disease, and malnutrition can also present as fatigue. Fatigue can be a side effect of ART and other medications commonly taken by patients with HIV. HIV-associated fatigue is a diagnosis of exclusion.

How do you determine the cause of a patient's fatigue?

Ask if the patient is having other symptoms of depression: change in sleep or appetite patterns, depressed mood, anhedonia, agitation or retardation, difficulties with concentration, decreased self-esteem, and suicidal ideation. Take a thorough social history and determine if multiple life stressors are present. Inquire as to how many hours of sleep the patient is getting per night and the number of middle-of-the-night awakenings; ask if the patient feels rested in the morning. Important history questions that help differentiate a physical from a psychological etiology for fatigue are in Table 8-3. Identify any barriers to effective sleep. Ask about the patient's diet and exercise habits, and determine if the patient drinks alcohol or uses recreational drugs, including caffeine. Thoroughly review the patient's medication list and identify any medications, such as certain antiretroviral drugs, beta-blockers, antihistamines, etc., that can be associated with fatigue. Do a complete review of systems and physical exam to elicit other symptoms or signs that may suggest an OD or other disease state. Simple laboratory tests, such as alanine aminotransferase (ALT), blood glucose, thyroid stimulating hormone (TSH), and hematocrit, can help to rule out common diseases that can cause fatigue. Electrolyte abnormalities can suggest adrenal insufficiency. Order other laboratory or diagnostic tests as symptoms and signs direct.

Table 8-3. History Questions to Differentiate Physical from Psychological Causes of Fatigue

	Psychological cause	Physical cause
Onset	Often follows problem or conflict	Related to onset of physical ailments
Duration	Chronic	Of recent onset
Progression	Fluctuates	Increases as disease advances
Effect of sleep	Unaffected by sleep	Relieved by sleep
Diurnal	Present in morning, may improve	Increases as the day progresses

NEUROPATHIC PAIN

What is the most common cause of neuropathic pain and paresthesias in patients with HIV?

Distal symmetrical polyneuropathy (DSP) is most commonly caused by antiretroviral drugs. The drugs didanosine (ddI), zalcitabine (ddC), stavudine (d4T) can all cause DSP at high doses. Studies have shown zalcitabine to be the most likely to cause neuropathy at standard doses; concurrent alcohol use or vitamin B12 deficiency may increase risk. HIV-related DSP is less common than drug-induced DSP. The two types of neuropathies present similarly, although onset may be more acute in drug-induced DSP. HIV-related DSP does not appear to respond to viral suppression with ART.

How do you diagnose and treat DSP?

Diagnose drug-related DSP by linking the onset of the symptoms with the initiation of drug therapy. Treat by drug removal; symptoms may worsen temporarily but should regress within several weeks. Residual painful symptoms of DSP may be treated with tricyclic antidepressants, narcotic analgesics, or gabapentin. The topical medication capsaicin may be helpful if the neuropathy is limited to a small surface area.

DERMATOLOGIC SYMPTOMS

How do you manage generalized pruritus in a patient with no cutaneous signs on exam?

If a patient with HIV has generalized pruritus with no obvious cutaneous diagnosis, acute drug reactions such as Stevens-Johnson syndrome, which can be life-threatening, and coexisting systemic illness such as hepatic dysfunction must be ruled out (see Table 8-4 and earlier section on medication-related issues). Order a complete blood count, liver function tests, and blood chemistries. Occasionally, scabies can present with minimal to no cutaneous signs. Pruritus due solely to HIV infection is a diagnosis of exclusion; it can respond to ART. (Symptomatic treatments for generalized pruritus are listed in Table 8-5.) In general, if a clear cause is not identified, xerosis, a common condition in patients with HIV disease, will be the most likely diagnosis. In this case, decreasing the amount of bathing, avoiding dry soaps, using emollient creams, and ceasing scratching are the basis of symptomatic treatment. In addition, general agents such as H-1 antagonists can be used. The best studied of these is hydroxyzine, which offers the benefit of sedation for nocturnal itching.

Table 8-4. Common Causes of Pruritus in Patients with HIV	
Very common	Less common
• <i>Staphylococcal folliculitis</i> • <i>Xerosis</i> • <i>Atopic dermatitis</i> • <i>Scabies</i> • <i>Psoriasis</i> • <i>Hypersensitivity to insect bites</i> • <i>Drug reactions</i>	• <i>HIV-associated pruritus</i> • <i>Eosinophilic folliculitis</i> • <i>Granuloma annulare</i> • <i>Lymphoma</i> • <i>Hepatic failure</i> • <i>Renal failure</i>

How does scabies manifest differently in HIV-infected persons?

Among HIV-infected persons with mild-to-moderate immune suppression, scabies causes similar clinical manifestations as seen in persons without HIV infection, namely multiple pruritic papular lesions. Treatment consists of applying 30-60 g of 5% permethrin cream to the entire body from the neck down, leaving it on for 8-12 hours, then washing it off, and repeating the entire process one week later. In HIV-infected persons with severe immune suppression (CD4 count of < 100 cells/mm³), an atypical form of scabies known as crusted or "Norwegian" scabies may develop. Crusted scabies is characterized by an enormous number of scabies

mites and manifests as nonpruritic, thick, grayish-white, plaque-like lesions. In severe cases, the large lesions can develop deep fissures. Treatment of crusted scabies consists of ivermectin 200µg/kg orally with a repeat dose a week later.

Table 8-5. Therapy Strategies and Treatment Options for Generalized Pruritus	
Therapy	Comment
Prevention of scratching	Scratching causes secondary irritation
Lubrication with ointments and creams with a fatty basis	eg, propylene glycol, wax esters
Avoidance of histamine induction by heat	eg, bathing in lukewarm or cold water
Avoidance of irritating substances	eg, alkaline soaps, wool clothing
Antihistamines	The evidence is sparse; watch for side effects
Topical agents • <i>Coolants</i> • <i>Anesthetic agents</i>	eg, menthol, phenol eg, EMLA® Cream (lidocaine 2.5% and prilocaine 2.5%)
Lindane	Empiric treatment for scabies if risk factors
UVB therapy	Three times a week, up to 20 treatments for maximal benefit
Hypnosis	Studies have demonstrated benefit

What are the causes and treatments of blisters and cutaneous ulcers in persons with HIV?

Several studies have suggested that HIV-infected persons, when compared with age-matched HIV-negative persons, have an approximately 10-fold increased risk of developing "shingles," a complication resulting from reactivation of varicella-zoster virus. Herpes zoster can occur at any CD4 cell count and thus does not require advanced HIV-related immune suppression. Indeed, the development of herpes zoster may serve as one of the first clinical events prompting an HIV-infected person to seek medical care. Persons with HIV can have more than one episode of herpes zoster. For unknown reasons, HIV-infected persons who start aggressive ART have an increased risk of developing herpes zoster in the 6-month period after starting ART; in this scenario, the herpes zoster does not reflect worsening immunologic function or waning effectiveness of ART.

Because immune-suppressed persons who develop herpes zoster have an increased risk of disseminated herpes zoster, most experts recommend that all HIV-infected persons with zoster receive therapy. As long as the patient has no evidence of disseminated disease, central nervous system disease, or cranial nerve involvement, oral therapy can be used. Therapy for localized dermatomal zoster consists of 7-10 days of oral therapy with valacyclovir (1000 mg tid), acyclovir (800 mg 5x/day), or famciclovir (500 mg tid). In addition, acute zoster-associated pain often requires therapy. Therapy for zoster in HIV-infected persons should not include corticosteroids. No evidence exists to suggest HIV-infected persons have a higher risk of developing post-herpetic neuralgia as a complication of zoster infection.

Among HIV-infected persons with mild or moderate immune suppression (CD4 count > 350 cells/mm³), herpes simplex virus (HSV) infections cause clinical manifestations similar to those in HIV-negative persons, namely self-limited oral or genital lesions that typically appear with vesicular or ulcerated lesions. Recommended therapy for episodic HSV infection consists of either acyclovir 400 mg po tid x 5-10 days, famciclovir 500 mg po bid x 5-10 days, or valacyclovir 1000 mg po bid x 5-10 days. In persons with more advanced immune suppression, particularly those with severe immune suppression (CD4 count < 100 cells/mm³), HSV infection may present as a non-healing, large, ulcerated lesion anywhere on the body. Therapy for these chronic, ulcerated lesions typically requires longer duration. In addition, those HIV-infected persons with severe immune suppression who receive chronic suppressive therapy for HSV have an increased risk of developing acyclovir-resistant HSV infection.

How does molluscum contagiosum manifest in severely immunosuppressed persons with HIV?

Among HIV-infected patients with severe immune suppression (CD4 count < 100 cells/mm³), molluscum contagiosum typically presents as flesh-colored, papular lesions, most often on the face, neck, chest, or genitalia. In contrast to immune competent patients who typically have a self-resolving illness, HIV-infected persons with severe immune suppression generally have a progressive increase in the number and size of the molluscum lesions, often culminating in very large and disfiguring lesions referred to as “giant molluscum.” These lesions are particularly problematic if located on the face. Extremely large lesions may require surgical removal, moderate-sized lesions typically respond to

liquid nitrogen therapy, and multiple small lesions are best treated with topical tretinoin 0.025% applied once a day. In addition, effective ART with improvement in immune function may help in managing molluscum.

How do you recognize and treat seborrheic dermatitis?

Although seborrheic dermatitis is a well-known dermatologic disorder in persons who do not have HIV infection, this disorder occurs with increased frequency and severity among HIV-infected persons. Patients with HIV infection and seborrheic dermatitis typically have symmetrical erythematous, scaled patches and flaking, most often on the scalp, eyebrows, beard, central chest, and axillae. Typically, seborrheic dermatitis spares the central part of the face. Most patients respond to topical antifungal creams, such as 2% ketoconazole cream. In some instances, adding 1% hydrocortisone cream may be required.

MOUTH LESIONS

Many patients with HIV have mouth pain: what are the most common mouth lesions?

The two most common oral lesions in HIV patients are oral candidiasis and oral hairy leukoplakia; they are clinical markers of symptomatic HIV infection. Oral hairy leukoplakia is a raised, white lesion that is usually seen on the lateral surface of the tongue. Hair-like projections can occasionally be visualized. It is usually asymptomatic, but may cause discomfort and impair taste and eating as it grows in size. The lesion appears more frequently in patients with lower CD4 counts and is thought to be caused by the Epstein-Barr virus.

Mucosal *candida* infections are seen as the CD4 cell count falls below 200-300 cells/mm³. The manifestations vary; they can involve the hard and soft palates, buccal mucosa, tongue, pharynx, and hypopharynx. The most common presentation is pseudomembranous candidiasis, or thrush. “Cottage cheese” plaques are seen on the soft palate, tonsils, and buccal mucosa and can be removed with a tongue blade. Atrophic candidiasis is a less seen and underdiagnosed form of candidiasis, consisting of flat, erythematous plaques in the same distribution as pseudomembranous candidiasis but lacking the white exudates. Mouth pain and loss of acuity of taste are common symptoms with atrophic candidiasis.

Diagnosis of a *candida* infection is commonly based on physical exam findings. Examination of a KOH preparation of a plaque scraping may also be used; culturing is rarely necessary. Response to a trial of topical antifungal agents (clotrimazole troches are easier than liquid nystatin to use) establishes the diagnosis. If the above diagnostics do not suggest *Candida*, a biopsy of the lesion may be performed. Oral hairy leukoplakia needs to be treated only if it causes mouth pain. It can be treated with high-dose acyclovir, valacyclovir, or famciclovir.

What are the causes of painful oral ulcers in patients with HIV?

Oral ulcers are common in patients with HIV. HSV causes primary or recurrent small, smooth, painful ulcers on the lips, gums, hard palate, or buccal mucosa. They can present as solitary lesions or in clusters. Lesions often last weeks, and treatment with acyclovir can shorten the course. Patients with disseminated cytomegalovirus (CMV) infection can occasionally have a large, solitary oral lesion. Aphthous stomatitis can present as single or multiple painful ulcers on the buccal and labial mucosa and the lateral aspect of the tongue. Aphthous ulcers are often exudative or necrotic in patients with HIV, and the course is usually more prolonged than in patients without HIV. Drug therapy with zalcitabine (ddC) can also cause ulcers. In managing oral ulcers, biopsy and viral culture establishes the etiology; some suggest treating empirically for HSV. If the lesion is consistent with aphthous ulcers, treat either with topical or oral steroids or thalidomide. An oral suspension consisting of diphenhydramine, viscous lidocaine, tetracycline, and dexamethasone may offer some pain relief. Removal of the offending drug is the treatment for drug-induced ulcers.

How do you recognize and treat gingivitis and periodontal disease?

These diseases can develop either insidiously or abruptly in patients with HIV and may be severe. Gingivitis is common and can occur at any CD4 cell count. Severe pain, foul breath, bleeding gums, and loosening of teeth are common symptoms, and exam may show a bright red marginal line on the gingiva, gingival erosion, necrosis and ulceration of interdental papillae, exfoliation of enamel, and loose teeth. The cause is unclear, although aerobic and anaerobic gram-negative bacteria, spirochetes, and yeast have been implicated. Severe, ulcerating gingivitis can be caused by *Klebsiella pneumoniae*, *Enterobacter*

cloacae, and other gram-negative bacilli. Treatment includes debridement, irrigation with povidone-iodine/ chlorhexidine oral solutions, and topical antiseptic agents or metronidazole.

WASTING

What are the common causes of weight loss and wasting in patients with HIV?

There can be many different psychological and physical causes of weight loss in HIV disease (see Table 8-6).

Table 8-6. Common Causes of Weight Loss in Patients with HIV

Inadequate dietary intake resulting from
Depression
Painful oral lesions
Esophageal lesions causing dysphagia
Reduced taste sensation (thrush/meds)
Medication side effects (eg, nausea)
Chronic diarrhea (malabsorption) resulting from
Cryptosporidia
Giardia
Hypermetabolic states
Infection
Occult malignancy (eg, B-cell lymphoma)
Endocrine problems
Hypogonadism
Adrenal insufficiency
Diabetes (PI-induced)

How do you work up a patient with weight loss and wasting?

The workup is driven by results of the history, physical exam, and CD4 cell count; a higher CD4 count is more suggestive of causes such as endocrine disorders, malignancies, depression, or medication side effects. Serum testosterone, glucose, and thyroid tests to assess hormone status may be ordered. If malnutrition is suspected, it is important to address this promptly, since malnutrition decreases the function and number of immunity cells and leads to increased morbidity and mortality. Evaluation of GI function, calculation of caloric intake, estimation of protein and energy requirements, measurement of serum prealbumin, albumin, folate, and vitamin B12, and determination of the extent of lean body mass lost make up a comprehensive nutritional assessment. Body cell

mass can be measured using mid-arm circumference. Specific dietary deficiencies should be addressed, vitamin and mineral supplements should be prescribed, and high-calorie protein-containing foods should be recommended. In the patient with a low CD4 count (< 100 cells/mm³), OIs such as *Mycobacterium avium* complex (MAC), tuberculosis, cytomegalovirus infection, cryptosporidiosis, and *Pneumocystis carinii* pneumonia (PCP) should be ruled out, as well as lymphoma. Order a complete blood count, chemistries, blood cultures, chest x-ray, oximetry, and gastrointestinal biopsies or stool cultures as indicated. Referral to a nutritionist or registered dietician is often helpful. Also see *Health Care and HIV: Nutritional Guide for Providers and Clients* under Suggested Resources for practical assessment tools and algorithms for providers as well as patient handouts.

What are the medical treatment options for AIDS wasting?

If an underlying cause of wasting has been identified, treatment of that cause is the first step in restoring weight. One important factor may be switching to ART that does not cause gastrointestinal/anorexia symptoms preventing food intake. Any infectious process should be identified and treated. For nonspecific AIDS wasting, the mainstay of treatment is nutritional supplementation along with appetite stimulants and antiemetics. Institution of ART and prevention of OIs are important in restoring weight. Human growth hormone has been shown to rebuild lean body mass, although it is expensive and survival advantage is controversial; some recommend that it be reserved for patients who have intractable, unexplained weight loss and require short-term treatment to maintain body cell mass during an acute illness (see Table 8-7 for treatment options).

MYALGIAS

What are some common causes of myalgias in patients with HIV?

HIV can cause an inflammatory myopathy at any stage of infection. Symptoms include slowly progressive, proximal muscle weakness of the extremities with or without myalgias. Myopathy due to zidovudine (AZT) toxicity presents similarly to HIV-associated myopathy, and it may be difficult to distinguish between these two disorders. Zidovudine toxicity occurs usually after several months of therapy (most commonly after 6 or more months of continual therapy). Myopathy or rhabdomyolysis due to HMG coenzyme A reductase

inhibitors (statins) or fibrates are another important concern with HIV-infected patients. Many patients are on these drugs for treatment of hyperlipidemia caused by treatment with PIs. PIs decrease the metabolism of statins, which can increase the chance of toxicity. Moreover, many patients are on both gemfibrozil and a statin, which can interact to increase the risk of muscle toxicity. Simple myalgias are more common than rhabdomyolysis or myopathy caused by the statins.

Table 8-7. Treatment Options for Specific Causes of Weight Loss

Cause of weight loss	Treatment options	Comments
Anorexia	Appetite stimulants • <i>dronabinol</i> 2.5-5 mg/d • <i>megestrol acetate</i> 800 mg/d	Some studies show that weight gained is from body fat and not lean body stores. Megestrol can raise blood sugar levels, especially when used with protease inhibitors.
Hypogonadism	testosterone • <i>IM</i> 200-300 mg every 2-3 weeks • <i>Transdermally</i> - Patch 5 mg/day - 1% gel 5-10 g/day oxandrolone nandrolone	Liver function tests must be monitored with use of oral anabolic agents.

How do you evaluate and manage a patient with myalgias or myopathy?

The first step is to check creatinine phosphokinase (CPK) levels. This should be done for any patient on zidovudine (AZT) or a statin who has symptoms of myalgias or muscle weakness. Periodic (every 3-6 months) monitoring of CPK levels is appropriate for patients who are on a statin/PI or statin/gemfibrozil combination. Muscle biopsy should be performed if signs and symptoms of myopathy do not remit within about a month after drug removal or if a patient has muscle enzyme elevations and is not on a drug known to cause muscle damage. Organisms may be seen on muscle biopsy, indicating an infectious myopathy. If no organisms are seen and there are signs of inflammation on biopsy, an inflammatory myopathy secondary to HIV is likely, and a trial of corticosteroids or therapy with intravenous immune globulin (IVIG) should be implemented.

DIARRHEA

What are the common causes of diarrhea in patients with HIV?

The main causes of diarrhea are related to either infections or medications. Infectious diarrhea can be caused by a number of organisms, dependent on the patient's CD4 cell count (see Table 8-8). Nelfinavir (NFV) is the antiretroviral drug most commonly associated with diarrhea. All the PIs can cause diarrhea. Didanosine (ddI) is the nucleoside most associated with diarrhea, but diarrhea is less common when the enteric coated (EC) form is used. Metformin, a drug used for treatment of lipodystrophy syndrome and diabetes, commonly causes diarrhea.

Table 8-8. Infectious Causes of Diarrhea in Patients with HIV

Any CD4 cell count (acute diarrhea)
Viruses (especially Norwalk virus)
<i>Clostridium difficile</i> (previous antibiotic exposure)
<i>Salmonella</i> spp
<i>Shigella</i> spp
<i>Campylobacter</i> spp
Any CD4 cell count (chronic diarrhea)
<i>Clostridium difficile</i>
<i>Giardia lamblia</i>
CD4 count <300 cells/mm³ (chronic diarrhea)
Microsporidia
Cryptosporidia
<i>Mycobacterium avium</i> complex (CD4<100)
<i>Isospora belli</i>
Cytomegalovirus (CD4 count <100/mm ³)
Idiopathic

What is the best approach to the evaluation of chronic diarrhea in the patient with HIV?

For patients who are on medication that can cause intractable diarrhea, one option is a trial of antidiarrheal medications (loperamide or atropine/phenoxylate either alone or in combination) and continuation of the previous antiretroviral regimen. If this does not work, another option is a trial off medication. If a patient is on ART, stop all medications for the 1-week evaluation

period. If there is a response, then a new agent can be substituted for the most likely causative drug, usually nelfinavir (NFV) or lopinavir plus ritonavir (LPV/r, or Kaletra). If there is no response when medications are stopped, then stool studies should be done. If the patient has a high CD4 cell count ($> 300/\text{mm}^3$), start with *C. difficile* toxin and *Giardia* antigen. If the CD4 cell count is low ($< 300/\text{mm}^3$), do a full workup with *C. difficile*, *Giardia* antigen, *Microsporidia*/*Cryptosporidia* assay, and modified AFB stain for cryptosporidia. If no organisms are identified, in patients with very low CD4 cell counts ($< 100/\text{mm}^3$) obtain blood cultures for *Mycobacterium avium*, and if these are negative, pursue lower endoscopy with particular emphasis on detection of cytomegalovirus on biopsy. In patients with higher CD4 cell counts, clinical followup and trials of antimotility drugs are a reasonable approach before pursuing endoscopy.

HEADACHE

What are the important causes of headaches in HIV-infected patients?

The causes of headache vary according to CD4 cell count. Patients with a CD4 count of > 300 cells/mm³ usually have headaches with common causes such as muscle tension, migraine, or drug side effect. Sinusitis is more frequent in patients with than without HIV and may cause headaches. In patients with low CD4 counts (< 200 cells/mm³) opportunistic infections (eg, Cryptococcal meningitis, toxoplasmic encephalitis) and malignancies (eg, CNS lymphoma) are important causes to consider.

How should you work up patients with headache?

Patients with CD4 counts of < 200 cells/mm³ should have a contrast head CT scan or MRI, followed by lumbar puncture if the scan does not reveal a cause. In a study of CT scans for evaluation of headaches in HIV-positive patients *all* cases with mass lesions or white-matter lesions occurred in patients with CD4 counts of < 200 cells/mm³. Serologic tests for cryptococcal antigen and *Toxoplasma* titers are helpful in patients with CD4 counts of < 200 cells/mm³.

KEY POINTS

Antiretroviral medications are a common cause of HIV-related symptoms. Some drugs can cause life-threatening reactions and conditions, including hypersensitivity reaction, pancreatitis, lactic acidosis, and Stevens-Johnson syndrome.

The CD4 cell count and viral load are important in symptom evaluation; symptoms associated with OIs in immunocompromised patients have other causes in patients with intact immune function.

Nausea and diarrhea, very common side effects of PIs, zidovudine, and didanosine, can be managed by switching drugs or with symptomatic therapy.

Pneumococcal pneumonia, the most common bacterial pneumonia in persons with HIV, can occur early in the course of the disease, before other manifestations of immune suppression. Sinus disease is also common in persons with HIV.

Chronic fatigue requires a careful assessment to differentiate psychological from physical etiologies so that the underlying cause can be addressed.

Painful neuropathy, frequently caused by antiretroviral medications, can also result from HIV disease. Treatment may include stopping a drug or treating with tricyclic antidepressants, narcotic analgesics, or gabapentin.

Dermatologic problems common in HIV disease include pruritus, crusted scabies, herpes zoster, molluscum contagiosum, and seborrheic dermatitis.

Common oral lesions include oral candidiasis, oral hairy leukoplakia, ulcers, and gingivitis. Common causes of oral ulcers are zalcitabine, HSV, and aphthous ulcers.

Wasting may have a treatable cause, but even nonspecific AIDS wasting can be treated with nutritional supplementation, appetite stimulants and antiemetics.

Myalgia, an especially common side effect of taking a PI and a statin, may require muscle biopsy and treatment with either an antibiotic or IVIG or steroids if the condition does not improve after stopping the implicated medications.

Headaches, common with HIV disease, may be due to a CNS infection or neoplasm if the CD4 count is less than 200 cells/mm³.

CASES**1.**

A 45-year-old HIV-positive man, last CD4 count 150 cells/mm³, comes to see you reporting aching in his right arm for 3 weeks. It began with only mild tenderness, but in the last week has become more painful and seems swollen. He is on ART with zidovudine (AZT), efavirenz (EFV), and nelfinavir (NFV). He is taking atorvastatin for hyperlipidemia. On physical exam, he is febrile, and his right arm is edematous and radiating heat without erythema. You obtain a CPK level which is normal.

Question: What is the most likely diagnosis?

Answer:

This patient has symptoms and signs of infectious myositis or pyomyositis, which usually develops insidiously over 2-3 weeks. In the first phase of infection, the involved muscle is tender with mild swelling. After 2-3 weeks a second phase manifests, usually with fever and edema, heat, and painful induration of the involved muscle. Erythema over the muscle is usually not seen. Laboratory values are usually notable for a lower than expected CPK but may include an elevated sedimentation rate and leukocytosis. Zidovudine-induced, statin-induced, and HIV-associated myopathy are less likely, as CPK would be elevated in these disorders, and the symptoms and signs in this patient are localized to one muscle group. Confirm the diagnosis of infectious myopathy with ultrasound or CT or MRI scanning, which will show a purulent abscess in the involved muscle. Blood cultures are not useful. If not treated, septic shock often ensues.

Question: What is the most likely cause?

Answer:

Most cases of infectious myositis are due to infection with *Staphylococcal aureus*. Other organisms reported have included *Streptococcus*, *Toxoplasma gondii*, cytomegalovirus, *Microsporidia*, *Cryptococcus neoformans*, *Mycobacterium avium intracellulare*, *Salmonella*, *Nocardia*, and gram-negative organisms.

2.

A 37-year-old man with Category 3 HIV disease (an AIDS indicator condition plus CD4 count nadir of <200 cells/mm³), last CD4 count 350 cells/mm³, comes to your office complaining of fatigue, nonspecific abdominal pain, nausea, and vomiting for the past 12 days. Review of systems is otherwise negative. He takes stavudine (d4T), zidovudine (AZT), and nelfinavir (NFV) as ART and fluoxetine for depression. On physical exam, his temperature is 37.9 degrees, respiratory rate is 25, abdomen is diffusely mildly tender to palpation, with increased tenderness in the right upper quadrant, no signs of jaundice, guaiac is negative.

Question: What is the differential diagnosis of causes related to ART?

Answer:

The differential diagnosis of ART-related etiologies in this case should include pancreatitis, based on symptoms of abdominal pain, nausea, and vomiting in a patient taking stavudine, although pancreatitis usually presents more acutely with more severe pain. Hepatitis should be considered with these symptoms in patients taking PIs. Lactic acidosis should always be suspected in a patient with these symptoms taking a nucleoside.

Question: What initial lab work should be ordered?

Answer:

Initial lab work may include CBC, basic metabolic panel, liver panel, amylase, lipase, lactate level, and coagulation studies. In the case of this patient, the lactic acid level was elevated. Further support for the diagnosis of lactic acidosis would include an increased anion gap, decreased bicarbonate, and elevated aminotransferases, lipase, amylase, CPK, and LDH.

Chapter 9:**Management of Opportunistic Diseases**

Constance A. Benson, MD

OVERVIEW*PNEUMOCYSTIS JIROVECI (CARINII) PNEUMONIA (PCP)**MYCOBACTERIUM AVIUM COMPLEX (MAC)**CYTOMEGALOVIRUS INFECTION (CMV)**CANDIDA ESOPHAGITIS**CENTRAL NERVOUS SYSTEM DISEASES**MYCOBACTERIUM TUBERCULOSIS**MALIGNANCIES**KEY POINTS**SUGGESTED RESOURCES***OVERVIEW****What are the major opportunistic diseases (ODs) in patients with HIV/AIDS?**

The diseases that occur as a result of HIV-related immunodeficiency include both opportunistic infections (OIs) and malignancies. The risk of developing an OI has declined dramatically with the widespread use of potent combination antiretroviral therapy (ART) (see Figure 9-1). The major OIs that occur in patients with HIV are *Pneumocystis carinii* pneumonia (the organism that causes human disease in PCP is now classified as *Pneumocystis jiroveci*, but PCP remains the conventional abbreviation in clinical use), tuberculosis, disseminated *Mycobacterium avium* complex (MAC) disease, cytomegalovirus (CMV) disease, *Candida* esophagitis, central nervous system (CNS) infections such as cryptococcal meningitis or *Toxoplasma* encephalitis, and cryptosporidiosis. While *Mycobacterium tuberculosis* is an infection that occurs in both immunocompetent and immunosuppressed patients, it remains one of the most common opportunistic co-infections in persons with HIV disease and is responsible for considerable morbidity and mortality worldwide. A host of other OIs may be seen less commonly or in patients in geographic areas where specific infections are endemic, eg, histoplasmosis in the central Midwest part of the U.S. or isosporiasis in South Florida and Puerto Rico.

**See Pocket
Guide Adult OI
Tables 1–6**

What factors are associated with higher risk of developing an OI?

OIs occur primarily in HIV-infected individuals who are not receiving either OI prophylaxis or ART (or who have not responded to it with an increase in their CD4 cell counts above the threshold that predicts risk of developing an OI). The principal risk of

Table 9-1. Risk Factors Associated with Development of Major Opportunistic Infections in HIV-Infected Individuals

Opportunistic Infection	CD4 Count Risk Threshold (cells/mm ³)	Other Risk Factors
<i>Pneumocystis carinii</i> pneumonia	≤200	Prior PCP Percent CD4 cells <14% Fever of unexplained etiology Presence of oral candidiasis
<i>Mycobacterium tuberculosis</i>	Any	PPD (tuberculin skin test) positive Exposure to an infectious contact
<i>Mycobacterium avium</i> complex	≤50	Prior respiratory or gastrointestinal colonization Prior OD High viral load (>10 ⁵ copies/mL)
Cytomegalovirus disease	≤50	Seropositive (IgG antibody to CMV) CMV viremia Prior OD High viral load (>10 ⁵ copies/mL)
Cryptococcal meningitis	≤50-100	Environmental exposure
Toxoplasmosis	≤100-200	Seropositive (IgG antibody to <i>T. gondii</i>)
<i>Candida</i> esophagitis	≤100	Prior <i>Candida</i> colonization High viral load (>10 ⁵ copies/mL)
Cryptosporidiosis	≤100	Environmental exposure (contaminated water, soil, animal exposure)
Histoplasmosis	≤100	Exposure (endemic areas – Midwest, Southeast U.S.)
Coccidioidomycosis	≤100	Exposure (endemic areas – Southwest U.S., Mexico)

Figure 9-1 Decline in the Incidence of Opportunistic Infections in HIV-1-Infected Individuals Receiving Potent Combination Antiretroviral Therapy

Source: Adapted from Palella FJ Jr, Delaney KM, Moorman AC, et al. Declining morbidity and mortality among patients with advanced human immunodeficiency virus infection. HIV Outpatient Study Investigators. *N Engl J Med*. 1998;338:853-860. Copyright 1998 by the Massachusetts Medical Society. Modified with permission (data extrapolated through 2000).

developing a specific OI is determined by the degree of immunosuppression, as measured by the CD4 cell count. The CD4 threshold of risk differs for each specific OI (see Table 9-1). It is uncommon for an OI to occur in HIV-infected individuals with CD4 cell counts above its threshold. For patients with the same CD4 cell count, those with high viral loads (plasma HIV RNA levels > 100,000 copies/mL) have a greater risk for developing an OD than those with a low viral load. Other factors that contribute to increased risk for ODs include previous exposure to or infection with a specific pathogen, prior occurrence of an OD, environmental exposure in the absence of a host response, and the use of ART.

What malignancies are associated with HIV infection?

The most common are Kaposi sarcoma (KS) and lymphomas. There is also a modest increase in the frequency of cervical cancer. In general, these 3 forms of malignancies correlate with immunosuppression, meaning the frequency increases with low CD4 cell counts, but the association is less strong than it is with the traditional AIDS-defining ODs. The rate of KS is approximately 20,000-fold higher with HIV infection compared with the general population, the frequency of non-Hodgkin lymphoma is 200- to 600-fold more frequent with HIV infection, and the rate of cervical cancer is 5-fold greater. Both lymphomas and KS are less frequent in the era of ART.

PNEUMOCYSTIS JIROVECI (CARINII) PNEUMONIA (PCP)

What are the clinical manifestations of PCP in patients with HIV infection?

PCP usually presents as an acute or subacute respiratory illness associated with fever, dyspnea, nonproductive cough, and fatigue. Physical findings on examination include tachypnea, fever, and inspiratory rales. Rarely, disseminated *Pneumocystis* occurs in HIV-infected patients with profound immunosuppression. Laboratory abnormalities associated with PCP include leukocytosis, hypoxemia, an elevated lactate dehydrogenase (LDH), and chest radiographic findings of localized or diffuse interstitial infiltrates. Occasionally, nodular or cavitory lesions may be observed. Pneumothorax in patients with advanced HIV is almost always associated with underlying *Pneumocystis* infection. The degree of hypoxemia is a measure of disease severity; severe PCP is defined as an arterial blood gas PO_2 of < 70 mm Hg with an arterial-alveolar O_2 gradient (AaO_2) of > 35 mm Hg. The diagnosis is confirmed by demonstrating the presence of *P. jiroveci* organisms in sputum or tissue samples obtained by sputum induction, bronchoscopy with bronchoalveolar lavage, or tissue biopsy. In the rare circumstance in which acute PCP presents very early with a normal chest radiograph, a gallium scan may demonstrate diffuse uptake in the lung compatible with an interstitial inflammatory process; however, this diagnostic test is nonspecific.

How should you manage PCP?

The preferred initial treatment for PCP in HIV-infected individuals is trimethoprim-sulfamethoxazole (TMP-SMX). Route of administration (oral or parenteral) is generally based on the severity of the disease. For those with severe PCP, parenteral therapy with trimethoprim 15-20 mg/kg and sulfamethoxazole 75-100 mg/kg, in 6-8 hour divided doses, is recommended. In addition, adjunctive treatment with corticosteroids, in a dose equivalent to 40 mg twice a day of prednisone for the first 5 days, followed by a tapering schedule of 40 mg/day for days 6-10, and then 20 mg/day to complete 21 days of therapy, should be initiated as soon as possible after starting treatment but preferably within the first 72 hours. For patients with mild to moderate PCP (PO_2 > 70 mmHg and AaO_2 gradient < 35 mmHg), oral treatment with 2 double-strength tablets of TMP-SMX every 8 hours is recommended. Gradual dose escalation may reduce the rate of occurrence of adverse reactions to TMP-SMX. For those unable to tolerate TMP-SMX, a number of alternative regimens are available for treatment (see Table 9-2).

Table 9-2. Alternative Regimens for the Treatment of *Pneumocystis carinii* Pneumonia in Those Unable to Tolerate Trimethoprim and Sulfamethoxazole

Disease Presentation	Alternative Treatment Regimens
Severe ($PO_2 < 70$ mm Hg; A-a O_2 gradient > 35 mm Hg)	Pentamidine 3-4 mg/kg/d IV IV Trimetrexate 45 mg/M ² /d IV + Leucovorin 0.5 mg/kg IV q6h Primaquine 15-30 mg/d (base) po + Clindamycin 600-900 mg IV q8h
Mild-moderate	Trimethoprim 15-20 mg/kg/d po + Dapsone 100 mg/d po q8h Primaquine 15-30 mg/d (base) p.o. + Clindamycin 300-450 mg po q6-8 hours Atovaquone suspension 750 mg po bid

What adverse reactions occur with treatment for PCP?

Patients should be carefully monitored for adverse reactions to treatment and response to therapy. Many patients will demonstrate acute worsening of signs and symptoms and have radiographic abnormalities in the first 3-5 days of treatment. This is the rationale for adjunctive corticosteroids in those with severe PCP. Five to 7 days of treatment may be required before a clinical response is observed, defined as a reduction in fever, and improvement in hypoxemia, respiratory symptoms, and radiographic abnormalities.

Adverse reactions to treatment are common in patients with AIDS. Many patients can be treated through these with supportive care and adjunctive medications to ameliorate symptoms; however, severe adverse reactions may require substituting alternative treatment regimens. Adverse effects most often associated with TMP-SMX include skin rash (rarely, Stevens-Johnson syndrome or toxic epidermal necrolysis), fever, hepatotoxicity, leukopenia, thrombocytopenia, renal dysfunction, and hyperkalemia. Major side effects of pentamidine include pancreatitis, renal dysfunction, dysglycemia, electrolyte abnormalities, and cardiac dysrhythmias. Toxicities commonly observed with trimetrexate include bone marrow suppression (particularly in those who are not treated with leucovorin), fever, rash, and hepatitis. Dapsone may cause fever, skin rash, and methemoglobinemia with hemolysis (particularly in those with G-6-PD deficiency). Primaquine also causes methemoglobinemia and

anemia, and clindamycin toxicities include nausea, rash, hepatitis, *Clostridium difficile* toxin-associated diarrhea, and rarely toxic megacolon. Atovaquone is associated with nausea, vomiting, diarrhea, rash, fever, and hepatitis.

Is secondary prophylaxis or maintenance therapy required after treatment of the acute episode of PCP?

All patients with a CD4 count of < 200 cells/mm³ should receive primary prophylaxis to prevent PCP. All patients who have experienced an episode of PCP should receive secondary prophylaxis to prevent a recurrence of PCP. Prophylaxis should be continued for life unless immune recovery occurs with ART. Prophylaxis for PCP should be discontinued if the CD4 count increases to levels of > 200 cells/mm³ and is sustained for at least 3 months. Prophylaxis should be restarted if the CD4 count declines to < 200 cells/mm³ or if PCP recurs regardless of CD4 cell count. Table 9-3 summarizes recommended and alternative regimens for primary and secondary prevention of PCP. It should be noted that TMP-SMX and dapsone plus pyrimethamine are also adequate for prevention of toxoplasmosis in susceptible individuals; dapsone alone, atovaquone alone, and aerosolized pentamidine are not.

Table 9-3. Recommended and Alternative Regimens for the Prevention of *Pneumocystis carinii* Pneumonia in Persons with HIV-1 Infection

Agents	Doses
Preferred	
Trimethoprim-sulfamethoxazole	One double-strength tablet po qd One single-strength tablet po qd
Alternative	
Trimethoprim-sulfamethoxazole	One double-strength tablet po 3x/week
Dapsone	100 mg po qd or 3x/week
Atovaquone	1500 mg po qd
Dapsone + pyrimethamine + leucovorin	200 mg + 75 mg + 25 mg po once/week
Aerosolized pentamidine (Respigard II)	300 mg once/month

MYCOBACTERIUM AVIUM COMPLEX (MAC)

What are the symptoms of MAC?

Disseminated *M. avium* complex disease is a multiorgan infection, usually occurring in patients with AIDS who have CD4 counts of < 50 cells/mm³ and principally affecting blood and lymphoreticular organs (lymph nodes, spleen, liver, bone marrow). Symptoms are nonspecific, usually consisting of high fevers, night sweats, weight loss, anorexia, and fatigue. Hepatosplenomegaly and less commonly central or peripheral lymphadenopathy are seen. Respiratory tract disease with interstitial or occasionally lobar or cavitary pulmonary infiltrates is a less common manifestation but may be seen in the context of multiorgan infection. Although there are no specific laboratory abnormalities associated with disseminated MAC, isolated elevation of alkaline phosphatase, marked anemia, and leukopenia or thrombocytopenia secondary to bone marrow infiltration may occur. The diagnosis is confirmed by the isolation of the organism from a biopsy or a sample obtained for culture from blood or involved tissue; 80%-85% of those with disseminated multiorgan disease have a positive mycobacterial blood culture. Blood cultures may require 7-10 days of incubation before growth of *M. avium* is detectable.

What is the recommended approach to treatment for disseminated MAC?

Disseminated MAC should be treated with a combination of clarithromycin 500 mg twice a day or azithromycin 500-600 mg/day plus ethambutol 15 mg/kg/day. The addition of rifabutin, 300-450 mg/day, as a third drug decreases the occurrence of relapse due to drug-resistant mycobacteria and is associated with improved survival in profoundly immunosuppressed individuals. This approach should be considered for those with very low CD4 cell counts who are not receiving or responding to ART. Treatment should be continued for life unless immune recovery occurs following ART that results in an increase in CD4 cells to levels > 100 /mm³ sustained for at least 6 months. In this setting, antimycobacterial therapy for those who have completed at least 12 months of effective treatment and have no signs or symptoms of disease may be discontinued. Therapy should be re-started if the CD4 cell count again declines to < 100 /mm³.

Primary prophylaxis to prevent disseminated *M. avium* complex disease is recommended for all HIV-infected adults and adolescents who have a CD4 count of < 50

cells/mm³. The preferred regimens are azithromycin 1200 mg once a week or clarithromycin 500 mg twice a day. Azithromycin is preferred when patients are receiving other drugs metabolized by the cytochrome P450 3A4 isoenzyme system, to avoid drug-drug interactions with clarithromycin. Rifabutin 300 mg/day is a second line alternative for prophylaxis, but is less effective than azithromycin or clarithromycin, and also must be monitored and dose-adjusted when used with other drugs metabolized by the cytochrome 3A4 isoenzyme.

CYTOMEGALOVIRUS (CMV) INFECTION

What are the major clinical syndromes associated with CMV infection in patients with HIV infection and how are they diagnosed?

Cytomegalovirus retinitis is the most common CMV-associated clinical syndrome observed in patients with AIDS. Patients with CMV retinitis involving peripheral portions of the retina may have no symptoms, or only minor visual complaints such as floaters or peripheral visual field defects. Central lesions may result in central scotomata and loss of central vision. The diagnosis is based on ophthalmologic examination demonstrating creamy white retinal exudates with hemorrhage; lesions obscure visualization of underlying vessels and other retinal structures. Retinitis is bilateral in up to 20% of patients. Disease progresses rapidly to blindness unless treated.

The second-most common clinical syndrome associated with CMV disease is gastrointestinal disease, either CMV colitis or CMV esophagitis. CMV colitis presents with fever, diarrhea, weight loss, and colon ulceration often with bleeding. Appropriate diagnosis usually requires colonoscopy and biopsy of ulcerations; tissue histopathology confirms the presence of characteristic intranuclear inclusions in mucosal cells or CMV antigens on immunohistochemical staining. CMV esophagitis presents with fever, odynophagia, and retrosternal pain. Exudative ulcers are demonstrated by esophageal endoscopic exam. Biopsy and histopathologic examination are necessary to confirm the diagnosis. Other less common CMV clinical syndromes in patients with AIDS are CMV encephalitis/encephalopathy, interstitial pneumonitis, hepatitis, and pancreatitis.

What is the recommended treatment for CMV retinitis?

CMV retinitis should be managed in cooperation with an experienced ophthalmologist. For patients with CMV retinitis that is immediately sight-threatening (central lesions approaching or involving the optic nerve or the fovea) systemic therapy with either IV ganciclovir or oral valganciclovir is the preferred initial treatment; many experts would also recommend surgical treatment with a ganciclovir intraocular implant (see Table 9-4). IV ganciclovir or oral valganciclovir is administered in an acute “induction” dose for 14-21 days, followed by a once-a-day chronic maintenance therapy dose. This approach is superior to other alternatives for preventing or delaying disease progression and provides systemic treatment to prevent other organ system involvement. If effective ART is not administered or patients remain immunosuppressed, the ocular implant should be replaced every 7-8 months. For patients with peripheral CMV retinitis that is not immediately sight-threatening, oral valganciclovir is the preferred treatment because of its ease of administration compared with other parenteral alternatives.

Table 9-4. Treatment Options for Cytomegalovirus Disease		
Drug	Induction dose	Maintenance therapy dose
Ganciclovir implant	N/A	Replace every 7-8 months
Oral valganciclovir	900 mg bid x 14-21d	900 mg/d
IV ganciclovir	5 mg/kg bid x 14-21d	5 mg/kg/d
Foscarnet	90 mg/kg bid x 14-21d	90 mg/kg/d
IV cidofovir (+ probenecid)	5 mg/kg once/w x 2 wks	5 mg/kg every 2 weeks

Chronic maintenance treatment for CMV retinitis should be continued for life unless ART results in a sustained increase in CD4 counts to levels of $> 100 \text{ cells/mm}^3$ for at least 6 months. If the CD4 count again declines to $< 100 \text{ cells/mm}^3$, maintenance therapy should be reinitiated. Immune recovery vitritis is a recognized complication of acute rises in CD4 cell counts and decreases in plasma HIV RNA levels following initiation of ART. It may be associated with an acute decrease in visual acuity due to the inflammatory cells clouding the vitreous fluid. Treatment with local corticosteroids while continuing anti-CMV therapy is associated with rapid improvement in most patients.

What is the recommended treatment for CMV gastrointestinal disease?

Treatment with either oral valganciclovir or IV ganciclovir or IV foscarnet is the recommended approach to treatment of CMV esophagitis or CMV colitis. In general, clinical symptoms and signs resolve within 2-3 weeks, and the suggested duration of treatment is 21-28 days, depending on the severity of the clinical presentation. Chronic maintenance treatment is not recommended unless recurrent episodes occur.

Strategies for treatment in those with relapse or progressive disease include either re-induction followed by maintenance therapy with the same agent, or switching to an alternative agent, a combination of 2 agents, or specifically for those with CMV retinitis, systemic therapy coupled with intravitreal injection. Recurrent or progressive disease should be managed by an expert.

CANDIDA ESOPHAGITIS

9

What are the presenting signs and symptoms of *Candida* esophagitis and how is it diagnosed?

The most common manifestations of *Candida* esophagitis are fever, anorexia, odynophagia, and retrosternal pain. Occasionally, nausea and rarely UGI bleeding from ulceration may occur. Esophagoscopy reveals adherent whitish plaques with shallow ulcers surrounded by erythematous borders. Invasive esophageal candidiasis can occur in the absence of oral candidiasis and must be distinguished from esophagitis due to CMV, herpes simplex virus, and aphthous esophagitis, all of which may be seen in patients with HIV infection. Isolation of *Candida* species in culture from a specimen obtained from the mucosal surface or the base of an ulcer provides supportive information but is not diagnostic, as colonization of mucosal surfaces with *Candida* is common in immunosuppressed individuals, particularly those who are receiving antibacterial therapies such as TMP-SMX for prophylaxis of PCP. The diagnosis can be confirmed by a biopsy of the ulcer and demonstration of yeast forms in tissue. The finding of oral candidiasis associated with esophageal symptoms has a positive predictive value of close to 100 % for *Candida* esophagitis. In patients with oral candidiasis and esophageal symptoms empiric therapy for *Candida* esophagitis should be given. If there is no clinical response after 5-7 days, upper endoscopy should be performed.

How do you treat *Candida* esophagitis?

Candida esophagitis requires systemic therapy. A number of options are available; however, the preferred treatment is fluconazole 100 mg/d for 14 days. Ketoconazole and itraconazole are effective alternatives, but drug-drug interactions with other anti-HIV therapies are common, and absorption is diminished in those with primary or drug-induced hypo- or achlorhydria. For patients unable to tolerate oral therapy, parenteral amphotericin B is effective. Chronic maintenance therapy or secondary prophylaxis is not recommended, but may be considered for patients who have frequent recurrent episodes. Chronic suppressive therapy with fluconazole has been associated with an increased risk of fluconazole (and other azole) resistant disease.

CENTRAL NERVOUS SYSTEM DISEASES

9

How do you distinguish cryptococcal meningitis from toxoplasmic encephalitis and CNS lymphoma in HIV-infected patients?

Patients with AIDS and a CD4 count of < 200 cells/mm³ may be at risk for developing CNS OIs such as cryptococcal meningitis or toxoplasmosis, as well as CNS lymphoma; most infections occur in those with CD4 counts of < 100 cells/mm³. Toxoplasmic encephalitis is rare in patients who are seronegative for *Toxoplasma gondii* (negative IgG antibody). CNS infection due to *T. gondii* and *Cryptococcus* spp. as well as CNS lymphoma may be relatively insidious in onset and associated with symptoms of fever, headache, and mental status changes. Focal neurological deficits and seizures are more likely to occur with toxoplasmic encephalitis and CNS lymphoma, although they sometimes occur in those with cryptococcal meningitis as well. The best diagnostic tests for a differential diagnosis of CNS disease are radiographic imaging of the CNS (with either a contrast-enhanced computerized tomographic [CT] scan or magnetic resonance imaging [MRI] scan) and lumbar puncture with cerebrospinal fluid (CSF) examination. Multiple localized enhancing lesions are common with toxoplasmic encephalitis; MRI is more sensitive than a CT scan for detecting these. CNS lymphoma is more likely to be associated with single and less commonly multiple space-occupying lesions, while cryptococcal meningitis is only rarely associated with space-occupying lesions. The CSF may demonstrate a normal to mild lymphocytic pleocytosis, normal to slightly elevated protein, and

normal to mildly decreased glucose for each, but a CSF cryptococcal antigen will be positive in 99%-100% of individuals with cryptococcal meningitis. Confirmation of the diagnosis of toxoplasmic encephalitis generally requires either demonstration of the organism in CSF by polymerase chain reaction (PCR) or culture (may not be routinely available) or a brain biopsy and demonstration of the organism in tissue. In practice, a trial of therapy is usually the first diagnostic tool for patients who have suggestive neuroimaging and positive *Toxoplasma* serology. Brain biopsy is reserved for patients who do not respond to empiric therapy. A brain biopsy is necessary to confirm the diagnosis of CNS lymphoma.

How do you treat cryptococcal meningitis?

Amphotericin B (0.7 mg/kg/d or the dose equivalent of liposomal or lipid complex amphotericin B), combined with flucytosine 100 mg/kg/day in divided doses, for the first 2 weeks, is the recommended initial treatment for cryptococcal meningitis. If a treatment response is evident this regimen is followed by fluconazole 400 mg/day for an additional 8 weeks or until CSF cultures are negative. The CSF opening pressure should always be measured when a lumbar puncture is performed, and if elevated above 200 mm H₂O, measures to reduce the pressure should be implemented. These may include serial lumbar puncture with CSF drainage sufficient to reduce the pressure by 50%, or in the case of severe increased intracranial pressure, the use of a lumbar drain or ventriculoperitoneal shunt. Secondary prophylaxis or chronic maintenance therapy with fluconazole, 200 mg/day, should be continued for life unless ART results in immune recovery. In this instance, maintenance therapy may be discontinued for those who have successfully completed a course of therapy for cryptococcal meningitis, have no residual signs or symptoms, and have a sustained increase in CD4 count to levels of > 100 -200 cells/mm³ for at least 6 months. Maintenance therapy should be re-initiated if the CD4 count again decreases to < 100 -200 cells/mm³.

MYCOBACTERIUM TUBERCULOSIS

Does the presentation of tuberculosis differ in HIV-infected and non-HIV-infected individuals?

Patients with HIV infection have an increased risk of infection with *Mycobacterium tuberculosis* following exposure to a person with active disease, and an

increased risk of developing active disease following an exposure. The risk of developing active disease is 30%-40% in the first year following a new exposure, and for HIV-infected patients with a positive tuberculin skin test related to prior TB exposure, the risk of developing active disease may be as high as 7%-8% per year.

For patients with a CD4 count of > 250 cells/mm³, the clinical signs and symptoms of tuberculosis are generally the same as for HIV-noninfected persons. Pulmonary tuberculosis accompanied by fever, cough, sputum production, chest pain, night sweats, weight loss, and anorexia is the principal manifestation. As immunosuppression progresses, the likelihood of extrapulmonary or disseminated (miliary) disease increases, although in most instances, pulmonary involvement is also present. Chest radiograph demonstrates lobar consolidation with cavitation, usually involving upper lobes, when reactivation tuberculosis is present. In those with primary tuberculous pneumonia, lower lobe infiltrates are more common. Hilar or mediastinal lymphadenopathy, pleural effusion, and interstitial infiltrates may be more common in patients with lower CD4 cell counts.

How do you diagnose TB in persons with HIV?

The diagnosis is the same as for non-HIV-infected persons, relying on a combination of compatible clinical signs and symptoms, radiographic findings, a positive tuberculin skin test, and a sputum sample demonstrating acid-fast bacilli (AFB). The diagnosis is confirmed by culture of the organism from sputum, blood, or other tissue. However, patients with advanced immunosuppression may have less extensive consolidation or lung cavitation, and sputum AFB smears may be positive in a lower proportion, because of the lower mycobacterial burden in the lung. Also, tuberculin skin tests are less likely to be positive because of impaired cell-mediated immune function. In immunocompromised patients, more aggressive means for making a diagnosis may be necessary, such as bronchoscopy with bronchoalveolar lavage or transbronchial biopsy to obtain samples for AFB smear and culture. Biopsy or culture of specimens obtained from extrapulmonary sites such as bone marrow and lymph nodes may be useful. All initial isolates of *M. tuberculosis* should be tested for susceptibility to antimycobacterial drugs, and susceptibility testing should guide the choice of initial treatment.

How do you treat tuberculosis in patients with HIV infection?

The recommendations for treatment of tuberculosis in patients with HIV infection depend in part on whether or not patients are on ART, and if they are, the specific antiretroviral regimens employed. All patients should receive directly observed therapy. See Adult OI Tables 2 - 7 for the recommendations for treatment of latent tuberculosis and drug-susceptible tuberculosis disease. Treatment with 4 drugs (isoniazid, rifampin or rifabutin, ethambutol, and pyrazinamide) is recommended either for the first 2 months of therapy or until results of susceptibility testing are available. If patients have drug-susceptible disease, 2 drugs, isoniazid and rifampin or rifabutin, should then be continued for at least 18 additional weeks. The continuation phase of therapy should be extended to 28 weeks (total duration of 9 months) for HIV-infected patients with advanced immunosuppression (CD4 count of < 100 cells/mm³) or who have an inadequate initial response or cavitary disease. Rifabutin should replace rifampin and doses should be appropriately adjusted for those who are receiving ART with agents likely to interact with rifamycins. The timing of initiation of ART and the most appropriate ART regimen for use in conjunction with antimycobacterial therapy remain controversial. Concurrent ART and tuberculosis treatment should be managed by an expert.

MALIGNANCIES

How does Kaposi sarcoma (KS) present?

KS is a poorly understood multicentric tumor of endothelial cells. The cause is human herpesvirus 8 (HHV-8), an infection that is more frequent in men who have sex with men. The mechanism of transmission is unclear, but the best evidence suggests transmission via saliva and semen. Many carry the virus with no consequences; it causes disease primarily in the presence of immunosuppression. The presentation is highly characteristic, with multiple purple to brown-black macules, or nodules that are usually asymptomatic and occur most frequently on the legs, face, oral cavity, or genitalia. The major complications include lymphedema (especially of the legs, face, and genitalia) and visceral involvement. Visceral involvement is common in the lung and GI tract, but is usually asymptomatic.

How do you diagnose KS?

The skin lesions are usually sufficiently characteristic to make this diagnosis clinically based on appearance, but a biopsy should be done when there is a need for confirmation. The differential diagnosis includes bacillary angiomatosis (which can be proven by biopsy with silver stain), hematoma, nevus, hemangioma, B-cell lymphoma, and pyogenic granuloma. When there is visceral involvement, the usual method used to establish the diagnosis is endoscopic examination to show typical mucosal surface lesions. With lung involvement, the x-ray is variable and may show nodules, infiltrates, effusions, and/or mediastinal/hilar nodes. Lung biopsy is often negative, but the bronchoscopic exam often shows a characteristic cherry-red bronchial nodule. With GI tract involvement, the usual screening test is stool for occult blood, and endoscopy is the usual method to make the diagnosis by showing a hemorrhagic nodule; the biopsy is often negative because of the submucosal location of the tumor.

9

How do you treat KS?

Many patients require no therapy except possibly makeup to cover the characteristic lesions. Topical treatment for skin involvement includes vinblastine, Panretin gel, liquid nitrogen, radiation, cryosurgery, or laser. Systemic chemotherapy is preferred when there is an extensive burden, defined as > 25 skin lesions, symptomatic visceral involvement, extensive edema, systemic (B) symptoms, or failure to respond to local treatment. The favored forms of chemotherapy are liposomal anthracyclines (Doxil or DaunoXome) or, less frequently, paclitaxel (Taxol). Immune reconstitution with ART is associated with a substantial reduction in the frequency of KS and a therapeutic improvement in those who already have these lesions. It should be noted that there is no cure for KS, and the goal of local therapy or systemic chemotherapy is to reduce tumor burden and relieve symptoms.

What lymphomas are associated with HIV infection?

The subtypes of lymphomas associated with HIV infection include B-cell large cell lymphoma, primary body effusion lymphomas, B-cell CNS lymphoma, Burkitt lymphoma, plasmablastic lymphoma, and Hodgkin disease. The most common is non-Hodgkin lymphoma.

What are the symptoms of non-Hodgkin lymphoma (NHL)?

Compared with the general population, patients with this complication have high rates of stage IV disease with systemic (B) symptoms and sparse node involvement. Common symptoms are fever of unknown origin, liver dysfunction, marrow suppression, lung disease (effusions, multinodular infiltrates, mass lesions, diffuse infiltrates, and/or hilar adenopathy), GI involvement (any level with pain and weight loss), and CNS with mass lesions.

How do you diagnose lymphomas?

Fine needle aspirates of enlarged nodes are helpful if positive, but false negatives are common. Biopsy is usually necessary.

How are lymphomas treated and what should be expected?

The usual treatment is chemotherapy with cyclophosphamide, doxorubicin, adriamycin, vincristine, and prednisone (CHOP); methotrexate, bleomycin, doxorubicin, cyclophosphamide, vincristine, and dexamethasone + G-CSF (M-BACOD); or etoposide, prednisone, vincristine, cyclophosphamide, and doxorubicin (EPOCH). Response rates are 50 % -60 %, but the long-term prognosis is poor unless there is immune reconstitution with ART.

How do you diagnose and treat primary CNS lymphomas?

The typical presentation is confusion, headache, memory loss, focal neurologic changes, usually without fever and usually with a CD4 cell count of < 50/mm³. The MRI shows single or multiple lesions that are isodense or hypodense. The differential diagnosis is primarily toxoplasmosis. Factors suggesting CNS lymphoma are the characteristic MRI findings, negative *T. gondii* serology, failure to respond to empiric treatment of toxoplasmosis within 1-2 weeks, thallium single-photon emission computed tomography (thallium SPECT) scan results, and CSF positive by polymerase chain reaction (PCR) for Epstein Barr virus (EBV) DNA. The definitive diagnosis can be made by stereotactic brain biopsy. Treatment is radiation and corticosteroids, often combined with chemotherapy. The prognosis is poor without immune reconstitution.

KEY POINTS

The risk of persons with HIV developing specific ODs is related to the degree of their immunosuppression, as measured by the CD4 cell count.

All patients with a CD4 count of < 200 cells/mm³ should receive primary prophylaxis to prevent PCP. PCP usually presents as an acute or subacute respiratory illness associated with fever, dyspnea, nonproductive cough, and fatigue.

All patients with a CD4 cell count of < 50 /mm³ should receive primary prophylaxis to prevent disseminated MAC. Disseminated MAC is a multiorgan infection that usually occurs at CD4 cell counts of < 50 /mm³. Symptoms are nonspecific, usually consisting of high fever, night sweats, weight loss, anorexia, and fatigue.

CMV retinitis, the most common CMV-associated clinical syndrome, progresses rapidly to blindness unless treated. CMV gastrointestinal disease, either colitis or esophagitis, presents with fever, diarrhea, weight loss, and colon ulceration often with bleeding.

The most common manifestations of *Candida* esophagitis are fever, anorexia, odynophagia, and retrosternal pain. Treatment requires systemic therapy.

Patients with a CD4 count of < 200 cells/mm³ are at risk for developing CNS ODs such as cryptococcal meningitis or toxoplasmosis, as well as CNS lymphoma. After initial treatment, chronic maintenance therapy should be continued for life unless immune recovery occurs as a result of ART.

Patients with HIV are at increased risk of infection with *Mycobacterium tuberculosis* and of developing active tuberculosis. Immunosuppression increases the likelihood of extrapulmonary or disseminated (miliary) disease. Because tuberculin skin tests are less likely to be positive in immunocompromised patients, more aggressive means for making a diagnosis may be necessary.

All HIV-infected patients with active tuberculosis should receive directly observed therapy. Treatment of tuberculosis in persons with HIV co-infection should be managed by an expert because treatment is complex and the infection is potentially life-threatening.

The major complications of KS, a multicentric tumor of endothelial cells, include lymphedema (especially of the legs, face, and genitalia) and visceral involvement. Extent of involvement determines whether treatment is required and whether it is topical or systemic.

The most common lymphoma associated with HIV is non-Hodgkin lymphoma. Common symptoms are fever of unknown origin, liver dysfunction, marrow suppression, lung disease, GI involvement (any level with pain and weight loss), and CNS mass lesions.

Chapter 10:

Abnormal Laboratory Values in HIV Disease

*David H. Spach, MD**John G. Bartlett, MD**COMMON ABNORMALITIES**HEMATOLOGIC COMPLICATIONS**LIVER DISEASE**RENAL DISEASE**KEY POINTS**SUGGESTED RESOURCES**REFERENCES*

COMMON ABNORMALITIES

What are some common abnormalities found when screening asymptomatic patients?

Some disease processes associated with HIV can be first identified in laboratory screening tests while patients are still asymptomatic. The primary care provider plays an essential role in monitoring for laboratory abnormalities, whether these abnormalities result from diseases or from antiretroviral therapy (ART). Table 10-1 lists screening tests that assist in promptly identifying and managing medical problems in asymptomatic patients. Abnormal laboratory tests occur more frequently in HIV-infected persons because 1) HIV is a multi-system disease, 2) HIV causes immune suppression that may result in opportunistic infections and tumors that involve multiple systems, 3) the drugs used routinely in management can cause adverse reactions that affect multiple systems, and 4) patients at high risk for HIV are often at high risk for other medical conditions.

What constitutes a positive PPD in HIV disease?

Induration of 5mm or more at 48-72 hours constitutes a positive PPD test for tuberculosis in a person with HIV. A PPD should be done at baseline and repeated annually if the initial test was negative and the patient is in a high-risk category for tuberculosis. The test has a relatively high rate of false-negative results in patients with a CD4 cell count of $< 200/\text{mm}^3$. Therefore, if the initial test was done when the CD4 cell count was low, it should be repeated when the CD4 cell count increases to $> 200/\text{mm}^3$ following ART. Patients with a positive PPD test need a chest x-ray and evaluation for active disease before isoniazid (INH) prophylaxis is initiated.

What is the role of a baseline chest x-ray?

A chest x-ray is recommended for detection of latent or active tuberculosis and other lung diseases and as a baseline for patients who are at high risk for pulmonary disease, especially bacterial pneumonia, *Pneumocystis* pneumonia, and tuberculosis. The x-ray is particularly important for any patients with a positive PPD skin test.

What do you do when a patient has a positive VDRL or RPR?

The standard screening tests for syphilis in sexually active patients are the nontreponemal tests, the VDRL or RPR. Any positive screening test should be confirmed with a fluorescent treponemal antibody absorbed test (FTA-ABS). Confirmation is particularly important because for biologic false-positive tests are more common with injection drug use, pregnancy and HIV infection. With a positive test, primary, secondary, and early latent syphilis (less than 1 year) should be treated with a single injection of benzathine penicillin (2.4 million units IM) once, late latent syphilis (more than 1 year or of unknown duration) should be treated with 3 doses at 1-week intervals of benzathine penicillin (2.4 million units IM with each dose), and neurosyphilis should be treated with aqueous penicillin G, 18-24 million units/day IV for 10-14 days. Patients who are not pregnant and do not have neurosyphilis who cannot receive penicillin may be treated with doxycycline (100 mg po bid) given for 14 days for primary, secondary, and early latent syphilis and for 28 days for late latent syphilis. Because the efficacy of doxycycline is not well established, patients who received doxycycline need extra followup. With penicillin allergy and neurosyphilis or pregnancy, there should be penicillin skin testing; if negative, penicillin is given, and if positive the patient should undergo penicillin desensitization followed by penicillin treatment. A lumbar puncture is recommended for any patient with neurologic signs or

Table 10-1. Abnormalities Identified in Screening Tests

Test	Implications of abnormal findings
CBC	Anemia – usually due to HIV or zidovudine Neutropenia – usually due to HIV or drugs, especially ganciclovir and zidovudine Thrombocytopenia – usually due to HIV
Alanine aminotransferase (ALT)	Usual causes of elevated levels are chronic hepatitis (HBV, HCV), alcoholic liver disease, or adverse drug reactions.
Creatinine	Usual causes of renal failure are common medical conditions in this population (hypertension, heroin use, diabetes, IgA nephropathy, etc), adverse reactions to drugs (including indinavir), or HIV nephropathy
Toxoplasma titer	Positive results in 10% of adults in US, higher in other countries. This indicates latent disease with possible activation if CD4 count < 100/mm ³
VDRL or RPR	If positive, need confirmatory FTA-ABS
Screen for <i>N. gonorrhoeae</i> and <i>C. trachomatis</i>	Positive results indicate high-risk behavior and need for treatment
PPD	Induration ≥5mm indicates need for evaluation for active TB and, if negative, INH treatment
Chest x-ray	Ghon complex, adenopathy, or evidence of chronic lung disease
CD4 count	Barometer of immune function
Viral load	Indicates rate of progression of untreated HIV and response to HAART
Hepatitis panel	
Anti-HCV	Positive results ± confirmatory HCV RNA usually indicates chronic HCV infection
Anti-HBc or Anti-HBs serology	Positive results indicate prior antigenic experience with HBV
HBsAg	Indicates HBV; if positive >6 months indicates chronic HBV
Anti-HAV	Positive test indicates prior antigenic experience due to HAV infection or vaccination

symptoms, patients with therapeutic failure (persistent clinical evidence of syphilis or a sustained 4-fold increase in titer), and all patients with latent syphilis, which includes latent syphilis of unknown duration. Some experts have recommended performing lumbar puncture for all HIV-infected persons with syphilis, regardless of the stage of syphilis. With respect to followup, the nontreponemal test should be done at 3, 6, 9, 12, and 24 months.

HEMATOLOGIC COMPLICATIONS

What are the common causes of anemia?

Anemia, which is common in HIV disease, is usually caused by 1) late-stage HIV, presumably due to viral infection of progenitor cells, 2) associated complications that infiltrate the marrow, 3) nutritional deficiency, 4) adverse drug reactions, or 5) iron deficiency. The findings and management are summarized in Table 10-2.

What causes thrombocytopenia?

Most cases are attributed to HIV infection of the multi-lineage hematopoietic progenitor cells in the marrow. This HIV-associated thrombocytopenia can occur in relatively early HIV, but is more common with late-stage disease. Although zidovudine (AZT) may cause anemia or neutropenia, early studies showed that it reverses thrombocytopenia. For patients not receiving ART, the preferred treatment for HIV-associated thrombocytopenia is to promptly initiate ART. The decision to intervene with intravenous immune globulin (IVIG) or corticosteroids is driven by signs or symptoms of active bleeding, the need to do an invasive procedure, or a lack of response to ART.

What causes neutropenia?

Neutropenia is most commonly related to drug therapy, especially with zidovudine (AZT), ganciclovir, or valganciclovir, but it can also be caused by late-stage HIV or marrow-infiltrate disease. With absolute neutrophil counts of < 500/mm³ it is important to monitor for infection and intervene with empiric antibiotics rapidly when appropriate. Address neutropenia by discontinuing the implicated agent or by providing cytokine therapy using G-CSF or GM-CSF.

Table 10-2. Causes of Anemia in HIV				
Cause	Cells	Reticulocyte count	Other tests	Treatment
HIV disease	Normal	Low	Low erythropoietin level	ART Recombinant human erythropoietin (rHU EPO)
Tumors and infectious diseases	Normal	Low	Positive identification of underlying disease (eg, lymphoma, KS, MAC, TB, CMV, histoplasmosis)	Treatment of underlying disease
Parvovirus	Normal	0	Positive serology & PCR for parvovirus	IVIG
Nutritional deficiency	MCV > 100 (but not with AZT or d4T)	Low	Low B12/folate level	Folic acid or cobalamin
Iron deficiency	MCV low	Low	Blood loss, low Fe, transferrin	Treatment of cause Iron therapy
Drug (toxicity)	Normal	Normal	Identify offending drug (zidovudine, ganciclovir, TMP-SMX, etc.)	Stop implicated agent
Drug (hemolysis)	Normal	Increased	Identify offending drug (dapsone, ribavirin); increased LDH, indirect bilirubin/low haptoglobin	RBC therapy Stop drug

LIVER DISEASE

What are the common causes of abnormal liver function tests?

Abnormal screening liver function tests reflect associated conditions (hepatitis B or C viral infection as discussed below), adverse drug reactions, alcoholic hepatitis, and HIV-related complications, including Kaposi sarcoma, lymphoma, *Mycobacterium avium* complex (MAC), tuberculosis, cytomegalovirus (CMV), or histoplasmosis. Start by defining the process as cholangiopathic or hepatocellular based on results of liver function tests (LFTs).

- AIDS cholangiopathy typically presents with right upper quadrant pain, high alkaline phosphatase, characteristic duct dilatation on ultrasound, and a CD4 cell count of < 100/mm³. The usual causes are infection (microsporidia, cytomegalovirus, or cryptosporidia) or idiopathic. Most cases respond temporarily to endoscopic biliary sphincterotomy.
- Hepatocellular injury is much more common and is caused by diverse conditions, including 1) hepatitis viruses, 2) alcoholic hepatitis, 3) cirrhosis, and 4) adverse drug reactions. All antiretroviral drugs are potentially hepatotoxic, but the indications for intervention vary depending on the mechanism and severity (see Table 10-3).

When should you stop antiretroviral drugs because of hepatotoxicity?

There are 3 situations in which antiretroviral drugs should be stopped because of hepatotoxicity (see Table 10-3):

- **Hypersensitivity syndrome (drug rash with eosinophilia and systemic symptoms [DRESS])**
The hypersensitivity reaction seen with abacavir (ABC) and nevirapine (NVP) is characterized by fever, eosinophilia, rash, and GI complaints, and usually occurs during the first 6 weeks of therapy. This situation should be urgently managed, and deaths have been reported.
- **Symptomatic lactic acidosis** This is ascribed to drugs in the NRTI class, which should be stopped.
- **Increased transaminase levels** This is ascribed to the PIs and the NNRTIs nevirapine (NVP) and efavirenz (EFV). The most serious reactions have occurred with nevirapine-associated hepatotoxicity. The mechanism is unclear, and treatment interruption is often considered necessary only when clinical hepatitis occurs.

Do patients infected with HIV have increased rates of hepatitis B virus (HBV) and hepatitis C virus (HCV) infection, and does coinfection affect the natural progression of HIV?

HIV-infected patients have higher rates of chronic HBV infection after exposure to HBV. With HBV coinfection, there is a higher frequency of evidence for HBV replication (higher frequency of HBeAg and higher levels of HBV DNA) and higher rates of HBV-associated liver disease. It is not known if HBV alters the natural history of HIV, but coinfection is associated with increased frequency of hepatotoxicity with ART. The relationship with HCV is similar. HIV coinfection is relatively common, a frequency of about 30% in all HIV-infected patients and as many as 85% in those with injection drug use as the risk factor. HIV has an

Table 10-3. Antiretroviral Drugs That Cause Abnormal Liver Function

Drugs	Frequency of abnormal liver function	Comment
NRTIs		
stavudine (d4T) didanosine (ddI) zidovudine (AZT)	8%-16%	Mitochondrial toxicity; risk highest with stavudine and didanosine together; risk with zidovudine lower than stavudine
lamivudine (3TC) emtricitabine (FTC) abacavir (ABC) tenofovir (TDF)		Rare cause of mitochondrial toxicity
abacavir (ABC)	4%-6%	Hypersensitivity-DRESS syndrome
lamivudine (3TC) emtricitabine (FTC) tenofovir (TDF)		Withdrawal of these drugs may cause HBV exacerbation
NNRTIs		
nevirapine (NVP) efavirenz (EFV)	8%-16%	Mechanism not known
nevirapine (NVP)	Rare	Hypersensitivity – DRESS syndrome
PIs		
All PIs	4%-6%	Mechanism unknown
indinavir (IDV) atazanavir (ATV)	10%-20% 30%-50%	Elevated indirect bilirubin; usually asymptomatic

important effect on promoting more rapid progression of HCV, but it is not clear whether HCV adversely affects the rate of HIV progression. Many studies have shown that HCV coinfection is a poor prognostic factor in the ART era, but this may well reflect the influence of injection drug use rather than HCV-associated liver disease.

Who should you test for HBV and HCV, and what tests should you perform?

At entry into health care, all patients with HIV should be screened for antibodies to HBV and HCV, as well as HBV antigen (see Table 3-1 in Chapter 3). Knowledge of the HBV and HCV status can provide valuable information for those persons with abnormal LFTs. In addition, testing can identify patients who are seronegative for HBV who can receive HBV vaccination. Some patients with HIV have negative HBV surface antibody titers, negative HBV antigen, but positive core HBV antibody. If they have not recently acquired HBV, this serologic pattern suggests a low-level persistent immune response to HBV; these individuals probably have adequate protection to prevent reinfection, but no studies have been done to accurately evaluate their risk. Moreover, no formal recommendation exists to provide a booster HBV vaccine to those persons with negative HBV surface antibody titers but positive HBV

core antibody. Serologic testing using an enzyme immunoassay for HCV is the preferred screening test for HCV, and those with positive tests should have a confirmatory test with either the RIBA assay or a test that detects HCV RNA. Several studies have shown that some persons coinfecting with HIV and HCV, particularly those with severe advanced HIV disease, can have a negative HCV antibody test on the enzyme immunoassay, but a repeatable positive HCV RNA test. Thus, some experts would recommend doing an HCV RNA assay on a person with a negative HCV enzyme immunoassay if HCV infection is suspected (usually because of abnormal LFTs).

How should you treat HBV in persons coinfecting with HIV?

All coinfecting patients should be considered for HBV therapy. Recommendations are somewhat arbitrary, but most recommend therapy with an alanine aminotransferase (ALT) at least 2 times the upper limit of normal (ULN), evidence of active HBV replication (e antigen or HBV DNA level of $> 10^5$ c/mL), and preferably with histologic evidence of moderate disease activity or fibrosis. There are 2 major forms of treatment and neither is “preferred.” One form is interferon- α -2a or α -2b given subcutaneously 3 times a week or once a day for 24-48 weeks. Many authorities now

recommend pegylated interferon with subcutaneous injections once a week, although there are few published studies with this formulation for treatment of HBV. The second form of therapy is nucleosides and nucleotides with activity against HBV. This gets tricky because many of these agents are active against HIV as well, and there are variable rates of HBV resistance. Lamivudine (3TC) is highly active against HBV but is associated with high rates of HBV resistance, up to 90% at 4 years. The same applies to emtricitabine (FTC). Alternatives are adefovir dipivoxil (trade name Hepsera), which is used in a dose that is probably not active against HIV but is highly active against HBV, has good activity against lamivudine-resistant strains, and has low rates of resistance by HBV during treatment. Tenofovir (TDF) has the same attributes as adefovir but is also highly active against HIV. It should be emphasized that the rationale for treating HBV is to reduce viral replication and hepatic disease progression but that cure is rarely achieved. Other standard components of therapy in patients coinfecting with HBV are 1) advising them to avoid or limit alcohol consumption, 2) teaching them appropriate precautions to prevent transmission of both viruses, and 3) administering hepatitis A vaccine if they are susceptible.

Who should receive HBV vaccine?

All HIV-infected persons with no evidence of HBV infection should receive this vaccine, although the response rates are related to age (decreased with increasing age) and with CD4 cell counts (responses decrease with lower counts). The standard is 3 doses followed by a measurement of HBs antibody levels about 1 month after the third dose. If the level is < 10 IU/mL the 3-dose series should be repeated. If the patient does not respond to the second series, no further vaccinations are currently recommended and the patient is considered a “non-responder.”

How do you treat patients with HCV coinfection?

Patients coinfecting with HIV and HCV should be 1) advised to avoid or limit alcohol consumption, 2) counseled to use appropriate precautions to prevent transmission of both viruses, and 3) given hepatitis A and B vaccine if they are susceptible. The prevention message should emphasize that the major route of transmission is by shared needles; the risk of transmission of HCV perinatally or with sexual contact is substantially less than that for HIV or HBV.

With regard to treatment of HCV, the goal is for cure, something that cannot be achieved with HIV or, to a large extent, with HBV. All patients with HCV should be evaluated for HCV therapy. Standard indications in the absence of HIV infection are chronic HCV, detectable HCV-RNA, and a liver biopsy showing bridging or portal fibrosis. The ALT levels may be elevated, but this finding is variable and does not indicate the severity of HCV-associated liver disease and is considered nonspecific. The liver biopsy is important for HCV therapeutic decisionmaking, but it is indicated only if the patient is considered a candidate for treatment based on multiple variables including the severity and stability of HIV, other comorbidities, probability of adherence, and contraindications for interferon. The standard treatment is pegylated interferon plus ribavirin for 48 weeks, regardless of the genotype. There is limited long-term experience with this treatment in patients with HIV coinfection, but it appears that the rate of a sustained virologic response as indicated by negative HCV DNA levels at 6 months post-therapy are significantly lower compared to those who are seronegative for HIV. This particularly applies to genotype 1, which accounts for the majority of cases. It also appears that the optimal response occurs when patients have relatively high CD4 cell counts, so this treatment is often preferred for those in early stage disease and for those who have responded to ART.

What HCV therapy should you use for persons coinfecting with HIV and HCV?

Currently, there are limited published data regarding various HCV treatment regimens for persons coinfecting with HIV. Trials have generally shown relatively poor responses to interferon monotherapy. Based on rapidly accumulating data from trials that have not included HIV-infected persons, pegylated interferon (pegylated interferon-alpha-2a or pegylated interferon-alpha-2b) plus ribavirin is now the standard of care. (For treatment guidelines, refer to Suggested Resources.) In addition, several series involving persons coinfecting with HIV and HCV have suggested better sustained viral response rates with pegylated interferon plus ribavirin than with older regimens. For persons not infected with HIV, recent guidelines have recommended that those with genotypes 2 or 3 receive 24 weeks of therapy and those with genotypes 1 and 4 receive 48 weeks of therapy. The optimal duration of therapy for persons coinfecting with HIV and HCV remains unknown, but most trials have used 48 weeks, regardless of genotype.

Are there special considerations regarding adverse effects of HCV therapy in persons coinfecting with HIV?

Treatment with interferon (or pegylated interferon) and ribavirin has significant possible adverse effects, including reactions at injection sites, bone marrow suppression, thyroid dysfunction, neuropsychiatric symptoms, and birth defects. Because interferon may cause significant leukopenia, CD4 cell counts should be monitored, and patients should be warned that CD4 counts might transiently decline while they are receiving interferon. Persons coinfecting with HCV and HIV may suffer drug interactions and toxicities. Ribavirin causes anemia; because this complication occurs more frequently when ribavirin is combined with AZT, either this combination should be avoided or more frequent use of erythropoietin should be anticipated. Ribavirin may enhance intracellular didanosine (ddI) levels and augment toxicity of the drug resulting with higher rates of pancreatitis and lactic acidosis; didanosine should not be given with ribavirin.

Is liver transplantation an option for HIV-infected persons?

Liver transplantation is an option in some transplant centers that combine expertise in HIV management with the transplant service. In a study at 5 institutions of 24 HIV-infected patients survival rates were similar to rates in patients without HIV infection (Ragni et al, 2003). Nevertheless, management is complicated by problems of drug interactions between ART and the standard immunosuppressive agents, poor tolerance of ART after liver transplantation, and relatively high frequency of acute graft rejection. As in patients without HIV infection, the prognosis with liver transplantation is poorer when liver disease is caused by HCV. The recommendation at present is to give the highest priority in patients with HIV infection to those without HCV and to those receiving and tolerating ART who have achieved HIV virologic control and immune reconstitution.

RENAL DISEASE

What are the possible causes of abnormal renal function tests?

Renal function is important to monitor because abnormal renal function may require altering drug dosage regimens, and it is important to know the cause of the abnormality. In general, renal dysfunction in patients with HIV infection can be caused by adverse drug reactions, HIV-associated nephropathy, and non-HIV-related conditions. The multitude of conditions that are not necessarily complications of HIV infection or its treatment include hypertension, glomerulonephritis, and heroin use.

For the patient on ART, what drugs are most likely to cause renal disease?

Adverse drug reactions that cause renal disease are most commonly associated with aminoglycosides, amphotericin, foscarnet, and cidofovir. The antiretroviral agent that is most frequently implicated is indinavir (IDV), which may cause indinavir crystals in the collection system, resulting in nephrolithiasis. The presentation may be renal colic, or it may be asymptomatic with evidence of crystals on urinalysis. In addition, indinavir can cause a crystal-induced nephropathy. On rare occasions, tenofovir (TDF) may cause renal insufficiency.

What are the cause and implications of HIV-associated nephropathy?

HIV-associated nephropathy, which is apparently the result of HIV infection of the kidney, presents as large, echogenic kidneys on ultrasound, nephrotic-range proteinuria, and rapidly progressing renal failure. This may occur at any stage of HIV but is most common as a late complication. Pre-ART studies show benefit from treatment with ACE inhibitors and possibly with corticosteroids; more recent studies show anecdotal evidence of a sometimes dramatic response to ART, but data from controlled trials are not available. Renal biopsy is necessary to establish the diagnosis. For patients with end-stage renal disease, there is increasing interest in and experience with renal transplantation. The usual criteria are irreversible renal failure combined with HIV response to ART resulting in virologic control and a CD4 cell count of $> 200/\text{mm}^3$.

KEY POINTS

Laboratory tests are frequently abnormal in HIV disease because 1) HIV is a multi-system disease, 2) HIV causes immune suppression that may result in opportunistic infections and tumors, 3) treatment has many potential adverse reactions affecting multiple systems, and 4) patients with HIV are often at high risk for other medical conditions.

Hematologic complications include anemia, neutropenia, and thrombocytopenia. The most common causes of anemia and neutropenia are either drug toxicity or the direct effect of HIV on progenitor cells; the cause of thrombocytopenia is most commonly a direct effect of HIV.

Liver disease is common because of high rates of concurrent viral hepatitis, especially HCV, and because all antiretrovirals are potentially hepatotoxic.

Abnormal renal function is usually a direct effect of HIV infection of the kidneys resulting in a rapid progression with nephrosis and end-stage renal disease; abnormal renal function from any cause is important to know about because it requires altering dose regimens for nucleosides.

Chapter 11:**Postexposure Prophylaxis**

*Renslow Sherer, MD
Bruce D. Agins, MD, MPH
Caroline J. Teter, PA-C, MPH*

*OVERVIEW**INTERVENTIONS FOR PEP IN HEALTH CARE SETTINGS**INTERVENTIONS FOR NONOCCUPATIONAL PEP (NPEP)**HIV PEP TREATMENT RECOMMENDATIONS**HEPATITIS PEP TREATMENT RECOMMENDATIONS**KEY POINTS**SUGGESTED RESOURCES**REFERENCES**CASES***OVERVIEW****What is postexposure prophylaxis (PEP)?**

Postexposure prophylaxis (PEP) prevents or aborts transmission of HIV with rapid initiation of short-term antiretroviral therapy (ART) following occupational or nonoccupational exposure. PEP should be considered in all health care personnel (HCP) and non-HCP exposed to blood or potentially infectious body fluids via percutaneous, mucous membrane, and nonintact skin exposures, injection drug use, intentional or unintentional sexual exposures, and human bites. Hepatitis B infection may be prevented following administration of immune globulin and vaccination when indicated.

PEP policies should be instituted in all health care settings. The essential elements include:

- Written protocols for documenting and managing exposures
- Assessment, counseling, and intervention immediately after any exposure
- Rapid access to medications and/or immunization, if indicated

What do we know about the effectiveness of PEP for HIV?

Retrospective case-control studies support the efficacy of PEP for occupational exposure to HIV, and 4 factors are associated with increased transmission rates: 1) deep injury, 2) visible blood on device, 3) needle placement in artery or vein, and 4) late stage HIV disease in source (this risk factor was identified prior to viral load testing, thus high viral load is likely an independent risk factor). Evidence of the effectiveness of nonoccupational PEP comes from small observational human studies,

extrapolation of data showing the interruption of maternal-infant transmission, and animal studies showing some degree of protection from genitally and intravenously acquired HIV. Even with optimal implementation, the degree of protection afforded by PEP is incomplete. Studies of PEP have demonstrated the greatest reduction in HIV transmission when antiretroviral medications are administered immediately after exposure to HIV-infected blood and body fluids. The efficacy of PEP is diminished after 36 hours and is minimal after 72 hours.

What do we know about the effectiveness of PEP for hepatitis B and C?

Hepatitis B transmission can be prevented through administration of immune globulin and hepatitis B vaccine. PEP for hepatitis C virus (HCV) has thus far proven to be ineffective.

What body fluids are infectious for HIV, HBV, HCV?

Blood is the most infectious body fluid. In the health care setting, cerebrospinal, synovial, pleural, peritoneal, pericardial, and amniotic fluids are all considered potentially infectious, although the only documented cases of occupational HIV infection have been with blood, body fluids with visible blood, or HIV viral cultures. Unless there is visible blood with the exposure, saliva, nasal discharge, tears, sweat, vomit, urine, and feces are not infectious. Semen and vaginal secretions are infectious for HIV, HBV, and HCV in the setting of nonoccupational exposure.

INTERVENTIONS FOR PEP IN HEALTH CARE SETTINGS

What types of exposures merit consideration of PEP in health care personnel (HCP)?

HCP are at increased risk from percutaneous, mucous membrane, and nonintact skin exposures to bloodborne pathogens, including hepatitis B, hepatitis C, and HIV. The risk of transmission is dependent on many factors, including the type, amount, route, and severity of exposure, the infection status of the source, and the HBV, HCV, and HIV immunity of the exposed worker (see Tables 11-1 and 11-2).

Table 11-1. High-risk Occupational Exposures

Exposures with higher risk of transmission of bloodborne pathogens
Deep percutaneous injury
Injury with a hollow-bore blood-filled needle
Exposure to blood of a patient in an advanced disease stage (high viral load)
Exposure to a large quantity of blood or body fluids

Table 11-2. Exposures with Low Risk of Transmission of Bloodborne Pathogens

Exposures with low risk of transmission (PEP not recommended)
Blood or fluid splashes on intact skin
Minor scratches or abrasions without evidence of percutaneous penetration
Penetration by small-bore needles without visible blood

An accurate history of the exposure is essential in determining the real risk of transmission. In studies, transmission of HIV by occupational exposure has an estimated 0.3 % risk with percutaneous exposure and 0.09 % with mucous membrane splash (Bell, 1997). The risk of infection for HBV (in individuals who have not been vaccinated to hepatitis B, or who were vaccine unresponsive) after percutaneous exposure is 37 %-62 % when the source is hepatitis B surface antigen (HbsAg) positive and hepatitis B e antigen (HBeAg) positive, and the risk of developing clinical hepatitis is 22 %-31 %. When the source is HbsAg positive and hepatitis B e antigen negative, the risk of HBV seroconversion is 1 %-6 %, and the risk of developing clinical hepatitis is 23 %-37 %. The risk of transmission is higher, ie 22 %-31 %, when the source has clinically evident hepatitis B hepatitis (Werner and Grady, 1982; CDC, 2001). Transmission of HCV through occupational exposure carries an average risk of 1.8 %.

What are immediate actions and initial considerations in PEP following a possible occupational exposure?

First aid for the HCP is the first immediate action, followed by collection of information in order to assess the situation and make rapid decisions regarding appropriate treatment (see Tables 11-3, 11-4, and 11-5). Quick, expert action by the care provider is essential because the effectiveness of PEP is variable and depends on the inoculum, type of injury, potency of the PEP regimen, and speed with which treatment is started. The decision to prescribe medications, as well as medication administration, should be made within 4 hours of the exposure, and must be made within 72 hours, and preferably sooner because of studies suggesting that the efficacy of PEP is diminished after 36 hours. Even with optimal implementation, ie within the first 4 hours, the protection afforded by PEP is not 100 %.

What counseling and education should you give the HCP?

The exposed HCP needs immediate counseling to assist in coping with the emotional stress of the exposure, and may require follow up care by a mental health professional. Psychological services should be available 24 hours a day, 7 days a week. A local crisis management team or an employee assistance program (EAP) may be effective ways to address this need.

The HCP should be told the relative risk of infection with HIV, HBV, and HCV following exposure, the effectiveness of PEP, and the risks and benefits of PEP. Exposed persons should be advised to return immediately if symptoms of acute HIV seroconversion occur, including fever, malaise, rash, swollen lymph nodes, fatigue or myalgias (most likely to occur 2-6 weeks after exposure).

Providers should advise exposed HCPs to prevent transmitting HIV to others, by means of the following measures, until the HCP has a negative HIV test 6 months after exposure:

- Refrain from donating blood, plasma, organs, tissue, or semen.
- Use barrier protection during sexual activity.
- If HCP is female, avoid pregnancy.
- If breast feeding, consider discontinuing, to avoid the risk of HIV transmission through breast milk.

If exposed to HBV, the HCP should follow infection control procedures that are in place at the institution.

Table 11-3: Algorithm for Actions after Occupational Exposure to Blood or other Body Fluids Potentially Contaminated with Bloodborne Pathogens	
1. Treat exposure site	- Wash the exposure site immediately (not using soap). - Flush mucous membranes with water. - Flush eyes with water or saline solution. - Do NOT apply caustic agents or antiseptics or inject disinfectants into the wound, because they may injure viable tissue and facilitate transmission.
2. Gather information about the exposure	- Date and time of exposure - Details of incident - Where and how exposure occurred - If related to a sharp device, type and brand - Details of exposure - Type and amount of fluid or material
3. Obtain information about the exposure source	- Determine if possible whether source materials contained HIV, HBV, or HCV (see Table 11-4). - If the source patient is HIV-positive, obtain a history of the stage of disease, viral load, history of ART, and information on ART resistance.
4. Obtain information about the health care provider	- Determine HIV status (rapid test, if possible) and, HBV vaccination and vaccine-response status (see Table 11-5). - Obtain medical history, including pregnancy and breastfeeding.
5. Assess the indication for PEP	- Using this information, assess the risk of exposure to HIV and decide whether PEP is warranted in this situation. - Assess the risk of exposure to HBV.
6. Manage the exposure	- Ensure appropriate and immediate access to informed counseling for all exposed HCPs, even when PEP is not recommended. - If treatment for exposure to HIV is indicated, initiate medication regimen as soon as possible, and definitely within 36 hours. Do not initiate treatment after 72 hours. - If treatment for exposure to hepatitis B is indicated, initiate treatment as soon as possible within 24 hours of exposure; the efficacy of HIVIG after 7 days is unknown. - Document counseling, postexposure management, and followup.

Table 11-4. Evaluation of Occupational Exposure Sources
Known sources
Test known sources for HbsAg, anti-HCV, and HIV antibody ^{a,b} : - Direct virus assays for routine screening of source patients are not recommended. - Use a rapid HIV-antibody test if available. - If the source person is not infected with a bloodborne pathogen, baseline testing or further followup of the exposed person is not necessary.
For sources whose infection status remains unknown (eg, the source person refuses testing), consider medical diagnoses, clinical symptoms, and history of risk behaviors.
Do not test discarded needles for bloodborne pathogens.
Unknown sources
For unknown sources, evaluate the likelihood of exposure to a source at high risk for infection.
Consider likelihood of bloodborne pathogen infection among patients in the exposure setting.

^a With attention to State regulations regarding confidentiality and informed consent.

^b If positive, confirmatory tests should be performed as appropriate including HBeAg, HIV Western blot, and HCV RNA.

Source: Centers for Disease Control and Prevention. Updated U.S. Public Health Service Guidelines for the Management of Occupational Exposures to HBV, HCV, and HIV and Recommendations for Postexposure Prophylaxis. *MMWR*. 2001;50(RR11):20.

Table 11-5. Laboratory Evaluation and Followup of Exposed Health Care Personnel

Lab tests	Comment	Frequency
HIV antibody test	Test HCP if source patient is HIV positive regardless of whether PEP is given	Baseline, 6 weeks, 12 weeks, 6 months (rapid test at baseline, if possible)
HBV	Test if source patient is HBsAg or HBeAg positive	Baseline and 4-6 months (or 1-2 months after last HBV vaccine)
Anti HCV	Test if source patient is HCV positive	Baseline and 4-6 months; HCV RNA at 4-6 weeks is optional
Liver enzymes	Test if source patient is HCV positive	Baseline and 4-6 months
CBC, renal function, and hepatic function	If PEP is warranted	Prior to initiating PEP and repeated in 2 weeks

Are there special considerations for PEP in dental settings?

Although the number of exposures is relatively high in dental settings, the risk of transmission is low and no different from other HCP settings. Factors that are associated with increased risk of transmission are failure to follow PEP protocols, failure to use puncture-proof containers, treating > 20 patients per day, failure to use eye protection or masks, and male gender. For more information, see Suggested Resources.

INTERVENTIONS FOR NONOCCUPATIONAL PEP (NPEP)

What is the role of nPEP for nonoccupational exposure?

PEP for nonoccupational exposure to HIV (nPEP) is routinely being administered in cases of sexual assault in hospital emergency departments and is increasingly being made available during other cases of sexual exposure or injection drug use exposure and in non-hospital settings. This issue is particularly relevant in the care of HIV discordant couples. Research on risk of HIV transmission from a single nonoccupational exposure is relatively lacking compared with

occupational exposures (see Table 11-6). A national registry has been developed to gather the data with which to develop a CDC recommendation for HIV PEP in the nonoccupational setting. Information about this registry can be found at <http://www.hivpepregistry.org>. In general, PEP for non-HCP is modeled after PEP interventions and procedures for HCP.

Table 11-6. Estimated Risk of HIV Transmission Following Different Types of Exposures

Type of exposure	Estimated risk
Needle-sharing exposure with an infected source	0.67%
Receptive anal intercourse with an infected source	0.5%-3.0%
Receptive vaginal intercourse with an infected source	0.1%
Insertive anal intercourse with an infected source	0.065%
Insertive vaginal intercourse with an infected source	0.05%
Oral sex with ejaculation with an infected source	Conflicting data; however, risk is considered to be extremely low (<0.05%)

Source: Mayer KH, Anderson DJ. Heterosexual HIV transmission. *Infect Agents Dis.* 1995;4:273-284.

What needs to be evaluated for the possible administration of PEP in the nonoccupational setting?

Factors to be considered when considering PEP for nonoccupational exposure are similar to those for occupational exposure, including 1) HIV status of potentially exposed person (a rapid test can be done in 20 minutes), 2) timing (within 72 hours, with rare exception) and frequency of exposure (recurrent exposure would require ongoing PEP and suggests need for prevention counseling as the primary intervention), 3) HIV status of source (if unknown, PEP can be initiated while this is being assessed and discontinued if HIV infection of the source cannot be confirmed), 4) transmission risk of behavior (see Table 11-6), 5) presence of other sexually transmitted diseases, particularly genital ulcer disease (which can facilitate HIV transmission). Exposures to persons who have recently seroconverted may carry a higher risk of transmission because of high HIV viremia.

What is the role of PEP for discordant couples?

Discordant couples (couples in which one person is infected and the other is not) should be routinely educated about how to protect the noninfected person. Both partners should be made aware of the possible effectiveness of PEP in cases of intended or unintended exposures and the importance of early initiation of PEP if it is to be used. Repeated, frequent exposures should signal providers to exercise caution about administration of PEP, since PEP should not be a substitute for avoidance of high-risk behavior. Any request for PEP should prompt additional counseling and psychosocial support to enhance behaviors to prevent HIV infection.

What is the role of PEP following sexual assault?

Persons who have been sexually assaulted should be considered at risk for HIV and HBV, as well as other STDs. The decision to begin PEP should not be based on the perpetrator's likelihood of infectivity or delayed pending the test results of the source (unless immediately available). Pregnancy is an important consideration when considering PEP, and emergency contraception should be considered for women who have been sexually assaulted.

A survivor of sexual assault may have had multiple exposures. When considering PEP, the most recent exposure should be considered, and PEP should be initiated if the exposure took place within 72 hours before the patient arrived at the health care facility. As with any consideration for PEP, weighing the benefits of PEP versus the possibility of medication side effects, the importance of completing the 28-day regimen and adherence issues should all be considered.

The provider should be sensitive to the psychosocial needs of the person who was sexually assaulted; the patient may not be physically or emotionally able to weigh the pros and cons about beginning PEP. Therefore, it is important to follow up within 24 hours to either emphasize the importance of adherence or to continue the discussion about initiating PEP if it is to occur within the 72-hour window.

See Suggested Resources for more information and resources in addressing issues of sexual assault.

What if the person who is exposed is a minor?

In cases involving minors, parental or guardian participation is extremely important, but parental or guardian consent for PEP may not be required. Nonetheless, in all cases, parental or guardian

participation should continue to be sought in the emergency situation and during followup. State laws and hospital policy must be considered.

HIV PEP TREATMENT RECOMMENDATIONS**If PEP is found to be appropriate, what information does the exposed person need regarding treatment?**

The exposed person must understand the risks and benefits of HIV PEP, potential medication toxicities and side effects, instructions on how and when to take the medication, and the importance of adherence to the regimen, including completing the course of 28 days. Women should understand pregnancy-associated risks, including perinatal transmission and teratogenicity. Breast-feeding should be discontinued until the woman receives an HIV-negative result 6 months after exposure.

What are HIV treatment recommendations and options for PEP?

Currently recommended regimens are shown in Tables 11-7, 11-8, and 11-9; however, these recommendations may be altered if the source patient has a history of ART or known viral resistance, is pregnant, breast-feeding, has hepatic or renal disease, or is taking certain medications. If viral resistance in the source patient is known or suspected, an HIV expert should be consulted prior to initiating HIV PEP medications.

Basic HIV PEP regimens include 2 NRTIs. These regimens are relatively simple, ie 1 or 2 pills twice a day, well tolerated, and of sufficient potency to meet the needs of PEP. However, they are substantially less potent than 3-drug regimens. As noted below, some experts, including the authors, believe that only 3-drug regimens should be used for PEP, particularly in the current era of greatly simplified and somewhat better tolerated 3-drug regimens.

Three-drug regimens, comparable to highly active antiretroviral therapy (HAART) regimens used to treat HIV infection, are recommended for more severe exposures, which carry a higher risk of HIV transmission, or with exposures to sources with known HIV resistance mutations. The 3-drug regimens increase the risk of medication toxicity and may worsen adherence, all of which should be weighed when choosing an HIV PEP regimen. The majority of exposures in the past have resulted in the administration of 2 medications; 3-drug regimens

Table 11-7. Recommended HIV Postexposure Prophylaxis for Mucous Membrane Exposures and Nonintact Skin[⊗] Exposures

Exposure Type	Infection Status of Sources				
	HIV-Positive Class 1 [*]	HIV-Positive Class 2 [*]	Source of unknown HIV status ⁺	Unknown source [⊗]	HIV-Negative
Small Volume [†]	Consider basic 2-drug PEP	Recommend basic 2-drug PEP	Generally, no PEP warranted; however, consider basic 2-drug PEP ^{**} for source with HIV risk factors [§]	Generally, no PEP warranted; however, consider basic 2-drug PEP ^{**} in settings where exposure to HIV-infected persons is likely	No PEP warranted
Large Volume [†]	Recommend basic 2-drug PEP	Recommend expanded 3-drug PEP	Generally, no PEP warranted; however, consider basic 2-drug PEP ^{**} for source with HIV risk factors [§]	Generally, no PEP warranted; however, consider basic 2-drug PEP ^{**} in settings where exposure to HIV-infected persons is likely	No PEP warranted

[⊗] For skin exposures, follow-up is indicated only if there is evidence of compromised skin integrity (e.g., dermatitis, abrasion, or open wound).

^{*} HIV-Positive, Class 1 asymptomatic HIV infection or known low viral load (e.g., < 1,500 RNA copies/mL). HIV-Positive, Class 2 – symptomatic HIV infection, AIDS, acute seroconversion, or known high viral load. If drug resistance is a concern, obtain expert consultation. Initiation of postexposure prophylaxis (PEP) should not be delayed pending expert consultation, and, because expert consultation alone cannot substitute for face-to-face counseling, resources should be available to provide immediate evaluation and follow-up care for all exposures.

⁺ Source of unknown HIV status (e.g., deceased source person with no samples available for HIV testing).

[⊗] Unknown source (e.g. splash from inappropriately disposed blood).

[†] Small volume (i.e., a few drops).

^{**} The designation, “consider PEP,” indicates that PEP is optional and should be based on an individualized decision between the exposed person and the treating clinician.

[§] If PEP is offered and taken and the source is later determined to be HIV-negative, PEP should be discontinued.

[†] Large volume (i.e., major blood splash).

Table 11-8: Recommended HIV Postexposure Prophylaxis for Percutaneous Injuries

Exposure Type	Infection Status of Sources				
	HIV-Positive Class 1 [*]	HIV-Positive Class 2 [*]	Source of unknown HIV status ⁺	Unknown source [⊗]	HIV-Negative
Less Severe [†]	Recommend basic 2-drug PEP	Recommend expanded 3-drug PEP	Generally, no PEP warranted; however, consider basic 2-drug PEP ^{**} for source with HIV risk factors [§]	Generally, no PEP warranted; however, consider basic 2-drug PEP ^{**} in settings where exposure to HIV-infected persons is likely	No PEP warranted
More Severe [†]	Recommend expanded 3-drug PEP	Recommend expanded 3-drug PEP	Generally, no PEP warranted; however, consider basic 2-drug PEP ^{**} for source with HIV risk factors [§]	Generally, no PEP warranted; however, consider basic 2-drug PEP ^{**} in settings where exposure to HIV-infected persons is likely	No PEP warranted

^{*} HIV-Positive, Class 1 asymptomatic HIV infection or known low viral load (e.g., < 1,500 RNA copies/mL). HIV-Positive, Class 2 – symptomatic HIV infection, AIDS, acute seroconversion, or known high viral load. If drug resistance is a concern, obtain expert consultation. Initiation of postexposure prophylaxis (PEP) should not be delayed pending expert consultation, and, because expert consultation alone cannot substitute for face-to-face counseling, resources should be available to provide immediate evaluation and follow-up care for all exposures.

⁺ Source of unknown HIV status (e.g., deceased source person with no samples available for HIV testing).

[⊗] Unknown source (e.g. a needle from a sharps disposal container).

[†] Less severe (e.g., solid needle and superficial injury).

^{**} The designation, “consider PEP,” indicates that PEP is optional and should be based on an individualized decision between the exposed person and the treating clinician.

[§] If PEP is offered and taken and the source is later determined to be HIV-negative, PEP should be discontinued.

[†] More severe (e.g. large-bore hollow needle, deep puncture, visible blood on device, or needle used in patient’s artery or vein).

Table 11-9. Treatment Options for 2- and 3-drug PEP

	Treatment Options
Basic 2-drug PEP	zidovudine (AZT) 300 mg bid + lamivudine (3TC) 150 mg bid (may be taken as Combivir bid)
	stavudine (d4T) 40 mg bid + 3TC 150 mg bid
	stavudine (d4T) 40 mg bid + didanosine (ddI) 400 mg qd on an empty stomach (No longer recommended because of increased toxicity unless a suitable alternative is not available.)
3-drug PEP	One of the above NRTI* combinations plus a third drug, usually a PI**, an NTRTI#, or an NNRTI*** to be determined in consultation with an HIV expert.
	nevirapine (NVP) (No longer recommended for PEP due to the potential for severe liver toxicity.)

* NRTI: nucleoside or nucleoside reverse transcriptase inhibitor

** PI: protease inhibitor

NTRTI: nucleotide reverse transcriptase inhibitor, i.e., tenofovir (TDF)

*** NNRTI: non-nucleoside reverse transcriptase inhibitors, i.e., efavirenz (EFV)

should be chosen with the advice of an HIV expert. In accordance with the same principles that are used in treating HIV-positive persons; some experts believe that 3-drug PEP regimens should be the mainstay of PEP and that 2-drug regimens should be used only during extenuating circumstances such as an inability to tolerate a protease inhibitor (PI). For example, the New York State PEP Guidelines now recommend zidovudine and lamivudine (Combivir) plus tenofovir (two pills in the morning and one pill in the evening) as the standard PEP intervention. (<http://www.hivguidelines.org>)

Although the current data on PEP for nonoccupational HIV exposures are scant, treatment recommendations for occupational PEP can be generalized to nonoccupationally exposed persons. As in the case of PEP in HCP, nonjudgmental counseling directed towards the reduction of future exposures is an important part of PEP in nonHCP.

What are the side effects of HIV PEP?

Side effects of HIV PEP regimens are common and occur in 30%-50% of patients. Severe side effects occur in 5%-30% of patients and often require discontinuation. Common side effects include gastrointestinal symptoms such as nausea, vomiting, diarrhea, and abdominal pain; rash; fatigue; headache and dizziness; cytopenia; neuropathy; hepatitis; and many others. In reported series to date, over half of HCP in PEP programs fail to complete their 28-day regimens because of side effects. Regularly scheduled

followup either in person or by phone has been shown to greatly improve adherence. Refer to other chapters for more detail on symptom management and metabolic complications with ART.

What medication toxicities should be monitored?

Regular laboratory evaluation for medication toxicity and seroconversion should be performed (see Table 11-5). A complete blood count and renal and hepatic function tests should be done before initiating PEP and repeated in 2 weeks. Continued monitoring is recommended for abnormal lab test results, and medication changes should be considered if abnormalities are severe. Specific monitoring parameters vary with the regimen; for example, glucose levels should be monitored if a PI is used. If the PI is indinavir (IDV) a urinalysis should also be checked to monitor for crystalluria and hematuria. Tenofovir (TDF) is well tolerated, but should be used with caution and careful monitoring in patients with compromised renal function (Refer to Drug Information Tables in the Pocket Guide for medication side effects.)

Two regimens deserve special consideration. Hepatotoxicity, Stevens-Johnson syndrome, and fatal hepatic necrosis have occurred in HCP treated with nevirapine (NVP) as part of their PEP regimen, and therefore its use is not recommended, given the variety of other options. Pregnant women treated with stavudine (d4T) and didanosine (ddI) were found to be at increased risk for fatal and non-fatal lactic acidosis, and therefore this combination is not recommended in the treatment of pregnant women. In addition, recent clinical trial data showed a higher rate of adverse effects with the combination of stavudine and didanosine in adults, and their use in combination is not recommended unless other alternatives are not available.

What are the treatment recommendations when the source patient is known to have specific HIV resistance mutations?

Resistance to HIV medications is an important consideration in the treatment of HIV-positive persons, and known resistance in the source patient should be a consideration when choosing an appropriate HIV PEP regimen. In addition, because of reported increases in resistance mutations in recently acquired HIV infection in several cities in the United States, resistance is increasingly a concern in untreated patients, and thus for PEP in exposures to unknown sources. HIV PEP failures attributed to exposure to resistant virus have been reported in the literature.

Unfortunately, resistance test results are often unavailable at the time of the consideration of PEP, and PEP should not be unduly delayed while this information is sought. A thorough drug, adherence, and HIV history from the source patient and consultation with an HIV expert is needed to make the optimal treatment recommendation.

When should expert consultation be sought?

Expert consultation is potentially valuable in many circumstances with PEP. As above, expert consultation is indicated in the setting of known or suspected drug resistance in the source in order to select drugs to which the patient's virus is likely to be susceptible. Other situations include:

- Delayed report of exposure, since the interval after which there is no benefit from PEP is undefined, in order to determine if PEP is still indicated
- Unknown status of the source, since the decision regarding the use of PEP should be individualized, based on the estimated likelihood of risk to the HCP, considering the severity of the exposure and the epidemiologic likelihood of HIV exposure
- Known or suspected pregnancy in the exposed person, in which case specific treatment recommendations may require modification
- Possible toxicity of the initial PEP regimen, in which case modification of the regimen and/or treatment of the adverse side effect may be considered

HEPATITIS PEP TREATMENT RECOMMENDATIONS

What are the treatment recommendations and options for possible hepatitis B exposure?

HBIG and immunization against HBV following exposure are the most effective methods to prevent HBV transmission (see Table 11-10). PEP for HBV with multiple doses of HBIG has been shown to be 75%-95% effective. Pregnant women can safely receive both the HBV vaccination and HBIG. When considering PEP for HBV exposures, both the source patient's HbsAg status and the exposed person's vaccination status and antibody response should be considered. Both HBIG and the hepatitis B vaccine should be administered within 24 hours of exposure. Anti-HBs should be drawn 1-2 months after completion of the third vaccine, but it is unreliable if the exposed person has received HBIG within the past 3-4 months.

Table 11-10. Recommended Postexposure Prophylaxis for Exposure to Hepatitis B Virus			
Vaccination and antibody response status of exposed workers*	Treatment		
	Source HBsAg positive⁺	Source HBsAg⁺ negative	Source of unknown or not available for testing
Unvaccinated	HBIG [§] x 1 and initiate HR vaccine series [†]		
Previously vaccinated			
Known responder**	No treatment	No treatment	No Treatment
Known nonresponder ^Ø	HBIG x 1 and initiate revaccination or HVIG x 2 [†]	No treatment	If know high risk source, treat as if sources were HBsAg positive
Antibody response unknown	Test exposed person for anti-HBs ^{††} 1. If adequate,** no treatment is necessary 2. If inadequate ^Ø , administer HBIG x 1 and vaccine booster	No treatment	Test exposed person for anti-HBs 1. If adequate [†] , no treatment is necessary 2. If inadequate [†] , administer vaccine booster and recheck titer in 1-2 months

* Persons who have previously been infected with HBV are immune to reinfection and do not require postexposure prophylaxis.

⁺ Hepatitis B surface antigen.

[§] Hepatitis B immune globulin; dose is 0.06 mL/kg intramuscularly.

[†] Hepatitis B vaccine.

** A responder is a person with adequate levels of serum antibody to HBsAg (ie, anti-HBs $\geq$ 10mIU/mL).

Ø A nonresponder is a person with inadequate response to vaccination (ie, serum anti-HBs < 10mIU/mL).

[†] The option of giving one dose of HBIG and reinitiating the vaccine series is preferred for nonresponders who have not completed a second 3-dose vaccine series. For persons who have previously completed a second vaccine series but failed to respond, two doses of HBIG are preferred.

^{††} Antibody to HBsAg.

Source: Centers for Disease Control and Prevention. Updated U.S. Public Health Service Guidelines for the Management of Occupational Exposures to HBV, HCV, and HIV and Recommendations for Postexposure Prophylaxis. *MMWR* 2001;50(RR11):22.

What are the treatment recommendations and options for possible hepatitis C exposure?

There are no recommended prophylactic treatments after exposure to HCV blood or body fluids. Current data do not support treatment during acute HCV infection at this time; referral of an individual with recently acquired HCV to a specialist in HCV care is appropriate.

Following exposure, testing should be performed on the source for anti-HCV. If positive, the exposed person should be tested for anti-HCV and alanine

aminotransferase (ALT) initially and in 4-6 months. HCV-RNA and ALT at 4-6 weeks are optional. All anti-HCV results should be confirmed by recombinant immunoblot assay; if positive an HCV RNA should be drawn. Drawing an HCV RNA at 4-6 weeks may be done for earlier diagnosis, but the person should be counseled that false-positives do occur. Current research supports early diagnosis of HCV as basis for the most effective management after exposure are known. Exposed persons should be counseled to refrain from donating blood, plasma, organs, tissue, or semen. Although the transmission risk by sexual activity is low, it is reasonable to recommend a barrier method until the results of testing 6 months after exposure are known. There are currently no recommendations to make any changes in breast-feeding, pregnancy, or professional activities. Mental health counseling should be offered as needed.

KEY POINTS

The goals of PEP are to prevent or abort the transmission of HIV and hepatitis B virus (HBV) and to enable early diagnosis of hepatitis C virus (HCV).

All exposed persons need followup within 24-48 hours depending on the pathogen.

HIV PEP, if determined to be appropriate, should be provided preferably immediately, and definitely within 36 hours of exposure. PEP is NOT recommended for minor exposures. If the provider is inexperienced in using HIV medications or managing PEP patients, an HIV specialist should be consulted before initiating treatment.

The risk of transmission of HBV is far greater than of HIV or HCV. All HCPs should be vaccinated against HBV. HBIG is highly effective in preventing transmission of HBV.

There is currently no recommended PEP medication for HCV. If possible, the source should be tested for antiHCV, and if positive, the exposed person should be monitored.

PEP should be available in all health care settings. PEP protocols should be developed, regularly updated, and included in regular employee training programs.

PEP for nonoccupational exposure (nPEP) is modeled after PEP for occupational exposures. nPEP is routinely administered in cases of sexual assault in emergency departments, and is increasingly being made available for other cases of sexual exposure or injection drug use exposure in non-hospital settings.

CASES**1.**

An employee states that she has just punctured herself with a needle after drawing a patient's blood. The patient has already left the clinic and no one knows anything about his medical history. The employee completed the HBV vaccination series and is hepatitis B surface antibody (HBsAb) positive. During the investigation the HIV prevalence in this setting was found to be low.

Question: What is the risk of HIV transmission?

Answer:

The risk of HIV transmission after a puncture wound with a hollow-bore needle is 0.3%. It is important to remember that the risk of infection is higher when there is a large-volume exposure, a deep percutaneous injury, or an injury with a hollow-bore, blood-filled needle, or if the source has advanced HIV disease or has a high level of HIV viremia. The current CDC recommendations advise against HIV PEP when the source is unknown and in settings where the HIV prevalence is low.

Question: What counseling and followup should be recommended?

Answer:

Because of the low prevalence of HIV in this setting, the employee should be advised against taking HIV medications. Also, because she is HBsAb positive she is not a candidate for HBV PEP. The HCP should be advised to refrain from donating blood, plasma, organs, or tissue, to use barrier methods during sexual activities, and to refrain from sharing any injection or other drug use equipment. She should also be counseled about universal precautions and administration should take steps to reduce the risk of future accidental needle sticks. She should be educated about the symptoms of acute HIV and advised to return immediately if those symptoms occur. Mental health counseling should also be offered.

A baseline HIV antibody and anti-HCV should be drawn. HIV antibody should be repeated at 6 weeks, 3 months and 6 months after exposure. A 12-month followup is recommended if the source is found to be coinfecting with HIV and HCV, or if the exposed becomes infected with HCV following exposure. Anti-HCV and ALT should be repeated within 4-6 months and if positive should be confirmed with supplemental tests.

2.

A patient known to be HIV negative 6 months ago comes to the clinic stating that last night he was the receptive partner of unprotected sexual intercourse with his HIV-positive partner when the condom broke. His partner has been HIV-positive for 5 years, currently has an undetectable viral load, and is taking Combivir (zidovudine + lamivudine) and efavirenz (EFV). He has never had a resistance test.

Question: Should the patient take HIV PEP medications?

Answer:

Although the current recommendations for nonoccupational exposures were released in 1998 and at that time found that PEP for nonoccupational HIV exposure was still unproven, current data support treating. Receptive anal intercourse with an HIV-positive partner carries with it a risk of transmission of 0.5%-3.0%. Your patient's risk is likely lower because of his partner's low level of viremia. PEP in nonoccupational settings is modeled after PEP for HCPs. In this case, the patient had a large exposure from a known HIV-positive source with an undetectable viral load.

Following the model for PEP for HCPs, the patient should be treated ASAP, ie within 4 to 72 hours but not more than 72 hours after exposure and receive 2 medications, although some experts would recommend using 3 medications. It would be reasonable to place the patient on the same combination as his partner because his partner has exhibited good adherence and good virologic control. Treatment should continue for 28 days.

The patient should be counseled about medication side effects and the importance of adherence and followup. Common side effects should be anticipated and pre-empted with counseling and, in some cases, treatment. Changing medications and/or modifying the dosage regimen may increase the likelihood of completion of the HIV PEP regimen. And finally, the patient should be educated about the symptoms of acute HIV infection and advised to return immediately if those symptoms occur.

Question: What lab specimens should be drawn?

Answer:

A baseline HIV Ab should be drawn and repeated at 6 weeks, 3 months, 6 months and 12 months after exposure, as well as an HBsAg, HBsAb, and HCV Ab. If he were unvaccinated against HAV or HBV then vaccination should be initiated immediately. Laboratory monitoring for drug toxicity should be performed at baseline and then 2 weeks after initiating therapy. The medical record of the patient's partner should immediately be reviewed, and treatment for HBV, HCV, or other sexually transmitted diseases should occur, if any of these are found. Expert consultation should be sought if needed.

Chapter 12:

Family Planning and Pregnancy

*María del Carmen Ríos, MD, MPH**José Rafael Morales, MD, FACOG**CARE OF HIV-POSITIVE WOMEN OF CHILDBEARING AGE**PREVENTING MOTHER-TO-CHILD TRANSMISSION (MTCT)**PERINATAL CARE FOR PREGNANT WOMEN WITH HIV**KEY POINTS**SUGGESTED RESOURCES**REFERENCES*

CARE OF HIV-POSITIVE WOMEN OF CHILDBEARING AGE

When should you provide pregnancy counseling to women living with HIV who are of childbearing age?

More than half the pregnancies in the United States are unplanned. For women living with HIV, education and counseling about pregnancy and HIV should be done early in the course of HIV care, not delayed until the woman is pregnant, so that she can make informed decisions about contraception and pregnancy. Many women with HIV mistakenly assume they cannot get pregnant and need to be educated before it is too late.

What counseling interventions should be included in primary care?

All women of childbearing age should receive the benefit of preconceptional counseling as part of routine primary medical care (ACOG, 1995). Women who have HIV should also be counseled about:

- The impact of HIV on the course and outcome of pregnancy
- The impact of pregnancy on HIV progression
- Appropriate contraception to prevent unintended pregnancies
- Perinatal transmission risks, including strategies to reduce the risk of perinatal transmission
- Permanency planning (guardian issues for children)

What primary care interventions are appropriate for women with HIV who want to become pregnant?

Certain measures can help facilitate a successful pregnancy if a woman with HIV wants to become pregnant:

- Institute routine preconceptional care such as genetic screening, screening for STDs, PAP smear, and initiation of folic acid supplementation.
- For women already on antiretroviral therapy (ART) or who have indications for therapy, ensure that medications are not contraindicated in pregnancy (efavirenz [EFV] is contraindicated) and optimize therapy to reduce viral load and reduce side effects.
- Vaccinate as indicated.
- Optimize maternal nutritional status.
- Screen for psychological and substance abuse disorders and treat.
- Refer for perinatal consultation as needed.

Are there options for HIV-positive individuals who are considering reproduction?

There are centers in the United States and in Europe that provide “sperm washing” to decrease the possibility of HIV transmission to the woman during planned conception. However, this method has not been well studied and, as a practical matter, is not available to most HIV discordant couples (Kim et al, 1999). Discordant couples who choose to become pregnant need to be educated about the risk of HIV transmission. To reduce the risk if the man is HIV-positive, his viral load should be as low as possible,

intercurrent STDs should be treated, and attempts to conceive should be well timed around ovulation to avoid unnecessary exposures during periods of decreased fertility. The American College of Obstetricians and Gynecologists has recently endorsed the use of reproductive technology in HIV-infected patients (ACOG, 2004). Which patients should be offered assisted reproduction and what the optimal methods are of decreasing heterosexual and perinatal HIV transmission must be determined.

When should pregnancy testing be done?

Since most pregnancies are unplanned, the diagnosis of pregnancy frequently occurs late in the first trimester, when organogenesis is nearly complete. In order to make the diagnosis earlier, pregnancy tests should be done when sexually active women have:

- Late or missed menses (unless she is using Norplant or Depo-Provera)
- Irregular bleeding (unless she is using Norplant or Depo-Provera)
- New onset of irregular bleeding after prolonged amenorrhea with Norplant/Depo-Provera
- New onset of pelvic pain
- Enlarged uterus or adnexal mass on exam

In addition, women with the potential of becoming pregnant should be tested before starting potentially teratogenic therapies such as efavirenz (EFV), which is the only antiretroviral drug that is contraindicated in pregnancy. Patients should be alerted to potential teratogenic effects on the fetus, and suitable contraception should be prescribed.

What contraceptive methods are recommended for women with HIV who do not want to become pregnant?

Condoms are the most common contraceptive method used by women living with HIV. Condoms, consistently used, have the added advantage of providing protection against STDs, including potential reinfection with HIV. This benefit should be emphasized when contraceptive advice is given to an HIV-positive or at-risk woman even if she is not seeking or does not need contraception but is sexually active.

Hormonal methods of contraception are also frequently used (delivered orally, by injection, or by skin patch). However, there are many important drug interactions between hormonal contraceptives and drugs used to treat HIV infection and HIV-related complications (see next question).

What are the most common drug interactions between oral contraceptives and drugs used in HIV disease?

Oral contraceptives significantly interact with amprenavir/fosamprenavir (APV/FAPV), efavirenz (EFV), lopinavir (LPV), nelfinavir (NFV), nevirapine (NVP), and ritonavir (RTV); an additional method of contraception, such as condoms, is recommended. Similarly, other drugs commonly used by HIV-infected patients, including tetracycline, rifampin, oral anticoagulants, beta-blockers, and antidepressants interact with oral contraceptives, and an additional means of contraception is advisable. Indinavir and atazanavir do not appear to have an interaction.

What contraceptive methods are not highly recommended for women with HIV who do not want to become pregnant?

Spermicides: Generally, a spermicide should be used along with a barrier method to increase its effectiveness. However, in some studies nonoxynol-9 (the active ingredient in spermicidal contraceptives) has been found to cause vaginal irritation and epithelial inflammation when used as the sole contraceptive method and on a regular and frequent basis. This may increase the risk of HIV transmission.

Intrauterine Device: The intrauterine device (IUD) is not recommended for HIV-infected women. The IUD is associated with pelvic inflammatory disease and is also associated with increased menstrual flow. Some studies even suggest that this device is linked to increased susceptibility to HIV transmission.

PREVENTING MOTHER-TO-CHILD TRANSMISSION (MTCT)

Which are the current recommendations for HIV testing of pregnant women?

Since prevention of vertical transmission (from mother to child) of HIV is so effective, identification of HIV infection in all women who are pregnant is imperative. Therefore:

- HIV testing should be a routine part of prenatal care for all women. The “opt out” method, in which HIV testing is included in the routine bloodwork and pregnant women have to refuse the test, results in higher test rates and should be used.

- Testing should be performed as early as possible in pregnancy to allow for timely interventions and decisions.
- HIV-negative women who are at high risk of acquiring HIV should be retested in the third trimester of pregnancy (ideally before 36 weeks). Women are at high risk if they have a history of STDs, exchange sex for money or drugs, have multiple sex partners during pregnancy, use illicit drugs, have HIV-positive or high-risk sex partners, and/or show signs and symptoms of seroconversion.
- Women whose HIV status is unknown and/or who present late in pregnancy or already in labor should be assessed promptly for HIV infection, using rapid HIV testing, to allow for timely prophylactic treatment. Standard confirmatory tests should be done after delivery for women with positive rapid test results.
- CDC recommends timely, routine screening of an infant if the mother has not been tested during pregnancy or delivery (CDC, 2003).

How should HIV testing be done?

HIV testing should be voluntary, and providers should carefully document informed consent. Providers should offer pre- and post-test counseling that includes information on modes of transmission of the virus, risk factors that might be present even if a woman has only one sex partner, and effective interventions to reduce the risk of perinatal transmission of HIV. There should be a discussion of services available for the provision of medical care, and the woman should be reassured that care for her and her infant will not be denied if she declines the test. Laws and regulations on HIV screening of pregnant women and their infants vary by State. Therefore, providers should be familiar with the State regulations and policies that apply to them (CDC, 2001).

When does transmission from mother to infant occur and what are risk factors for transmission?

Vertical transmission can occur during the perinatal period and infancy, that is, before or close to the time of birth or during breastfeeding. Risk factors associated with vertical transmission include (CDC, 2001):

- Advanced disease in the mother
- High plasma viral load
- Maternal injection drug use during pregnancy
- Preterm delivery
- HCV coinfection
- Failure to follow the recommended regimen of zidovudine prophylaxis
- Breast-feeding

- Delivery more than 4 hours after rupture of membranes
- Concurrent STDs
- Chorioamnionitis
- Certain obstetrical procedures

How common is vertical transmission of HIV with and without ART?

In the absence of antiretrovirals, the perinatal transmission rate of HIV infection is approximately 25%. There is a direct correlation between maternal viral load as measured by plasma HIV-1 RNA and probability of perinatal transmission. A large study showed that the rate of perinatal transmission among women with viral load > 100,000 c/mL was 40.6%, with 50,001 to 100,000 c/mL it was 30.9%, with 10,001 to 50,000 c/mL it was 21.3%, with 1,000 to 10,000 c/mL it was 16.6%; and with < 1,000 c/mL it was 0% (Garcia et al, 1999).

Treatment with zidovudine (AZT) alone can reduce transmission to close to 8%. Multi-agent antiretroviral therapy can reduce the transmission rate even further (see Table 12-1).

Table 12-1. Antiretroviral Treatment and Perinatal Transmission

Treatment category	Number treated	HIV transmission rate (95% confidence interval)
Untreated	396	20.0% (16.1, 23.9)
AZT monotherapy	710	10.4% (8.2, 12.6)
Dual therapy, non-HAART	186	3.8% (1.1, 6.5)
HAART	250	1.2% (0, 2.5)

Source: Cooper ER, Charurat M, Mofenson L, et al. Combination antiretroviral strategies for the treatment of pregnant HIV-1-infected women and prevention of perinatal HIV-1 transmission. *J Acquir Immune Defic Syndr*. 2002;29:484-494.

Do pregnant women with very low or undetectable viral loads need ART?

Yes. All pregnant women should receive ART. Analysis of the first study of the effectiveness of ART in reducing perinatal transmission (ACTG 076 study) showed that zidovudine (AZT) significantly reduced perinatal transmission even when the baseline viral load was < 1,000 c/mL (Ioannidis et al, 2001). This study provides the rationale for zidovudine monotherapy in untreated pregnant women with a baseline viral load of < 1,000 c/mL.

What pharmacologic interventions are recommended to reduce the risk of MTCT?

ART should be offered to **all** HIV-infected pregnant women, and zidovudine chemoprophylaxis should be incorporated into the antiretroviral regimen to prevent perinatal transmission because safety and efficacy data are greatest for zidovudine (PHS, 2002) (see Pocket Guide Pregnancy Table 1). Zidovudine prophylaxis is associated with significant reduction in perinatal transmission that is independent of viral load (Sperling, 1996; Shapiro et al, 1999) and of zidovudine resistance (Eastman et al, 1998).

Are there additional interventions to reduce the risk of MTCT and improve maternal/fetal health?

When the woman is HIV positive there are interventions that can reduce the risk of MTCT.

- Pregnant women with HIV should be counseled to refrain from cigarette smoking, injection and illicit drug use, and unprotected sexual intercourse with multiple sex partners.
- STDs in pregnancy should be treated since they are associated with a higher risk of vertical transmission.

Can cesarean section reduce the risk of MTCT?

Elective cesarean section reduces the risk of perinatal transmission and should be offered at 38 weeks to pregnant women when the viral load is likely to be > 1,000 c/mL at delivery (Dominguez, 2003). ACOG in a joint statement with the American Academy of Pediatrics (AAP) recommended offering HIV-positive pregnant women scheduled cesarean section at 38 weeks gestation (AAP, ACOG, 1999; CDC, 2001), rather than waiting until 39 weeks. *There is no evidence of benefit of C-section after onset of labor, after rupture of membranes, or in women with viral loads of < 1000 c/mL.*

What interventions should occur during a scheduled cesarean section?

When a scheduled cesarean section is planned, intravenous zidovudine should start 3 hours before surgery according to standard dosing (see Pocket Guide Pregnancy Table 5). Since infectious morbidity is potentially increased, the obstetrician should consider antibiotic prophylaxis. Other antiretrovirals should not be interrupted at the time of delivery regardless of route of delivery.

What should you advise mothers about breastfeeding?

The risk of HIV transmission with breastfeeding is approximately 16%. Avoidance of breastfeeding is recommended in the United States and other industrialized countries since replacement feeding is safe and accessible. In resource-poor countries where risks of replacement feeding include malnutrition and infections other than HIV, the World Health Organization recommends exclusive breastfeeding during the first 3 months of life since **exclusive** breastfeeding carries a lower risk of HIV transmission than mixed feeding. To minimize the risk of HIV transmission in these settings, breastfeeding by HIV-positive women should be discontinued as soon as feasible, taking into consideration local circumstances and the risks of replacement feeding (WHO, 2001).

What testing should neonates of HIV-positive mothers receive?

When neonates are born to HIV-positive mothers, serial testing for HIV should be done within the first few days of life, at age 1 month, and again at 4-6 months or later (AAP, ACOG, 2002). Early identification of HIV in neonates is crucial for adequate management. Since maternal antibody may be present, HIV antibody testing is not useful until the baby is 18 months old. Using either HIV-DNA PCR or HIV culture, however, pediatricians can usually determine the HIV status of infants by the age of 4 months.

PERINATAL CARE FOR PREGNANT WOMEN WITH HIV

What medical and counseling interventions are appropriate for pregnant women with HIV?

Initial evaluation of an HIV-positive pregnant woman should include an assessment of her HIV disease status. Besides the standard components of prenatal care indicated for all pregnant women, the provider should obtain CD4 cell counts and viral loads, and resistance tests should be performed. Viral loads and CD4 counts should be repeated every 3 months.

The goals of ART during pregnancy are to:

- optimize the health of the woman
- protect the fetus from HIV
- provide regimens that are neither toxic for the woman nor teratogenic for the fetus.

Clinicians should discuss short- and long-term benefits and risks for both the woman and the fetus before initiating or modifying ART. Options should be presented in a non-coercive way, and the final decision always lies with the patient. A long-term plan should be developed, and the importance of adherence to ART should be stressed.

What antiretroviral regimens are recommended for pregnant women with HIV?

The use of the 3-part zidovudine (AZT) chemoprophylaxis regimen, alone or in combination with other antiretroviral agents, should **always** be offered and discussed with all infected pregnant women to reduce the risk of perinatal HIV transmission (see Pocket Guide Pregnancy Table 3). Any pregnant woman with HIV should be offered a treatment regimen that adheres to the currently recommended treatment for HIV-infected adults, which generally consists of 2 reverse transcriptase inhibitors into which zidovudine is incorporated, plus a protease inhibitor (see Pocket Guide Pregnancy Table 4). Efavirenz (EFV) is contraindicated in the first trimester because it has been associated with birth defects in a monkey model. Referral to providers who are experienced in the care of pregnant HIV-infected women is recommended.

Are there special considerations when a woman already on ART becomes pregnant?

When an HIV-infected woman receiving ART is found to be pregnant after the first trimester she should be counseled to continue therapy. Zidovudine should be a component of the antenatal ART regimen after the first trimester whenever possible, although this may not always be feasible. A woman receiving ART whose pregnancy is recognized during the first trimester should be counseled regarding the benefits and potential risks of continuing ART during this period of organogenesis. As discussed above, efavirenz (EFV) is contraindicated in the first trimester. Also, dapsone, a folic acid antagonist, has been reported to increase the risk for neural tube defects. Maternal absorption and metabolism of protease inhibitors (PIs) change during pregnancy, and there are specific recommendations for dose adjustments of nelfinavir (NFV) (<http://www.aidsinfo.nih.gov>).

What are some of the problems that may occur when antiretroviral agents are prescribed during pregnancy?

Hyperglycemia and diabetic ketoacidosis have been reported with PI use during pregnancy. Therefore, pregnant women using PIs should be carefully instructed to watch for symptoms of hyperglycemia, and blood glucose levels should be closely monitored.

Lactic acidosis is more common in the last trimester of pregnancy, and hepatic enzymes and serum electrolytes should be monitored frequently during the last trimester in pregnant women receiving nucleoside analogues. The combination of stavudine (d4T) and didanosine (ddI) in HIV-positive pregnant women is not recommended as it has been associated with maternal mortality from severe lactic acidosis.

Hyperemesis gravidarum is a common complication of pregnancy. If a woman needs to discontinue ART because of pregnancy-related hyperemesis, she should not restart medications until sufficient time has elapsed to ensure that the drugs will be tolerated; all drugs should be stopped at once and reintroduced simultaneously to reduce the potential for emergence of resistance.

What medical and counseling interventions are appropriate for postpartum followup of women with HIV?

Comprehensive care and support services, including primary, obstetric, pediatric, and HIV specialty care, family planning services, mental health and substance abuse treatment, and coordination of care through case management for the woman, her children, and other family members are important for women with HIV and their families. Maternal medical services during the postpartum period must be coordinated between the obstetric care provider and the HIV specialist. When treatment is required for the woman's HIV infection, continuity of ART must be assured.

What followup should be done for the infants of mothers with HIV?

Infants of HIV-positive women on ART should be followed for potential side effects of antiretroviral medications even if the infants are HIV-negative; followup should continue into adulthood because of the theoretical concerns regarding potential carcinogenicity of the nucleoside analogue antiretroviral drugs. Infected children should be followed to determine their need for prophylactic treatment or ART, as well as to assess possible delays in growth and development.

Where should prenatal exposure cases be reported?

Cases of prenatal exposure should be reported to the Antiretroviral Pregnancy Registry. This registry collects anonymous observational data. The Registry can be contacted at:

Antiretroviral Pregnancy Registry
115 N. Third St., Suite 28401
Wilmington, NC 28401
Tel: 800-258-4263
FAX: 800-800-1052

KEY POINTS

All HIV-positive women of childbearing age should receive information about the impact of HIV on the course and outcome of pregnancy, the impact of pregnancy on HIV progression, and appropriate contraception to prevent unintended pregnancy.

To assure early identification of pregnancy in women with HIV who are sexually active, pregnancy tests should be done whenever they have late or missed menses or other signs of possible pregnancy. Women with the potential of becoming pregnant should be tested before starting potentially teratogenic therapies such as efavirenz (EFV). Patients should be alerted on potential teratogenic effects on the fetus, and suitable contraception should be prescribed.

Contraceptive methods recommended for women with HIV include condoms, which also protect against STDs and prevent HIV transmission to their partners, and hormonal methods. The drug interactions between oral contraceptives and many drugs used in HIV disease make an additional means of contraception advisable in many cases. Spermicides and intrauterine devices are not recommended for use by HIV-infected women.

HIV testing should be a routine part of prenatal care for all women. HIV testing should be voluntary using the “opt out” method (the HIV test is part of routine bloodwork and the woman may opt to refuse the test). Pre- and post-test HIV counseling should be provided.

All pregnant women infected with HIV should receive antiretroviral therapy. Zidovudine monotherapy can be provided to untreated pregnant women with a baseline viral load of < 1,000 c/mL, but a 3-part ART regimen including zidovudine should always be offered and discussed. Pregnant women should be offered the currently recommended treatment regimens for HIV-infected adults, except that efavirenz (EFV) is contraindicated in the first trimester.

Medical problems associated with ART during pregnancy include hyperglycemia and diabetic ketoacidosis, lactic acidosis, and hyperemesis gravidarum.

ASSESSMENT OF SUBSTANCE ABUSE PROBLEMS

What is the definition of a substance abuser?

A substance abuser is an individual who repeatedly uses an addictive substance or performs a certain behavior even with the knowledge of its negative health consequences. A person is drug dependent or addicted if he or she uses drugs repeatedly despite the social, interpersonal, or other problems associated with their use and has a physical or psychological tolerance to the drug and experiences withdrawal symptoms after the effects of the drug wear off. Long-term drug abuse can interfere with normal brain activity and metabolism and can become a chronic, relapsing condition characterized by compulsive drug craving and drug seeking. There are other kinds of addiction that may not involve the use of substances, such as gambling, sex, and eating-related disorders, all of which involve a range of dysfunctional behaviors with undesirable social, medical, and economic consequences (see Table 13-1).

Table 13-1: Range of Substances and Behaviors That Can Be Abused

Addictive substances	Behaviors
- Marijuana - Cocaine - Heroin - Amphetamines, other stimulants - Tranquilizers - Hallucinogens - Steroids and recreational drugs	- Eating disorders: anorexia, bulimia, bingeing - Sex disorders: compulsive sexual activity - Gambling - Internet addictions: compulsive use of the internet

How should primary care providers address substance use problems in their patients?

The first task is to consciously look for behavioral and physical signs of maladaptive drug use and to use a simple screening tool such as the CAGE examination (described below) to detect it. Common indicators of drug abuse are frequent absence from work or school, recurrent injuries, motor vehicle accidents, depression, anxiety, labile hypertension, sleep problems, sexual dysfunction, or abdominal symptoms. Physical signs of drug abuse such as tremor, liver disorders, and physical changes such as nasal irritation caused by cocaine are well known to health care providers.

The second task is to tell the patient his or her diagnosis of drug abuse or dependence. Providers are often concerned about upsetting a patient with a stigmatizing diagnosis. Giving a concise, objective description of clinical findings without making judgments is important. Common pitfalls for providers to avoid during this discussion are listed as the DEATH Glossary (Table 13-2).

The third task before sending a patient to treatment is to try a brief intervention in the office. It has clearly been shown that brief interventions given in community centers, hospitals, and ambulatory clinics decrease the morbidity and mortality associated with drug abuse (see Suggested Resources). For physicians who have received training on buprenorphine treatment for opiate addicts, there is the added opportunity to treat opiate drug users in the private practice setting without referring the individuals to drug use centers (see section on Treatment of Substance Abuse below).

Table 13-2: The DEATH Glossary

Common Pitfalls for Providers to Avoid when Diagnosing Drug Abuse Problems

D Drinking or Drug-use	Details are not relevant; talking with a person on drugs is not useful. The simple issue here is talking to the patient when he or she is sober, ie, has not taken a drug before the visit.
E Etiology	Do not spend much time on how drug use started but focus on getting the person to treatment.
A Argument	Avoid arguing at all costs. No meaningful conversation will occur in an argument.
T Threats	Guilt and shame do not promote recovery from chemical dependency. Threats or evoking guilt will not promote successful therapy.
H Hedging	Hedging hurts your credibility. Being ambivalent about giving the diagnosis will not help the patient. If the patient disagrees with you, unequivocally agreeing to disagree is a valid starting point for getting to successful recovery.

Diagnosing drug or alcohol dependence or addiction is not an easy task. Many people who are addicted to alcohol or drugs attempt to conceal or deny that they have an addiction. In addition, diagnostic tests for drug dependence and addiction lack specificity and sensitivity. Although blood and urine tests are usually quite reliable at detecting recent drug use, individuals can be adept at avoiding being tested or at manipulating test results. See Table 13-3 for the duration of time substances are detectable in urine.

Table 13-3: Duration of Time Drugs Are Detectable in Urine

Substance	Duration
Alcohol	48 hours
Amphetamines	12 hours
Barbiturates	10-30 days
Valium	4-5 days
Cocaine	24-72 hours
Heroin	24 hours
Marijuana	3-30 days (in heavy users)
Methaqualone	4-24 days
Phencyclidine (PCP)	3-10 days
Methadone	3 days
Sex, food, gambling	Not applicable

Why is substance abuse such a big issue in HIV care?

Injection drug use is estimated to be responsible for 25% of HIV transmission in the United States and is directly or indirectly responsible for 57% of HIV transmission to women. Less well appreciated is the fact that drug-using behaviors may be a significant HIV transmission risk factor for many men who do not inject drugs. In a recent study of men who have sex with men (MSM), up to 16% may have drug use as a risk factor for acquiring HIV (Chesney, 2003). The high degree of association between injection and noninjection drug use underscores the importance of primary care providers' being able to diagnose drug using behaviors.

Are there tools to help providers assess patients for drug and alcohol use?

Experts in addiction medicine use a combination of behavioral and clinical testing to diagnose drug abuse. There are 9 commonly used drug-use screening tests: Addiction Severity Index (ASI), Alcohol Dependence Scale, Alcohol Use Disorders Identification Test (AUDIT), CAGE (see below), Clinical Institute Withdrawal Assessment for Alcohol, Revised (CIWA-Ar), Drinker Inventory of Consequences (DrInC), Michigan Alcohol Screening Test (MAST and SMAST), Problem Oriented Screening Instrument for Teenagers (POSIT), and Self-Administered Alcoholism Screening Test (SAAST) (American Society of Addiction Medicine, 1998). Six of them are specifically designed to detect alcohol use.

Which screening tests are most useful in primary care practice?

The CAGE test is a non-threatening quick screening test for detecting drug use in adults (see Table 13-4) and the POSIT test useful for screening adolescents aged 12-19. The questions below are designed to assess key substance-using behaviors. The letters in CAGE correspond to important emotions or behaviors indicative of drug use.

Table 13-4: The CAGE Screening Test	
C	1. Have you felt that you ought to C ut down on your drinking or drug use?
A	2. Have people A nnoyed you by criticizing your drinking or drug use?
G	3. Have you ever felt bad or G uilty about your drinking or drug use?
E	4. Have you ever had a drink or used drugs first thing in the morning (E ye opener) to steady your nerves, to get rid of a hangover, or to get the day started?

The Problem Oriented Screening Instrument for Teenagers (POSIT) examination is a 139 item yes/no questionnaire for assessing adolescent risk factors in substance abuse, physical health, mental health, family and peer relationships, educational and vocational status, social skills, leisure and recreation, aggressive behavior, and delinquency. A nonexperienced provider can conduct the test in 20 to 25 minutes. The questionnaire is available free in English and Spanish from the National Clearinghouse for Alcohol and Drug Information by mail at P.O. Box 2345, Rockville, MD 20847-2345 or by telephone at 1-800-729-6686.

What would provide a more in-depth assessment of drug and alcohol use?

Two detailed evaluations of drug and alcohol use are the Diagnostic and Statistical Manual of Mental Disorders, fourth edition (DSM-IV) and Addiction Severity Index (ASI) for alcohol or drug use. The DSM-IV defines the diagnostic criteria for substance dependence as a maladaptive pattern of substance use, leading to clinically significant impairment or distress, as manifested by 3 or more of the following, occurring at any time in the same 12-month period:

1. Presence of drug withdrawal symptoms
2. Escalation of drug doses

3. Persistent inability to reduce or control drug use
4. Increased time spent obtaining drugs
5. Personal and business activities reduced by drug use
6. Development of drug tolerance
7. Knowing drug use's negative health and personal effects, yet continuing to use drugs

TREATMENT OF SUBSTANCE ABUSE PROBLEMS

What should you do before referring a person for treatment?

The decision to refer a person for drug abuse treatment should come after the provider has detected a substance use problem, conducted initial evaluations to determine the degree of drug use and physical harm done by the drug use, and provided brief interventions to stop drug abuse. After the diagnosis and brief interventions (if appropriate), the provider should refer the patient to a drug treatment system or an addiction physician.

What role does the primary care provider's attitude play in successful drug abuse treatment?

Drug abuse treatment is successful if the provider addresses his or her own biases about addiction, understands the factors contributing to addiction, provides appropriate pharmacologic and behavioral care, and recognizes that drug addiction is a chronic disease problem. Many drug abuse treatment failures are associated with hostile or unsupportive providers whose behaviors are based on the assumption that drug use is voluntary. Since successful drug abuse therapy depends on adherence to treatment regimens, any factors that facilitate adherence will foster successful treatment outcomes. The patient's perception that the primary care provider is nonjudgmental and supportive is an essential factor in successful therapy.

How can the primary care provider enhance the success of drug abuse treatment?

The primary care provider must prevent or treat exogenous factors that negatively affect successful drug abuse therapy. We now recognize significant environmental (social), genetic, biologic, and behavioral factors that facilitate drug addiction:

Environmental factors Common factors are family or sibling drug use, poverty, poor education, and homelessness. Patient referral to social services and family referral into drug treatment will facilitate the patient's therapy.

Genetic factors Ten percent of drug users have multifactorial genetic predispositions to drug use. Many patients have significant severe drug use problems requiring care from addiction specialists as soon as possible.

Biologic factors Many patients have preexisting mental health problems such as depression and attention deficit and hyperactivity disorder (ADHD) which, if recognized and treated, may prevent or modulate drug use.

Behavioral risk factors For adolescents, peer pressure is a common cause of drug use. Early education by parents and the primary care physician about drug use are very important for preventing drug use by adolescents.

What is the role of drug detoxification in drug abuse treatment?

Drug detoxification is the transitional therapy between identifying drug abuse and beginning a comprehensive program to treat it. The objective of drug detoxification is to facilitate a safe drug withdrawal process in supportive surroundings. Detoxification is not a treatment or cure for drug addiction; it is an intervention to get a person to the stage of comprehensive drug abuse therapy. Two common medical interventions to modulate symptoms are benzodiazepines in alcohol withdrawal and clonidine in opiate withdrawal.

What are the components of a comprehensive drug abuse treatment plan?

Effective drug abuse treatment encompasses a combination of behavioral and pharmacologic therapies to treat the individual's particular substance abuse problems and needs. Drug use medication is only one element of successful, comprehensive drug treatment, which includes addressing the individual's medical, psychological, social, vocational, and legal problems (see Table 13-5). Behavioral drug abuse prevention and treatment programs are provided in residential settings and in prisons. These programs may provide

medications to treat drug abuse, medical treatment for coexisting illnesses, and /or behavioral interventions using a number of personal, family, and community interventions. The most important community interventions are the 12-step or self help programs such as Narcotics Anonymous, Cocaine Anonymous, and Alcoholics Anonymous.

What should you do after the patient has completed a drug treatment program?

The primary care provider's task in assuring successful drug addiction treatment is to treat drug abuse as a chronic disease. Drug abuse treatment is effective if provided correctly and consistently. Approximately 50 % of alcoholics, 60 % of opiate addicts, 55 % of cocaine addicts, and 30 % of nicotine (cigarette) addicts are successfully treated. Note the success rate is generally lower for the legal addictive drugs, which may be because of ready access to those substances. For the illicit drug addictions, success occurs only if the drug abuse therapy is given on a continual basis for the lifetime of the patient. Drug use studies have clearly shown that drug abusers will relapse as any patient would who has a chronic disease. In direct comparisons, drug-addicted patients are actually less likely to relapse into addiction and are more adherent to their medication than persons with diabetes mellitus or hypertension.

Table 13-5: Components of Drug Abuse Treatment

Personal needs	Treatment needs
• Family services • Housing and transport • Financial services • Legal services • AIDS/HIV services • Educational service • Medical service • Vocational service • Child care service	• Behavioral therapy • Clinical and case management • Intake and processing • Treatment plans • Pharmacotherapy • Continuing care • Substance use monitoring • Self help/peer support groups

How do you use maintenance medications in treating drug abuse?

Maintenance treatment medications, important adjuncts to comprehensive drug abuse and dependence treatment, are used in the same way the nicotine patch is used for cigarette smokers. The medications help stabilize the drug user by reducing drug craving and thereby reducing high-risk behaviors associated with acquiring illicit drugs to attain the drug-induced high. Medication is used most effectively by patients who have good social support and higher education levels and are highly motivated to get off illicit drugs.

What are the common medications used in drug abuse treatment?

Use of medications to treat illicit drug use is limited because most of the approved medications are for opiate addiction and alcohol abuse. Effective opiate addiction medications are divided into 2 classes: opiate agonists and opiate antagonists. Opiate agonists are used to substitute for the opiate without causing the euphoria associated with drug abuse. The opiate agonists include methadone, L-alpha-acetyl-methadol (LAAM), and buprenorphine, which has recently been approved for medical use in the United States (Johnson, 2000). The other class is the opiate antagonists, the most important of which is naltrexone. Buprenorphine, actually a partial agonist-antagonist, may be used by physicians who undergo an 8-hour training course on how to use the medication. This medication has the highest potential for providing care in the private practice setting. Details for obtaining buprenorphine training and certification are available at the Office of Substance Abuse and Mental Health Administrations website, www.samhsa.gov, in the addiction treatment section under office-based therapies.

How do you detect, manage, and prevent relapse?

After the patient has been treated and is off drugs, the responsibility of the primary care physician does not end. The most common complication after patients have stopped using drugs is relapse. Four points to remember: 1) relapse should be expected to occur in most users; 2) on average 3-4 episodes may occur before complete abstinence; 3) relapse is not a treatment failure; it is a time to intensify treatment; and 4) the primary care provider is critical in preventing episodes of relapse. The most critical issues for the primary care provider to keep track of in the detection and prevention of relapses are to:

- Provide close followup.
- Do not make medical care dependent on drug abstinence.

- Recognize missed appointments as a sign of relapse and need for followup.
- Encourage and monitor the drug treatment/sobriety program of the patient.
- Treat comorbid psychiatric conditions aggressively.
- Identify drug use trigger points with the patient and discuss how to avoid them.
- Develop a plan to identify and manage relapse early.
- Make every effort to keep communication open and nonjudgmental.

MEDICAL AND PAIN MANAGEMENT ISSUES**What exactly do drugs do to the brain?**

Researchers continue to explore the variety of functional and structural changes that occur in the brain during drug use. Drug dependencies have been linked to disturbances in the dopaminergic pathways of the mesolimbic reward system, which lies deep in the brain. This system interconnects the ventral tegmentum to the nucleus accumbens with other connections to the limbic system and orbitofrontal cortex (Leshner, 1997). Disturbances in these areas are responsible for the behavioral changes and drug craving that characterize the drug-addicted person. Brain imaging studies have suggested that the changes in the brain are chronic, even after the person stops consuming drugs and may cause the relapses of most drug users.

What are the common medical problems of patients who inject drugs?

Patients who inject drugs often have comorbid clinical conditions, which are listed below with specific recommendations.

Mental health problems Treat early. Depression is the most common problem.

Hepatitis C Screen all drug users for hepatitis C and B and treat when indicated. Consult a specialist in HIV/AIDS and hepatitis C for coinfecting patients. Screen for depression before initiating therapy for hepatitis C. Treating hepatitis is important for preventing hepatotoxicity associated with ART.

Sexually transmitted diseases Screen regularly and provide safe sex education. Like other people, drug users often do not stop having sex even if they are infected with multiple diseases.

Tuberculosis Past tuberculosis exposure is common in injection drug users (as many as 30 % are PPD positive); they should be screened for TB.

Skin and soft tissue infections Cellulitis and skin abscesses are very common in injection drug users. The practice of “skin popping” markedly increases the risk of abscess formation.

Noninfectious health problems Treat accordingly. Drug users and alcoholics have multiple health problems that should be treated aggressively. The fewer medical problems patients have, the more likely they are to adhere to the treatment plan. Common problems to be aware of:

- Drug interactions (between medications and between medications and illicit drugs)
- Diabetes mellitus and hypertension
- Social environment (housing, child care)
- Pain management

How do you manage pain in opiate-addicted patients?

It is incorrect to assume that individuals addicted to opiates or any other kind of drug should receive less pain medication because they are addicted. They should receive pain therapy based on the diagnosed cause of the pain just like nonaddicted patients. The therapeutic approach differs according to whether the pain is acute or chronic.

How should you treat acute pain in a person diagnosed as a drug abuser?

Appropriate actions to take for drug-abusing patients in acute pain related to a recent diagnosable injury involve managing the pain:

1. Determine the source of the pain.
2. Provide pain medication that relieves the symptoms. Opiates may be used if they are what will stop the pain.
3. Give the medication in regularly scheduled doses. This prevents undesirable drug-seeking behaviors resulting from treatment on an as-needed (PRN) basis.
4. If pain is persistent or the cause is unclear, check for underlying psychiatric problems or an undetected source of pain.
5. If opiates are used, taper the doses slowly to avoid drug withdrawal.

How should you treat chronic pain in a person diagnosed as a drug abuser?

If the pain is chronic, the treatment strategies shift to not only finding the source of the pain, but also to using the entire spectrum of pain-relieving strategies with or without nonopiate pain medication (see Table 13-6). One exception is a patient with cancer-associated pain, for whom any effective medication (potentially addictive or not) is appropriate.

Table 13-6: Treatments for Chronic Pain in Known Drug Abusers

Medications used for pain control

Nonsteroidal anti-inflammatory drugs (eg, 30 mg ketorolactromethamine, which is equivalent to 6-10 mg morphine)
Tricyclics
Anticonvulsants
Muscle relaxants
Topical agents
Opiates

Physical interventions for pain control

Thermal: heat and cold are both effective and underutilized
Peripheral counterstimulation: transcutaneous electrical nerve stimulation (TENS) and vibration
Manual therapies: massage and chiropractic and osteopathic manipulation
Active movement: stretching and active exercise
Orthotics: splints and other supportive devices

HIV/AIDS ISSUES

Can HIV transmission be prevented in active substance abusers?

A comprehensive HIV prevention strategy in a primary care practice includes interventions to provide drug treatment, to take care of mental health problems, and to prevent HIV transmission during drug use and sexual activity. The primary care provider should routinely screen for drug abuse and treat or refer for treatment as quickly as possible. This is particularly important for adolescents who are at high risk for HIV, hepatitis B and C, and other infections. One study has shown that once adolescents start injecting drugs, over 90 % will become infected with hepatitis C within 18 months. The provider should also counsel patients who are actively using drugs not to share needles with others and to take advantage of programs that distribute clean needles. Programs use the needle distribution strategy as a first step to engage individuals who can then be encouraged to accept medical and drug abuse treatment services.

When is an active substance abuser ready for HIV treatment?

The most important clinical decision for successful treatment of drug-abusing patients with HIV is deciding when they are ready -- both substance abuse treatment and antiretroviral therapy (ART). Patients fall into 3 categories: those who do not want treatment, those who are ambivalent, and those who want treatment. For patients who do not want treatment, the provider should continue to be available with information on HIV and drug abuse treatment until they are ready to consider treatment. For those who are ambivalent about treatment, time is well spent during several clinical visits discussing the health issues of AIDS and drug abuse until they are ready for treatment. For patients who are ready for treatment the next step is to assess what factors will affect their adherence (see Chapter 7: Adherence to HIV Therapies). History of injection drug use, race, gender, age, socioeconomic status, level of education, and occupation are poor predictors of medication adherence. Accurate predictors of adherence are:

- The patient's health beliefs
- Ease of access to health care providers
- Familiarity with the treatment setting
- Existence of a social support system

- Perceived support from clinical staff members
- Simplicity of medication regimens

Interaction with providers and ambiance of the treatment setting account for almost half of the support factors needed to encourage drug users to adhere to treatment regimens. This pattern is true for active drug users, with the possible exception of persons addicted to crack cocaine.

Difficult economic and social situations, including unemployment and unstable housing, may make adherence to clinical treatment plans for both drug addiction and HIV even more difficult to follow. For these reasons some drug abuse treatment centers provide residential treatment to minimize outside influences on drug use. Also, methadone clinics provide an ideal opportunity for rehabilitated substance users to receive adherence support for ART through directly observed therapy (DOT) at the clinic.

What immunizations should drug abusers with HIV receive?

Because of the higher risk of tetanus in injection drug users, tetanus boosters should be given when due. Pneumococcal and influenza vaccines are recommended for all patients with HIV. Drug abusers with no antibodies to hepatitis A and hepatitis B should be immunized. Hepatitis A can be fatal in individuals with hepatitis C.

Are there important drug interactions between antiretrovirals and medications for drug treatment?

A common problem in treating patients with HIV who are drug users is the drug interactions between medications. Studies have shown that interactions of methadone and antiretroviral medications are linked to CYP450 3A4 sites in the liver. The most significant interactions are between methadone and nevirapine (NVP) or efavirenz (EFV), which precipitate rapid drug withdrawal symptoms (see Table 13-7). Methadone programs should be alerted when methadone patients are started on efavirenz or nevirapine, as dose escalation of methadone will probably be required. When methadone and didanosine (ddI) are coadministered the uptake of didanosine may be lowered requiring a higher dose of didanosine (See Drug Tables 7 and 8 in the Pocket Guide). Other interactions caused by drugs such as abacavir

(ABC) and all the PIs except indinavir (IDV), though pharmacologically measurable, are not clinically apparent and standard doses are appropriate. Potential interactions between illicit drugs and HIV medications are less well understood. Methamphetamine products have been associated with sudden death in individuals on protease inhibitors. Anecdotal reports describe how selective serotonin reuptake inhibitor (SSRI) antidepressant medications may produce side effects that mimic drug withdrawal and may decrease AIDS medication adherence.

Table 13-7: Antiretroviral Drugs that Affect Methadone Levels

NRTI	NNRTI	PI
zidovudine (ZDV) ↔	nevirapine (NVP) ↓	indinavir (IDV) ↔
didanosine (ddI) ↔	delavirdine (DLV) ↑	ritonavir (RTV) ↓
zalcitabine (ddC) ↔	efavirenz (EFV) ↓	nelfinavir (NFV) ↓
stavudine (d4T) ↔		saquinavir (SQV) ?
abacavir (ABC) ↓		amprenavir (APV) ↓
		lopinavir (LPV) ↓
		atazanavir (ATV) ↓

↓ = decreases methadone blood levels

↔ = indeterminate effect

↑ = increases methadone blood levels

Why are HIV and drug abuse both such noticeable issues now?

HIV and substance abuse are both significant public health problems that merit the attention of public health officials and policymakers. Today, an estimated 40 million people worldwide are living with HIV. Of these, 2 to 3 million people are injection drug users. In the United States, approximately a third of HIV/AIDS cases are related to injection drug use. Research shows that use of drugs, injected or not, can affect decisionmaking – particularly about engaging in unsafe sex – that can endanger the health of the drug user and of others. Substance abuse is a double-edged sword because it increases an individual's risks for continuing drug use while also increasing the likelihood of exposure to HIV and other bloodborne infections. Infectious diseases that are more prevalent among injection drug users than in the general population are HIV, other STDs, including hepatitis B and C, and tuberculosis. Prevention and early treatment of drug abuse and drug-related diseases are critical public health measures to reduce the spread of new infections.

KEY POINTS

Substance abuse and addiction involve compulsive drug-seeking behavior that interferes with an individual's ability to function normally in many aspects of daily life. Substance abuse and mental health problems often occur together and, unless treated, can lead to chronic social and medical consequences.

Accurate and reliable diagnosis of substance abuse or dependence is not a perfect science. Screening techniques, in concert with a thorough medical history and evaluation, are important in detecting and correctly diagnosing a substance abuse-related disorder.

HIV transmission is preventable in people who use drugs. For drug users and the community at large, drug addiction treatment is disease prevention.

Hepatitis C is extremely common in patients with a past or current history of injection drug use. All patients with hepatitis C should be vaccinated against hepatitis A and B if serologic studies show no prior exposure.

The clinical issues to be addressed are to treat comorbid conditions as soon as possible, treat drug use and HIV aggressively, and be aware of common drug interactions seen in patients treated for drug use and HIV simultaneously.

Chapter 14:**Mental Health Disorders***Linda Frank, PhD, MSN, ACRN**Glenn J. Treisman, MD, PhD**Niccolo D. Della Penna, MD**OVERVIEW**DISORDERS OF ATTENTION OR COGNITION**PERSONALITY DISORDERS**MOOD DISORDERS**ANXIETY DISORDERS**SUGGESTED RESOURCES**REFERENCES***OVERVIEW****Why is it important to address mental health disorders in persons living with HIV?**

HIV infection increases the risk of developing psychiatric disorders, including depression, mania, psychosis, and substance abuse (Treisman, 1999). For patients with preexisting mental illness, a diagnosis of HIV can significantly impact their ability to cope with HIV disease, adhere to treatment regimens, and take advantage of support networks and care systems, and can result in deterioration in their quality of life. Individuals with previous histories of mood, cognitive, or anxiety disorders may exhibit a reemergence or exacerbation of symptoms. As persons with HIV/AIDS live longer and the focus of care shifts from acute to chronic, the long-term psychological impact of HIV disease becomes more apparent.

What common HIV-related medical conditions have psychiatric symptoms?

It is essential for primary care providers to be aware of the need for a comprehensive evaluation of psychiatric symptoms in persons with HIV disease. Many psychiatric symptoms can indicate an underlying opportunistic disease or other condition (see Table 14-1).

What are the most common mistakes made in mental health management of HIV-infected patients?

Primary care providers commonly 1) under-diagnose depression, 2) under-dose antidepressant medications, 3) neglect substance use management and treatment, 4) stigmatize patients with psychiatric disorders, and 5) assume that psychotherapy implies a lengthy and detailed conversation.

Table 14-1. HIV-Related Conditions That Can Present With Psychiatric Symptoms

Type of problem	Condition
Opportunistic brain infections	Toxoplasmosis, cryptococcal meningitis, cytomegalovirus infection, tuberculosis, progressive multifocal leukoencephalopathy, neurosyphilis
Opportunistic malignancies	Lymphoma, Kaposi sarcoma
Metabolic complications	Fever, anemia, blood infections, hypoxia, hypotestosteronism
Drug toxicity	Corticosteroids, alpha-interferon, efavirenz (EFV)
Substance abuse complications	Recreational drugs (cocaine, alcohol, methamphetamine, hallucinogens, nitrate inhalant, opiates) Prescribed drugs (benzodiazepines, opiates, psychostimulants)

What conditions warrant psychiatric consultation?

Providers should obtain psychiatric consultation in 1) major depression refractory to medication trials, 2) bipolar disorder, 3) schizophrenia, and 4) suicidal or homicidal thoughts.

DISORDERS OF ATTENTION OR COGNITION**What are the characteristics of delirium in patients with HIV infection?**

Delirium, which is a state of global derangement of cerebral function, occurs more frequently in medically

ill, brain injured, or metabolically unstable patients. The clinical presentation and the differential diagnosis in HIV patients are the same as in HIV noninfected individuals, with the additional possibility that delirium is HIV-related. Presentation may vary in the presence of psychomotor agitation or retardation. Emotional changes are common and often unpredictable, and hallucinations and delusions are frequently seen. Electroencephalography may show diffuse slowing of the background alpha rhythm, which resolves as confusion clears. The syndrome has an acute or sub-acute onset and remits fairly rapidly once the underlying cause is treated.

How do you manage delirium in patients with HIV infection?

Non-pharmacologic treatments include identification and removal of the underlying cause, reorientation of the patient (calendars, clocks, view of outside world, and active engagement with staff members), and pharmacologic management of behavior or psychosis. Low doses of high-potency antipsychotic agents such as haloperidol are often useful. Newer, atypical antipsychotics are currently being used with some success, but those with more anticholinergic activity may worsen the condition. Benzodiazepines should be used cautiously, as they may contribute to delirium in some patients, except in cases of alcohol or benzodiazepine withdrawal deliria. Physical restraint should be used as little as possible as it often worsens delirium.

How do you diagnose and treat minor cognitive-motor disorder (MCMD)?

MCMD is a less severe neurocognitive disorder of earlier HIV infection, and the symptoms are often overlooked because they may be very subtle. Cognitive and motor slowing are most prominent and are often discovered as a result of a minor complaint, such as taking longer to read a novel, dysfunction when performing fine motor tasks, or an increased tendency to stumble. Diagnosis is made by the finding of 2 or more of the following symptoms for more than a month: impaired attention and concentration, mental slowing, impaired memory, slowed movements, lack of coordination, and changes in personality (irritability or emotional lability). Some patients continue to have minor problems, while others progress to frank dementia. Antiretroviral therapy (ART) may be of some benefit in slowing progression, but this conclusion is confounded by a lack of understanding of factors that lead some patients to progress while others remain static.

How do you diagnose and treat HIV-associated dementia?

HIV-associated dementia presents with the typical triad of symptoms seen in other subcortical dementias—memory and psychomotor speed impairments, depressive symptoms, and movement disorders. Initially, patients may notice slight problems with reading, comprehension, memory, and mathematical skills. Patients later develop global dementia, with marked impairments in naming, language, and praxis. Clouding of consciousness is absent, and there is no evidence of another cause. Motor symptoms are often subtle in early stages, including occasional stumbling while walking or running, slowing of fine repetitive movements, and slight tremor. There may be impaired saccadic eye movements, dysdiadochokinesia, and hyperreflexia. Apathy is also a common early symptom, often causing noticeable withdrawal from social activity. A frank depressive syndrome also commonly develops, typically with irritable mood and anhedonia instead of sadness and crying spells. Sleep disturbances are quite common, as is weight loss. Psychosis may develop in a significant number of patients and generally presents with paranoid beliefs, although hallucinations may exist. In 5%-8% of patients, a syndrome known as AIDS mania develops in addition to the HIV-associated dementia. In later stages, there may be frontal release signs and rather severe motor symptoms, including marked difficulty in smooth limb movements, especially in the lower extremities.

HIV dementia is typically seen in late stages of illness, usually in patients who have had a CD4 count nadir of < 200 cells/mm³. Certain risk factors have been associated with eventual development of HIV dementia, namely, higher HIV RNA viral load, lower education level, older age, anemia, illicit drug use, and female sex. Prognosis is rather poor, with a rapidly progressive nature, usually ending in death within 2 years.

Standard of care is to ensure an optimal ART regimen and treat associated symptoms aggressively. Depression can be treated with standard antidepressants, and in some cases methylphenidate or other stimulants may be useful in the treatment of apathy. Safety assessments should be performed as with any other case of dementing illness.

What is the relationship between psychosis and HIV?

Psychosis, including schizophrenia, contributes to behaviors that may lead to HIV infection, including higher rates of injection drug use, unprotected sex,

multiple sex partners, trading sex for money or other goods, and sex while intoxicated (Cournos et al, 1994). Providers who see patients with psychosis should be sensitive to the risk of acquiring HIV and should screen patients carefully for risk behaviors.

Accumulating evidence suggests that HIV infection may be directly linked to the onset of psychosis. Psychosis can be a manifestation of delirium, affective disorders, or schizophrenia, but can it occur in the absence of these conditions. Estimates of the prevalence of new-onset psychosis in patients with HIV range from 0.5%-15%, which is higher than in the general population (Kendler et al, 1996; Sewell et al, 1994). New-onset psychosis may also be a manifestation of HIV-associated encephalopathy. History of substance abuse also is more common among patients with psychosis.

How do you treat HIV-infected patients with schizophrenia?

The principles of treatment for HIV-infected patients with schizophrenia follow the same basic principles as for any other patient with schizophrenia, namely, control of symptoms with medications and psychosocial support and rehabilitation. Quite often, patients require long-term treatment and require various antipsychotic medications to control the delusions, hallucinations, and overall level of disorganization.

PERSONALITY DISORDERS

What is the relationship between personality disorders and HIV infection?

Personality disorders represent extremes of normal personality characteristics and are disabling conditions. Clinical observation suggests that patients with personality disorders who are highly extroverted and highly neurotic are most prone to engage in HIV risk behavior. These individuals are preoccupied by and act upon their feelings, and their actions tend to be unpredictable and inconsistent. Past experience and future consequences have little salience in decisionmaking for individuals who are ruled by feeling; the present is paramount. Their overarching goal is to achieve immediate pleasure or removal of pain, regardless of circumstances. Patients are more fixed upon the reward of sex and remarkably inattentive to the STDs they may acquire. In addition, substance abuse is more likely a comorbidity with these patients. Injection drug use is markedly more common because

the experience is much more intense and pleasurable. Thus, patients with personality disorders are at risk for HIV infection, and if they are already HIV-positive they are at risk for transmitting HIV to others. Management of patients with personality disorders includes encouraging a focus on thoughts rather than feelings, use of a behavioral contract, emphasis on constructive rewards, use of relapse prevention strategies, and coordination with additional health and psychosocial care providers.

MOOD DISORDERS

What are characteristics of adjustment disorders in patients with HIV?

Adjustment disorders are common emotional responses to HIV and often account for the “hopeful highs” and “helpless lows” experienced by some patients. These reactions are typically situational and transient, but reflect significant distress in the patient. Adjustment issues vary according to a variety of factors in addition to stage of illness, risk factors, socioeconomic status, level of education, characteristics of support networks, and comorbid psychiatric disorders. Adjustment reactions are most likely to occur at the time of significant medical events, especially during transition points in the illness. These conditions typically are accompanied by less severe depression and/or anxiety than are classic mood disorders. Treatment is usually non-pharmacologic and includes promotion of a structured environment, reassurance, engagement of the patient in the treatment process, close monitoring for progression of symptoms, and supportive counseling and psychotherapy.

How do you diagnose bipolar disorder in patients with HIV?

Bipolar disorder, also known as manic-depressive illness, is a condition in which patients classically alternate between extended episodes of depression and briefer periods of hypomania or mania with increased mood, increased energy, increased confidence, and grandiose ideas. Manic episodes are associated with increased rates of substance abuse and impulsive behavior, and there has been speculation that bipolar disorder may be a risk factor for HIV infection. AIDS-related mania appears to be specifically associated with late-stage HIV infection and is associated with cognitive impairment and a lack of previous episodes or family

history. The history will usually reveal progressive cognitive decline prior to the onset of mania. Irritable mood is more typical than euphoria, and prominent psychomotor slowing may replace the expected hyperactivity of mania, complicating the diagnosis. The presentation is usually quite severe in its course. AIDS mania appears to be more characteristically chronic, has few spontaneous remissions, and readily relapses with cessation of treatment (Lyketsos et al, 1997).

How do you treat bipolar disorder in patients with HIV?

The treatment of mania in early-stage HIV infection is responsive to mood stabilizing medications, particularly lithium, valproic acid, and carbamazepine. Antipsychotic agents, particularly atypical agents, are often utilized in the acute phase as well. These medications decrease manic symptoms and may prevent recurrence. Treatment strategies may be somewhat different in advanced HIV disease. AIDS mania may respond to treatment with antipsychotics alone. In general, patients are often exquisitely sensitive to dosage changes that might otherwise seem trivial. Few data exist for the newer anticonvulsants such as gabapentin and lamotrigine, and these medications should be used sparingly. The major problem with lithium in AIDS patients has been rapid fluctuations in blood level, even when on previously stable doses. Lithium intoxication is not uncommon in this setting. Valproic acid has been successfully used when titrating to usual therapeutic serum levels of 50-100 ng/dL. Hepatotoxicity may significantly limit treatment, particularly in the setting of chronic viral hepatitis or severe hepatic *Mycobacterium avium* complex infiltration. Hematopoietic abnormalities may also occur, requiring close monitoring of white blood cell and platelet levels. Carbamazepine may be effective but is poorly tolerated because of sedation and potential for bone marrow suppression in combination with antiviral medications and viral burden. Patients with late-stage HIV are also significantly affected by toxic side effects of antipsychotic medications, and a much lower dosage may be required than in other settings.

How do you diagnose major depressive disorder in patients with HIV?

Several lines of evidence suggest that HIV is a causal factor in depression, and that depression is a causal factor in HIV-related morbidity (Ciesla and Roberts, 2001). Differentiating appropriate sadness from pathologic depression may be difficult in the person infected with HIV. Psychomotor retardation and apathy of AIDS dementia complex may be confused with

depression, but will often improve in patients who are on combination antiretroviral treatment. Organic mood disorders may also have symptoms similar to major depression and are responsive to antidepressant medication.

Depression is underrecognized, underdiagnosed, and undertreated (see Table 14-2). At the same time, it is important for providers to consider alternative diagnostic possibilities for depressive symptomatology (see Table 14-3).

Table 14-2. Risk Factors for Depression

History of prior mood disorder
History of substance abuse or active substance use
Prior suicide attempt
History of anxiety disorder
Family history of depression or suicide
Inadequate social support
Nondisclosure of HIV status
Multiple losses
Advancing illness
Treatment failure

Table 14-3. Differential Diagnosis of Major Depression

Nonpathologic states of grief and mourning
Dysthymia
Delirium
Dementia
Demoralization
Substance intoxication
Substance withdrawal
CNS injury or infection
Acute medical illness

What are the pharmacologic treatment options for major depression?

Pharmacotherapy is the mainstay of treatment for major depression (see Table 14-4). No single antidepressant has been found to be superior in treating HIV-infected patients as a group. Patient adherence to regimens is critical, and those who take adequate doses of antidepressants have the best chance of improving. A general rule is to start with low doses of any medication, titrating up to a full dose slowly, in order to minimize early side effects that may act as obstacles to adherence.

Table 14-4. Medications to Treat Depression in HIV Disease

Medication	Starting dose	Usual therapeutic dose	Serum level	Advantages	Interactions with HIV medications
nortriptyline (Pamelor)	10-25 mg qhs	50-150 mg qhs	70-125 ng/dL	Promotes sleep, weight gain, decreases diarrhea	Fluconazole, lopinavir/ritonavir, and ritonavir increase nortriptyline levels.
desipramine (Norpramin)	10-25 mg qhs	50-200 mg qhs	>125 ng/dL	Promotes sleep, weight gain, decreases diarrhea	Lopinavir/ritonavir and ritonavir increase desipramine levels.
imipramine (Tofranil)	10-25 mg qhs	100-300 mg qhs	>225 ng/dL	Promotes sleep, weight gain, decreases diarrhea	Lopinavir/ritonavir and ritonavir increase imipramine levels.
amitriptyline (Elavil)	10-25 mg qhs	100-300 mg qhs	200-250 ng/dL	Promotes sleep, weight gain, decreases diarrhea	Lopinavir/ritonavir and ritonavir increase amitriptyline levels.
clomipramine (Anafranil)	25 mg qhs	100-200 mg qhs	150-400 ng/dL	Promotes sleep, weight gain, decreases diarrhea	Lopinavir/ritonavir and ritonavir increase clomipramine levels.
doxepin (Sinequan)	10-25 mg qhs	150-250 mg qhs	100-250 ng/dL	Promotes sleep, weight gain, decreases diarrhea	lopinavir/ritonavir and ritonavir increase doxepin levels.
fluoxetine (Prozac)	10 mg qam	20 mg qam	unclear	Activating, energizing	Amprenavir, delavirdine, efavirenz, indinavir, lopinavir/ritonavir, nelfinavir, ritonavir, and saquinavir increase HIV medication levels. Nevirapine decreases fluoxetine levels.
sertraline (Zoloft)	25-50 mg qam	50-150 mg qam	unclear		Lopinavir/ritonavir and ritonavir increase sertraline levels.
citalopram (Celexa)	20 mg qam	20-60 mg qam	unclear		Lopinavir/ritonavir and ritonavir increase citalopram levels.
paroxetine (Paxil)	10 mg qhs	20-40 mg qhs	unclear	Mildly sedating	Lopinavir/ritonavir and ritonavir increase paroxetine levels.
fluvoxamine (Luvox)	50 mg qhs	150-250 mg qhs	unclear	Mildly sedating	Amprenavir, delavirdine, efavirenz, indinavir, lopinavir/ritonavir, nelfinavir, ritonavir and saquinavir increase HIV medication levels. Nevirapine decreases fluvoxamine levels.
venlafaxine (Effexor)	37.5 mg qam	75-300 mg qam	unclear		Lopinavir/ritonavir and ritonavir increase venlafaxine levels.
mirtazepine (Remeron)	7.5-15 mg qhs	15-45 mg qhs	unclear	Promotes sleep, weight gain	
nefazodone (Serzone)	50 mg bid	300-400 mg/d in divided doses	unclear	Mildly sedating	Efavirenz and indinavir increase HIV medication levels.
trazodone (Desyrel)	50-100 mg qhs	50-150 mg qhs for sleep 200-600 mg qhs for depression	unclear	Promotes sleep	Lopinavir/ritonavir and ritonavir increase trazodone levels.
bupropion (Wellbutrin)	100 mg qam	150-400 mg/d in divided doses	unclear	Activating, no sexual side effects	

The first week of treatment usually determines whether a patient will be able to tolerate the medication at all. Following this period, the dosage should be increased slowly to either a typical therapeutic dose or serum level, when appropriate. Patients should be encouraged to wait as long as possible for the therapeutic effect, which may take at least 6 weeks to achieve. Close monitoring for side effects should be done at every visit, and the side effects treated whenever possible. For example, insomnia because of selective serotonin reuptake inhibitor (SSRI) use may respond well to low doses of trazodone. Constipation from tricyclic antidepressants is often relieved by increasing water and fiber intake. Sexual side effects from SSRIs are common and may be treated with sildenafil in some, or by drug holidays, switching to bupropion, and addition of buspirone, cyproheptadine, or ginkgo biloba.

For patients showing only partial response to antidepressant medications after an adequate trial period, several other agents are often useful for augmentation strategies. The best studied is lithium, yet its side-effect profile often prevents use in the HIV setting. Olanzapine, risperidone, and pindolol have also been reported to be effective augmenting agents, as well as addition of a second antidepressant, other mood stabilizers, trazodone, methylphenidate, benzodiazepines, sleep deprivation, and phototherapy.

If no benefit is gained from the primary antidepressant, even after augmentation, a new primary agent should be chosen and similarly titrated slowly, and augmented if necessary. There is evidence to suggest that a response may be seen from 1 drug where none was seen from another in the same class.

What are the nonpharmacologic treatments for major depression?

Psychotherapy is an integral part of the treatment of major depression. Treatment with medication plus psychotherapy has been shown to be more effective for patients than either modality alone. Patients often require education about the disease nature of their depression, encouragement, and therapeutic optimism that the treatments will work. Medical providers who keep the concept of psychotherapy in mind will structure their interactions with patients to slowly empower and enable the patients to take control of their lives, thus relying on their providers less and less.

ANXIETY DISORDERS

How do you diagnose anxiety disorder in patients with HIV infection?

Anxiety disorder, which can include generalized anxiety disorder, panic disorder, obsessive-compulsive disorder, and post-traumatic stress disorder, is a common response to the stressors of HIV infection at any stage. True anxiety disorders tend to be less prevalent than depressive disorders, particularly at later stages of HIV infection. Anxiety is often a component of major depression, and further history should be ascertained for patients presenting with symptoms of panic or anxiety. Anxiety may also be due to substance use, and neurologic and physical impairment.

What are pharmacologic treatments for HIV-infected patients with anxiety?

Physicians must aggressively screen for major depression in patients presenting with anxiety symptoms, because both conditions often coexist. In particular, anxiety is a frequent symptom of major depression. Antidepressant medications are very effective in most cases.

In particularly debilitating cases, however, anxiolytic medications can be used for time-limited intervention and in low doses. Exclusion of patients with comorbid substance abuse is essential prior to initiation of anxiolytic medication, because of the abuse liability. Medications with a short half-life should be very cautiously used, as dependence may easily develop over a short period of usage. Particular attention should be given to the issues of hepatic function and choice of anxiolytic. Lorazepam, oxazepam, and temazepam avoid hepatic glucuronide conjugation by means of an alternate metabolic pathway and should be chosen as first-line medications for patients with HIV-associated liver dysfunction, as in patients with viral hepatitis.

What are nonpharmacologic treatments for HIV-infected patients with anxiety?

Specific advantages to utilizing nonpharmacologic intervention for anxiety include a decrease in pill burden, decrease in CNS sedation and cognitive impairment, lack of drug-drug interaction, and avoiding polypharmacy. Some interventions are 1) muscle relaxation, 2) meditation techniques, 3) psychotherapy, 4) exercise, 5) biofeedback, 6) behavioral techniques, 7) guided imagery, and 8) cognitive therapy.

Chapter 15:**Palliative and End-of-Life Care***Carla S. Alexander, MD**Kennita R. Carter, MD**INCORPORATING PALLIATIVE CARE INTO HIV CARE**CARE AT THE END OF LIFE**KEY POINTS**SUGGESTED RESOURCES**REFERENCES***INCORPORATING PALLIATIVE CARE INTO HIV CARE****What is palliative care?**

Palliative medicine is the discipline devoted to the relief of suffering and the promotion of quality of life. Palliative, meaning non curative, has often been misunderstood to be limited to end-of-life or hospice care; it is rather a more general term for the type of supportive care needed throughout the trajectory of any chronic illness or major injury.

In traditional medical care, efforts are primarily curative or restorative until a poorly defined point when provider and patient acknowledge disease progression and decide to shift toward less aggressive management (See Figure 15-1a). In chronic progressive illnesses supportive care might be provided simultaneously assuring maximum quality of life throughout the course of illness for patients, family and caregivers (Figure 15-1b).

Why is palliative care still needed for people with HIV/AIDS, now that antiretroviral therapy (ART) is so successful?

AIDS, originally considered a terminal illness, has transitioned to a chronic disease for those who are able to use ART. However, there is still a steady death rate in the United States of 15,000 to 16,000 per year. While the numbers are low compared with the epidemic in the early years, persons living with HIV disease continue to experience pain, body habitus changes, and other physical and emotional symptoms that negatively impact their daily quality of life. Preventing and controlling these problems are as relevant as reducing viral load. Setting realistic goals and improving self-esteem allow the person with HIV disease to remain in control of his/her life and to be a productive member of society.

Figure 15-1b: Integrated Model of Care (curative and palliative together)

Source: World Health Organization. *Cancer Pain Relief and Palliative Care, Report of a WHO Expert Committee*. Publication #1100804. Geneva: World Health Organization, 1990.

What does palliative care focus on?

The following are essential elements of palliative care:

- Goals of care are patient- and family-driven and frequently revised.
- Relationships with an interdisciplinary team provide the mechanism for care.
- Truth-telling and support for realistic decisionmaking are the norm.
- Aggressive prevention and control of bothersome symptoms are paramount.
- It is understood that psychosocial, emotional, and spiritual needs significantly impact symptoms.
- Integration of a palliative care approach throughout the disease trajectory improves quality of life.
- Early identification of and communication with a proxy decisionmaker is a priority.
- Evaluation and treatment decisions are modified based upon prognosis.
- Near the end of life, unnecessary drugs are eliminated and comfort measures provided.
- Assisting the dying person to achieve psychosocial and spiritual closure is a goal of care.
- Family and friends are provided with care techniques and communication skills.
- Care of the caregiver and of the provider are essential aspects of providing supportive care.

- Legal, ethical, and cultural aspects are acknowledged and respected.
- It is recognized that dying is an inevitable part of life, not an enemy to be denied.
- Anticipatory grieving and bereavement support for the family are included in care.

How can palliative care be incorporated into primary HIV care?

A palliative approach to HIV disease management begins by obtaining an accurate assessment of the patient's support system, life goals, and preferences early in the disease process. Then the following activities are incorporated into the care plan:

- Open appraisal of stage of disease with appropriate goal setting
- Yearly review of goals (more frequently if symptomatic)
- Anticipation of and prophylaxis for side effects of ART
- Education regarding advance care planning well before patient is symptomatic
- Use of standardized questionnaires to assess presence of symptoms and their impact on quality of life
- Provision of separate medical appointments to manage symptoms such as pain or weight loss

- Reduction of diagnostic studies and number of medications as prognosis shortens
- Regular review of health power of attorney and support of patient wishes
- Discussions of prognosis with patient and family soon enough to allow closure near the end of life
- Referral to hospice/palliative home care when office visits become burdensome for patient
- Maintenance of contact with family during bereavement period
- Acknowledgement of staff members' feelings of loss when patients die

What are some common symptoms experienced by persons with advanced HIV disease?

In surveys, patients receiving ART report experiencing the same symptoms as patients reported in the earlier years of the epidemic, but the frequencies of symptoms have changed (Mathews et al, 2000; Vogl et al, 1998). Fatigue, sadness, diarrhea, and fever continue to plague patients even when disease is controlled by ART. Pain is still experienced by up to 75% of patients and may be present in multiple areas at once, including the extremities and oral, esophageal, abdominal, or rectal sites. Adequate treatment for one type of pain may only expose another. This often raises the specter of “drug-seeking behavior” when in fact the patient is simply able to be aware of the secondary pain after the greater pain is relieved (see Chapter 13, Management of Substance Abuse). Peripheral neuropathy can be caused by ART, HIV disease itself, or unrelated disease such as diabetes. This pain does not seem to be related to the degree of control of viral burden, and cause must be sought through historytaking as many patients seem to overlook early manifestations such as numbness. Refer to Chapter 8, Symptom Management, as well as resources under Suggested Resources for management of pain and symptoms.

How important is pain control in advanced HIV disease?

Pain, as with any symptom, should be described, quantitated, treated, and promptly reevaluated with appropriate dose modification of therapy (see Table 15-1). In the *Guidelines for Management of Cancer Pain*, pain experienced by those with HIV disease is compared with the chronic pain experienced by persons with cancer, which often requires management with opioids (AHCPR, 1994). Unlike blood pressure, which might be regulated over weeks, pain should be controlled within the shortest time possible to prevent the development of long-term symptoms such as depression and anhedonia.

Table 15-1. Mnemonic for Assessment of Pain

A	A sk about pain regularly; A ssess systematically
B	B elieve the patient and family
C	C hoose treatment options appropriate to patient and setting
D	D eliver medications on an “around-the-clock” basis with adequate “breakthrough” doses
E	E valuate results frequently; E mpower patients and families to control pain

The following guidelines are helpful in prescribing pain medication (American Pain Society, 1999):

1. Use a grading system (such as the scale of 0–10) to document pain severity and compare the number obtained to a second number following treatment to evaluate response.
2. Start with a dose that will acutely relieve the pain. This may be given intravenously or subcutaneously to achieve a rapid response. Care should be taken to observe for any signs of respiratory depression in opiate-naïve patients who receive parenteral opioids.
3. Next, begin a low dose every 3–4 hours (based on the half-life of the drug) “around-the-clock,” **not** on an as-needed, basis. The initial dose should be chosen based on the age, size, and renal/hepatic function of the patient. (See Suggested Resources for additional guidance on pain management.)
4. A “breakthrough dose” should also be prescribed every 1–2 hours prn equal to a sixth of the total daily opioid dose. This allows for development of a steady state drug level and avoids alternation of great pain intensity with somnolence. This is the same approach used to control hyperglycemia with a sliding scale of regular insulin based on glucometer readings; doses are based on pain scores.
5. When pain is fairly well controlled, it is appropriate to change the patient to a long-acting pain medication for ease of administration. The dose is calculated by adding together the total dose taken in 24 hours and dividing by the half-life of the new preparation. For example, for a medication meant to be given every 12 hours: divide the total dose by 2, and this number will be the dose every 12 hours. Don't forget the breakthrough dose. This is a short-acting opioid, preferably of the same type as the long-acting one for use at times when the pain is not adequately controlled.
6. Other forms of administration include liquid formulations for persons with difficulty swallowing, rectal suppositories, “sprinkles” that can be mixed with soft food, and patches that allow absorption of the medication through the skin.

What is advance care planning?

Advance care planning is an attempt to clarify patient wishes near the end of life. Identification of a “health care proxy,” a person who makes decisions if the patient becomes unable to communicate his or her own wishes, should be encouraged and documented in the medical record with contact information. Even when formal directives have not been written the patient should discuss his or her thoughts and concerns about the end of life with that person. Hosting a family meeting to discuss the issues might also be useful. A “living will” may be difficult to write because it is not possible to anticipate every event that might occur when one is critically ill. It may be better for the person to clarify general thoughts about the use of ventilators or other intensive support mechanisms for sustaining life. Permanency planning should be included in this discussion whenever children are involved.

Family members feel inadequate when confronted with end-of-life decisionmaking. Realistic guidance provided to the health care proxy can minimize that emotional burden (see Table 15-2). The provider should discuss in detail what a resuscitation effort means and give a specific description of what might happen during the use of “life supports” (eg, one cannot talk and may not be able to communicate when on a respirator; the combination of early dementia and an episode of hypoxia might result in significant diminution of mental capacities).

What is hospice care?

Hospice can be a philosophy, a place, a type of home care, or a reimbursement mechanism (EPEC Curriculum, 2003). The goal of hospice care is to reduce suffering by controlling symptoms, consolidating medications, and supporting the patient and family in living fully until death. However, in the United States obtaining hospice care for any individual often depends on insurance coverage. For a person on Medicare a referral to hospice care requires that the patient have a life expectancy of less than 6 months if the disease runs its normal course. This is a complex determination in any chronic illness. Patients who have decided to forego restorative therapy or who no longer want to be admitted to a hospital are not the norm in HIV disease, but working with a local hospice program may make this transition less burdensome. For financial reasons the patient may be offered “palliative” rather than “hospice” care.

Table 15-2. Useful Questions for Exploring Patient and/or Family Concerns

Domain	Question
Physical comfort	Tell me about your pain. Can you rate it on a 10-point scale?
	How much do you suffer from physical symptoms like shortness of breath, fatigue, or bowel problems?
Continuity with one's self	What makes life most worth living for you at this time?
	If you were to die sooner rather than later, what would be left undone?
Maintaining and enhancing relationships	How are your family (or loved ones) handling your illness?
	Have you had a chance to tell your family (or loved ones) how they are important to you?
Making meaning of life and death	What kind of legacy do you want to leave behind?
	What would allow you to feel that going through this illness has a purpose?
	Do you have spiritual beliefs that are important in how you deal with this illness?
Achieving a sense of control	How would you like your death to go?
Confronting and preparing for death	How much are you thinking about dying now? What are you thinking about it?

CARE AT THE END OF LIFE

What are the challenges of end-of-life care for the provider?

Deciding when to make the transition from curative/restorative mode to one of comfort measures only and having the skills to communicate this to the patient are probably the greatest challenges facing the provider (see Table 15-3). While guidelines exist for having difficult conversations effectively, avoiding conveying

a message of abandonment is the real difficulty. Being adept at managing symptoms such as pain can give the provider confidence when initiating this conversation. Reassuring the patient and family that comfort measures are always possible and isolating one problem at a time may minimize their sense of being overwhelmed. Simply asking the patient what goals are important helps refocus on concrete issues that can be successfully mastered.

Another significant challenge for the provider may be foregoing invasive diagnostic studies when the patient is moving closer to death. The astute practitioner needs to rely on physical assessment and knowledge of probabilities to surmise the cause of a symptom. Using one medication for multiple outcomes minimizes pill burden. For example, steroids may be employed for relief from dyspnea; this same drug might also improve appetite and sense of well-being, suppress fever, and relieve achiness related to prolonged bedrest.

Table 15-3. Mnemonic for Breaking Bad News	
S	S etting and listening S kills
P	P atient and family P erception of condition

What roles do culture and spirituality play in end-of-life care?

Culture and spirituality are significant factors affecting how end-of-life care should be delivered to each individual patient and family. Lack of clarification of cross-cultural differences can be a barrier to patients' receiving appropriate end-of-life care. Spirituality, connection with a higher power, or a sense of meaning can provide tremendous comfort and support. Not recognizing these issues or the impact of AIDS-related stigma might even add to suffering. It is useful to ask the patient if he/she has a faith and how important it is to him/her. If the provider does not feel comfortable

addressing these issues, every attempt should be made to have someone on staff or for easy referral to address this need. It has been clearly documented in medical literature that spiritual concerns might be involved in exacerbation of all types of illness.

How do you provide reality-based hope for the person with advanced AIDS?

Hope is an intrinsic value that allows the human spirit to persevere even against great difficulty. When a person is nearing the end of life, it may not be reasonable to want to live until a certain birthday that will not occur for several months. In this case, the health care staff needs to help with a redefinition of hope that is more achievable. Some families in hospice programs have celebrated religious holidays a month ahead of time, held ceremonies before they were originally scheduled, and made videotapes of the dying person to be played during an up-coming event.

How do you conduct a family meeting?

Prior to a family meeting, the provider must prepare a mental agenda to identify internal and external barriers to achieving a clear and therapeutic picture of the goals important to all involved (see Table 15-4).

What does the patient need to accomplish before death?

There are multiple physical, psychosocial, and spiritual issues that deserve attention in order for the patient to die peacefully and to leave satisfactory memories for family and friends. The patient and family need to:

- Appoint a health power of attorney and talk with that person about support preferences
- Make a will to avoid conflict following death, including guardianship issues
- Attempt to resolve previous misunderstandings or estrangements
- Encourage family and friends to openly discuss the patient's deterioration to avoid a "conspiracy of silence"
- Express love and appreciation to family, friends, and staff
- Engage family, friends, and staff in a life review (eg, telling stories about accomplishments, regrets, funny things that have happened along the way)
- Create a memory book or video tape, or write letters for children left behind
- Discuss plans or preferences regarding funeral or memorial service
- Say goodbye to family, friends, and caregivers (the patient needs reassurance that those left behind will be cared for and that he or she will be remembered)

Table 15-4. Components of a Discussion about End-of-life Care

I. Making preparations prior to a discussion about end-of-life care:

- Review previous knowledge of the patient and/or their significant others
- Review previous knowledge of the patient's attitudes and reactions
- Review your knowledge of the disease prognosis, treatment options
- Examine your own personal feelings, attitudes, biases, and grieving
- Plan the specifics of location and setting: a quiet, private place
- Have advance discussion with the patient or family about who will be present

II. Holding a discussion about end-of-life care:

- Introduce everyone present
- If appropriate, set the tone in a non-threatening way: "This is a conversation I have with all my patients..."
- Find out what the patient or significant other understands
- Find out how much the patient or significant other wants to know
- Be aware that some patients do not want to discuss end-of-life care
- Discuss prognosis frankly in a way that is meaningful to the patient
- Do not discourage all hope
- Avoid temptation to give too much medical detail
- Make it clear that withholding life-sustaining treatment is NOT withholding caring
- Use repetition to show that you understand what the patient or the significant other is saying
- Acknowledge strong emotions and use reflection to encourage patients or their significant others to talk about these emotions
- Tolerate silence

III. Finishing a discussion of end-of-life care:

- Achieve common understanding of the disease and treatment issues
- Make a recommendation about treatment
- Ask if there are any questions
- Ensure basic followup plan and make sure the patient and/or significant others know how to reach you for questions

What can the family expect as their loved one is dying?

Many people have little experience with the actual process of dying. At a time when family members feel grief and a loss of control, it is comforting to have a simple description of what to expect as they sit at the bedside. The provider needs to offer this information (see Table 15-6) as well as to suggest activities the family can do to offer comfort and to alleviate their feeling of helplessness.

What must the provider do after the patient dies?

At the time of death, those present need verification that in fact their loved one has died. It is useful to review what has happened and to offer supportive comments to those present as they adjust to this new information. It is comforting for them to remain with the deceased and say their goodbyes. Cultural beliefs will dictate behavior, and it is helpful to have discussed these practices ahead of time. Providers can:

- Reassure the family that they provided good and loving care
- Allow family members to remain at the bedside as long as necessary to bring closure

What steps should you take after writing a Do Not Resuscitate (DNR) order?

After writing an order for "No CPR" the provider should reverse these letters to offer family and friends "RPC" - Reassurance, Presence, and Caring. Facilitate conversations that acknowledge the role of family and friends in care. Be present for family even if only briefly. For hospitalized patients, write orders to intervene that assure comfort measures will be provided even when antibiotics or pressors might be discontinued (see Table 15-5).

- In the hospital, place something on the bed to honor the space recently vacated
- Tell family when to expect autopsy findings if autopsy is requested
- If an autopsy is performed, schedule time to discuss this with the family
- Notify other staff members who may have cared for this patient
- Send a condolence card
- Call family 1-2 weeks after the death to listen

Table 15-6: What the Family Should Expect of the Patient Prior to Death

1–2 weeks prior to death	• <i>Withdrawal from people</i> • <i>Decreased food and liquid intake</i> • <i>Talking with those who are already dead</i> • <i>Sleeping longer periods</i> • <i>Picking at clothing</i> • <i>Feeling very fatigued</i>
Days to hours prior to death	• <i>Surge of energy; seems like “himself”</i> • <i>Cheyne-Stokes respirations</i> • <i>Decreased urine output</i> • <i>Acral and large joint cyanosis</i> • <i>“Death rattle”</i> • <i>Weak pulse and decreased blood pressure</i>

Source: Adapted from Kearnes, *Gone from My Sight*. Depoe Bay OR: BK Books; 1995.

How can a primary care practice or clinic avoid staff burnout when several of the patients have died?

Providers who suffer from the death of more than one patient over a short time period may experience symptoms of multiple loss syndrome which, if unattended, can lead to symptoms found in post-traumatic stress disorder. They need to take the time to effectively grieve. How this is accomplished is a personal matter for each individual, but the clinic or health care facility must recognize the importance of allowing each person to come to a sense of closure after a patient's death. For some, attending the wake or funeral may be helpful. For others, a clinic-based time for remembering the individual(s) can provide a structured outlet for feelings of grief.

The focus of providers tends to be on caring for others. Primary care providers often have not received formal training in preventing and identifying burnout. With an ever increasing work load and shrinking time for office visits and administrative responsibilities it is easy to miss signs of stress (see Table 15-7). O'Neill and McKinney describe a 2-pronged approach to preventing and managing burnout. This involves developing more effective individual coping skills as well as creating a less stressful work environment (O'Neill and McKinney, 2003). Examples of personal coping strategies include: 1) being mindful of eating, exercise, and sleep patterns, 2) keeping a daily journal to record the events that cause stress, and 3) discussing personal experiences with someone else. A less stressful work environment includes a choice of mechanisms for 'taking a break' from the steady emotional drain of patient care.

Table 15-7: Common Signs of Stress for Caregivers

Physical	Psychological	Behavioral
Backaches	Anger and frustration	Emotional outbursts
Change in eating patterns	Loss of self-confidence and self-esteem	Withdrawal from friends and family
Diarrhea	Loss of interest in and commitment to work	Loss of punctuality and neglect of duty
Elevated blood pressure	Feelings of inadequacy, helplessness, and guilt	Decrease in judgmental ability
Fatigue	Feelings of restlessness	Inability to focus on tasks
Gastrointestinal problems	Depression	Tearfulness
Headaches	Sense of being overwhelmed or overloaded	Increased use of alcohol or other drugs
Insomnia	Mood swings	Difficulty getting along with people
Muscle tension	Sense of failure	Impaired work performance
Weight loss	Anxiety about the future	Resistance to change

Source: O'Neill JF, McKinney M. Caring for the caregiver. O'Neill JF, Selwyn PA, and Schietinger H, Eds. *The Clinical Guide to Supportive and Palliative Care for HIV/AIDS*. Rockville, MD: Health Resources and Services Administration, 2003.

KEY POINTS

Palliative medicine is the discipline devoted to the relief of suffering and the promotion of quality of life. Palliative care has often been thought to be limited to end-of-life or hospice care; it is rather a more general term for the type of supportive care needed throughout the trajectory of HIV disease.

Advance care planning is an attempt to identify a decisionmaker should the patient become unable to communicate his or her own wishes.

Deciding when to make the transition from curative/restorative mode to one of comfort measures only and having the skills to communicate this to the patient are probably the greatest challenges facing the provider.

There are multiple physical, psychosocial, and spiritual issues that need resolution in order for the patient to die peacefully and to leave satisfactory memories for family and friends.

The focus of providers tends to be on caring for others. Providers who suffer from the death of more than one patient over a short time period can experience symptoms of post-traumatic stress disorder. They need to take the time to effectively grieve.

Chapter 16:

Clinic Management

*Jonathan Allen Cohn, MD, MS, FACP**PATIENT RECRUITMENT AND RETENTION**CLINICAL SERVICES NEEDED FOR HIV CARE**SUPPORT SERVICES AND LINKAGES NEEDED FOR HIV CARE**KEY POINTS**SUGGESTED RESOURCES*

PATIENT RECRUITMENT AND RETENTION

How can primary care clinics recruit patients with HIV into care?

The persons who were easy to recruit and retain in care are already enrolled; the more challenging patients await recruitment. Every clinic should 1) be linked to agencies providing HIV testing and services for persons with HIV and 2) make clinic access easy for the clients of those outside services.

Many clinics establish referral linkages with community services that provide HIV counseling and testing services (CTS), AIDS service organizations (ASOs), STD treatment facilities, family planning agencies, drug treatment facilities, local health departments, regional HIV/AIDS hotlines, and local hospitals and emergency rooms. Many clinics also offer free confidential or anonymous CTS using State or Federal funding.

Clinic personnel should build personal relationships with agencies that may provide referrals, invite staff of community agencies to visit the clinic, or hold an open house. Providers from ASOs, such as case managers, can be invited to accompany patients on clinic visits. Referring agencies must know what services the clinic provides and which patients it serves, as well as those it cannot serve. Clinics with Ryan White Care Act (RWCA) funding should be able to accept patients regardless of health insurance or ability to pay. Primary care clinics can benefit from having a brochure describing their programs and array of services, along with information about making appointments, hours of service, and so forth.

Clinics differ based on the characteristics of the people living in their catchment area and the expertise of clinic staff. Some successful clinics target a narrow but underserved population and concentrate on

meeting the needs of that population. A youth-friendly environment may differ from one targeting the working poor.

How do clinics retain patients in care?

Respect, cultural competence: Respecting patients and providing them with effective care builds trust and keeps them coming back. New clinic attendees may have strong feelings related to HIV infection (fear of death) or how they acquired it (issues of shame or of secrecy). They may lack trust in medical care (prior personal experiences or the legacy of the Tuskegee syphilis experiments) or in current treatments (“Everyone I knew who took AZT died...”). Patients encounter barriers where there are cultural differences or language barriers between themselves and the staff. Staff members should be trained to anticipate, recognize, and work with these issues.

Welcoming staff attitude: Patients should always be made to feel that they came to the right place (even when it is not true, and they must be referred on). Patients should receive understanding and support, even when they arrive in clinic without obtaining the required managed care referral form (at least the first few visits). Providers must know the target population and build a system that will make patients feel welcome. Many RWCA-funded clinics employ patient advocates, persons from the target community who may or may not themselves be HIV-infected. Advocates directly assist patients in negotiating the clinical care system and help patients ask questions or make their needs known to clinical staff. Advocates or peer support persons can be instrumental in helping patients build self-esteem and acquire new habits that will enable them to use health care services in a proactive manner. It is very helpful for patients to be able to forge a personal connection with at least one staff member.

Welcoming environment: Physically comfortable waiting and examination areas, with linguistically and culturally appropriate decoration and reading material, are important for patient retention. A clinic that serves parents or children should make available toys or children's books.

Orientation to clinic systems and rules: New patients need a brief description of clinic staff and services, routine and emergency procedures, prescription refill procedures, and after-hours followup. They must understand about requirements for referrals from managed care providers, and new patients may need help with such requirements. Patients must also be oriented to what is expected of them (eg, coming on time, calling to cancel or reschedule appointments) and the consequences of not fulfilling their responsibilities (eg, clinic rules regarding late arrivals). A handout or pamphlet with staff names, clinic hours and phone numbers, and emergency procedures can be very helpful.

Systems to support attendance: Patients should receive reminders (by phone or mail) about 48 hours before each appointment. It is also useful to have a staff member contact patients who have missed appointments to find out what prevented them from attending and offer to reschedule. ASOs may have funding for transportation (eg, door-to-door taxi service for selected patients, van service, vouchers for use on public transportation). Other barriers may require a coordinated effort by the clinic staff, case manager, and others. Clinic sessions should be scheduled at times convenient for the patients; mid-to-late afternoon is best for school-age children, occasional evenings or weekends are good for working people.

CLINICAL SERVICES NEEDED FOR HIV CARE

What is the optimum array of services that an HIV clinic should provide?

All patients with HIV need a similar array of services that must be provided either directly or through referral. Patients need providers knowledgeable in the diagnosis and treatment of HIV infection and its complications, including state-of-the-art use of antiretroviral therapy (ART). Services must address the clinical conditions associated with patients' current or prior risk behaviors. Given improved life expectancy, patients need age-appropriate general preventive and screening services. The high rates of premorbid mental health problems in persons with HIV and mental health problems related

to HIV disease make mental health services a key component of HIV care. Substance abuse treatment is crucial. Confronting the epidemic by including HIV prevention activities in clinical care sites is a new activity, challenging and critically important (see Chapter 4).

The HIV/AIDS Bureau of the Health Services and Resources Administration (HRSA) lists basic services required for agencies to receive funding through the RWCA Title III (Early Intervention/Primary Care) Program (Table 16-1). Some States have produced more detailed lists for agencies wishing to receive special State-level funding for HIV care; see the New York State list for comparison (Table 16-2). Funded programs generally must demonstrate continuity in primary care, 24-hour access to emergency care, ongoing staff training, an administrative apparatus adequate to manage the program and its funding, a reporting system to meet the grantors' requirements, and quality management. Programs that do not receive explicit funding for clinical care and/or support services need to rely more on referral networks.

**Table 16-1: HIV/AIDS Bureau
Requirements for Title III-funded Early
Intervention/Primary Care Programs**

- HIV counseling, testing, and referral
- Counseling and education on living with HIV disease, including availability and use of treatment therapies
- Appropriate medical care and monitoring, including CD4 cell monitoring, viral load testing, antiretroviral therapy, and prophylaxis and treatment of opportunistic infections, malignancies, and other related conditions
- Oral health care, outpatient mental health care, substance abuse treatment, nutritional services, and specialty care either directly or through a formal referral mechanism
- Appropriate referrals for other health services
- Perinatal care including therapy to reduce mother to child transmission (MTCT)
- Screening/treatment of TB

Source: Adapted from Ryan White C.A.R.E. Act Title III Manual. Rockville, MD: HIV/AIDS Bureau, Health Resources and Services Administration. 1999(Section II):5. Available at <http://www.hab.hrsa.gov/CATIE/> Accessed 2/04. Table 16-2. Comprehensive Ambulatory HIV Programs from the New York State AIDS Institute

Monitoring and treating the long-term complications of ART, such as insulin resistance, lipodystrophy syndromes, dyslipidemia, and osteopenia, are of increasing importance. Instituting formal activities to assist patients in behavior change is increasingly recognized as an essential component of HIV care. Hepatitis C diagnosis and management are of particular importance for patients who have had blood product

exposures or who were drug injectors. Screening for premalignant human papillomavirus (HPV) disease in men using anal Pap smears is potentially valuable, although it has not become a universal standard of practice.

Clinics should also have a system in place to protect the safety of their employees in regard to occupational HIV exposure (See Chapter 10 as well as Suggested Resources below).

Table 16-2. Comprehensive Ambulatory HIV Program Standards of the New York State AIDS Institute

Clinical services that must be provided by ambulatory HIV programs	
On site	
• Age appropriate, confidential HIV counseling and testing • Initial and annual comprehensive medical evaluations, including substance abuse and mental health assessments • Cognitive function testing • Ongoing clinical HIV disease monitoring • HIV-specific therapies and prophylactic treatments, including treatment education and adherence monitoring • Routine gynecologic care and followup (including reproductive counseling, pelvic examinations, and Pap smears) • Routine family planning services • Case management • Patient health education, including risk reduction and nutrition counseling	
On site or via linkage	
• Access to consultations by specialists in infectious diseases • Core diagnostic and therapeutic services - laboratory, including early diagnostic methods to establish the infection status of children - radiology, including MRI - pharmacy - dental services - mental health services, including clinical social work, clinical psychology, and psychiatry as clinically appropriate • Other primary care, specialty, and subspecialty services - obstetrics - pediatrics, adolescent medicine, and pediatric subspecialties - ophthalmology - dermatology - outpatient surgery - clinical pharmacy - subspecialties of internal medicine, including gastroenterology, hematology, pulmonology, and oncology	

Source: New York State AIDS Institute. Comprehensive Ambulatory HIV Program Standards. Part 490 of Title 10 NYCRR. November 1994.

What is different about providing HIV care compared with other types of medical care?

HIV care is new; the epidemic was recognized in 1981, and potent therapy became available in 1996. Therapeutic options are much improved, but there is little room for error. Drug resistance may occur rapidly and is irreversible. The ongoing development of new therapeutic agents is impressive, yet is not rapid enough to ensure future therapies to persons who received inappropriate prescriptions, or who did not receive the requisite education, support, and counseling to succeed with their therapy. With therapies that have been in use for less than 10 years, much is still unknown about long-term outcomes.

Juxtaposed against the need for expertise in HIV care is the need to expand access. The only prerequisite to developing expertise in HIV care is commitment. A wide range of providers may be the HIV experts for their communities: midlevel practitioners and physicians, generalists and subspecialists. Providing infected persons with the tools to succeed in their treatment and to avoid future HIV transmission may require stepwise behavior change. A persistent and nonjudgmental approach is most likely to be effective (for more on adherence see Chapter 7). Providers may have to change their own behaviors so they can be more effective in patient care.

Most persons receiving HIV care reduce their transmission behaviors, lowering the risk of HIV infection for others. Others do not change their behaviors, or do so only partially, or relapse. Providing prevention interventions in a clinic protects the public health. Clinic staff may know sex and drug using partners of patients, and find themselves with a duty to warn those who may be unknowingly exposed. These issues will be familiar to those in tuberculosis and STD treatment settings; but for many these challenges are new (see Chapter 4 on HIV prevention and Chapter 13 on substance abuse).

HIV/AIDS is associated with discrimination and stigma because of its association with sexual behavior and with drug injection, and because HIV is incurable and may still be eventually fatal. Historically, there has been discrimination because of fear of contagion based on misconceptions regarding transmission. Discrimination may still be encountered in families and communities experiencing HIV for the first time.

What can clinics do to ensure that patients receive the necessary array of services?

Clinic forms can be designed to remind providers of care standards, simplify data collection, and serve other purposes as well. Sample forms for initial and followup visits are posted on the HRSA HIV/AIDS Bureau (HAB) website (<http://www.hab.hrsa.gov>). They include reminders regarding clinical standards, reminders of services required for billing levels, checklists built around definitions used by RWCA grantees for reporting to HRSA, and other data for quality management. Staff members may rebel when confronted with new forms; however, using checklists often saves time by listing required elements of the visit and by reducing the amount of writing. Including clinical, data, and quality management staff in the process of designing forms eases the transition.

Information systems can produce reports useful to providers, for example listing a patient's prior diagnoses, medications, and sequential plasma HIV RNA levels and CD4 cell counts (see again the HAB website for examples). Similar flow sheets can be generated from electronic medical record systems; some commercial services also provide such services, but confidentiality must be assured. Periodic reports of achievement of clinical standards (viral load targets, opportunistic infection prophylaxis, vaccination, cancer screening, and other health maintenance activities) can easily be provided to individual providers, and to the clinic medical director, linking implementation of the chronic care model (see Chapter 1) and quality management (see Chapter 17).

What enhancements can make an HIV clinic more effective?

Clinics can enable patients to better care for themselves by providing them with information about HIV and by building a community among them. Patients should be given education materials; a separate area with HIV-related materials may help maintain confidentiality. Some clinics display male and female condoms with instructions about their use and have available other information on safer sex and birth control. Much information is available for patients, including publications on medications, side effects, and adherence. Free materials are available from Federal and State web sites, and the pharmaceutical industry also produces some excellent materials.

Many ASOs and clinics host support groups for interested patients. Participation must be voluntary, and only patients comfortable with revealing their status

to other patients will be willing to participate. Some groups target specific populations. Groups may be more successful if an experienced counselor or mental health provider leads them.

Some clinics hold classes on HIV and adherence. Clinics serving pregnant women and parents may include classes on birth preparation and parenting. Other clinics provide periodic symposia to keep patients up-to-date on treatment advances. For clinics that have a community advisory board, the board can be the organizing force for these community updates. Both public grants and the pharmaceutical industry support these events.

Some youth-oriented clinics arrange social events and outings for their patients. Some programs for children or mothers provide support services for both infected and affected children, ranging from formal psychological care to supportive recreational activities after school or during school breaks.

How can clinics implement interdisciplinary care?

It is not enough to have staff from many disciplines on the payroll; rather, systems have to be created that allow staff to function as a team. Training with followup by supervisors is essential. Specific tasks of each staff member need to be assigned (Table 16-3). Ideally, the staff can meet for a few minutes prior to each clinic session to anticipate special needs and allocate personnel resources. Some clinics place a checklist on each chart at each visit, to indicate which team members a patient is meant to see that day and to confirm that all intended interactions have occurred.

The team's potential can best be utilized if there is a regular opportunity to meet and discuss patients outside of clinic sessions, often called multidisciplinary team meetings. When all members participate, the discussions can range from selecting antiretroviral regimens based on genotype or phenotype results for one patient to addressing chronic mental illness for another. Services for infected and affected family members can be coordinated at these sessions.

Should clinics have a stated policy regarding controlled drugs?

Controlled drugs are needed as part of comprehensive care of HIV-infected patients, for treatment of psychiatric conditions and pain. At the same time, many patients with HIV have had prior or have current issues with substance abuse. The clinic should have policies in place regarding prescription of controlled

medications: how many prescription refills are provided at a time, how new refills are provided, access to controlled drug prescriptions or refills outside of normal clinic hours, and refills of lost medication or lost prescriptions. To avoid confusion or disagreement some clinics have patients sign copies of the clinic policy regarding use of controlled medications before they are given prescriptions. It may be necessary to provide formal notification to a substance abuse program or parole officer that the clinic is prescribing a controlled medication, specifying the drug, dose, and duration of treatment.

Table 16-3. Clinic Staff Responsibilities

Tasks prior to a clinic visit
• Remind every patient of appointments via phone call or postcard • Review charts to list items to address during the visit
Tasks during a clinic visit
• Verify patient's current contact information and current insurance status • Orient new patients • Assist with insurance gaps (teaching about need for referrals, help with insurance application or ADAP, etc) • Assess other barriers to care and psychosocial needs • Assess medication adherence • Teach and provide behavior change counseling about medications and self-care • Assess ongoing transmission behaviors • Teach and provide behavior change counseling about transmission behaviors • Educate about clinical trial opportunities (if applicable) • Make referrals for psychosocial services • Make referrals/appointments for medical, dental, mental health care
Tasks following clinic sessions
• Make followup calls regarding new medication regimens or referrals • Call or mail postcards to patients who miss their visits • Help patients overcome barriers to clinic attendance • Extract data and enter it into the information system (not necessary with electronic medical records)

SUPPORT SERVICES AND LINKAGES NEEDED FOR HIV CARE

How do support services enhance the clinical care of persons with HIV?

It is a rare clinic that has the funding, personnel, and expertise to address all of its patients' psychosocial issues. Most patients need services from an array of agencies. Case managers assist patients in accessing the range of services and entitlements that can help them succeed in treatment. This includes assistance in applying for insurance; accessing support groups; accessing supplemental food, housing, homemaker and other concrete services; accessing mental health and substance abuse services. Case managers should perform periodic assessments of clients' needs and update comprehensive care plans every 6 months. Home visits can be very useful as part of the assessment. Some case managers or their agencies will provide selected direct services themselves; these may include short-term counseling, transportation for clinic visits, accompanying patients to clinic visits, and providing financial assistance for specific emergencies. Excellent case managers help motivate patients.

Close coordination between clinic staff and case management is important to avoid duplication of effort and services. Periodic case conferences between clinic staff and case managers are ideal. Written communication, for example sharing case management care plans, can be useful. Case management agencies and clinical sites need to obtain written consent from patients to share the information that allows coordination.

How do clinics create useful linkages with community-based services?

Clinics can develop relationships with community-based case managers or directly with providers of specific services, such as mental health, substance abuse, or housing. Personal contact between clinic and agency is important to establish the relationship, and ongoing contacts are necessary for coordination. Community organizations are often pleased to give in-service education to clinic staff in order to streamline the referral process. Clinics should make their expectations clear to community-based agencies. Clinics can function as advocates to ensure that their patients receive the attention and services for which they were referred. Periodic interdisciplinary meetings of clinic staff with representatives of community-based agencies, including case managers, are very useful.

How should consumers be involved in the provision of HIV clinical care?

Many clinics have created consumer advisory boards to participate in planning and quality management. Experiences have varied greatly, with some advisory board members educating themselves about the issues and providing expert input to these processes. Other boards act more as social event or support groups. Clinics are likely to have to train board members in technical background regarding HIV and care provision, and in the role of advisors. Board members must agree to confidentiality policies, even though information about individual patients or staff members should not be discussed. Clinics have to create meaningful opportunities for advisory board members to provide input: this may involve discussion of workplans in writing grant applications, planning outreach activities, modifying clinics to enhance recruitment and retention of patients, and participating in quality management teams. When consumers are living in poverty or otherwise difficult conditions, obtaining ongoing participation of volunteers may require providing transportation to meetings, meals at meetings, and reimbursement for childcare or similar expenses. Some clinics find it useful to pay officers of their advisory boards in order to enable the officers to devote adequate amounts of time to the project. If this seems contradictory to the spirit of volunteerism, we should remember how much continuing education of medical and nursing professionals relies on enhancements to recruit participation. Creating effective advisory boards takes time, but can be a valuable investment. Advisory board members, while providing an outside view of the clinic to the clinic management, often provide useful community outreach and improve public relations.

Less intensive consumer input involves the use of periodic satisfaction surveys or questionnaires of clinic patients, confidential or anonymous mechanisms for eliciting suggestions, and a publicly accessible grievance procedure. Clinics with advisory boards use these mechanisms as well.

What resources are required to provide comprehensive HIV/AIDS care?

Financial: Patient access is maximized in clinics that can accept Medicare, Medicaid (including Medicaid managed care), and county insurance programs. Clinics should have a sliding fee scale. Clinics should assist appropriate patients to enroll in the AIDS Drug Assistance Program (ADAP), to access the drug coverage or other clinical services that vary by State.

Within designated metropolitan areas, RWCA Title I funding may be available. Clinics planning to serve a moderate-to-high volume of HIV patients can apply for a RWCA Title III planning grant. Clinics serving women, pregnant women, youth, and families are eligible to apply for Title IV funding. Clinics may collaborate with other agencies in seeking RWCA funding.

Personnel: A lone provider whose patients are self-sufficient or can access community-based services can “provide” comprehensive HIV/AIDS care. For most patients, care is more effective if multiple team members are available at the clinical site.

Facilities: In addition to the usual office layout, other facilities are useful. An examination room suitable for gynecologic exams is important. An apparatus for pulse oximetry is very useful in assessing patients with respiratory symptoms. Easy access to facilities for collecting venous blood, urine, and stool specimens should be available. On-site access to rapid tests that do not require CLIA certification may be useful, such as urine pregnancy tests, capillary blood glucose, and perhaps the newly licensed rapid whole blood HIV antibody screening test. Laboratory certification to perform urine analysis and microscopic examination of vaginal fluid specimens is very useful. Refrigeration to maintain vaccines and material for tuberculin skin testing is necessary. Refrigeration also enables the clinic to provide patients with on-site injection of medications required once a week or less frequently and to instruct patients in the use of more frequent injections.

Training and technical assistance: Patients look to nontechnical staff to corroborate information given by physicians and midlevel providers. Further, patients expect the same accepting attitude from all staff members. Thus, all staff need training in both technical and cultural matters. One important resource is the local performance site of the AIDS Education and Training Center (AETC) funded by HRSA to provide training and technical assistance to clinics. The local AETC and the National Clinicians’ Consultation Warmline provide detailed and patient-specific education to assist clinicians in making treatment decisions. Written educational materials for staff, such as national and regional treatment guidelines, are available free on the web and are frequently updated. Many regional and national meetings provide training in both clinical care and prevention. Assistance with enhancing and implementing systems of care, including instituting a quality management program, is also available from the AETCs. Chapter 18 provides other resources for training and information.

KEY POINTS

In order to recruit persons with HIV who are not in care, clinics need to establish referral linkages with community agencies such as HIV testing services, AIDS service organizations that provide case management, STD and drug abuse treatment facilities, family planning agencies, local health departments, regional HIV/AIDS hotlines, and local hospitals and emergency rooms.

Clinics can retain patients in care by respecting patients, providing them with effective care, and addressing cultural and language differences between patients and staff. Providing a welcoming staff attitude and physical environment are also important.

Orienting patients to the clinic systems and rules and telling them what is expected of them can improve attendance and adherence to care.

Primary care clinics must be able to provide, either directly or through referral, an array of clinical and psychosocial services that includes mental health and substance abuse services, support for HIV prevention and adherence to care, and close medical monitoring. Some issues that differ in HIV disease from other medical conditions include that there is little room for error in providing treatment, that providers may need to change their own behaviors and attitudes to provide effective care, that preventing HIV transmission is a critical component of patient care, and that patients continue to suffer discrimination and stigma.

Patient services can be enhanced in primary care clinics through the introduction of mechanisms for reminding staff of clinical standards, simplifying data collection, and monitoring quality improvement. These can include forms, checklists, and flowsheets, on paper or in electronic databases, and can result in feedback such as reports to individual providers. In addition, educational materials and support activities for patients can enhance their care.

An interdisciplinary care team, which is an important component of HIV primary care services, can be developed by creating systems for staff collaboration and communication, such as training, assignment of tasks with checklists on patient charts designating responsible team members, and multidisciplinary team meetings at which the issues of individual patients are discussed.

Resources needed to provide comprehensive HIV care include the capacity to accept Medicare, Medicaid, and county insurance programs and access to the AIDS Drug Assistance Program for coverage of antiretroviral drugs. In addition, the Ryan White Care Act makes a variety of funding programs available for direct funding to clinics for care. Ongoing training and technical assistance are critical to keep the expertise of staff up to date.

“Quality of care is the degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge.”

(Institute of Medicine, 1990)

“All health care organizations, professional groups, and private and public purchasers should pursue six major aims; specifically, health care should be safe, effective, patient-centered, timely, efficient, and equitable.”

(Institute of Medicine, 2001)

OVERVIEW

Quality Improvement: Why Bother?

An open letter to clinic directors:

You may have dismissed quality improvement from your agenda for many reasons. You may think it is someone else's job, or it's a lot of extra work with no benefit, or think that you've already got a quality program in place. You may think that your current system of monitoring the charts in your clinic and giving feedback to the providers who aren't doing the right thing is a quality improvement (QI) program. You may also think that your clinic is doing a fantastic job and that you don't need to monitor its quality. Here's why it's worth investing the time and effort:

- Data generated from your QI program showing improvements over time demonstrate that the program is worth its funding
- QI provides an opportunity to solve problems that are part of the system and not dependent on one individual
- Focus on performance measurement and improvement usually stimulates employees to maximize their performance
- Clinicians have the opportunity to provide leadership through championing best outcomes for patient care
- Innovative problem-solving techniques lead to better care and promote a positive working environment
- QI projects demonstrate compliance with accreditation authorities and grant sponsors
- Quality improvement activities that lead to better outcomes provide a competitive edge when competing for alliances with purchasers
- Monitoring systems that are dependent on single individuals will not last when these key players leave the clinic or are absent for long periods, whereas a fully functioning quality improvement program that involves staff working in teams with a clearly defined infrastructure will keep going when even the most dynamic individuals depart.

This chapter describes how your clinic can develop, implement, and maintain a QI Program and what your role in it might be, whether part of a QI Project Team, the Quality Committee, or simply a customer of the performance measurement and quality improvement processes.

• • • • •

What is Quality Improvement (QI)?

Quality improvement (QI) includes regular measurement of care processes and outcomes to analyze processes and systems of care. It involves implementation of solutions to improve care and monitor their effectiveness with the goal of achieving optimal health outcomes for patients. Ongoing cycles of change and remeasurement are implemented to test and try different ideas to determine which result in improved care. QI activities in clinics can range from a single team focusing on improving one aspect of care to a comprehensive QI program with many teams working on a wide variety of improvement projects, with a well-established plan and an oversight committee.

The methods of QI are based on core principles that are readily translated into a practical approach and integrated into the clinical care delivery system (see Table 17-1). Successful implementation of QI involves actions at 2 different levels: the QI activities and the HIV program processes that provide the structural backbone for them. This section will articulate the core principles and describe activities that can be easily adapted into the HIV ambulatory care setting to implement a sustainable QI program.

Table 17-1: Core Principles of Quality Improvement

- *Focus on the customer: improvement activities result in improved patient health*
- *Measurement: collect and use data to improve care*
- *Emphasis on systems of care: improve processes that link to desired outcomes*
- *Involvement of participants: encourage direct participation in teams by those individuals who implement the processes being evaluated*

Descriptions of the chronic care model that serves as an important application of QI principles to HIV care can be found in Chapter 1, Figure 1-1, and Chapter 18, the section on Integrating HIV Specialty into Practice. A training manual developed from an HIV/AIDS collaborative is available from the Institute for Healthcare Improvement (see Suggested Resources).

Why aren't chart audits sufficient for QI – Why can't management just conduct QI?

Measurement alone is not sufficient to improve quality. A common pitfall in implementing QI programs is to rely solely upon performance data, the medical or program director's interpretation of it, and one person's decisions about how to make changes. Successful improvements

most often result when staff members from the systems being assessed work together in teams. When they are engaged in the process, they are more likely to generate ideas to try and to accept changes.

Which personnel should be involved in QI?

The size of the clinic will determine who participates in quality-of-care activities. In small HIV clinics with a primary care provider, case manager, nurse, and support staff, most of the staff are involved in all aspects of QI work. Larger institutions usually establish an HIV Quality Committee that includes senior management staff of the HIV clinic, designated QI staff if there are any, and other key players who work in the clinic. A member of this committee represents the group in the agency-wide quality committee. The Quality Committee identifies the priorities for improvement or agrees to use priorities identified by staff or patients in the clinic. The Quality Committee also charters improvement teams, identifying potential members who are key stakeholders in the process under investigation or their representatives.

Who should be on the teams?

Teams are formed to address the specific care processes or systems undergoing improvement. Team members should be selected to represent the different functions involved in these processes or to represent the components of the system under focus. The size of a team varies according to the size of the clinic and the process under study. In small clinics, the few dedicated HIV program staff may constitute the project teams, with added representation from different departments as needed, such as from the lab, or from other medical disciplines. In larger clinics, teams often include 6-10 members. Membership should include representatives from the different groups in the clinic who are involved in the care process. In addition to the clinical and case management representatives, scheduling clerks and medical records staff are often important representatives, especially when followup appointments and documentation are important components of the care process or have been identified as areas that need to be improved.

What are the responsibilities of the team?

Teams are expected to identify areas of change, implement pilots to test the change, review data assessing the change, and ultimately make recommendations about improvements. Team meetings should be kept flexible and adapt to the working environment of the clinic as much as possible, although a few specific guidelines will help keep things running

smoothly. These include designating a leader for the team, developing clear and specific aims and goals, and ensuring that a clear line of accountability is defined pointing back up to the Quality Committee. Sometimes, short impromptu meetings keep the momentum of the project going and enable rapid decisionmaking based on results as soon as they become available.

As the Project Team conducts its work and gains experience, it will become more independent and assume more responsibility for ongoing measurement, data collection, and implementation of steps toward improvement.

DATA COLLECTION

How do you select which components of care should be measured?

Indicators are measurable aspects of care that evaluate the extent to which a facility provides a certain element of care. Indicators should be based on standards or guidelines, meet the primary goals of QI, and reflect priorities specific to the community and the clinic. For example, in HIV clinics where the population includes a large number of women, indicators may include rates of routine Pap smears, rates of preconception counseling, or other aspects of care specific to women. In clinics that care for a high volume of patients with severe immunosuppression and advanced HIV disease, indicators may include rates of prophylaxis for specific opportunistic infections, such as PCP and MAC. Some indicators should be selected by soliciting input from patients who attend the clinic (see Table 17-2). Staff members also often know what aspects of care would benefit from being measured and improved and should be consulted to determine priorities. If routine data collection systems already exist in the clinic, data should be reviewed to determine which components of care would be prime candidates for improvement (see Table 17-3 for sample indicators).

Table 17-2: Methods for Obtaining Input from Patients

- Suggestion box
- Surveys
- Focus groups
- Consumer advisory board

Table 17-3: Sample HIV Quality Indicators

Element Of Care	Quality Of Care Indicator
HIV staging	CD4 cell count test performed every 4 months Viral load measurement test performed every 4 months
Antiretroviral therapy	ART drug usage for stable and unstable patients
Tuberculosis screening	Annual PPD testing
OI prophylaxis	PCP prophylaxis (CD4 count <200 cells/mm ³) MAC prophylaxis (CD4 count <50cells/mm ³) Pneumococcal vaccination
Gynecological care	Annual pelvic exam with Pap smear
Syphilis screening	Annual syphilis serology
Substance abuse education	Annual discussion of substance use Annual discussion of tobacco use
Coordination of care	Annual dental exam

Once the aspect of care has been selected, how do you develop and measure the indicators?

Three major activities constitute the process of indicator development:

- 1) Define the measurement population: location, gender, age, clinical condition, visits.
- 2) Define the measures.
- 3) Develop the data collection plan.

The measurement population is defined by determining the location of care being studied, whether both men and women are eligible, the applicability of the indicator to different age groups, whether any clinical conditions are necessary to determine whether the indicator is applicable, and whether the patient must have been in treatment or visited the clinic more than once.

After defining the population, the measure needs to be defined. For each measure, specific criteria must be developed to define the “yes” response and the “no” response (see Table 17-4). Often this involves deciding during which time period an activity has been performed. For example, an indicator measuring viral load monitoring must include the frequency with which that test should be performed. One simple way to construct this measure would be to ask “Was viral load measured within the last 4 months?”

Table 17-4. Examples of Specific Measures with Definitions of Responses

Measure	Definition of measure	Yes/No response
TB screening (Eligibility: HIV-infected patients without a history of previous TB treatment or a history of a positive PPD)	Was PPD testing performed (placed and read within 72 hours) in the past 12 months?	Yes: PPD screening was performed (placed and read) No: PPD screening was not performed (or it was placed but results were not documented)
PCP prophylaxis	Did the patient with <200 CD4 cells/mm ³ and no sustained CD4 cell increase to >200/mm ³ during the last 6 months of the review period receive PCP prophylaxis?	Yes: The patient received PCP prophylaxis No: The patient did not receive PCP prophylaxis

The data collection plan includes determining the source of information, such as whether medical records or an electronic database will be used, how the data will be recorded, who will record the data, and how a sample will be selected. A representative sample will allow inferences to be made about the clinic population based on observations of the smaller sample. Some form of random sampling should be used, either from a random numbers table, or a selection of every nth record from the list of eligible patients.

A common pitfall at this point is to think of the measurement sample as a research project. For the purposes of QI, a sample just needs to be current, representative, and readily obtained (ie, sample size calculations and the achievement of statistically significant results are not necessary).

Should you measure only one indicator at a time?

Definitely not. Several indicators should be measured simultaneously, whether abstracted from medical records or analyzed through administrative databases. Indicators reflecting different aspects of patient management should be selected, as well as those involving different populations. Indicators should also be selected to evaluate different components of the health care system, such as the different components of the chronic disease model.

How should you analyze and display data?

Data should be reviewed and distributed to all members of the team and others involved in the care process under evaluation. Whenever possible, data should be displayed in graphic format. Once data from several time periods have been collected (eg, rates of patients with viral load performed every 4 months collected in 2 different time periods), a simple line graph (run chart) can be constructed with each point representing a performance rate (percentage) for a given period of time. This is usually the simplest and most effective way to show performance data (see Figure 17-1).

Figure 17-1: Sample Run Chart: Percentage of Patients PPD Tested, by Month

Source: *Measuring Clinical Performance: A Guide for HIV Health Care Providers*. New York, NY: New York State Department of Health AIDS Institute. April, 2002.

How does improvement occur?

Once the data have been reviewed by the team and the process for improvement identified, the next step is to decide where opportunities for improvement exist. This process is described as the PDSA (Plan-Do-Study-Act) or PDCA (Plan-Do-Check-Act) cycle (see Figure 17-2).

The first step is to investigate this care process in greater detail. Several techniques are often used to accomplish this goal. The simplest is brainstorming, in which individuals offer their suggestions for which processes are the best candidates for change. Another easy method is flowcharting, in which the group breaks down the process into its components to identify how it is coordinated and how its parts fit together. Then, the areas that would be most likely to benefit from improvement are selected for change (see Figure 17-3).

Figure 17-2. Plan-Do-Study-Act Cycle

Source: Institute for Healthcare Improvement. HIV/AIDS Bureau Collaborations: Improving Care for People Living with HIV/AIDS Disease. Boston: Institute for Healthcare Improvement; 2002. Available at <http://www.ihl.org/collaboratives/breakthroughseries/HIV/ChronicCare.pdf>.

Once a change in a particular step of the process has been selected, a pilot test of the change can be quickly implemented and evaluated. A limited implementation of the proposed change can be tested – perhaps with just the next few patients, or those attending on the next day, or those seen by a particular clinician. If the pilot does not work, another change can be selected and quickly implemented. If the change is feasible and improvement is noted, then the change can be adopted more widely, before formal remeasurement occurs, and a regular period of remeasurement adopted. If the change was not successful, then another one can be chosen and tested.

What systems need to be established to support QI?

The key to sustaining QI in the clinic is development of an infrastructure that supports ongoing QI activities. The central components of this infrastructure include:

- A QI Plan with goals and a process to prioritize these goals
- An organizational framework that displays clear lines of accountability for QI in the organization

Figure 17-3. Sample Flow Chart

Source: New York State Department of Health AIDS Institute. HIVQUAL Group Learning Guide: Interactive Quality Improvement Exercises for HIV Health Care Providers. Available at <http://www.hivguidelines.org>.

- Commitment of senior management staff to support the program, allocate resources, and celebrate its successes
- Creation of a culture that supports quality in the program and that values the activities of QI as part of the regular work of the clinic (see Table 17-5)
- Establishment of a formal QI Committee to oversee quality activities, monitor the Quality Plan, and evaluate its effectiveness

Table 17-5. Tips for Promoting a Culture of Quality Improvement: Integration of Quality into the Regular Work of the Clinic

- Educate staff about QI and provide them with the skills to participate in QI activities
- Communicate results from improvement projects throughout the clinic
- Display data and storyboards
- Celebrate successes
- Articulate the values of QI in meetings
- Provide opportunities for all staff to participate in QI teams
- Reward staff members through performance evaluation for their contributions to the QI Program

The regular, ongoing work of the QI Committee, supported by the clinic's leadership, constitutes the backbone of the infrastructure that supports ongoing QI activities. The committee oversees the dynamic process of planning, implementation, and evaluation that involves:

- Analysis of data from the QI projects
- Solicitation of feedback from participating staff
- Decision-making based on the information from its analysis

These activities contribute to sustaining the QI Program and its activities in the clinic.

Will improvements last?

Sustainability is probably the biggest challenge that clinics face in the field of QI. All too often, improvements do not last once initial projects are completed, because the structure and culture to support QI is not present or is not supported. The challenge of sustainability is therefore two-fold – not only to maintain the successes of QI work and its clinical outcomes, but also to maintain the systems of QI and to keep the QI program vital. By asking questions about how care systems can be improved and how QI activities are progressing, clinicians play an important role in both catalyzing and supporting QI activities.

What are the key components of a quality plan?

The key elements of a quality plan include a quality statement that describes the purpose and goals of the QI program, priorities of the program, a description of the organizational systems needed to implement the program, including committee structure and functions, definitions of accountability, roles and responsibilities, the process for obtaining consumer input, core measures, data collection processes, and a description of how the plan will be evaluated.

KEY POINTS

Providers play an active role in the activities of QI and can lead these efforts by asking questions to determine how improvements can be made. Although the QI program may require extra work from busy providers, the opportunities to systematically measure clinical performance will provide useful information that leads to better care for the patients they serve.

QI includes regular measurement of care processes, analysis of processes and systems of care, and implementation of solutions to improve care and monitor their effectiveness. The goal of QI is to achieve optimal health outcomes for patients.

QI teams identify areas of change, implement pilots to test the change, review data assessing the change, and ultimately make recommendations about improvements. When staff members from the systems being assessed work together in teams and are engaged in the QI process, they are more likely to generate ideas and to accept changes.

Indicators, measurable aspects of care that evaluate the extent to which a facility provides a certain element of care, should be based on standards or guidelines, meet the primary goals of QI, and reflect priorities specific to the community and the clinic.

Once data have been reviewed by the team and the process for improvement identified, the next step is to decide where opportunities for improvement exist. This process is described as the PDSA (Plan-Do-Study-Act) process. The first step is to investigate this care process in greater detail. Once a change in a particular step of the process has been selected, a pilot test of the change can be quickly implemented and evaluated. If the pilot is successful, the change can be adopted widely. If the pilot is not successful, another change can be selected and tested.

Sustainability is probably the biggest challenge that clinics face in the field of QI. The key to sustaining QI in the clinic is development of an infrastructure that supports ongoing QI activities.

Chapter 18:**Keeping Up-To-Date: Sources of Information for the Provider***OVERVIEW**HUMAN RESOURCES**WRITTEN RESOURCES**ELECTRONIC AND WEB-BASED RESOURCES**INTEGRATING HIV SPECIALTY INTO PRACTICE**KEY POINTS**SUGGESTED RESOURCES**Bruce D. Agins MD, MPH**Renslow Sherer, MD**Caroline J. Teter, PA-C, MPH***OVERVIEW****Doesn't the Guide itself provide sufficient information about HIV care?**

At a pace unlike that in any other field, rapid change characterizes the field of clinical HIV medicine. Fortunately, opportunities to stay current with the fast-paced changes in science and practice are available through a variety of sources.

What kinds of resources are available for keeping up-to-date?

One approach to identifying educational resources for providers is to consider them an expanding circle of information sources, starting at the local level, and finally reaching the globally available web of information on the Internet. Resources can also be grouped by type of information delivery:

Human Resources Conferences, training workshops, case-based presentations, educational consultations (in-person, telephone, distance-learning), preceptorships, audio tapes, video tapes

Written Materials Books, journals, newsletters, self-assessment, slides, handouts

Web-Based Information Downloadable articles, webcasts, resource directories, search engines, listserves, e-newsletters

What kind of standards are available to assure that HIV providers are keeping up-to-date?

Professional associations and State governments have developed policies defining HIV specialists that specify the number of patients that providers should directly manage in order to qualify for this experience-driven classification, reinforcing through regulations and requirements the simple notion that providers need to

keep current in order to provide good care. See last section, Integrating HIV Specialty into Practice, for details.

HUMAN RESOURCES**How do you identify what's available in your own community?**

The single most important step in obtaining current information is to identify local resources. The first step is to determine whether any HIV experts are practicing nearby who provide care to with HIV in the community. HIV specialists are an important source of information – not only about clinical practice, but also about educational opportunities in the area. Local hospitals or clinics may offer grand rounds on topics in HIV clinical care or continuing education programs. Local infectious disease societies or HIV medical associations may sponsor meetings at which new information is disseminated. Every region in the United States is targeted by a regional AIDS Education and Training Center (AETC), funded by the HIV/AIDS Bureau (HAB) of the Health Resources and Services Administration (HRSA), that offers a menu of educational programs designed to fit the specific needs of practicing providers, including physicians, mid-level practitioners, nurses, and dentists (see Figure 18-1).

AETC educational sessions also present excellent opportunities to make personal contact with clinical experts. Establishing relationships with local experts can lead to ongoing communication about advances in care, telephone consultations when needed, and the potential for referrals when patient management becomes especially complicated, such as when drug resistance occurs or salvage therapy is required, prompting changes in antiretroviral therapy (ART).

Figure 18-1. AIDS Education and Training Centers

Contact information for regional as well as national and international centers is available at <http://www.aidsetc.org/>. Accessed 3/04.

Are AIDS conferences useful for providers who are not HIV experts?

A number of national conferences provide opportunities to obtain cutting-edge information (see Table 18-1). The range of offerings usually meets the needs of providers just learning about HIV as well as providers who are already HIV experts.

What if you practice in a remote area?

In remote geographic areas, the nearest HIV expert may actually be far away and attendance at conferences and meetings may not be feasible. In this situation, the regional AETC can be contacted to determine how to obtain direct educational programming. When distance prevents on-site attendance at educational programs, newer technologies may enable long distance participation. Satellite broadcasting and down-linking to local facilities may be available and has been a useful approach in various parts of the United States. Distance learning and web-based information also provide important sources of education when other programming is unavailable. Many sessions are videotaped or audiotaped. Videocassettes and audiocassettes may be distributed or purchased for a modest price.

Is clinical consultation possible even if you are not affiliated with an HIV specialty practice?

In areas of the country with no HIV clinical experts, a number of consultative and co-management options are available through the AETCs or statewide education initiatives to assure that patient care is of the highest quality. Informal discussions with experienced providers in the region are probably the easiest way to access expertise, especially since these providers may be available for formal clinical consultation when decisions are made about ART, such as when to initiate, modify, or discontinue therapy.

Clinical consultations are available not only through the regional AETCs, but also from the National HIV Clinical Consultation Center, based at the University of California San Francisco (UCSF). This service provides a “warmline” — a toll-free phone number staffed from 6:00 a.m. to 5:00 p.m. PST by physicians, nurse practitioners, and pharmacists who are available to answer providers’ questions. During other times, or when the phone line is busy, voicemail messages can be left and calls returned. The HIV experts discuss options with callers, presenting pros and cons of various approaches with the goal of improving the capability of the provider to manage the current situation and others like it. The Center also refers callers to their local resources for expertise, consultation and training.

Center Warmline: 1-800-933-3413**

WRITTEN RESOURCES

What books and journals are most useful for primary care providers?

Although a basic textbook of HIV/AIDS medicine provides a basic reference of core knowledge, it becomes outdated nearly as quickly as it is published, particularly in relation to ART. Small books such as the Pocket Guide included in this guide contain quick reference materials, are more frequently updated, and provide summaries that can be useful at the point of care. Other books provide specialized information related to the care of specific groups of persons with HIV. For example, *A Guide to the Clinical Care of Women with HIV* offers an excellent comprehensive overview of issues pertaining to the care of women, with useful tables, photographs, and practical information for the provider.

Most major journals include articles about HIV. Clinical trials and review articles periodically appear in the major internal medicine journals. Two important peer-reviewed HIV-specific journals, *AIDS* and *JAIDS (Journal of the Acquired Immune Deficiency Syndromes and Human Retrovirology)*, include studies and review articles in the domains of basic science, epidemiology, clinical care, and HIV prevention. Other regularly published bulletins and journals offer review articles on basic aspects of clinical management that are useful summaries for the primary HIV care provider. *The Johns Hopkins HIV Report* provides summaries of current issues and controversies in HIV care authored by experts from the Hopkins HIV Service. Question and answer sessions with experts are often included as part of these publications. See Table 18-2 for a list of recommended publications. Also, a comprehensive list of HIV professional journals can be found at http://www.mednets.com/index.cfm/fuseaction/articles_aids_aidsjournals Accessed 3/04.

Can journal articles be accessed on the internet?

To keep up with all of the HIV journals is impossible, especially when a practice is not exclusively devoted to HIV care. Several websites post information about newly published articles and can easily be scanned to seek relevant or noteworthy information (see Table 18-3). *Medscape*, which has a specific section dedicated to HIV, and *HIVinSite* are two good sources of news. An abstract of almost any article can be retrieved through the National Library of Medicine’s website at *PubMed*. A useful list of websites, references and news may also be found at Medline Plus. The Kaiser Daily HIV/AIDS Report offers a daily news summary that includes both newspaper articles and major clinical or scientific releases that anyone can subscribe to by registering at the website. The Aegis website links to news summaries that can be quickly accessed to obtain the desired summary.

Are there guidelines for HIV care?

The Department of Health and Human Services has sponsored several guidelines panels composed of HIV clinical experts to develop evidence-based and consensus-driven practice recommendations for the provision of HIV care. These guidelines are updated regularly, and are posted on the official website of AIDSInfo, a service of the U.S. Department of Health and Human Services at <http://www.aidsinfo.nih.gov>. Currently available Federal guidelines address the following topics:

- ART for adults and adolescents
- ART for pediatric HIV
- Perinatal screening, prevention, and care
- Healthcare worker exposure
- Nonoccupational exposure
- Prevention of opportunistic infections
- Management of tuberculosis
- Incorporation of HIV prevention into care
- Nutrition

New York State has sponsored an HIV Guidelines Program since 1985 through which independent guidelines are developed that specifically target frontline providers and contain concise recommendations for primary care physicians, nurse practitioners,

and physician assistants. In addition to guidelines for adults and children, other guidelines specifically address mental health and oral health for persons with HIV. These guidelines, along with information about implementation strategies, including best practices, quality improvement methods, and success stories, can be found at <http://www.hivguidelines.org>.

ELECTRONIC AND WEB-BASED RESOURCES

Which web-based resources are most useful?

Numerous websites provide useful information about HIV. While it is beyond the scope of this chapter to provide a comprehensive listing of all HIV-related websites, Table 18-3 is a partial listing of some particularly useful ones. Websites in the Search Engines category allow the user to enter a topic of interest and obtain a list of other websites or resources from which to choose. There are search engines that are general as well as medical. Websites in the Resource Listings category provide lists of HIV resources, including agencies, other websites, and informational materials. The General HIV Resources category contains some of

Chapter 18: Keeping Up-To-Date: Sources of Information for the Practicing Clinician

the websites that are most useful when specific HIV information is being sought. One important example is the database of antiretroviral drug interactions that is part of the HIV InSite website. The HIV CME websites provide continuing medical education and award CME

credits, usually at no cost. The Specific HIV Topics category lists some of the websites addressing focused issues related to HIV care, such as drug dependency and treatment adherence.

Chapter 18: Keeping Up-To-Date: Sources of Information for the Practicing Clinician

Websites targeting consumers enable them to directly access scientific and clinical information and to pose questions to experts. These websites empower patients by helping them to better understand their disease and its manifestations and by enabling them to advocate for their own health and to more fully participate in decisionmaking about their care. See Table 2-1, Information Resources for Patients, in Chapter 2.

Thinking ahead: can personal digital assistants (PDAs) help you keep up?

A revolution in healthcare information technology has begun that brings information resources directly to the provider at the point of care, whether at the bedside or during the clinic visit. Mobile computing through handheld devices, such as personal digital assistants (PDAs), are now available and have begun to change the practice of medicine by facilitating capture of data and retrieval of information. PDAs (eg, Palm, Pocket PC, Visor) are now used as clinical tools for reference, prescribing, coding and patient education (see Table 18-4).

* Websites accessed 1/04.

Currently, the greatest advantage of carrying a PDA is having medical resources at your fingertips. Through a function that uses a cradle to connect with a website via a personal computer, the provider's PDA can "synch" with a master database that is maintained and updated regularly.

Transfer of information is easily accomplished with PDAs through "beaming." By pointing the PDA at another

PDA and tapping on the appropriate prompts, data are quickly transported into the other PDA database. Similarly, information can be beamed to a printer, which is a particularly useful feature for quickly printing patient information or prescriptions.

As PDA technology rapidly evolves, the utility and efficacy of handheld computing will similarly expand. Potential new uses of PDA technology include portable access to MEDLINE, full text journal articles, information searches, comprehensive information storage, and point-of-care access to guidelines, algorithms, and other decisionmaking tools to enhance the quality of care.

PDA versions of patient tracking systems and coding references (<http://www.meistermed.com>) have also been developed. Ultimately, PDAs will be used in conjunction with electronic medical record systems, with information being "beamed" between the two systems. This powerful application of PDA technology will permit comprehensive individualized patient data files that can include current and past medical information, laboratory data, and even reminders for providers to perform periodic preventive health or monitoring tests. Providers who have not already taken the first step, purchasing and using a PDA, should become acquainted with this important new technology as an important source of clinical information and aid to patient management (see Table 18-5).

INTEGRATING HIV SPECIALTY INTO PRACTICE

Making it stick: how can you integrate new information into clinical practice?

Numerous resources at the fingertips of providers enable them to obtain up-to-the-minute information about new developments or management strategies for HIV care. However, even the best-educated provider cannot assure that quality of care will be achieved through access to the most recent standards and current information unless the system in which care is provided has been adapted to integrate that information. Strategies for developing and sustaining systems to support information can be implemented at the local level through individual actions and through quality improvement programs.

A variety of resources provide assistance in successfully integrating current information into HIV care. Most notably, the decision support framework of the chronic care model developed by the University of Washington has been used to improve care delivered by Ryan White CARE Act-funded clinics (see Figure 1-1 in Chapter 1). Quality improvement strategies based on this model include the following principles:

- Embed current guidelines in the care delivery system.
- Establish linkages with key specialists to ensure that primary care providers have access to expert support.
- Provide continuous skill-oriented interactive training programs for all staff to update knowledge of current guidelines.
- Provide feedback to providers on their use of guidelines.
- Incorporate community-based staff (social workers and case managers) into decision support.
- Educate patients about guidelines.

One example of the application of these strategies is conducting chart audits in order to benchmark practices and feed the information back to providers. Other examples are using flow sheets or checklists to embed guidelines into practice and developing simplified versions of guidelines for providers and patients. The most successful strategies to incorporate guidelines into systems of care are those that include reminders at the point of care or decisionmaking. An important rule of thumb is that multiple interventions work better than just one. For more information on quality improvement, see Chapter 17.

How do you develop the experience needed to qualify as an HIV specialist?

Multiple studies show better outcomes when providers managing patients have expertise in HIV (see Table 18-6). In the absence of a formally recognized subspecialty society devoted to HIV medicine, government agencies, professional societies, and academic institutions have developed definitions of HIV specialization in order to develop policies, standards, and regulations, and to monitor the quality of care provided to persons with HIV (see Table 18-7). Definitions of HIV specialists generally focus on two major areas, experience and HIV CME credits, and also require that experience be current and that knowledge be updated annually. Generally, requirements for experience in the care of patients with HIV range from 10 to 20 patient-years of experience. All definitions emphasize currency of experience and education, given the rapid pace at which HIV clinical management standards change.

Table 18-7. HIV Specialist Definitions

Agency	Requirements
American Academy of HIV Medicine (AAHIVM)* http://www.aahivm.org/new/revised_definition.htm	Current and valid state licensure (MD, DO, PA, NP) Experience: Direct, continuous, ongoing care to at least 20 patients within the past 2 years CME: 30 hours within the past 2 years Exam: AAHIVM exam at application
Association of Nurses in AIDS Care (ANAC) and HIV/AIDS Nursing Certification Board (HANCb) http://www.anacnet.org/certification/hancb/index.html Certification as an Advanced HIV/AIDS Certified Registered Nurse (AACRN); there is also the HIV/AIDS Certified Registered Nurse (ACRN) for nurses not functioning in advanced practice roles	Current Registered Nurse licensure with master's degree or higher in nursing Experience: At least 2,000 hours of HIV/AIDS nursing experience and 3 years experience as an RN within 5 years prior to application CME: 70 hours every 4 years Exam: HANCb exam at application
California (State law, effective January, 2004)	Demonstrated expertise in treating a condition or disease involving a complicated treatment regimen that requires ongoing monitoring of the patient's adherence to the regimen
Department of Health and Human Services Centers for Medicare and Medicaid Services (CMS) Factsheet on Experienced HIV/AIDS Providers*: http://www.cms.hhs.gov/states/letters/smd10699.asp	Experience: active caseload of 25 patients (rural) or 50 patients (urban) within the past 24 months, with a minimum of 12 patients within the past year.
HIV Medicine Association (HIVMA) [HIVMA is part of the Infectious Diseases Society of America*. Click on HIVMA at: http://www.idsociety.org/ Accessed 3/04.]	Experience: Direct, continuous medical care to at least 20 patients within the past 2 years CME: 30 hours within the past 2 years; Category I in the areas of diagnosis and treatment of HIV OR Board certification or recertification in infectious diseases within the past 36 months
Johns Hopkins University Moore Clinic	Experience: 50 patients a year CME: 50 HIV-related credits a year Chart Audits Examination (not required)
New York State Department of Health AIDS Institute* (Click on Policy at http://www.hivguidelines.org/ for HIV Specialist Policy)	New York State licensure Experience: Ambulatory care management of at least 20 patients a year who are receiving ART CME: 10 hours per year AAHIVM or HIVMA qualification plus ambulatory care requirements
TennCare Tennessee	Experience: active caseload of 50 patients each seen at least twice a year CME: 20 AIDS-related category I credits annually

* Websites accessed 2/04.

KEY POINTS

While rapid change characterizes the field of clinical HIV medicine, opportunities to stay current are available through a variety of human, written, and electronic resources.

The most important step in obtaining current information is to identify local resources, including local HIV specialists and regional AIDS Education and Training Centers (AETCs). The regional AETCs offer continuing education programs, distance learning for remote geographic areas, and clinical consultation for providers in the area. The National HIV Clinical Consultation Center also provides telephone consultation to providers.

A basic textbook of HIV/AIDS medicine can provide core knowledge, but it quickly becomes outdated. Books can be supplemented with newsletters, journals, and frequently updated pocket guides. Websites post summaries of newly published journal articles as well as noteworthy information. Clinical guidelines for various aspects of care and prevention are updated regularly and are available on internet websites.

The personal digital assistant (PDA) is a new healthcare information technology that enables providers to have a wealth of clinical information at the point of care. PDAs can be used in conjunction with electronic medical records for patient management.

Numerous websites provide access to information about HIV through search engines, sites that provide listings of resources including other websites, sites that provide HIV-specific information for providers and consumers, and sites that offer CME credits for providers.

Several government agencies and professional societies have developed definitions for the HIV specialist. Two major areas of qualification are experience in clinical management of patients with HIV and completion of HIV CME credits.

New clinical information must be continuously integrated into the system in which care is provided. Strategies for developing and sustaining systems to support information can be implemented through individual actions and through quality improvement programs.

HHS 
@HHSGov

We delivered a clear message: federal funds must be used responsibly. California's Personal Responsibility Education Program grant was revoked today because it failed to remove delusional gender ideology that isn't part of the program's mission. We stand firm on doing the right thing for children.

At the United Nations General Assembly, on behalf of @POTUS and the United States, @SecKennedy:

- Reaffirmed the Trump Administration's commitment to exit the World Health Organization
- Rejected the divisive and controversial Political Declaration on Non-Communicable Diseases
- Asserted that there is no constitutional or international right to abortion
- Opposed destructive gender ideology

The United States will walk away from the WHO, but we will never walk away from the world—or our commitment to end chronic disease.

We stand ready to lead, to partner, and to innovate with every nation committed to a healthier future.
